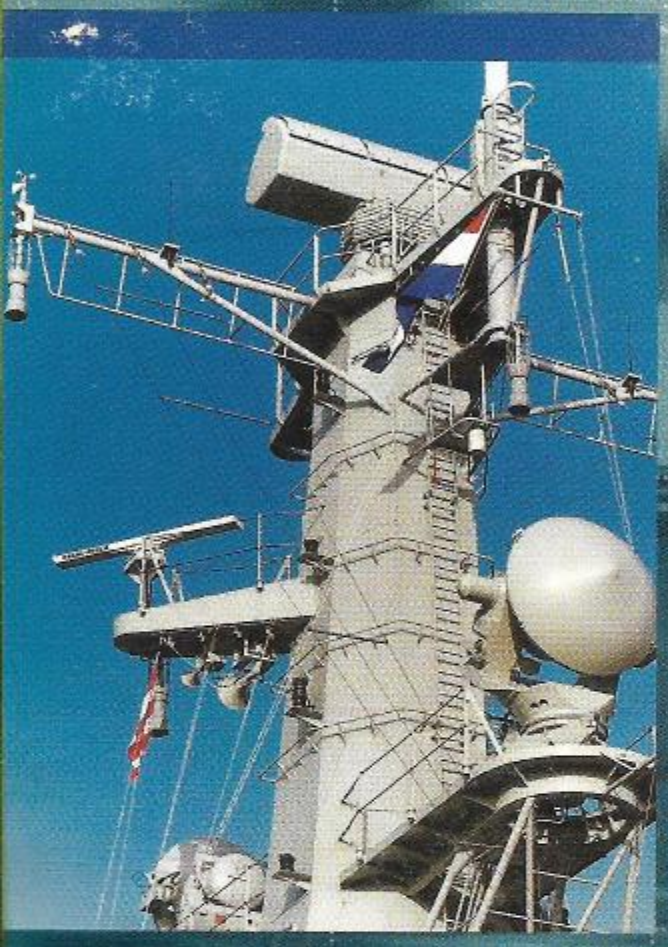
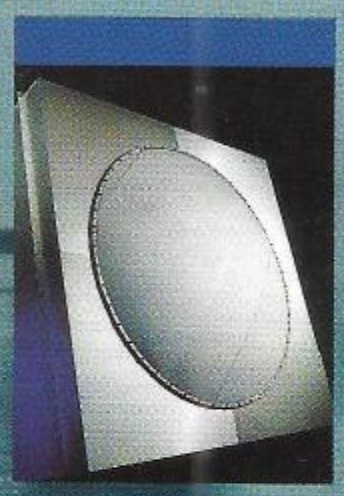
Specialists in defence electronics





Hollandse Signaalapparaten B.V. (Signaal) specializes in designing and producing integrated command and control, sensor, and communications systems, as well as ground-based air defence systems and telecommunication equipment.

Signaal's main area of activity is the development and production of Naval Combat Systems for a wide range of surface ships for Naval Forces and Coastguard organisations, ranging from patrol vessels up to frigates.

As a recognized Combat Systems house, Signaal not only produces numerous subsystems for active and passive surveillance, weapon control for guns and missiles and command functions, but has also earned a distinct reputation in overall combat system design and integration.

Signaal's capabilities are not only applied to new naval construction programmes, but are equally relevant to the modernisation or upgrade of existing naval platforms.

On shore Signaal's naval expertise is demonstrated by coastal surveillance systems, which include command facilities.

NEW

Jane's Marine Propulsion

THE INDISPENSABLE VOLUME FOR ALL WHO NEED TO KNOW ABOUT MARINE ENGINES

Whatever you need to know about marine propulsion, you will find it covered in this new publication from Jane's. Whether you need details of an engine's cylinder arrangement or its fuel consumption, transmission or gearbox type or propeller details you'll find it all here.

Jane's Marine Propulsion provides full details of the construction, performance and applications of almost all marine engines currently in production for naval or commercial use. It also gives you manufacturer details.

Intended for

- Propeller manufacturers
- Engine manufacturers
- Navies
- Commercial shipping industry
- Shipbuilders
- Ship design bureaux
- Shipping owners
- Transmission manufacturers
- Engine control equipment manufacturers

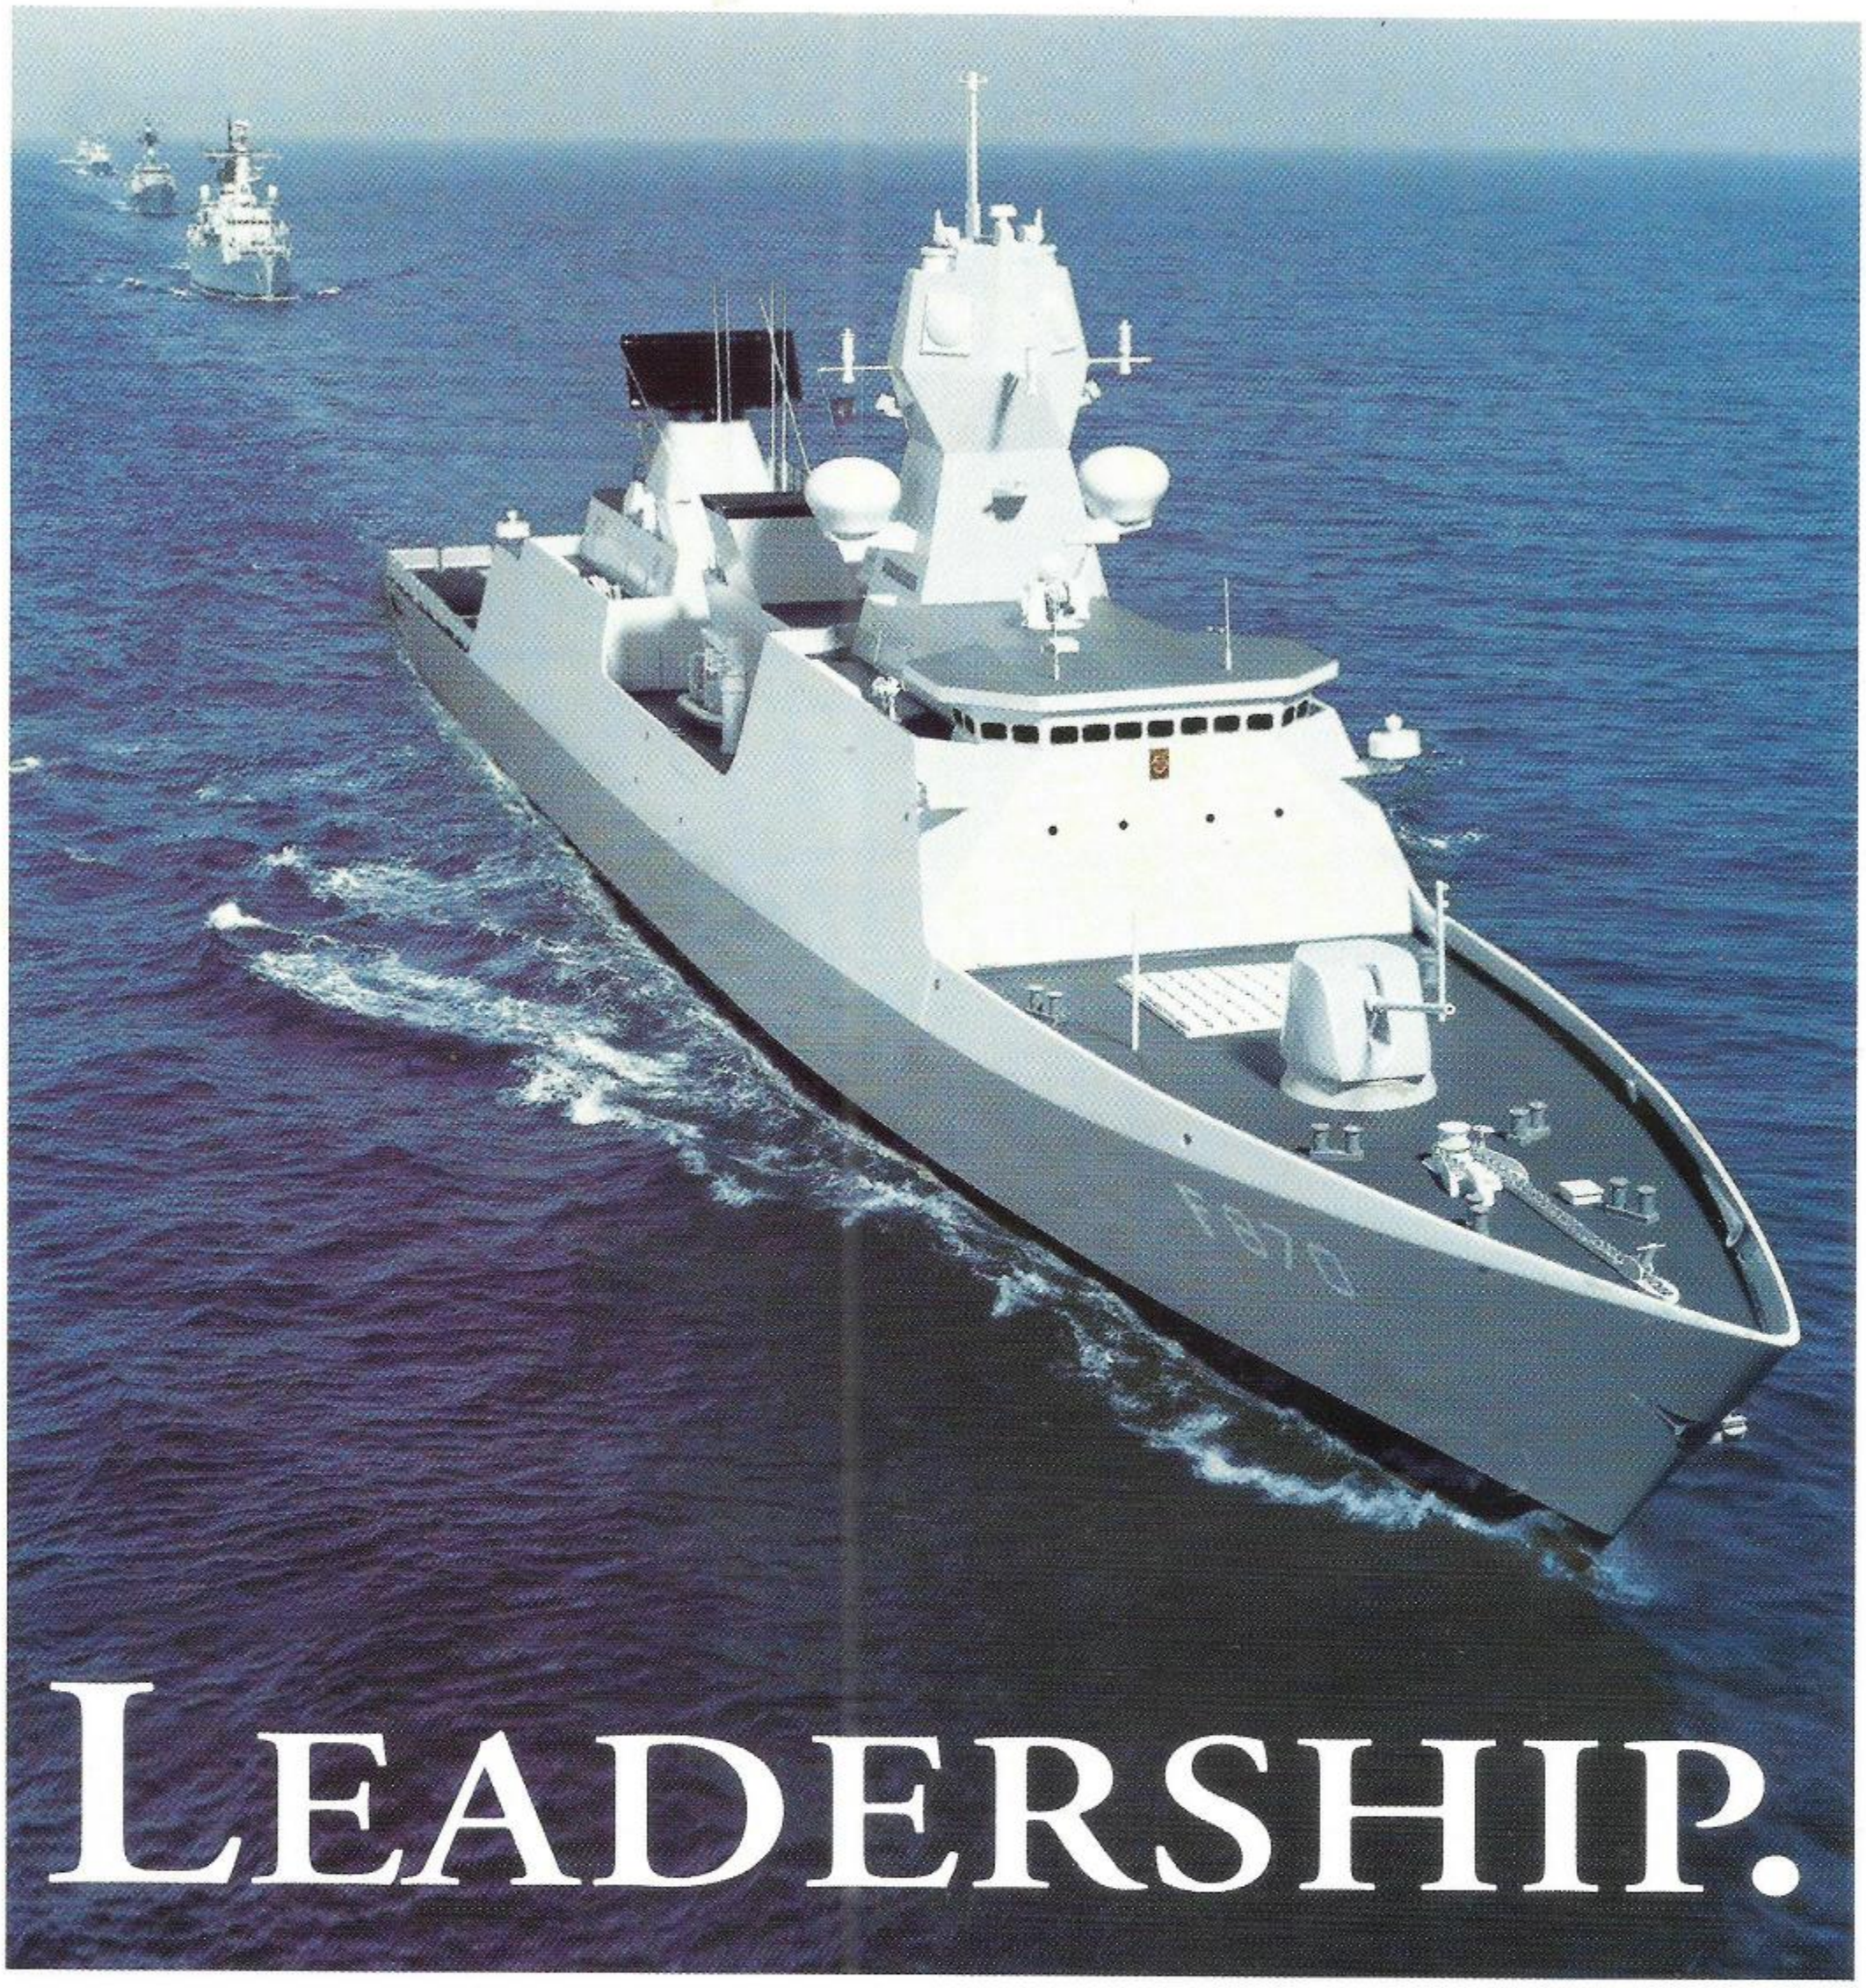
"The shape of ships to come?" Many ship designers are now producing designs which are radical departures from the traditional warship design. The Vosper Thornycroft "Sea Wraithe" shown here is stealthy, asymmetric, multi-faceted and can even change its radar cross-section while at sea. (Vosper Thornycroft)

Jane's

MAJOR WARSHIPS

1997

Volume Two



Leadership means innovation, experience, flexibility, reliability and quality. It made us the sole supplier to the Royal Netherlands Navy for complex ships like this Air-Defence and Command Frigate with fully automated platform control and integrated communication and weapon systems. A perfect example of high-end technology, resulting in the lowest lifecycle costs in its league. Suitable for all climatic conditions from the poles to the equator. To comply with the Navy's cost-efficient requirements the vessel has a highly economic crew-ship interface to facilitate operations, utilising a minimum crew with low maintenance costs.

This expertise is also used to build other craft, such as Landing Platform Docks and Offshore Patrol Vessels. Closely co-operating with each Defence Agency we actively explore the technical options to arrive at the best cost-performance formula. Customers around the globe turn to Schelde Shipbuilding because they get more for their money.

SCHELDE SHIPBUILDING

A ROYAL SCHELDE COMPANY

Introduction

The aim of *Jane's Major Warships* is to present the reader with all the information currently available on all major naval combatants. The book includes all but the very smallest combat craft and excludes patrol craft, auxiliaries, logistic vessels, harbour craft, training ships, coastguard vessels, army vessels and small boats, although some of these may follow in later volumes. In general terms, the cut-off point between major ships which have been included and minor ships to be excluded has been taken as 500 tonnes full load displacement, although a degree of flexibility has had to be applied, particularly in fast attack craft.

Jane's Major Warships is divided into two volumes covering:

Volume I
- Introduction
- Aircraft carriers
- Shipboard aircraft
- Ballistic missile submarines
- Nuclear-powered attack submarines
- Diesel-electric-powered attack submarines
- Cruisers
- Destroyers
- Index (to Volume I only)

Volume II
- Frigates
- Corvettes
- Fast attack craft
- Amphibious warfare ships
- Mine countermeasures vessels
- Index (to Volume II only)

Each entry is designed to give the reader all the information required on the ship concerned, without having to cross-refer to other parts of the book. The only exception is aircraft, where a certain amount of information is included in the ship entry, with full details given in the 'Shipboard Aircraft' section.

This means that short descriptions and specifications of weapons and electronic equipment are repeated in different entries, an approach which has been adopted in order that the reader only needs to make a 'one-stop' consultation of the book to find everything that is required. However, it should be noted that each weapon or electronic entry is tailored to give information specific to the ship concerned.

If even more detailed information or background on a weapons system or electronic equipment is needed then the reader should refer to the relevant *Jane's* yearbook, such as *Jane's Naval Weapons Systems, Jane's Underwater Warfare Systems* or *Jane's Radar and Electronic Warfare Systems.*

A certain amount of historical information is given in some class entries. This is considered essential to place the class in its contemporary context, and to show how the surviving ships have developed from their original to their current states.

TABLE I. NAVAL RANKS BASED ON SIZE OF SHIP

US/UK rank[1]	France[2]	Germany	Italy	Spain[3]
Captain	*Capitaine de Vaisseau*	*Kapitän zur See*	*Capitano di Vascello*	*Capitan de Navio*
Commander	*Capitaine de Frégate*	*Fregatten-Kapitän*	*Capitano di Fregata*	*Capitan de Fregata*
Lieutenant-Commander	*Capitaine de Corvette*	*Korvetten-Kapitän*	*Capitano di Corvetta*	*Capitan de Corbeta*

Notes:
(1) Also followed by most Commonwealth navies (except for Singapore), and a number of other navies, including Japan and South Korea.
(2) Also followed by most former French colonial territories.
(3) Followed by many South American navies.

Warship Designations

One of the difficulties in categorising warships is that there is no international agreement on the definitions of the various types of ship. Thus, in Western navies the description of warships follows a pattern that is fundamentally traditional, classifying warships into groups such as cruisers, destroyers, frigates and corvettes. These descriptions give a very general idea of the size, role and capability of the ship, so that, in the most general terms, a frigate is larger and more capable than a corvette, while a destroyer is larger and more capable still. The only known source of such warship designations is Standardised NATO Agreement Number 11 of 1966 (STANAG 11/66) which, of course, has no authority outside the Alliance, but as there is no known comparable document, it forms a useful basis for designations.

STANAG 11/66 is summarised at Appendix 1 to this Introduction and it will be seen that it attempts to classify every type of naval vessel or craft to be found in any navy. Experience suggests that it tends to be amended to suit national changes rather than to set standards with which nations will comply. It is, nevertheless, the only standardisation document in this area.

It should be noted also that warships are sometimes categorised for motives other than the purely naval. There have been occasions, for example, where navies have deemed it necessary to mislead potential enemies (or friendly politicians) into thinking that a proposed warship is smaller and less significant than it really is. Thus, in the past, cruiser-sized ships have been described as destroyers, and frigates as corvettes. Conversely, navies have sometimes wished a potentially hostile power to over- rather than underestimate their capabilities and so they have placed a warship in a category greater than is properly the case, for example, by describing a ship which most navies would classify as a corvette, a 'frigate'.

An additional factor is that many navies enshrine the relative size of ships in the middle-grade officers' ranks titles, as shown in Table 1, where a four-ring captain is a 'captain of ship' (in the sense of a traditional sailing 'ship-of-the-line') while a commander is a 'captain of frigate' and a lieutenant-commander is a 'captain of corvette.'

A further complication arises where ships are rebuilt to fit a different role from that for which they were originally designed. Sometimes the ships are redesignated to match this change; when the British Royal Navy rebuilt a large number of Second World War destroyers in the 1950s as convoy anti-submarine escorts, for example, it changed their designation to 'frigate.' Other navies, however, do not do this, and ex-US Navy 'Gearing' and 'Sumner' class ships have remained designated 'destroyers' throughout their lives, regardless of their changes in role.

A cruiser is defined by STANAG 11/66 as a vessel of '150 m (492 ft) and over', with subdivisions of CA (a cruiser with 150 mm (6 in) guns or larger and carrying no missiles) or CG (cruiser having guided missiles as a main armament). Despite this, the US Navy's 'Kidd' class ships are designated destroyers, even though they are 171 m (561 ft) in length, displace 9,574 tonnes and have an armament as heavy as that of cruisers, such as the 'California' and 'Bainbridge' classes. Similarly, the 'Ticonderoga' and 'Spruance' classes share a common hull and propulsion system, but the former are designated cruisers and the latter destroyers.

According to STANAG 11/66, destroyers have a length bracket of 95 to 140 m (312 to 459 ft), whereas the frigate length bracket is somewhat greater at 75 to 150 m (246 to 492 ft). The difference between the two lies in the role, where destroyers are optimised for '. . . operations with strike, ASW, and amphibious forces, and to perform screening and convoy duties' while frigates are '. . . fitted primarily to fulfil an ASW role: generally has lighter surface armament than DD.' The surface armament stipulation seems to have been overtaken by modern technology, where most destroyers and all but the smallest frigates are armed with one 76 mm gun and eight Harpoon SSM launchers.

The Russian system is shown in Table II. This system is also a mixture of functional designations (large anti-submarine ship,

TABLE II. RUSSIAN WARSHIP DESIGNATIONS[1]

Russian designation	Russian abbreviation	English translation	Examples	Western designation
Raketnyy Kreyser	RKR	Missile cruiser	Kirov Slava	Battle cruiser Missile cruiser[2]
Kreyser	KR	Cruiser	Sverdlov	Cruiser
Bol'shoy Protivolodochnyy Korabl'	BPK	Large anti-submarine ship	Kara Udaloy	Cruiser Destroyer
Eskadrennyy Minonosets	EM	Destroyer	Sovremenny	Destroyer
Storozhevoy Korabl'	SKR	Patrol ship	Krivak Koni	Frigate
Malyy Raketnyy	MRK	Small missile ship	Tarantul Nanuchka	Corvette
Raketnyy Kater	RKA	Missile cutter	Osa	Fast attack craft[3]

Notes:
(1) This is only a small selection, and concerns the major warship types only.
(2) The 'Kirov' class is much larger than the 'Slava' class but in the Russian Navy both share the designation RKR. In the West, however, the Kirov is generally designated a battle cruiser (BC), a designation previously used in the first half of the twentieth century to denote a ship of battleship size and with a battleship's armament, but which sacrificed armour for speed. (BC does not appear in STANAG 11/66)
(3) Fast attack craft (FAC) is not a NATO designation, but is widely accepted.

patrol ship) and of traditional designations such as *kreyser* (cruiser) and *eskadrennyy minonosets* (destroyer).

Entries
Some further explanations of the layout and contents of the entries is in Appendix 2.

Parts of a ship
For the convenience of non-specialist readers, diagrams are given in Appendix 3 which illustrate the naval terminology used in this book.

Acknowledgements
A book such as this could not be prepared by the editor alone and I wish to record my heartfelt thanks to the following:

The editorial staff at Jane's, Coulsdon, including Ruth Simmance, Sulann Staniford, the ever-patient Diana Burns, Carol Offer, Emma Pond, Carol Gallagher, Dominic Burns, Dan Faulkner, Anita Slade, Judy Kent, Lynette Murphy, Kevan Box, Jenny Jefferies and many others, all of whose cheerfulness and helpfulness in the face of considerable difficulties have been greatly appreciated.

Keith Faulkner for his help and guidance through some very troubled waters.

For their contributions to the content of the book I wish to thank John Pullin, David Foxwell and, in particular, Ted Hooton, editor of *Jane's Naval Weapon Systems,* who not only contributed the FAC section, but also patiently answered many questions and gave some very helpful advice.

For his very helpful comments on parts of the book, I am most grateful to Captain Jim Patton, USN (Retd).

I also wish to thank those who contributed photographs, including Henry Steele, Paul Tomkins and Kathleen Bunten of Jane's, Hanny and Leo van Ginderen, Pär-Henrik Sjöström and Hans Harboe-Hansen, and Ian Sturton, whose artistic touch and sure hand produced all the side and plan views.

Contributions
This book depends to a great extent on information, pictures and diagrams received from readers. Readers are, therefore, cordially invited to send such pictures and information to:

APPENDIX 1

The NATO Standard Ship Designator System (Extract)

Serial	Letter designator	STANAG 11/66[1] Reporting title	Description[1]	Editors' comments
1.	BB	Battleship, general	General designator for battleship. Largest possible type of surface combatant designed for surface action. Showing a reasonable compromise between speed, protection and armament.	1. Last applied to US 'Iowa' class. 2. Note there is NO category of 'battle-cruiser'
3.	CA	Cruiser, gun	A cruiser with guns (15 cm (6 in)) or larger as its main armament and which has no missiles	
4.	CC	Cruiser, general	General designator for all cruiser-type ships of 140 m (459 ft) or more	
5.	CG	Cruiser, guided missile	A ship of cruiser size, having a guided missile system as main armament	Peruvian *Almirante Grau* is one of few remaining examples
6.	CH	Cruiser, helicopter	A cruiser equipped with a major flight deck with a primary mission of operating and maintaining helicopters.	Peruvian *Aguirre* is one of few remaining examples
7.	CV	Aircraft carrier	1. General designator for aircraft carriers 2. Designator for multirole aircraft carriers	
8.	CVH	Aircraft carrier, VSTOL/ helicopter	A carrier not fitted with arrest gear/catapult, operating VSTOL and/or helicopters, which is not an amphibious or mine warfare vessel.	
9.	CVS	Aircraft carrier, ASW	Carrier capable of operating VSTOL and/or helicopters in sustained ASW operations and escort duties	For example, British 'Invincible' class as originally built
10.	DD	Destroyer, general	General designator for destroyer-type ships. Major surface combatant in range of about 95-140 m (312-459 ft). General mission is to conduct operations with strike, ASW, amphibious forces and to perform screening and convoy duties. May have helicopters not especially fitted for ASW.	Suffix 'G' is frequently added to indicate primary missile armament.
11.	DE	Destroyer, escort	A destroyer-sized ship optimised for escort duties	Has not been applied to a new class for many years
12.	FF	Frigate/corvette, general	General description for a frigate. A surface combatant in size range of about 75-150 m (246-492 ft). Fitted primarily to fulfil an ASW role: generally has lighter surface armament than DD	Suffix 'G' is frequently added to indicate primary missile armament
13.	FS	Corvette	Small escort in size range 60-100 m (197-328 ft)	For example, Italian 'Minerva' class
14.	LCAC	Landing craft, air-cushion	A high-speed (40 kts) assault landing craft capable of travelling over land or water from over-the-horizon distances (12-200 n miles) using air-cushion/gas-turbine propulsion	
15.	LCC	Amphibious command ship	Command ship for amphibious task force and landing operations. May carry a limited number of troops and supplies for the headquarters element of the landing force	For example, US Navy 'Blue Ridge' class
16.	LCM	Landing craft, mechanised	Landing craft in the range 15-25 m (49-82 ft), capable of carrying one tank or 50-200 troops. Must have landing ramp	
17.	LCP	Landing craft personnel	Landing craft suitable only for personnel. Size range 7.5 to 30 m (24.6-98 ft) overall. May be fast and/or ramped.	
18.	LCU	Landing craft, utility	All-purpose landing craft. Size range 25-55 m (82-180 ft). Capable of handling 2-3 tanks or 300-450 troops. Must have landing ramp or other landing facilities. Full load displacement of 120-500 tonnes.	
19.	LCVP	Landing craft, vehicle, personnel	Similar in size to LCP but capable of carrying light vehicle in place of troops. Must have bow ramp	
20.	LCW	Landing craft, swimmer support	High-speed craft utilised primarily for underwater demolition and/or special warfare operations	
21.	LFS	Amphibious fire support ship	Landing ship converted for use in amphibious assaults (sic). Armament is usually rocket launchers, but may also have bombardment guns; may or may not carry amphibious troops	

Serial	Letter designator	STANAG 11/66[1] Reporting title	Description[1]	Editors' comments
22.	LHA	Amphibious general assault ship	A large general purpose amphibious assault ship which embarks and lands elements of an assault force in both organic helicopters and organic landing craft. Capable of carrying about 1,800 assault troops. Must have internal stowage and ramp and flooded well capability for vehicles or craft.	
23.	LHD	Amphibious assault ship, multipurpose	A large multipurpose amphibious ship that embarks and lands elements of a landing force in assaults by helicopter, landing craft and amphibious vehicles. Also can conduct sea control and power projection missions with VSTOL aircraft and ASW helicopters	
24.	LKA	Amphibious cargo ship	Ship which carries supplies for amphibious assaults and can land same in its own organic landing craft	
25.	LL	Amphibious vessel, general	General designator for amphibious vessels	Is never used
26.	LPA	Amphibious transport, personnel	Ship capable of carrying 1,300-1,500 troops and landing them in its own landing craft	
27.	LPD	Amphibious transport, dock	A ship which carries about 1,000 troops. Capable of carrying up to nine LCM; primarily a troop ship and armoured car carrier, with considerable internal berthing space. Must have permanent helicopter platform	
28.	LPH	Amphibious assault ship	A large helicopter carrier with the mission of transporting and landing about 1,800 assault troops with its own aircraft. Employment of organic landing craft not a principal function	
29.	LSD	Landing ship, dock	Primarily a tank and vehicle carrier, but capable of transporting 150-400 assault troops and launching them embarked in organic landing craft without off-loading in the landing area. Need not have a helicopter platform.	
30.	LSL	Landing ship, logistics	A landing ship capable of carrying initial, second echelon and follow-on equipment, vehicles and troops. Normally ramped. Not part of initial assault force.	
31.	LSM	Landing ship, medium	Ship in size range 45-85 m (148-279 ft). Capable of beaching to land troops and/or tanks. Must have bow doors and/or landing ramp	
32.	LST	Landing ship, tank	Ship in size range 85-160 m (279-525 ft) to transport troops, vehicles and tanks for amphibious assault. Must have bow doors and/or landing ramp	See Note 2.
33.	LSV	Landing ship, vehicle	Ship in size range 45-60 m (148-197 ft) overall, intended primarily to carry vehicles. Must have bow doors and/or landing ramp. Not capable of beaching.	
34.	MM	Mine warfare vessels, general	General designator for mine warfare vessels	
35.	MCCS	MCM command and support ship	An armed combatant fitted for the command and support of MCM vessels and their equipment	
36.	MCD	MCM vessel, diving	A mine countermeasures vessel specially equipped to carry out and support diving operations	
37.	MCJ	MCM vessel, hovercraft	Specially equipped for MCM operations	
38.	MCMV	Mine countermeasures vessel, general	General designator for mine countermeasures vessels	
39.	MCS	MCM support ship	An armed combatant fitted for the control and support of MCM vessels in combat situations. Has limited facilities for repair of MCM vessels and their equipment	
40.	MH	Minehunter, general	Ship fitted with specific equipment to hunt mines	
41.	MHA	Minehunter, auxiliary	Any seagoing ship not designed as a minehunter but converted to such use	
42.	MHC	Minehunter, coastal	Very low-magnetic signature ship in size range 25-60 m (82-197 ft) with an enhanced minehunting capability. Must be equipped with unusually sensitive gear for the detection of sea mines. May or may not carry sweep gear as well. May carry frogmen for mine clearance.	
43.	MHSC	Minehunter/sweeper, coastal	A mine warfare craft capable of hunting and sweeping mines in coastal waters	
44.	MHSO	Minehunter/sweeper, ocean	A mine warfare craft capable of hunting and sweeping mines in the open ocean	

Serial	Letter designator	STANAG 11/66[1] Reporting title	Description[1]	Editors' comments
45.	MHI	Minehunter inshore	Same basic function as MHC but designed to operate in more shallow waters and estuaries	
46.	MHO	Minehunter ocean	Same basic function as MHC but operates primarily in open seas	
47.	ML	Minelayer, general	Any ship with a primary mission of laying mines	
48.	MLA	Minelayer auxiliary	Any fishing or merchant ship having both capability and mission to lay mines	
49.	MLC	Minelayer coastal	Minelayer in the size range 50-85 m (164-279 ft) overall	
50.	MLI	Minelayer inshore	Minelayer in the size range 25-50 m (82-164 ft)	
51.	MLO	Minelayer ocean	Large ship over 85 m (279 ft) used primarily for minelaying	
52.	MLR	Minelayer river	Small minelayer 15 m (49 ft) or less, suitable only for operations in rivers or protected roadsteads	
53.	MLS	Minelayer, support ship	A large armed ship (over 90 m) capable of extensive minelaying, but not capable of speeds up to 30 kts. Has facilities for command and control of mine warfare ships and boats in combat environment. Has limited support capability.	
54.	MS	Minesweeper, general	Ship designed to sweep mines	
55.	MSA	Minesweeper, auxiliary	Any seagoing ship not designed as a minesweeper but converted to such use.	
56.	MSC	Minesweeper, coastal	Non-magnetic minesweeper between 40-60 m (131-197 ft)	
57.	MSCD	Minesweeper coastal with drone(s)	Coastal minesweeper capable of deploying and/or controlling unmanned remote-controlled or towed vehicle(s) capable of clearing mines	
58.	MSF	Minesweeper, fleet	Minesweeper in size range 46 m (151 ft) or more which cannot be regarded as non-magnetic	
59.	MSI	Minesweeper, inshore	Minesweeper between 20-40 m (65.6-131 ft). Intended and equipped for inshore minesweeping	
60.	MSO	Minesweeper, ocean	Non-magnetic minesweeper 45 m (148 ft) or more	
61.	MSR	Minesweeper, river	Shallow water minesweeper in the size range 12.5-25 m (41-82 ft), which has been armoured to provide protection for crew in close combat situations. Within the USN a converted LCM-6 known as MSM	
62.	PP	Patrol vessel, general	General designator for patrol vessels	
63.	PB	Patrol boat, general	Coastal patrol unit intended for a basically coastguard function. Should include any coastal patrol ship under 45 m (148 ft) which cannot qualify as a PG in armament. May be unarmed	
64.	PBF	Patrol boat, fast	Unit qualifying as a PB but capable of at least 35 kts	
65.	PBR	Patrol boat, river/ roadstead	Light armed unit generally suitable by design only for operations in sheltered waters, such as rivers and roadsteads	
66.	PBS	Patrol boat, fire support	High-speed (35 kts) craft not over 30 m (98 ft) in length, fitted and employed primarily to provide close in fire support. The primary weapons are multiple rocket launchers, but can have guns, as well	
67.	PC	Patrol subchaser, general	Ship in size range 35-55 m (115-180.5 ft) designed and fitted primarily for ASW role	
68.	PCE	Patrol boat, escort	Ship in size range 55-75 m (180.5-246 ft) designed and fitted primarily for ASW role and coastal duty. Improved seakeeping, vice mere large size. Distinguishes PCE from PC and ships lacking this should be typed PC.	
69.	PCF	Patrol subchaser, fast	Same basic function as PC, but capable of speeds of at least 35 kts	
70.	PG	Patrol ship, general	Patrol, blockade and surveillance ship in range 45-85 m (148-279 ft) overall. Designed to operate in other than open ocean areas. Has special mission of attacking hostile ships. Must have at least 76 mm main armament.	
71.	PGF	Patrol ship, fast	Same as PG, but with speed of at least 35 kts	
72.	PGS	Patrol ship, ASW	ASW patrol ship in range 45-85 m (148-279 ft). Fitted with medium-range sonar and ASW weapons	

Serial	Letter designator	STANAG 11/66[1] Reporting title	Description[1]	Editors' comments
73.	PHM	Patrol combatant, guided missile	A high-speed patrol combatant (hydrofoil) with SSM capability, which can operate offensively against surface combatants and conduct surveillance screening and special operations.	
74.	PT	Patrol/torpedo boat	High-speed (35 kts) anti-surface ship torpedo-equipped unit 20-30 m (65.6-98 ft)	
75.	SS	Submarine, general	General designator for submarines	
76.	SSA	Submarine, auxiliary	Submarine used mainly in a non-combatant role which has at least a residual combat capability	
77.	SSB	Submarine, ballistic missile	Submarine armed with ballistic missiles normally deployed on strategic missions	
78.	SSBN	Submarine, ballistic missile, nuclear	Primary strategic nuclear submarine armed with ballistic missiles	
79.	SSC	Submarine, coastal	Submarine designed primarily for operations in coastal and shallow water	
80.	SSG	Submarine, attack, surface missile	A submarine fitted with underwater or surface-to-surface missiles	
81.	SSGN	Submarine, attack, surface missile, nuclear	A nuclear submarine fitted with underwater or surface-to-surface missiles	
82.	SSK	Submarine, patrol	A non-nuclear, long-range patrol submarine. May have primary anti-surface or anti-submarine role	
83.	SSN	Submarine, attack, nuclear	A nuclear-propelled attack submarine that has both anti-submarine and anti-surface capability	

Notes:
(1) These are taken verbatim from the STANAG 11/1966 Edition 4 (Amendment 6).
(2) It should be noted that although the designation 'LST' still exists, the designation 'LCT' (landing-craft, tank) is not in the STANAG.

Suffixes
The following suffixes can be added to qualify most of the preceding groups:

A A unit equipped with force surface-to-surface (SSM) or underwater-to-surface (USM) guided missiles. (Notes 1,3,4)
B [The suffix 'B' is NOT used]
C A ship equipped with a critical angle towed array system (CATAS)
D A ship equipped with a depressed towed array system (DTAS)
E A unit for experimental purposes
F A ship other than a CV type equipped with fixed-wing aircraft
G A unit equipped with force surface-to-air guided missiles (SAM). (Notes 1,3,4)
H A ship equipped with helicopter(s)
I [The suffix 'I' is NOT used]
J A unit that is either an air-cushion or surface-effect design
K A ship equipped with hydrofoils
L A unit minelaying capability (Note 5)
M A ship equipped with more than one force missile system; that is, SAM + SAM, SAM + SUM. (Notes 1,3,4)
N A ship or submarine using nuclear propulsion (Note 2)
O, P } [Suffixes 'O' and 'P' are NOT used]
Q A unit configured for, or employed on, a Command, Control and Communications mission
R A unit equipped primarily to carry out radar picket duties
S A unit with minesweeping/minehunting capability (Note 5)
T A unit used primarily for training with a reduced operational capability
U A unit equipped with surface-to-underwater (SUM) or underwater-to-underwater (UUM) missile-delivered force weapon. (Notes 1,3,4)
V A ship equipped with variable depth sonar (VDS)
W A ship without organic helicopter(s) but equipped with a flight deck and limited helicopter facilities
X, Y } [Suffixes 'X' and 'Y' are NOT used]
Z A non-self-propelled ship or craft

Notes:
(1) Suffixes may be combined as required but suffix 'M' should not be used with suffixes 'A,' 'G,' or 'U'.
(2) Suffix 'N', when used, is normally the last character.
(3) A force weapon contributes to the overall force offensive and/or defensive posture.
(4) The suffix 'G' for US Navy ships indicates a ship equipped with surface-to-air guided missiles (SAM) and does not exclude other systems (SSM and/or SUM). The US Navy does not use suffixes 'A', 'M' or 'U' to indicate missile systems.
(5) To be used for vessels whose primary purpose is not mine warfare.

APPENDIX 2

Entries

Classes

(a) Ships are grouped together by classes under the country where the design originated, and within such classes by alphabetical order of countries.
(b) Where necessary, an introduction or 'overview' is given, which is designed to give the reader the overall picture, to show how the class originated and how it was dispersed, either by building to foreign orders, or by foreign sales at the end of the ships' careers in the original navies.

Building programme. The current status of the class is divided into:
(a) 'Built' The total number constructed
(b) 'Building' The total number on firm order and under construction
(c) 'Active' The total in service on 1 January 1997
(d) 'Projected' The total on firm order
(e) Where there is a degree of uncertainty a question mark is appended.

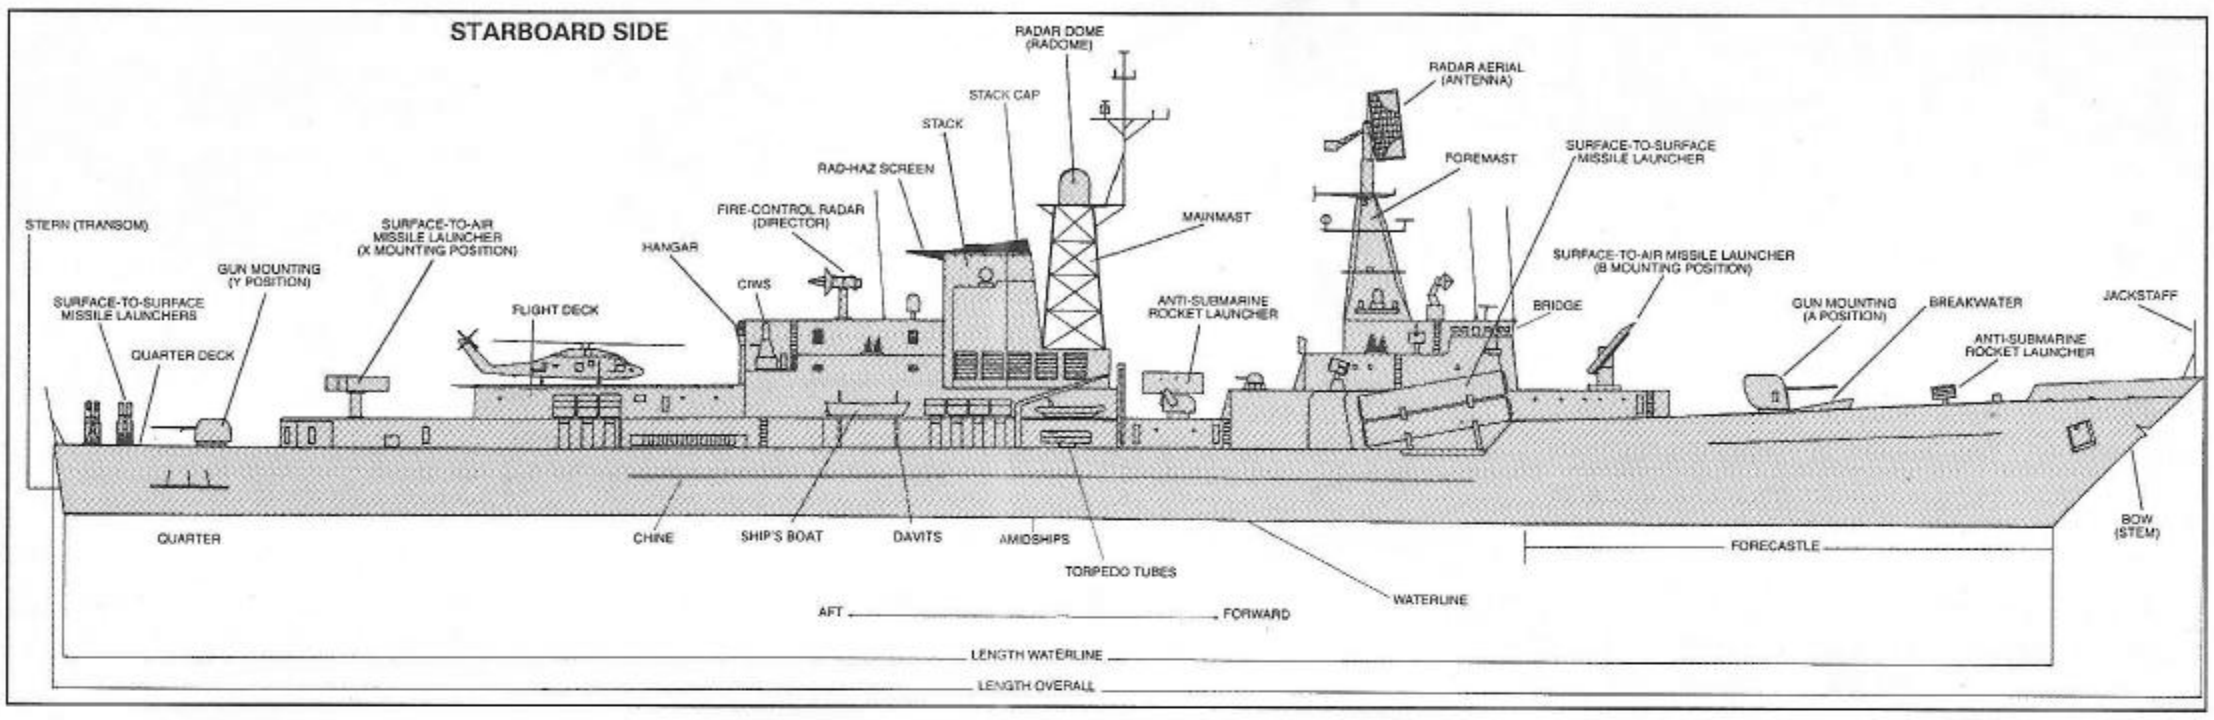
Displacement. This is given as
(a) Light: without fuel, water or ammunition
(b) Standard: as defined by Washington Naval Conference 1922 — fully manned and stored but without fuel or reserve feed-water
(c) Full load: fully laden with all stores, ammunition, fuel and water

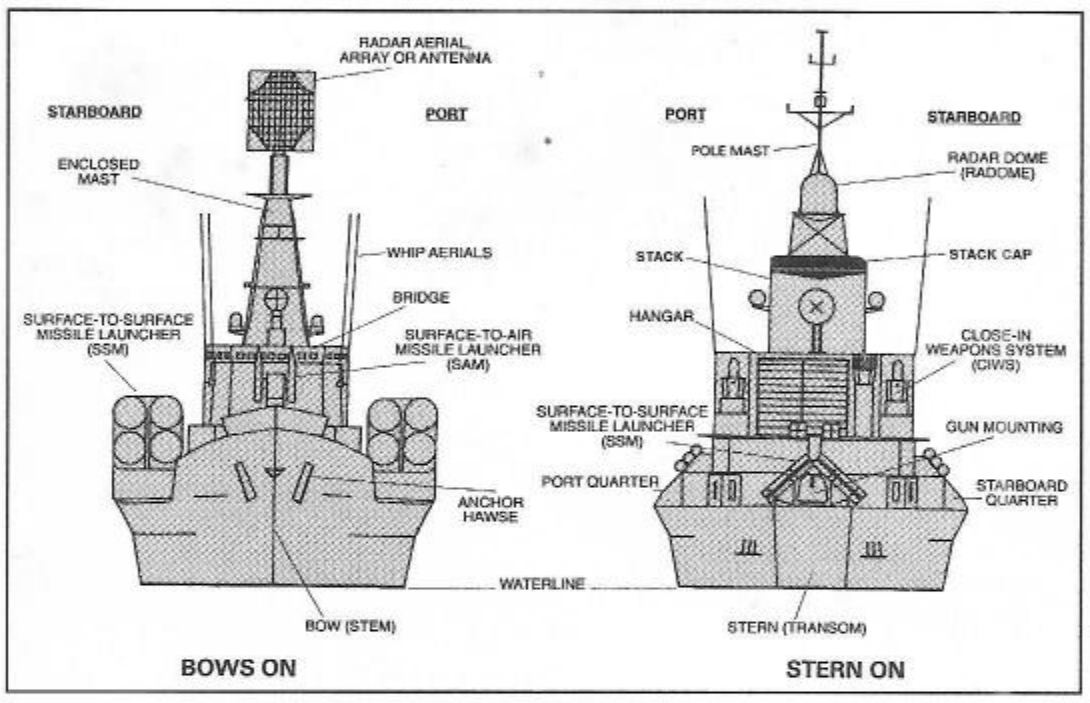
Dimensions

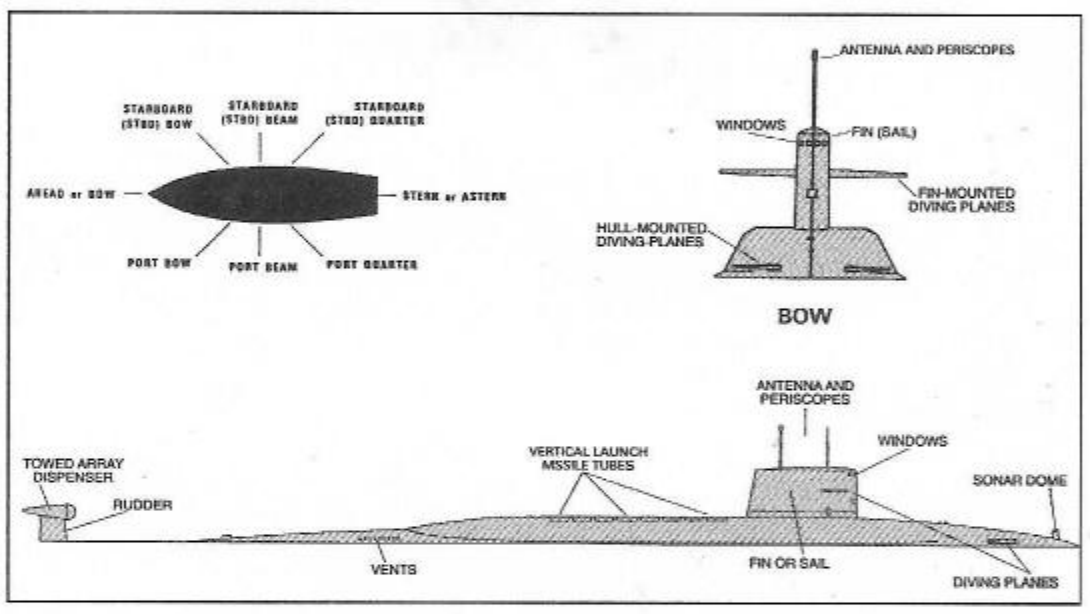
(a) Length. This is length overall, unless specified by:
i: '(oa)' length overall between extremities
ii: '(wl)' length of waterline at standard load
(b) Beam. Maximum width of the hull, but excluding sponsons.
(c) Draught. Draught at standard load at deepest point

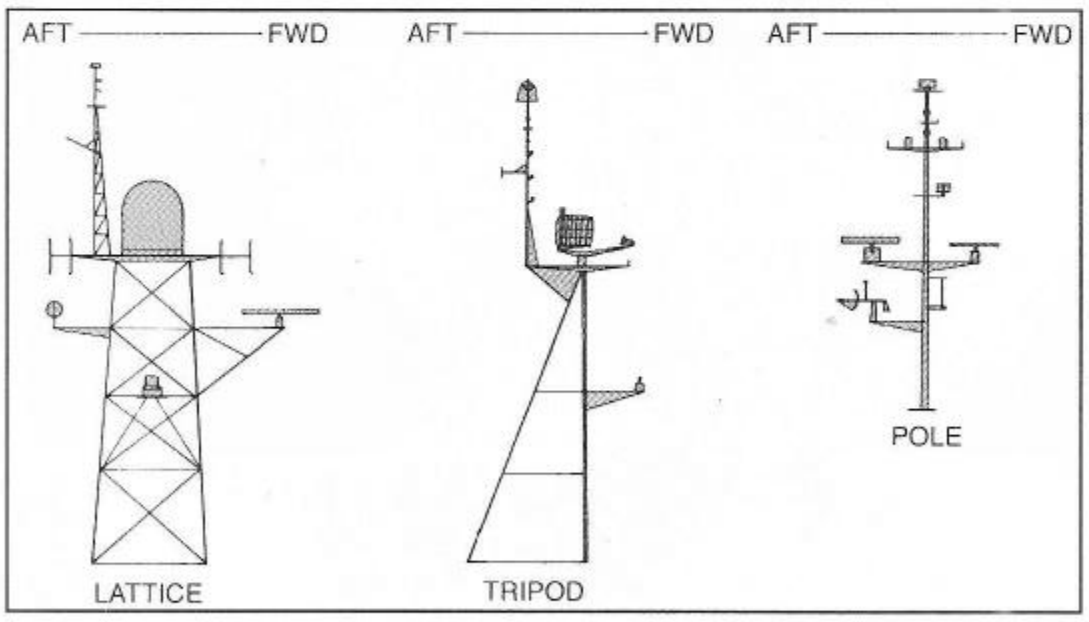
HMS *Norfolk* (H M Steele)

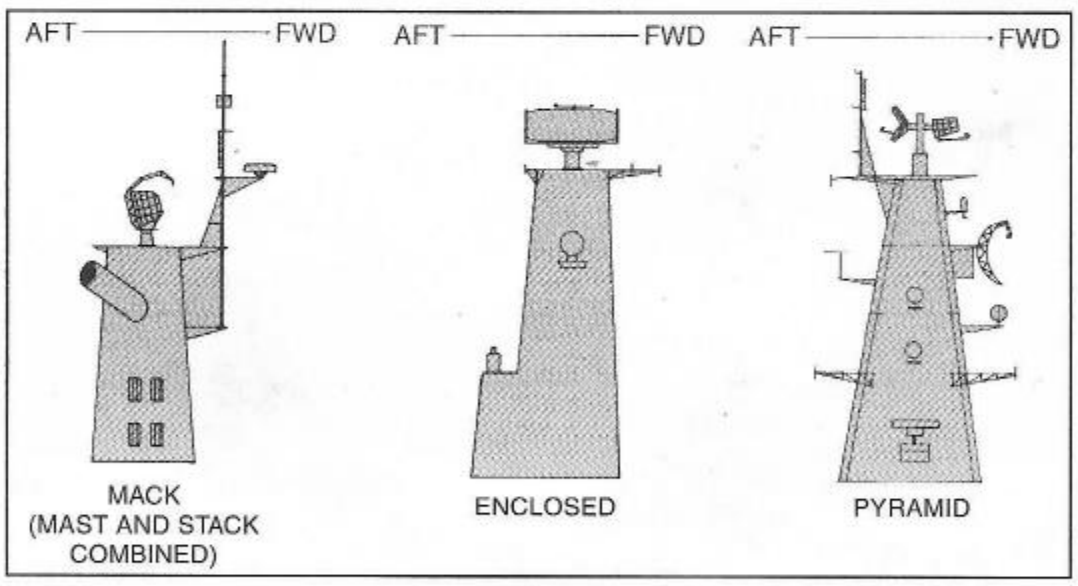
APPENDIX 3











Above are composite diagrams of warships, submarines and masts, which are annotated for the benefit of non-specialist readers

Glossary

AAW Anti-air warfare
ACDS Advanced combat direction system
ACV Air cushion vehicle
AEW Airborne early warning
AIP Air independent propulsion
ANV Advanced naval vehicle
ARM Anti-radiation missile
A/S, ASW Anti-submarine (warfare)
ASuW Anti-Surface Warfare
ASM Air-to-surface missile
AUV Autonomous undersea vehicle
BPDMS Base point defence missile system
Cal Calibre — the internal diameter of a gun barrel; also used for measuring length of the barrel, for example, a 152 mm gun 50 calibres long (152 mm/50) would be 7.6 m (25 ft) long
cep Circular Error Probable — a measure of the accuracy of missiles, bombs and artillery shells, being the diameter of a circle within which 50 per cent of the missiles/projectiles would land
CIWS Close in weapon system
COD Carrier onboard delivery
CODAG, CODOG Descriptions of mixed propulsion systems: CODLAG = combined diesel-electric and gas turbine
COGAG = combined gas turbine and gas turbine
COGOG = combined gas turbine or gas turbine
COSAG = combined steam and gas turbine
CONAS = combined nuclear and steam
cp Controllable pitch (propellers)
DC Depth charge
DCT Depth charge thrower
DP Dual-purpose; a gun which can be used against both surface and aircraft targets
Displacement Basically the weight of water displaced by a ship's hull when floating: (a) Light: without fuel, water or ammunition
(b) Standard: as defined by Washington Naval Conference 1922 — fully manned and stored but without fuel or reserve feed-water
(c) Full load: fully laden with all stores, ammunition, fuel and water
DSRV Deep submergence recovery vessel
dwt Deadweight tonnage
ECM Electronic countermeasures, for example, jamming
ECCM Electronic counter-countermeasures
EEZ Exclusive economic zone
EHF Extreme high frequency (30-300 GHz)
ELF Extreme low frequency (0-3 kHz)
ELINT Electronic intelligence, for example, recording radar, radio, and so on
ESM Electronic support measures, for example, intercept
EW Electronic warfare
FAC Fast attack craft
FLIR Forward looking infra-red radar
FRAM Fleet rehabilitation and modernisation programme (a US Navy programme in the 1960s)
GFCS Gun fire-control system
GMLS Guided missile launch system (US)
GPS Geographical positioning system
grt Gross registered tonnage
GWS Guided weapon system
HF High frequency (3-30 MHz)
HMG Heavy machine gun
Horsepower (hp) Power developed or applied: or (hp(m))
(a) bhp: brake horsepower = power available at the crankshaft
(b) shp: shaft horsepower = power delivered to the propeller shaft
(c) ihp: indicated horsepower = power produced by expansion of gases in the cylinders of reciprocating steam engines
(d) 1 kW = 1.341 hp = 1.360 metric hp. 1 hp = 0.746 kW = 1.014 metric hp. 1 metric hp = 0.735 kW = 0.968 hp
(e) Sustained horsepower may be different for similar engines in different conditions
IFF Identification friend/foe
kT Kiloton; measure of the power of a nuclear explosion, where 1 kT is equivalent to the effect of 1,000 tons of TNT
kW Kilowatt
LAMPS Light airborne multipurpose system (US)
Length The length of a ship, which can be expressed in various ways:
(a) oa: overall = length between extremities
(b) pp: between perpendiculars = between fore side of the stem and after side of the rudderpost
(c) wl: waterline = between extremities on the waterline
LF Low frequency (30-300 kHz)
LMCR Liquid metal cooled reactor
LRMP Long-range maritime patrol
MAD Magnetic Anomaly Detector — a system used by aircraft to detect submarines by identifying the movement of a steel body through the earth's magnetic field
MAP US Military Assistance Programme
MCMV Mine Countermeasures Vessel
MDF Maritime defence force
Measurement *see* Tonnage
MF Medium frequency (300 kHz-3 MHz)
MFCS Missile fire-control system
MG Machine gun
MIRV Multiple, independently targetable re-entry vehicle
MRV Multiple re-entry vehicle
MSA Maritime Safety Agency (Japanese)
MSC Military Sealift Command (US)
MW Megawatt
NBC Nuclear, biological and chemical (warfare)
net Net registered tonnage
n miles Nautical miles
NTDS Naval tactical direction system (US)
NTU New Threat Upgrade (US)
oa Overall length; that is, the length between the two extremities of the hull
OTC Officer in Tactical Command
PDMS Point defence missile system (US)
PUFFS Passive underwater fire-control system (US)
PWR Pressurised water reactor
RAM Radar absorbent material
RAS Replenishment at sea
RBU Anti-submarine rocket launcher (Russian)
RIB Rigid inflatable boat
Ro-ro Roll-on/roll-off
ROV Remote operated vehicle
rpm Revolutions per minute of engines, propellers, radar aerials and so on
SAM Surface-to-air missile
SAR Search and rescue
Satcom Satellite communications
SDV Swimmer delivery vehicle
SES Surface effect ship
SHF Super high frequency (3-30 GHz)
SINS Ship's inertial navigation system
SLBM Submarine-launched ballistic missile
SLCM Ship-launched cruise missile
SLEP Service Life Extension Program
SRBOC Super rapid blooming offboard countermeasure
SSBN Submarine, ballistic missile, nuclear-powered (that is, nuclear-powered, strategic missile submarine)
SSDE/SSE Submerged signal and decoy ejector
SSK diesel electric-powered submarine
SSM Surface-to-surface missile
SSN attack submarine, nuclear powered
STIR Surveillance Target Indicator Radar
SUBROC/ASROC Rocket-assisted torpedo, part of whose range is in the air (US)
SURTASS Surface Towed Array Surveillance System (US)
SUWN-1 Surface-to-underwater missile launcher (Russian)
SWATH Small waterplane area twin hull
TACAN TACtical Air Navigation beacon
TACTASS TACtical Towed Acoustic Sensor System (US)
TAS Target Acquisition System
TASS Towed Array Surveillance System
Tonnage Measurement tonnes, computed on capacity of a ship's hull rather than its 'displacement' (see above):
(a) Gross: the internal volume of all spaces within the hull and all permanently enclosed spaces above decks that are available for cargo, stores and accommodation. The result in cubic feet divided by 100 = gross tonnage
(b) Net: gross minus all those spaces used for machinery, accommodation and so on ('non-earning' spaces)
(c) Deadweight (dwt): the amount of cargo, bunkers, stores and so on that a ship can carry at her load draught
Tonnes Metric ton = 1,000 kg = 0.98 tons
UHF Ultra-high frequency (300 MHz-3 GHz)
UUV Unmanned undersea vehicle
VDS Variable depth sonar which is lowered to best listening depth. Known as 'dunking' sonar in helicopters
Vertrep Vertical replenishment; that is, resupply at sea using helicopters
VHF Very High frequency (30-300 kHz)
VLF Very low frequency (3-30 kHz)
VLS Vertical launch system
VSTOL Vertical or short take-off/landing
VTOL Vertical take off/landing
WIG Wing-in-ground effect
wl Waterline length

COUNTRY NAMES

Throughout this work, where it is necessary to list countries, this is done using the UN and NATO convention of alphabetical order according to the initial letter of the country name, using the anglicised spelling. The order in such a listing does not, therefore, imply any suggestion of relative size or importance, or of comparative merit.

In the case of Russia and the Soviet Union the following convention has been applied:

In any references of a purely geographical nature the name 'Russia' is used and, as far as possible, names of regions and towns are given in their modern (1997) form. Thus, for example, the name 'St Petersburg' is used even when the event referred to may have taken place in the Soviet era.

In references to the country and the navy, the terms Soviet Union and Soviet Navy are used where the events referred to happened before 1990. For events after that date the terms Russia and Russian Navy are used.

ELECTROMAGNETIC SPECTRUM

Some confusion has been caused over the past few years by the use of two different systems to describe radio frequencies and wavelengths. One particular problem has been the use of frequency band letters by the EW fraternity and the waveband letters by the radar fraternity. To avoid this, *Jane's Major Warships* follows the lead given by *Jane's Radar and Electronic Warfare Systems* in using the NATO frequency band designation as standard throughout (ie, Column (1) below). In order that readers can evaluate wavelength against frequency the wavelength letters are given in Column (3).

RADAR BANDS

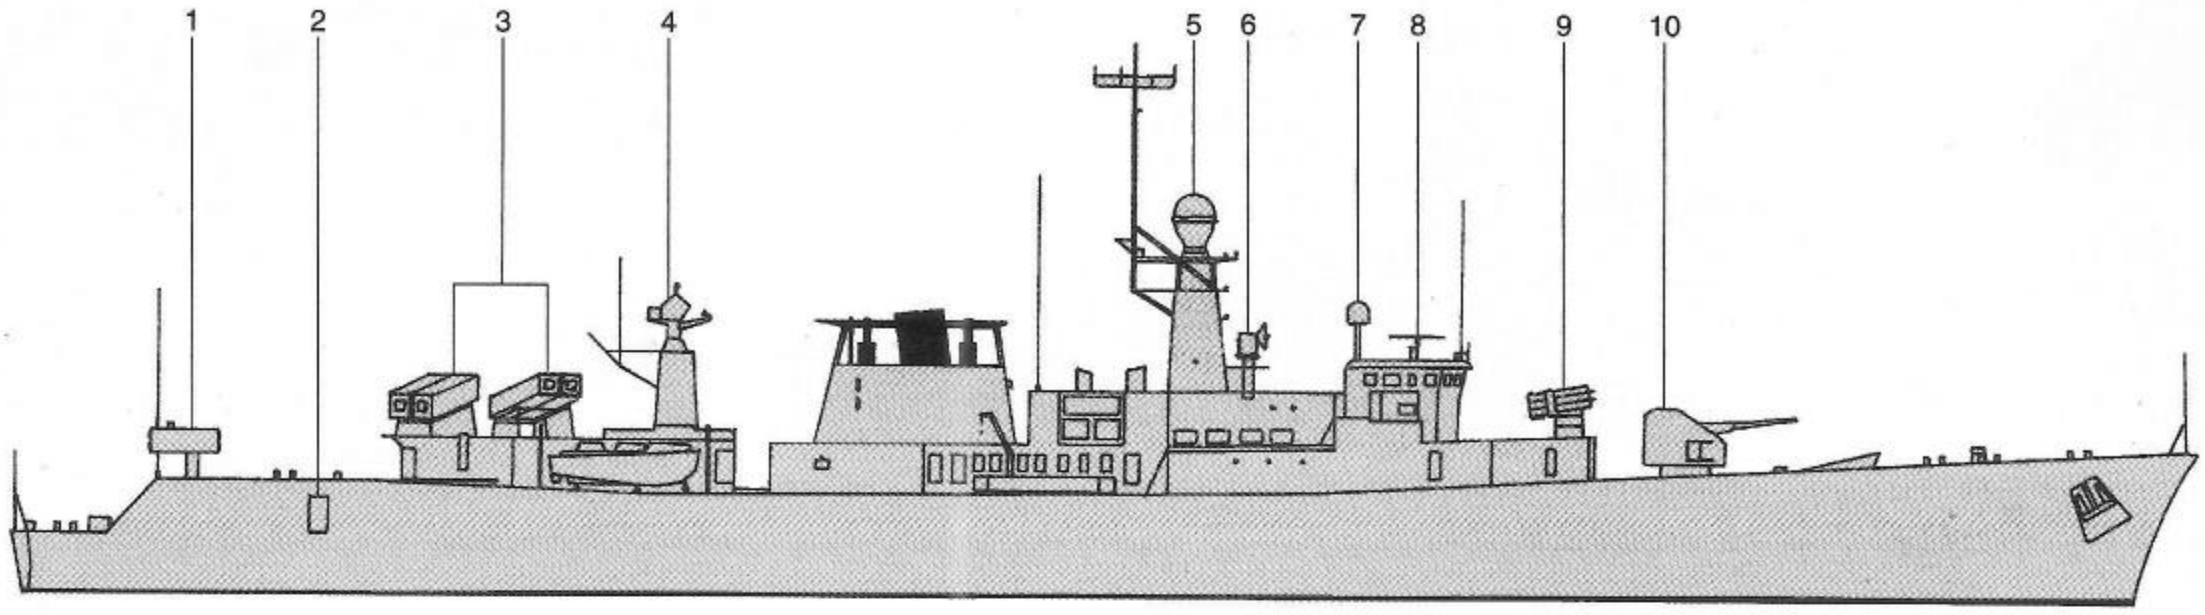
Frequency band	Frequency	Wavelength band	Wavelength
(1)	(2)	(3)	(4)
A	100-300 MHz	VHF	300-100 cm
B	300-500 MHz	UHF	100-60 cm
C	0.5-1 GHz	UHF	60-30 cm
D	1-2 GHz	L	15-30 cm
E	2-3 GHz	S	10-15 cm
F	3-4 GHz	S	7.5-10 cm
G	4-6 GHz	C	5-7.5 cm
H	6-8 GHz	X	3.75-5 cm
I	8-10 GHz	X	3-3.75 cm
J	10-20 GHz	X-Ku	1.5-3 cm
K	20-40 GHz	K-Ka	7.5 mm-1.5 cm
L	40-60 GHz	V	5-7.5 mm
M	60-100 GHz	W	3-5 mm

COMMUNICATIONS BANDS

Frequency	Band	Frequency
ELF	Extra Low Frequency	0-3 kHz
VLF	Very Low Frequency	3-30 kHz
LF	Low Frequency	30-300 kHz
MF	Medium Frequency	300 kHz-3 MHz
HF	High Frequency	3-30 MHz
VHF	Very High Frequency	30-300 MHz
UHF	Ultra High Frequency	300 MHz-3 GHz
SHF	Super High Frequency	3-30 GHz
EHF	Extremely High Frequency	30-300 GHz

FRIGATES (FF)

WIELINGEN



Wielingen (Ian Sturton)
1 *Eight Sea Sparrow SAMs in Mk 29 launcher* **2** *Launch tube (covered) for ECAN L5 Mod 4 533 mm (21 in) torpedoes* **3** *Four MM 38 Exocet anti-ship missiles* **4** *DA-05 air/surface search radar* **5** *WM-25 fire-control radar* **6** *DMAb optical director* **7** *Satcom* **8** *TM 1645/9X navigation radar* **9** *375 mm six-barrelled ASW mortar* **10** *Single 100 mm (3.9 in)/55 Mod 68 gun*

GENERAL SPECIFICATIONS

Operator: Belgium
Type: E-71

Class: WIELINGEN

Built: 4
Active: 3

Displacement:
light: 1,940 t
full load: 2,430 t

Dimensions
Length: 106.4 m (349 ft)
Beam: 12.3 m (40.3 ft)
Draught: 5.6 m (18.4 ft)

Speed:
max: 26 kts
cruise (one diesel): 15 kts
cruise (two diesels): 20 kts
Range: 4,500 n miles at 18 kts; 6,000 n miles at 15 kts

Complement: 159 (13 officers)

SHIPS

WIELINGEN (F 910)
Builder Boelwerf, Temse, Belgium
Laid down 5 Mar 1974
Launched 30 Mar 1976
Commissioned 20 Jan 1978

WESTDIEP (F 911)
Builder Cockerill, Hoboken, Belgium
Laid down 2 Sep 1974
Launched 8 Dec 1975
Commissioned 20 Jan 1978

WANDELAAR (F 912)
Builder Boelwerf, Temse, Belgium
Laid down 28 Mar 1975
Launched 21 Jun 1977
Commissioned 27 Oct 1978

Wandelaar (F 912) (Belgian Navy)

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

Raytheon Sea Sparrow point-defence missile system

There is a single Mk 29 octuple launcher for the Sea Sparrow system, which is located aft. The system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg blast fragmentation warhead and a dual-purpose proximity-impact fuze. The RIM-7M missiles originally carried have been replaced by RIM-7P, which has improved electronics and a computer with significantly increased capacity. There are no reloads.

Specifications
RIM-7P
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 226.8 kg (500 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturers/Contractors
Raytheon Company, Equipment Division (prime system contractor).
Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Aircraft Company Missile Systems Group (second missile source).
Naval Weapons Center, Crane, USA (warhead).

ANTI-SHIP MISSILES (ASM)

Exocet MM 38 medium-range anti-ship missile

Four Aerospatiale MM 38 Exocets are mounted on the roof of the after deckhouse, in individual ITS *(Installation de Tir Standard)* launcher-containers, within which they are suspended from a launch rail in the ceiling. The launcher-containers point outwards and are

Westdiep *(F 911). The cap on the muzzle of the 533 mm (21 in) torpedo tube can just be seen on the ship's side below the Sea Sparrow launcher* (B Sullivan)

raised at an angle of 12° to the horizontal. Targets are acquired by the ship's search radar and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence. This involves turning on the thermal battery, releasing the mechanical safety locks, igniting the booster, and, finally, breaking the umbilical cord; the total process takes some 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change of course during its flight.

The attack consists of three phases:

Cruise phase. The cruise phase starts as the missile clears the container and the missile, powered by the sustainer motor, flies towards the general location of the target at a height of about 100 m which is low enough to reduce the chance of detection but adequate for target acquisition. This phase can be as long as 11.9 n miles (22 km) and ends when the seeker acquires the target. This seeker is a Dassault Electronique ADAC (Auto Directeur Anti-Clutter) active monopulse radar, working in the I-band (8-10 GHz), which has a typical range of 13 n miles (24 km) against FACs.

Approach phase. On detecting the target the missile descends to 9-15 m (30-50 ft) in the approach phase.

Terminal phase. During this final phase the missile descends to 8 m (26 ft) (2-5 m (6.6-16 ft) in a calm sea) for a sea-skimming run in to the target.

A salvo may be fired in 12-20 seconds.

Specifications

MM 38
Length: 5.21 m (17.1 ft)
Diameter: 35 cm (13.8 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 2-22.5 n miles (4-42 km)
Guidance: Inertial and active radar
Sustainer motor: SNPE Eole alloy-cased CDB; weight 151 kg (333 lb); max burn time 93 s
Booster: SNPE Epervier boost motor, burn time of 2.4 s
Warhead: Luchaire 165 kg (364 lb) fragmentation warhead
Fuzes: Delayed impact fuze and autopilot-controlled proximity fuze

Manufacturer/Contractor

Aerospatiale Tactical Missiles, Chatillon Cedex, France.

TORPEDOES

There are two 533 mm (21 in) torpedo launchers, one on each beam, located in the ship's side, aft. Ten ECAN L5 torpedoes are carried.

ECAN L5 Mod 4 533 mm (21 in) torpedoes

L5 is a lightweight ASW torpedo, which can be used for direct or indirect attacks. The weapon is of conventional design with a light alloy body, four fins and twin contrarotating propellers, and a blunt nose made of a laminated material. The torpedo is electrically propelled using silver/zinc batteries. They have passive/active seekers which have various operating modes including direct attack or programmed search.

Specifications

Mod 4
Length: 4.4 m (14.43 ft)
Diameter: 533.4 mm (21 in)
Weight: 935 kg (2,061 lb)
Speed: 35 kts
Range: 5 n miles (9.54 km)
Depth: 555 m (1,820 ft)
Warhead: 150 kg (331 lb)

Manufacturers/Contractors

DCN International (prime).
ECAN, Saint Tropez, France.

GUNS

100 mm/55 Modèle 1968

There is one single 100 mm/55 Modèle 1968-II CADAM dual-purpose mounting located on the foredeck ('A' position). This is normally operated in the fully automatic remote mode with an unmanned turret, although there is a fall-back manual mode, which requires two men in each turret. The turrets have been taken from an old ship and upgraded to CADAM (CADence AMéliorée) standard with improved recoil and feed systems, raising the firing rate from 60 rds/min to 78 rds/min. The magazine in the 'Wielingen' class carries 600 rounds.

Specifications

Calibre: 100 mm
Length of barrel: 55 calibres
Muzzle velocity: 870 m/s (2,854 ft/s)
Traverse: 360° at 40°/s
Elevation: −15 to +80° at 25°/s
Mounting weight: 21 t
Crew: 2 (optional) and 2 loaders

Westdiep *(F 911). The main armament is the single Creusot-Loire 100 mm gun on the foredeck and between that and the bridge is the six-tube Modèle 1964 375 mm ASW mortar, also from Creusot-Loire. Above the bridge is the well-known Signaal 'egg', in this case housing the WM 25 fire-control radar antennas* (Belgian Navy)

Range:
anti-surface: 9.15 n miles (17 km)
anti-air: 8,000 m (26,000 ft)
Rate of fire: 78 rds/min
Ammunition: 13.5 kg (multipurpose projectile); 9.7 kg (charge)

Manufacturers/Contractors
Direction des Constructions Navales (DCN) (prime).
Mécanique Creusot-Loire, Marine Products (mountings).
DCN Ruelle (gun).
CSEE, Défense (servo equipment).

ANTI-SUBMARINE MORTARS

Creusot-Loire Modèle 1964 375 mm ASW rocket system
There is a single, six-tube Model 1964 ASW rocket launcher on the forecastle. This weapon was developed in France, but uses Bofors 375 mm rockets. The system consists of a rocket launcher, a handling system, the ship sonar and a fire-control system. Reload time is three minutes, each tube being loaded separately. The rate of fire is one round a second and rockets may be fired singly or in salvos. There are two types of rocket, both with Hexotonal filling. The Type E (Erika) rocket has Stidar time and impact fuzes, while the Type N (Nelli) uses the Zambo proximity and impact fuzes.

Rockets

	Type E	Type N
Weight	250 kg (551 lb)	230 kg (507 lb)
Muzzle velocity	130 m/s (427 ft/s)	205 m/s (673 ft/s)
Explosive weight	107 kg (236 lb)	80 kg (176 lb)
Range	0.35/0.87 n miles (0.65/1.63 km)	0.85/2.11 n miles (1.58/3.62 km)
Final sinking speed	10.7 m/s (35 ft/s)	9.2 m/s (30 ft/s)

Manufacturer/Contractor
Creusot-Loire, France.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Thomson-CSF DR 2000 radar threat warner
The Thomson-CSF DR 2000U ESM system detects pulse and continuous wave (CW) signals, and when coupled with the Dalia analyser is used as a basic ESM suite, under the company designation TMV 434. There are six DF antennas and one omnidirectional antenna on a telescopic mast, and a processing control/display console in the EW centre. It provides a virtual 100 per cent probability of detection over the complete 360° of azimuth and gives instantaneous audio and video alerts.

Manufacturer/Contractor
Thomson-CSF, RCM, Elancourt, France.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher
There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 4 km (2.2 n miles)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

AN/SLQ-25 Nixie noisemaker
One AN/SLQ-25 Nixie (Phase 1), a solid-state, modular design electroacoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed through the transom or in a partially or totally enclosed location on the main deck. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm long (3.10 ft), 15.24 cm (6 in) in diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body at a time is deployed.

Manufacturer/Contractor
Aerojet ElectroSystems, Sacramento, California, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

SEWACO IV data handling and weapon control system
Sewaco IV is an automated data handling and weapon control system, which was specifically designed for the 'Wielingen' class frigates to form the link between the ship's sensors and its weapons. The main functions of Sewaco are: sonar display and control; contact evaluation; classification; contact motion analysis; tactical plot and general plot functions; weapon control; and simulation and test.

Sewaco consists of seven identical Display and Computer Consoles (DaCCs) with a built-in SMR-MU computer. The large amount of data from the sonars is handled by two extra SMR-MUs, also housed in the CCU. Sensors comprise a Signaal DA-05 air and surface warning, and target indication radar, Signaal WM25 combined search and tracking radars, a Raytheon TM 1645/9X navigation radar (also used for helicopter control, if required), IFF, Thomson-CSF DR2000 ESM suite, datalink, optical director, and sonar. The weapon control and combat information equipment consists of the WM25FCS for missiles, gun and ASW rockets.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

RADARS

Set	DA 05	WM 25	TM 1645/9X
Company	Signaal	Signaal	Raytheon
Role	Air/surface search/target indication	Fire control (SSM/127 mm gun)	Navigation

COMMUNICATIONS AND DATALINKS

Datalink: Link 11
Satcom.
IFF: Mk XII.

WEAPONS CONTROL

Two CSEE DMAb optical directors.

SONARS

AN/SQS-505A sonar
The Canadian Westinghouse AN/SQS-505 sonar is a hull-mounted 7 kHz, search and attack sonar. It is a deep water, omnidirectional, surveillance system, but is

Wielingen *(F 910), name ship of a class of three. These were the first large warships to be designed and built in Belgium and have proved to be most successful. Note Satcom dome on bridge roof* (H & L van Ginderen Collection)

also able to operate in a directional mode that can maintain search ability while tracking defined targets. Three selectable frequencies are available so that several ships can survey an area in close proximity without cross-talk. In high sea states leading to excessive roll and pitch of the ship, the AN/SQS-505A utilises transmit beam stabilisation, which delays transmission until near optimum roll and submergence conditions prevail, thereby minimising chances of the target being missed altogether.

Specifications

Coverage: 360° (azimuth)
Range: 183-3,000 m (200-3,200 yd)
Doppler range: ±40 kts (7.2 kHz)
Displays: Range (A Scan); Bearing (B Scan)
Doppler Frequencies: 6.4, 7.2 and 8.0 kHz
Source levels: From 224.233 dB/µPa/m (transmission mode dependent)
Initial detection: 12 ping history of returns
Bearing accuracy: 1° RMS
Range accuracy: ±1% range reading
Transmission modes: Omni, TRDT, DT, ASPECT
Power level: High and low (10 dB reduction)

Manufacturer/Contractor

Westinghouse Canada Inc, Burlington, Ontario, Canada.

PROPULSION

Specifications

System: Combined diesel-or-gas turbine (CODOG)
Engines: One Rolls-Royce Olympus TM3B gas turbine; 19 MW (25,440 hp) sustained; two Cockerill CO-240 V 12 diesels; 4.4 MW (6,000 hp(m))

Shafts: 2
Propellers: cp

FURTHER INFORMATION

PROGRAMME

The Belgian Navy acquired eight ex-RN 'Algerine' class warships for use as fleet minesweepers and ASW escorts in 1949-53. These were due to be withdrawn from service by 1969 and the Belgian naval staff formulated a requirement for a replacement which would provide 'in close co-operation with Allied naval forces, protection of the Allied and national merchant shipping in the North Sea, the English Channel and its Western Approaches'. The units were to possess a full ASW capability and to be equipped with limited anti-air and anti-surface weapons.

Three principles were laid down. First, that only those features essential to the escort mission and self-protection were to be provided. Second, to mount only weapons and sensors which had been standardised (or, at least trialled) by other NATO navies. Third, that the ships must be built in Belgian yards.

The programme was approved on 23 June 1971, design studies were completed in July 1973 and the order was placed in October 1973. Two ships were built by Boel at Temse and two by Cockerill at Hoboken, and the first ship from each yard was commissioned in January 1978, followed by the second from each yard in October 1978.

DESIGN

This is a compact and well-armed class of frigate with as good a combination of anti-air, anti-surface and ASW capabilities as could be expected in a hull of this size. The only serious deficiency is the lack of an ASW helicopter.

The ships are fully air conditioned and are fitted with Vosper roll dampers.

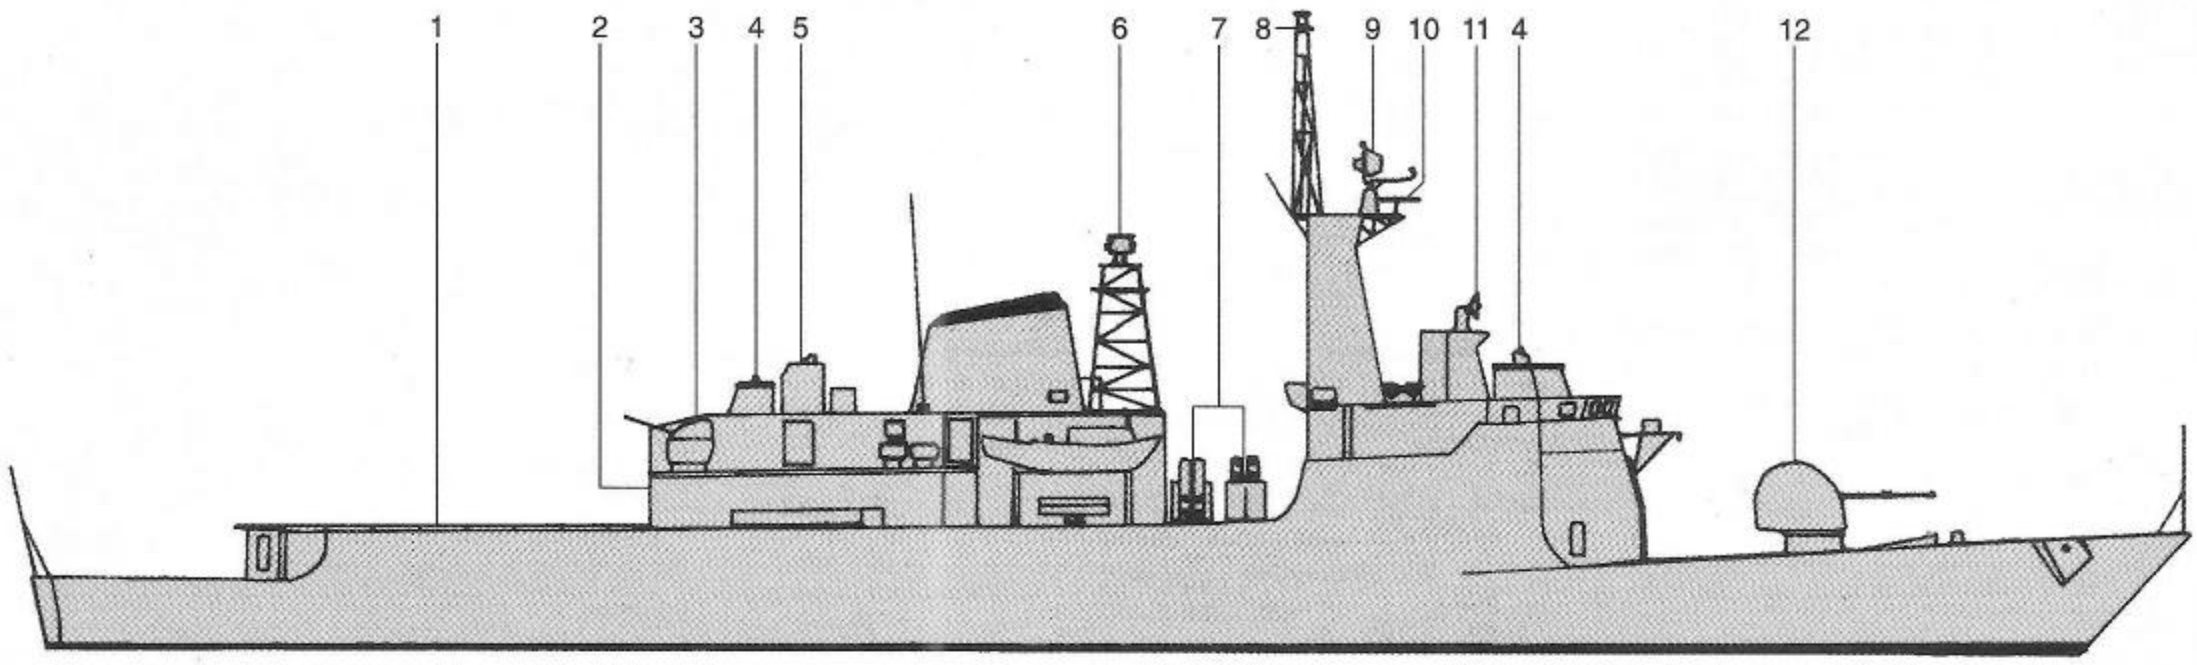
MODERNISATION

In the 1980s the need for a CIWS was recognised and there was a plan to fit whatever system the Netherlands Navy decided upon. The Dutch selected the Goalkeeper, but the Belgian plans were abandoned in 1993. The Sea Sparrow missiles were, however, upgraded from 7M to the 7P model. Current plans are for the existing search and fire-control radars and the ESM system to be upgraded when funds are available. The fitting of an electro-optic scanner is also under consideration. Updates to the sonar, IFF and communications systems are also planned in due course.

DEPLOYMENT

The ships are based at Zeebrugge. *Westdiep* (F 911) and *Westhinder* (F 913) deployed to the Adriatic in 1993 as part of the UN embargo forces. *Westhinder* (F 913) subsequently hit rocks off the Norwegian coast in mid-1993 and was then deleted and offered for sale, although no purchaser has yet been found. Two of the three remaining ships are to be kept in an operational status.

INHAUMA



Inhauma (Ian Sturton)
1 *Flight deck (for UH-12 Esquilo (AS 350 Ecureuil)* **2** *Hangar* **3** *Bofors 40 mm/70 enclosed mount* **4** *OFDLSE optical director* **5** *Saab EOS-400 fire director* **6** *IPqM SDR-7 jammer* **7** *Aerospatiale MM 40 Exocet anti-ship launchers* **8** *IPqM SLQ-1/Racal-Decca Cygnus B1 ESM (radar intercept)* **9** *Plessey AWS-4 surface search radar* **10** *Kelvin Hughes Type 1007 navigation radar* **11** *Selenia Orion RTN-10X fire-control radar (for 114 mm gun)* **12** *Vickers 114 mm (4.5 in)/55 Mk 8 gun*

GENERAL SPECIFICATIONS

Operator: Brazil

Class: INHAUMA

Active: 4
Building: 1
Proposed: 1

Displacement:
standard: V 30 to V 33 — 1,600 t; V 34 — 1,785 t
full load: V 30 to V 33 — 1,970 t; V 34 — 2,350 t

Dimensions
Length: V 30 to V 33 — 95.8 m (314.2 ft); V 34 — 100 m (328 ft)

Beam: 11.4 m (37.4 ft)
Draught: 3.7 m (12.1 ft)(hull): 5.3 m (17.4 ft) (sonar)

Speed: 27 kts
Range: 4,000 n miles at 15 kts

Complement: 122 (15 officers)

SHIPS

INHAUMA (V 30)
Builder Arsenal de Marinha, Rio de Janeiro, Brazil
Laid down 23 Sep 1983
Launched 13 Dec 1986
Commissioned 12 Dec 1989

JACEGUAY (V 31)

Laid down 16 Dec 1994
Launched Aug 1998
Commissioned Sep 2000

Julio de Noronha *(V 32). This class was designed in Brazil, with assistance from Marine Technik, a German design consultancy. The gun is the British Vickers 114 mm (4.5 in)/55 Mk 8, with its Selenia Orion RTN-10X director on the bridge roof (Robert Pabst)*

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 40 medium-range anti-ship missile

Two pairs of Exocet launchers are mounted immediately abaft the foremast, firing across the ship.

Specifications

	MM 40 Block 1	MM 40 Block 2
Length	5.78 m	5.80 m
Diameter	35 cm	35 cm
Wing span	1.13 m	1.13 m
Weight	855 kg	870 kg
Speed	Mach 0.9	Mach 0.9
Range	2-38 n miles (4-70 km)	2-40.5 n miles (4-75 km)
Warhead	165 kg HE frag	155 kg HE frag
Fuze	Delay impact/ proximity	Impact/proximity
Guidance	Inertial and active radar	Inertial and active radar

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited in the waist.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications

Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

Vickers 114 mm (4.5 in)/55 Mk 8 multipurpose gun

The 'Inhauma' class mounts a single 114 mm (4.5 in)/55 calibre Mk 8 gun in 'A' position. This weapon provides quick-reaction short-range air defence, engages surface targets including fast attack craft, and provides gunfire support to ground forces. The weapon system consists of the gun mounting, the ammunition feed system, the remote power control system, and the captain-of-turret panel.

The barrel is 6.22 m (20.4 ft) long, is fitted with a muzzle brake and fume extractor, and has a life of 3,300 rounds EFC. The mounting is completely enclosed in a glass fibre shield which protects it against the environment, blast and shrapnel. The loading system is hydraulically operated, with an autoloader which is manually fed by two loaders and has a capacity of six rounds. The hoist transfers them in two stages to the turret from where they are raised by a pivoting loading arm to the breech where they are inserted by a power rammer. After the shell is fired the case is extracted automatically and ejected through a chute in the front of the mounting.

Specifications

Calibre: 114 mm
Length of barrel: 55 calibres
Traverse: 340° at 40°/s
Elevation: −10 to +55° at 40°/s
Muzzle velocity: 868.7 m/s (2,850 ft/s)
Weight of projectile: 21 kg (46.3 lb)
Rate of fire: 25 rds/min
Range:
anti-surface: 11.9 n miles (22 km)
anti-air: 6,000 m (20,000 ft)
Crew: 4 (gun captain (CIC), loading supervisor, 2 loaders)

Manufacturer/Contractor

Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

Bofors 40 mm L/70

Two single Bofors 40 mm AA guns are mounted on a platform at the after end of the hangar. They have glass-reinforced plastic (GRP) shields.

Specifications

Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000-1,025 m/s (3,281-3,363 ft/s)
Range:
anti-surface: 6.75 n miles (12.5 km)
anti-air (nominal): 6,900 m (22,638 ft)
Rate of fire: 300 rds/min (practical)
Ammunition: 2.21 kg (4.9 lb)

ELECTRONIC WARFARE SYSTEMS

DECOYS

Plessey Shield Tactical Decoy System

There are two launchers, each with six parallel barrels, for the Plessey Shield system, sited on either beam, just forward of the mast. Shield is a microprocessor-controlled, fully automatic missile decoy system, which is designed to provide effective protection for various sizes of ship, including fast attack craft, corvettes, frigates and destroyers. On detecting a threat, Shield selects the most appropriate response from up to six million scenarios held in its EPROM memory, using data obtained from onboard sensors such as radar and ESM and then automatically deploys the pattern of decoys that will give the highest probability of success. GEC-Marconi chaff rockets are fitted with a variable fuze which allows the chaff to be dispersed at optimum positions along the trajectory. To counter threats with a dual-mode capability, both chaff and infra-red decoys can be deployed automatically. Shield offers four protection modes — confusion; distraction; seduction/ breaklock; and seduction dump — and uses two types of decoy — chaff and infra-red — which may be used on their own, or in combination with each other.

Manufacturer/Contractor

Plessey, UK.

Cutlass B1 ESM system

Cutlass B1 is designed for operation in very dense signal environments, receiving signals in the 1 to 18 GHz frequency range, measuring their parameters, comparing these with those in the radar library which contains the parameters of 2,000 radars, and displaying the information — all within one second. The EW operator is presented with a tabular display for threat identity and threat evaluation, and a tactical display giving a pictorial representation of the RF environment. Selected digital outputs can be sent to other local systems, and hard copy printout of the intercepted radar is also available. The tabular display can indicate 150 intercepts, in the order of priority. Cutlass is wide open in both bearing and frequency: that is, it does not employ sweep techniques, giving a very high-intercept probability (nearly 100 per cent). Cutlass B1 uses the Cutlass processor and an Instantaneous Frequency Measurement (IFM) receiver. It has a 32-element array antenna to provide bearing measurement by phase analysis techniques. This antenna also provides RF for the IFM. In both systems the processor is provided with fast and accurate information on incoming pulses.

Specifications

Frequency coverage: 2-18 GHz
Accuracy: 2° RMS in bearing
Coverage: 360° azimuth; +40 to −10° elevation
Pulse density capability: 500,000/s
Radar store capability: 2,000 modes

Manufacturer/Contractor

Racal Radar Defence Systems Ltd, Chessington, Surrey, UK.

Racal Cygnus B1 jammer

The Cygnus radar jammer operates in the I or J-bands and was designed for integration with Cutlass ESM equipment. Cygnus uses both responsive noise and deception jamming to provide an effective jamming capability against all types of radar including early warning, target acquisition and missile guidance. It has a narrow beamwidth giving high effective radiated power (300 kW) and is kept on target by a built-in, interferometer type, passive tracking system in both azimuth and elevation. The tracking system may also be used to relay accurate position data to systems of other ships. RF received by the tracking antennas is also used as the basis of transmitted RF and modulation and power management is under the control of a processor which also controls the tracking procedure. Types of modulation sequence available include range gate pull off and false target generation.

Manufacturer/Contractor

Racal Radar Defence Systems Ltd, Chessington, Surrey, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

CAAIS 450 tactical picture compilation system

CAAIS (Computer Assisted Action Information System) was developed for the UK RN (Outfit DBA) and is a tactical picture compilation system designed for air, surface and underwater warfare. The system automatically tracks air and surface targets, processes sonar and EW inputs, operates a digital datalink, designates targets, controls torpedoes and produces vectored attack orders for ASW helicopters.

The version used in the 'Inhauma' class, CAAIS 450, is a distributed processing system using the FM1600E computer operating at 650 Kips and with a memory of 1.2 million words. Programming is in Coral 66 software language. Each console has its own computer, core, Dragon display drive (using Ferranti F100L microprocessors)

and input/output devices. There are two types of display system; two-operator (Racal-Decca ED 1600 console) and single-operator (Racal-Decca ED 1200).

CAAIS 450 accepts ESM and Datalink YB input and is linked directly to ship sonar systems. It is also capable of surface-to-air, surface-to-surface and anti-submarine weapon and ECM system designation. It has a total track capacity of 120, of which 100 may be automatic.

Manufacturer/Contractor
Ferranti Naval Systems, UK.

WSA 421
The WSA 421 (WSA = Weapon System Automation) fire-control system has a mainframe architecture based upon a single Ferranti computer and a Selenia (now Alenia) RTN-10X tracker radar with targets designated through the CAAIS. The system includes a control console with four operators and a target acquisition unit, with a PPI display and an A/R scope. The RTN-10X radar is an I-band conical scan radar with a maximum range of 20 km. It features a slatted parabolic reflector and feed with integral trunnion box, the antenna coverage being −30 to +90°. The antenna includes a GEC-Marconi closed-circuit television camera. It has a 200 kW peak-power, frequency changeable, high-power magnetron transmitter.

The WSA 421 has a federated architecture based upon the 24-bit Ferranti FM1600E computer, which has an operating speed of 650 Kops (thousand operations per second) and a memory of 1.2 million words, with one computer housed in each console. The system uses Coral 66 language software.

In addition to the consoles and the tracker radar, the system includes a television camera, a visual sight and an Nd:YAG laser rangefinder. The visual sight is usually the TDS to which the Ferranti Type 901 laser rangefinder may be added. The laser has a wavelength of 1.064 µm, a pulse length of 25 µs and a PRF of 10 pps. Optional extras include range-only radar, surface-to-air missile direction and an ASW capability through rocket and torpedo control.

The basic WSA 421 fire-control system is designed to control two guns of differing calibres against two targets. It may also be used to control a surface-to-air missile. The system consists of a two-man fire-control console, an interface cabinet and an interface with the CAAIS 450 tactical data handling system. The fire-control console consists of a target acquisition unit and a gun controller's unit. The former has a PPI which may also be used to display either a B-scope for air search or an expanded B-scope for surface tracking and ranging.

The gun control unit has a 17.78 cm (7 in) alphanumeric data display with supporting keyboard, a closed-circuit television monitor, a joystick two gun control units, a magnetic tape unit for loading program and recording, and a system status monitor.

Manufacturer/Contractor
Ferranti International Plc, Defence Systems Integration.

Link YB
The Brazilian Navy purchased Link YB, which was developed in the UK by Ferranti as a digital link suitable for sale to non-NATO countries for naval and aircraft use. Different users have versions tailored to their own needs; Link YB, for example, is exclusive to the Brazilian Navy. Link Y, generally, uses a standard message format of two 24-bit words and a transmission speed of 300-1,200 bits/s.

RADARS

Set	AWS-4	Type 1007	RTN-10X

WEAPONS CONTROL

CelsiusTech EOS-400 electro-optical fire-control system
The EOS-400 TV tracker/laser rangefinder fire director system is used to provide an accurate target position. It consists of a television tracker for automatic tracking in conjunction with a laser rangefinder, both units being mounted on a common training and elevating stabilised platform. The control/display unit is usually located in the operations room, while the only other major item, the electronics cabinet, can be sited in any convenient position in the ship.

The control/display unit contains a TV monitor and a joystick for sensor platform operation, a mode selector, and target data displays. The electronics cabinet houses the video tracking electronics and other control electronics. The video output is connected to the platform and the video input to the control/display unit. The system can track either surface or airborne targets among several in close formation, even when radar tracking is not possible. Inputs from other systems include those from the surveillance radar, and reference data from the ship's compass. The system calculates ballistics for several guns and gives gun-laying data.

Specifications
Tracking parameters
Training: Unlimited
Elevation: −30 to +85°

Platform
Angular speeds, azimuth and elevation: 150°/s
Angular accelerations: Azimuth 2 rad/s²; elevation 3 rad/s²
Angular transducers: Multispeed synchros
Stabilisation: Rate gyros in 2 axes
Tracking: Digital correlation
Contrast selection: Automatic black/white
Lock on area: Whole field

Daylight camera
Scanning standard: 625 lines
Camera tube: Si-vidicon

Laser rangefinder
Wavelength: 1.06 µm
Repetition rate: 10 Hz
Beamwidth: 1.5 mrad

Manufacturer/Contractor
CelsiusTech, Sweden.

SONAR

STN Atlas ASO 84-2 (DSQS-21C) hull-mounted sonar
The DSQS-21 sonar was originally designed by (the then) KAE for the German Navy's Type 122 frigate. The ASO 80 series were the subsequent export models, the specific model for the 'Inhauma' class being the ASO-84-2. Computer-aided detection techniques are used for classification and tracking and the information is presented on colour CRT displays to permit Doppler coding and the discrimination of data on the integrated displays. The transducer array is 1 m (3.28 ft) in diameter and consists of 32 staves.

Manufacturer/Contractor
STN Atlas Elektronik GmbH, Bremen, Germany.

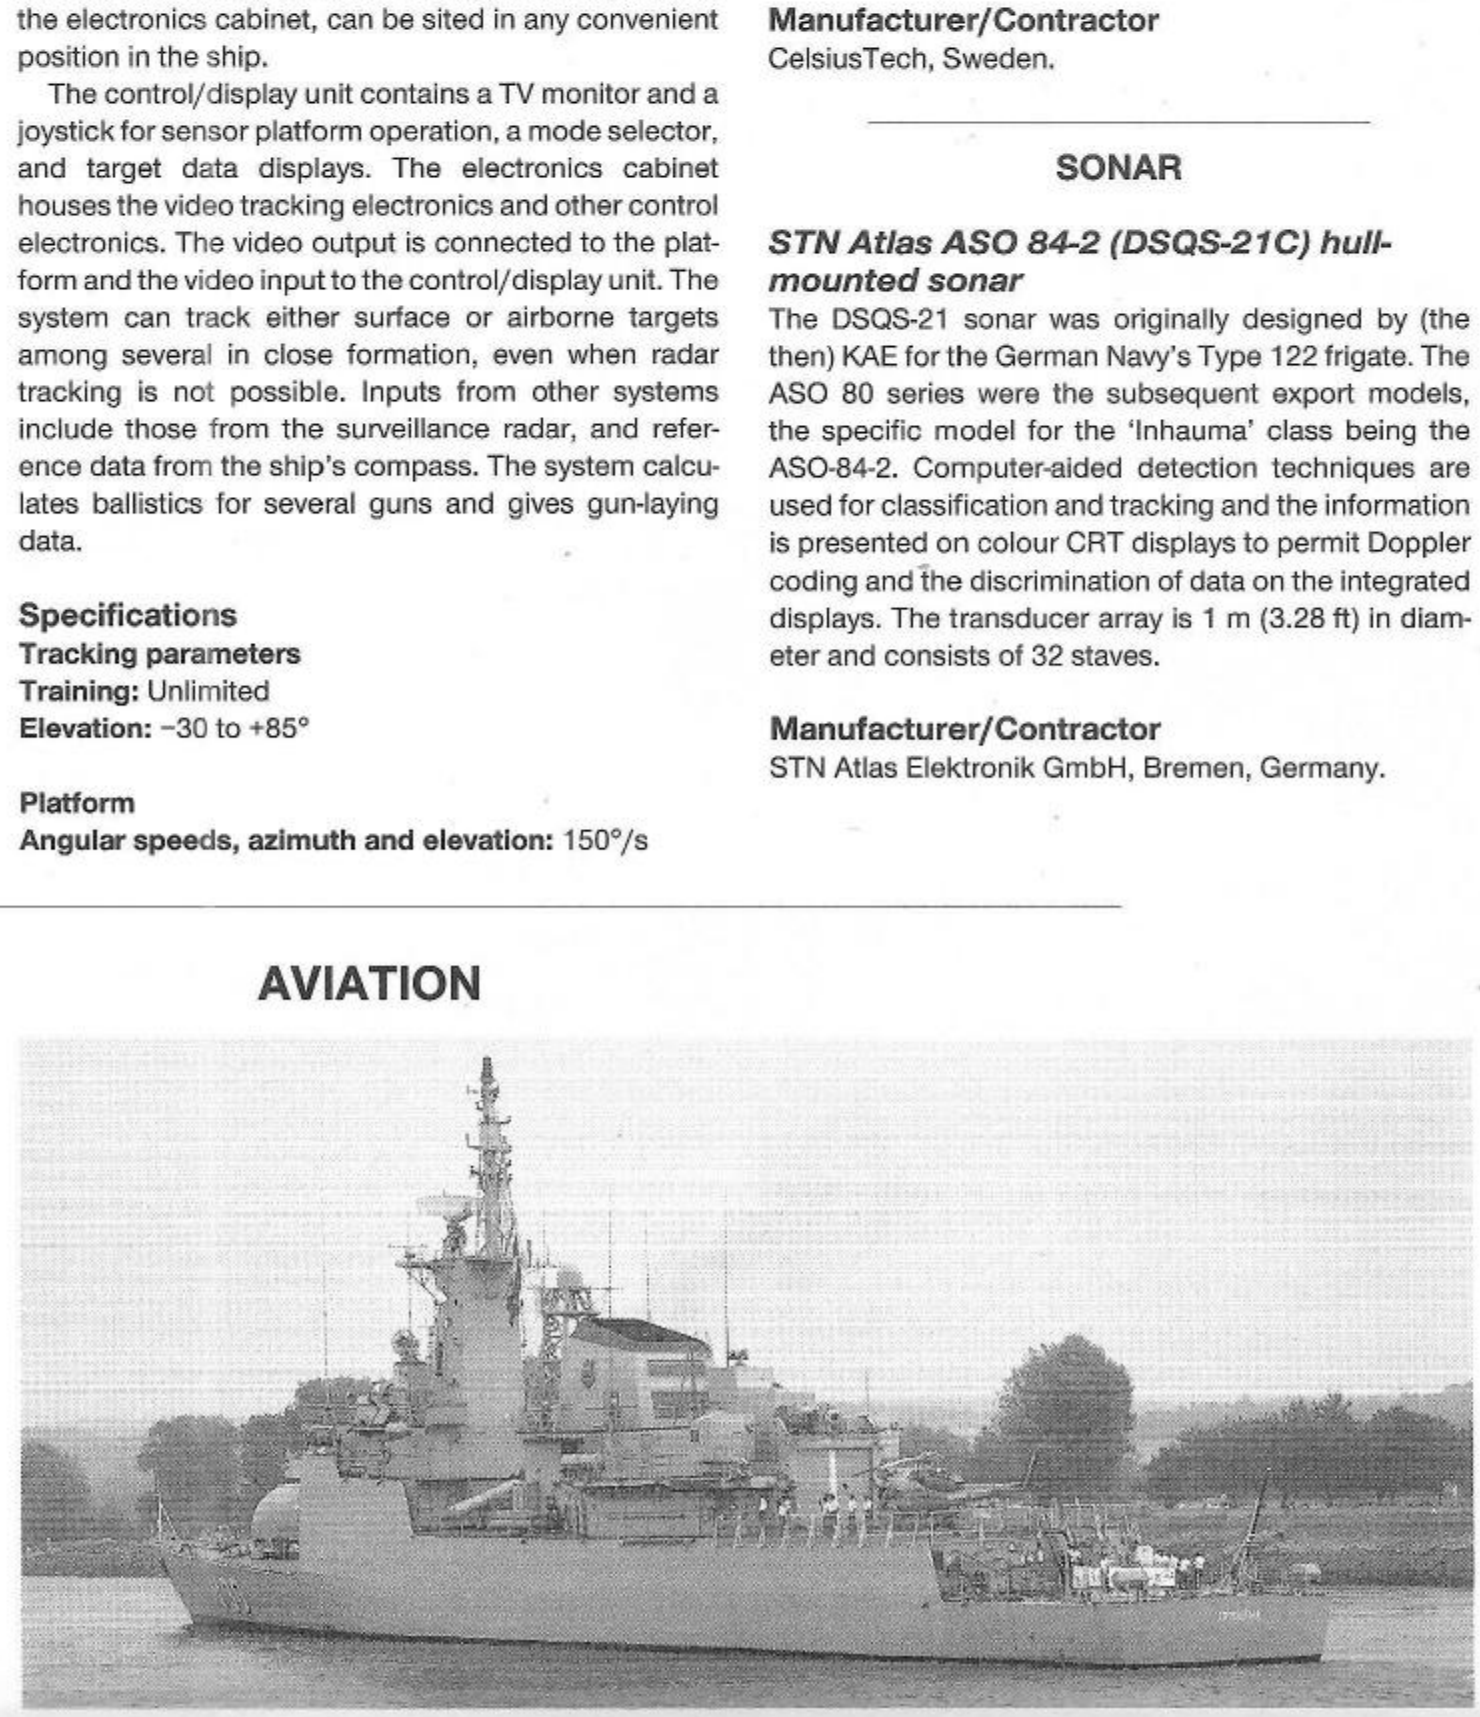
AVIATION

AVIATION FACILITIES

Specifications
Flight deck: 18 × 11 m (60 × 37 ft)

HELICOPTERS

UH-12 Eurocopter AS 350 Ecureuil
One Eurocopter AS 350 Ecureuil five/six-seat light general purpose helicopters.



Inhaúma *(V 30) name ship of a class of six. The ship embarks an Aerospatiale UH-13 (AS 355F2 Ecureuil 2) seen here on the flight deck. Note the two Exocet launchers and triple 324 mm torpedo tubes abreast the stack* (Jane's/H M Steele)

Specifications

Main rotor diameter: 10.69 m (35.07 ft)
Length, rotors turning: 12.94 m (42.45 ft)
Length, fuselage: 10.93 m (35.86 ft)
Height overall: 3.14 m (10.3 ft)
Main rotor disc area: 89.75 m² (966.1 sq ft)
Weight, empty: 1,146 kg (2,526 lb)
Weight, max take-off: 2,100 kg (4,630 lb)
Weight, max take-off: 2,100 kg (4,630 lb)
Max speed, (never exceed): 155 kts (287 km/h)
Max cruise: 126 kts (234 km/h)
Max rate of climb: 456 m (1,500 ft)/min
Service ceiling: 4800 m (15,750 ft)
Range, no reserve at economic cruise: 394 n miles (730 km)
Weapons: 20 mm Giat M621 gun, or FN Herstal TMP twin 7.62 mm machine gun pods, or Thomson Brandt 68.12 launchers for 68 mm rockets (12), Forges de Zeebrugge launchers for 7–2.75 in rockets (7), or ESCO HeliTOW anti-tank missile system

Manufacturer/Contractor

Eurocopter, Paris, France

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 1 General Electric LM-2500 gas turbine; 20.52 MW (27,500 hp) sustained; 2 MTU 16V 396 TB94 diesels; 4.26 MW (5,800 hp(m)) sustained
Shafts: 2
Propellers: 2 KaMeWa cp

FURTHER INFORMATION

PROGRAMME

The construction contract was signed on 1 October 1981, with the first pair ordered on 15 February 1982 followed by the second pair on 9 January 1986. In mid-1986 the government gave approval, in principle, for the construction of a total of 16 ships but this has been reduced to an additional two and an order for the fifth ship, *Barroso,* stretched by 4.2 m (13.8 ft) was placed in 1994, with a sixth ship likely to be ordered in 1996.

DESIGN

The original Inhauma design was prepared by the Brazilian Naval Design Office with advice from the German private design company, Marine Technik and it is worth noting that there is a slight similarity to the FS 1500 corvette, which was designed and built in Germany for Colombia ('Padilla' class) and Malaysia ('Kasturi' class).

Barroso, now under construction, is to have more powerful diesel engines, Brazilian electronic equipment, a larger flight deck, greater freeboard at the bow and an improved combat data system. It will also incorporate new stealth features.

MODERNISATION

The EW equipment aboard the first four ships may be in the course of replacement by domestically designed and manufactured equipment. Possible models include the IPqM SDR-7 and the Elebra SLQ-1 jammer.

Jaceguay *(V 31). The last two ships in the class are to have increased freeboard in the bows and new 'stealth' features* (Robert Pabst)

WEAPONS SYSTEMS

ANTI-SHIP MISSILES

Mk 16 launcher group

The Improved 'Restigouche' class is fitted with a Mk 16 Launcher Group located aft, with a single Mk 112 launcher, which consists of four pairs of launch tubes, each pair elevating independently. Maximum launch rate is 3 missiles per minute.

Honeywell RUR-5A ASROC

ASROC consists of a Mk 46 torpedo with strap-on aerodynamic surfaces and a rocket motor to enable it to fly to within range of its submarine target. Attached to the rear end of the torpedo is a short airframe assembly of clam-like construction, held together by a steel band, with a Naval Propulsion Plant solid propellant booster and four trapezoidal aerodynamic surfaces to provide stability in flight. The torpedo has a dome-shaped frangible plastic nose cap to protect the transducer as it enters the water. Payload is an Alliant Mk 46 Mod 5 torpedo, which has a seeker designed specifically to detect most types of target including submarines with anechoically coated hulls and has an estimated acquisition range of 460 m (1,509 ft).

When a submarine target is detected it is tracked and the attack console's fire-control computer predicts the target's position. The launcher is turned in the appropriate direction and elevated to an angle appropriate to the range. The fire-control computer then orders the launch and the booster burns for a programmed time of between 1 and 4 seconds, by which time the missile will have reached a height of between 60 and 305 m (197 and 1,000 ft), although the aerodynamically stable airframe enables it to coast up to 600 m (1,969 ft). On reaching the programmed position, an explosive bolt cuts the steel band holding the airframe assembly sections together and, as they separate, the parachute deploys to retard the torpedo's fall, water entry taking place some 14 to 50 seconds after launch. As the torpedo enters the water the frangible nose cap breaks off and the torpedo begins its search for the target using a predetermined pattern.

Specifications

ASROC missile
Length: 4.6 m (15.1 ft)
Diameter: 32.5 cm (12.8 in)
Span: 84.5 cm (33.3 in)

Weight: 435 kg (959 lb)
Range: 0.86-5.39 n miles (1.6-10 km)
Speed: Mach 0.9

Mk 46 Mod 5 torpedo
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight: 230 kg (507 lb)
Speed: 40 kts (max)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg (97 lb); PBXN-103

Manufacturer/Contractor
Loral Defense Systems, Akron, Ohio, USA.

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited on the quarterdeck.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

Gatineau *(236) one of the two remaining 'Improved Restigouche' class frigates. The weapon on the foredeck is the Vickers 76 mm/70 Mk 6 with the two barrels in a common elevating mass and an electrically driven loading system* (Jane's/H M Steele)

GUNS

Vickers 76 mm (3 in)/70 Mk 6
The Improved 'Restigouche' class is one of the very few still to retain the Vickers 76.2 mm (3 in) Mk 6 twin mounting, with one mounting in 'A' position on the foredeck. The mounting consists of two guns in a common elevating mass which receive ammunition from an electrically driven system.

Specifications
Mounting Mk 6
Weight: 45 t
Traverse: 360°
Elevation: 0 to +89°
Crew: 20

3 in gun
Calibre: 76.2 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,036 m/s (3,399 ft/s)
Rate of fire: 90 rds/min
Weight of round: 23.13 kg (51 lb)
Range: 9.2 n miles (17 km) (anti-ship)
Mounting weight: 38 t
Mounting traverse: 360°
Mounting elevation: to +90°

Manufacturer/Contractor
Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

AN/SLQ-501 (CANEWS I) radar warning system
CANEWS is a real-time radar detection and analysis system, covering the frequency band 0.5-18 GHz in five bands, each with its own receiver. It has four major subsystems: an IFM-based (instantaneous frequency measurement) antenna and receiver subsystem; a data transfer unit incorporating a high-speed digital processor; twin processors for real-time analysis, supervision and interfacing with the ship's command and control system; and a display console. A library holds data on numerous radar modes and signatures, and analysis of the detected RF signals identifies the radar type and platform, as well as providing an indication of the confidence level. Many of the functions are automatic to reduce operator workload, but AN/SLQ-501 also provides facilities for manual control if required, with one operator only required to control the complete ESM system.

Manufacturer/Contractor
Lockheed Canada Inc, Kanata, Ontario, Canada ((CANEWS II) prime).

ELECTRONIC COUNTERMEASURES (ECM)

AN/ULQ-6
AN/ULQ-6 is a deception jammer which was originally developed to deal with the threat posed by Soviet missiles such as SS-N-2.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher
There are four Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

ADLIPS tactical data handling system
ADLIPS (Automatic Datalink Plotting System) is a modular system which collects and processes 'own ship' sensor data, together with transmitting, receiving, filtering and displaying target track data, from ships and aircraft through Link 11 and Link 14 data communications networks to compile a composite tactical display rapidly. It exchanges target track, weapon assignment and status data with 'own ship's weapon systems. All members of the operations room team have access to the complete tactical picture through a remote plasma display.

ADLIPS is a mainframe system using a 16-bit AN/UYK-20 general purpose computer with 96 k memory, CMS-2 program language and 750 nanosecond cycle time. The program loading, training and analysis facilities are provided by an AN/USQ-26 cartridge magnetic tape system with 9.6 Mbyte storage capacity. An HF Link 11 radio transceiver provides for communications over this link while an AN/USQ-76 modem allows operation in either picket or net controlled modes. The radio has independent transmitter and receiver sections digitally tuned in 100 Hz steps. For Link 14 a CV-2757/SGC interface converts the low-level signals from the computer to the high-level signals required by the cryptographic equipment and the inverse conversion.

The main presentation is on two Situation Information Displays (SID), each of which has a 51 cm (20 in) diameter CRT for presenting raw radar video, IFF data and computer-generated graphics to produce a picture

of the tactical situation. Each system, which has a capacity of up to 140 tracks, also has a hard copy plotter.

Manufacturer/Contractor
Litton Systems Canada Ltd.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 11; Link 14

Satcom: Satcom is installed; model unknown

Tacan: URN 25.

WEAPONS CONTROL

Mk 69 Gun Fire Control System (GFCS)

The Mk 69 GFCS is the fire-control system for the 76 mm (3 in) guns. The director, with its associated AN/SPG-515 radar is located on the bridge roof.

SONARS

AN/SQS-505 hull-mounted and VDS search and attack sonar

Gatineau (236) only. The Canadian Westinghouse AN/SQS-505 sonar is a combined hull-mounted and VDS 7 kHz, search and attack sonar. It is a deep water, omnidirectional, surveillance system, but is also able to operate in a directional mode that can maintain search ability while tracking defined targets. Three selectable frequencies are available so that several ships can survey an area in close proximity without cross-talk. In high sea states leading to excessive roll and pitch of the ship, the AN/SQS-505 utilises transmit beam stabilisation, which delays transmission until near optimum roll and submergence conditions prevail, thereby minimising chances of the target being missed altogether.

Specifications
Coverage: 360° (azimuth)
Range: 183-3,000 m (200-3,200 yd)
Doppler range: ±40 kts (7.2 kHz)
Displays: Range (A Scan); Bearing (B Scan)
Doppler frequencies: 6.4, 7.2 and 8.0 kHz
Source levels: From 224.233 dB/µPa/m (transmission mode dependent)
Initial detection: 12 ping history of returns
Bearing accuracy: 1° RMS
Range accuracy: ±1% range reading
Transmission modes: Omni, TRDT, DT, ASPECT
Power level: High and low (10 dB reduction)

Manufacturer/Contractor
Westinghouse Canada Inc, Burlington, Ontario, Canada.

AN/SQS-510 sonar

Terra Nova (259) only. *Terra Nova* has the AN/SQS-510 which combines a hull-mounted transducer with a towed array. The hull-mounted element is a 7 kHz medium-size search and attack sonar, which can be used in direct communication with a digital computer, either for the transfer of range and bearing information, or it can give assistance to the operator in detection and tracking. It is a deep water, omnidirectional, surveillance system, but is also able to operate in a directional mode that can maintain search ability while tracking defined targets. Three selectable frequencies are available so that several ships can survey an area in close proximity without cross-talk.

Specifications
Coverage: 360° (azimuth)
Range: 183-3,000 m (200-3,200 yd)
Doppler range: ±40 kts (7.2 kHz)
Displays: Range (A Scan); Bearing (B Scan)
Doppler frequencies: 6.4, 7.2 and 8.0 kHz

Gatineau *(236) showing the stern-mounted SQS 500 VDS 'fish' retracted into the transom. The ASROC launcher occupies a prominent position, but it was replaced by eight Harpoon launchers for the 1990-91 Gulf deployment* (Jane's/H M Steele)

Source levels: From 224.233 dB/µPa/m (transmission mode dependent)
Initial detection: 12 ping history of returns
Bearing accuracy: 1° RMS
Range accuracy: ±1% range reading
Transmission modes: Omni, TRDT, DT, ASPECT
Power level: High and low (10 dB reduction)

Manufacturers/Contractors

Computing Devices, Ottawa, Canada (prime and software).
Westinghouse Canada Inc, Burlington, Ontario, Canada (sonars).

C-Tech Spectra 3000

When these ships went to the Gulf in 1990-91 they were fitted with the C-Tech Spectra 3000 mine avoidance sonar, which appears to have remained aboard. This is a version of the same company's CTS-36 RDN system, installed in the Danish STANFLEX 300 vessels. CTS-36 is a hull-mounted system optimised for mine avoidance in coastal waters and is a scanning and multibeam sonar, using narrow receiving beams, high-speed scanning and digital processing techniques to provide instantaneous detection, classification and target data in a full 360° field of view. At least three tracking channels are provided with target and ship's track, target range, depth, bearing, speed and heading instantaneously displayed.

Manufacturer/Contractor

C-Tech Ltd, Cornwall, Ontario.

AN/SQS-501

The Kelvin Hughes AN/SQS-501 is the Canadian version of the British Type 162 ('Cockchafer') side-looking target detection sonar whose main use is in detecting and classifying seabed targets, such as a bottomed submarine. There are three transducers: one faces downwards at 25° below the horizontal, while the other two face sideways to cover a 3° wide and 40° vertical sector. The transmitter delivers 40 W to the central, downward-looking transducer and 80 W each to the side-looking transducers. The set operates at 50 kHz and accuracy is <2 per cent over ranges of 270 m (300 yd) and 550 m (600 yd).

Manufacturer/Contractor

Kelvin Hughes.

PROPULSION

Specifications

System: Steam turbine
Main machinery: 2 Babcock & Wilcox boilers; 43.3 kg/cm² (600 psi); 454°C (850°F); 2 English Electric turbines; 22.4 MW (30,000 hp);
Shafts: 2

FURTHER INFORMATION

PROGRAMME

When the Canadian post-war frigate programme started in the late 1940s the navy was able to draw on a wealth of ASW experience gained in the North Atlantic during the Second World War, coupled with an adventurous design team under the leadership of Rowland Baker, a British naval constructor on secondment to Canada. The result was the 'St Laurent' class, whose dramatic appearance and many innovations caused considerable astonishment in the naval world. Seven St Laurents were commissioned between 1955 and 1957, and they were succeeded by a developed version, the 'Restigouche' class, seven of which were ordered in 1952. Four of these were modernised between 1966 and 1973, and were then designated the 'Improved Restigouche' class.

The three unmodified ships were paid off into reserve in 1974 and eventually discarded. The 'Modified Restigouche' ships, however, remained in service and were modernised yet again under the 'Destroyer Life Extension' programme during the period 1983 to 1986. Two of those ships were paid off in the early 1990s and two now remain in service.

DESIGN

The 'Restigouche' class ships had exactly the same hull and propulsion system as the 'St Laurent' class, but the armament fit was considerably revised. The St Laurents had two US pattern twin 76 mm (3 in) mounts and in the Restigouche the forward of these was replaced by a twin Vickers 76 mm (3 in) Mk 6, which had, in fact, been specially designed for the Canadian frigates, but had been omitted from the earlier ships due to topweight problems.

MODERNISATION

Four ships were refitted in 1966 to 1973. The main change involved removing the after gun turret and one Mk 10 Limbo mortar and replacing them with the ASROC launcher and a variable depth sonar. A lattice foremast was also stepped.

There were also considerable improvements to the communications. The four 'Modernised Restigouche' ships were again refitted under the 1983 to 1986 DELEX programme when they were fitted with new air search radar, GFCS, communications and EW equipment. The Bofors rocket launcher was replaced by Super RBOC and Tacan fitted on a pole mast which replaced the top section of the lattice mast. Triple Mk 32 torpedo tubes were also fitted.

Terra Nova went to the Gulf in 1990 and was later relieved by *Restigouche*. For this deployment their ASROC launcher and the remaining Limbo Mk 10 ASW mortar were removed and replaced by eight Harpoon SSM and a Phalanx Mk 15 CIWS, while a number of the ship's boats were removed to make way for two single Bofors 40 mm/60. They were also fitted with Plessey Shield chaff launchers and a special mine avoidance sonar (see C-Tech Spectra 3000 above). On their return to Canadian waters they reverted to the standard fit, except that the Limbo mortar was not reinstalled and the mine avoidance sonar was retained.

Since that time Satcom terminals have been fitted in both remaining ships, while *Terra Nova* alone has received AN/SQS-510 sonar system.

DEPLOYMENT

Both are now based in the Atlantic Fleet.

Contingency plans exist for air defence to be supplemented if further operational deployments take place. This will include carrying additional 12.7 mm MGs, plus Blowpipe and Javelin shoulder-launched SAMs.

Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant

Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

Mk 33 76 mm (3 in) L/50 gun mounting
There is a single US Navy Mk 33 76 mm (3 in) L/50 twin mounting on the foredeck. The gun tubes are 50 calibre

Mk 22s with autofretted monobloc barrels which are 3.81 m (12.5 ft) long, and weigh 562 kg (1,239 lb). The EFC life is 4,300 rounds. The Mk 33 is a twin gun, power-driven, base ring mount with remote control and local reversion. The Mod 7 closed mounting has an environmental shield made from GRP for protection against icing and bad weather. The mounting operates with the Mk 60 fire-control system. The fixed 10.9 kg (24 lb) round has a 5.9 kg (13 lb) projectile which includes 1.68 kg (3.70 lb) of nitrocellulose propellant.

Specifications
Calibre: 76.2 mm
Length of barrel: 50 calibres
Muzzle velocity: 823 m/s (2,700 ft/s) (new gun, nominal); 808 m/s (2,650 ft/s) (mid-life)
Range: 7 n miles (13 km)
Altitude: 8,951 m (29,368 ft)
Ammunition: 10.9 kg (24 lb)

Mk 33
Traverse: 360°
Elevation: −14/15 to +85°
Traverse rate: 30°/s
Elevation rate: 24°/s
Rate of fire: 100 rds/min

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

AN/SLQ-501 (CANEWS I) radar warning system
CANEWS is a real-time radar detection and analysis system, covering the frequency band 0.5-18 GHz in five bands, each with its own receiver. It has four major subsystems: an IFM-based (instantaneous frequency measurement) antenna and receiver subsystem; a data transfer unit incorporating a high-speed digital processor; twin processors for real-time analysis, supervision and interfacing with the ship's command and control system; and a display console. A library holds data on numerous radar modes and signatures, and analysis of the detected RF signals identifies the radar type and platform, as well as providing an indication of the confidence level. Many of the functions are automatic to reduce operator workload, but AN/SLQ-501 also provides facilities for manual control if required, with one operator only required to control the complete ESM system. Lockheed Canada is leading a consortium of Canadian EW companies to define and develop CANEWS II, which will retain existing antennas and receivers, but add a new processor and further receivers to handle more complex threats, higher signal densities and wider operating frequencies. CANEWS II was tested in 1994-95 and underwent sea trials in 1996.

Manufacturer/Contractor
Lockheed Canada Inc, Kanata, Ontario, Canada (CANEWS II): (prime).

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher
There are four Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)

Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

ADLIPS tactical data handling system
ADLIPS (Automatic Datalink Plotting System) is a modular system which collects and processes 'own ship' sensor data, together with transmitting, receiving, filtering and displaying target track data, from ships and aircraft through Link 11 and Link 14 data communications networks to compile a composite tactical display rapidly. It exchanges target track, weapon assignment and status data with 'own ship's weapon systems. All members of the operations room team have access to the complete tactical picture through a remote plasma display.

ADLIPS is a mainframe system using a 16-bit AN/UYK-20 general purpose computer with 96 k memory, CMS-2 program language and 750 nanosecond cycle time. The program loading, training and analysis facilities are provided by an AN/USQ-26 cartridge magnetic tape system with 9.6 Mbyte storage capacity. An HF Link 11 radio transceiver provides for communications over this link while an AN/USQ-76 modem allows operation in either picket or net controlled modes. The radio has independent transmitter and receiver sections digitally tuned in 100 Hz steps. For Link 14 a CV-2757/SGC interface converts the low-level signals from the computer to the high-level signals required by the cryptographic equipment and the inverse conversion.

The main presentation is on two Situation Information Displays (SID), each of which has a 51 cm (20 in) diameter CRT for presenting raw radar video, IFF data and computer-generated graphics to produce a picture of the tactical situation. Each system, which has a capacity of up to 140 tracks, also has a hard copy plotter.

Manufacturer/Contractor
Litton Systems Canada Ltd.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 11; Link 14

Tacan: URN 25.

WEAPONS CONTROL

Mk 60 Gun Fire Control System (GFCS)
The Mk 60 GFCS is the Canadian designation for the digitised, solid-state version of the US Mk 69 GFCS. This is the fire-control system for the twin 76 mm guns and the director is mounted on the bridge roof together with the associated SPG-515 radar.

SONARS

AN/SQS-505 hull-mounted attack sonar
Annapolis (265) only. The AN/SQS-505 search and attack sonar is in a retractable, hull-mounted dome, and is a deep water, omnidirectional, sonar surveillance system, but can also be operated in a directional mode when tracking a defined target. There are three selectable frequencies to enable several ships to operate in close proximity without cross-talk. In high sea states which result in excess roll and pitch of the ship, the AN/SQS-505 utilises transmit beam stabilisation, which delays transmission until near optimum roll and submergence conditions prevail, in order to minimise the chances of the target being missed altogether.

Specifications
Coverage: 360° (azimuth)
Range: 183-975 m (200-3,200 yd)
Doppler range: ±40 kts (7.2 kHz)
Displays: Range (A Scan); Bearing (B Scan); Doppler

RADARS

Set	SPS-503 (CMR 1820)	SPS-502*	SPG-515	Type 127E
Company	Canadian Marconi Radar (CMR)	Norden	Bell	Sperry
Role	Air/surface search	Surface search	Fire control (GFCS Mk 60)	Navigation
Band	E/F	G	I/J	I
Range	70 n miles (128 km)	—	—	120 n miles
Beam	1.5 × csc² to 40°	1.5 × 20°	2.6°	1°
Peak power	20 kW	130 kW	250 kW	25 kW
Gain	30.75 dB	31 dB	39 dB	—
Pulsewidth	54 µs	0.12/1 µs	0.25 µs	0.05/0.025/1.2 µs
PRF	740 pps	2,250/750 pps	1,000 pps	4,000/2,000/500 pps
Scan rate	10.20 rpm	16 rpm	29 Hz	—

Note: * SPS-502 is essentially an AN/SPS-55 married to an AN/SPS-10D antenna.

Frequencies:
active: 6.4 kHz, 7.2 kHz, 8.0 kHz
passive: 4.5 kHz
Source levels: From 224.233 dB/µPa/m (transmission mode dependent)
Initial detection: 12 ping history of returns
Bearing accuracy: 1° RMS
Range accuracy: ±1% range reading
Transmission modes: Omni, TRDT, DT, ASPECT

Manufacturer/Contractor
Westinghouse Canada Inc, Burlington, Ontario, Canada.

AN/SQS-510 sonar
Nipigon (266) only. The Computing Devices of Canada (CDC) AN/SQS-510(V) is installed in *Nipigon* only. This sonar is a development of the Canadian Westinghouse AN/SQS-505 sonar and is combined with the AN/SQR-501 towed array (see below). The hull-mounted element is a 7 kHz medium-size search and attack sonar, which can be used in direct communication with a digital computer, either for the transfer of range and bearing information, or it can give assistance to the operator in detection and tracking. It is a deep water, omnidirectional, surveillance system, but is also able to operate in a directional mode that can maintain search ability while tracking defined targets. Three selectable frequencies are available so that several ships can survey an area in close proximity without cross-talk.

Specifications
AN/SQS-510
Coverage: 360° (azimuth)
Range: 183-3,000 m (200-3,200 yd)
Doppler range: ±40 kts (7.2 kHz)
Doppler frequencies: 6.4, 7.2 and 8.0 kHz
Source levels: From 224.233 dB/µPa/m (transmission mode dependent)
Initial detection: 12 ping history of returns
Bearing accuracy: 1° RMS
Range accuracy: ±1% range reading
Transmission modes: Omni, TRDT, DT, ASPECT
Power level: High and low (10 dB reduction)

Manufacturers/Contractors
Computing Devices, Ottawa, Canada (prime and software).
Westinghouse Canada Inc, Burlington, Ontario, Canada (sonars).

AN/SQR-501 CANTASS
The AN/SQR-501 is a passive, critical angle towed array consisting of a Computing Devices Canada display and processing subsystem, the Lockheed Martin AN/SQR-19A towed array and Indal Technologies OK-419 handling gear. The display subsystem uses two, four or six high-definition monochrome TV monitors specifically designed by Whittaker Electronics Inc for this application. The acoustic data processing system uses the Computing Devices AN/UYS-510 signal processor, modular interfacing and data management electronics. The acoustic data processing subsystem also provides for the storage and playback of raw acoustic data by means of a Sony DR 1000L high-density digital recorder.

The system provides frequency and bearing analysis of acoustic emissions from long ranges. Data are presented to the operator on programmable CRT displays in a variety of alternative formats. Audio data is presented as a further aid to detection and classification. Processing algorithms were developed by the Canadian Defence Research Establishment, Atlantic and implemented by Computing Devices Canada Ltd. Implementation of systems processing and data manipulation is entirely in software using Ada. The modular design offers a growth capability and adaptability to meet changing requirements.

The 'wet-end' is the AN/SQR-19A, with a 240 m (800 ft) array on a 1,700 m (5,600 ft) cable, which reaches depths of 360 m (1,200 ft).

Manufacturer/Contractor
Computing Devices Canada Ltd, Ottawa, Ontario, Canada (prime and processing elements).

Westinghouse AN/SQS-501
The Westinghouse AN/SQS-501 is the Canadian version of the British Kelvin Hughes Type 162 ('Cockchafer') side-looking target detection sonar, whose main use is in detecting and classifying seabed targets, such as a bottomed submarine. There are three transducers: one faces downwards at 25° below the horizontal, while the other two face sideways to cover a 3° wide and 40° vertical sector. The transmitter delivers 40 W to the central, downward-looking transducer and 80 W each to the side-looking transducers. The set operates at 50 kHz and accuracy is <2 per cent over ranges of 270 m (300 yd) and 550 m (600 yd).

Manufacturer/Contractor
Westinghouse Canada Inc, Burlington, Ontario, Canada.

Computing Devices UYS-503(V) sonar processor
UYS-503(V) is the processor for the SQS-510 and SQS-501 sonars.

AVIATION

HELICOPTERS

One CH-124B Heltas Sea King ASW

Specifications
Dimensions
main rotor diameter: 18.90 m (62.0 ft)
disc area: 280.5 m² (3,019 sq ft)
length overall (both rotors turning): 21.91 m (71.88 ft)
Weights:
empty: 5,601 kg (12,350 lb)
max take-off: 9,525 kg (21,000 lb)
Performance:
max speed (never exceed): 144 kts (267 km/h)
typical cruising speed: 110 kts (204 km/h)
service ceiling: 3,720 m (12,200 ft)
range (max standard fuel): 410 n miles (760 km)
Power plant: 2—1,118 kW (1,500 shp) General Electric T58-GE-100 turboshafts
Accommodation: Crew of 4 in ASW role (pilot, co-pilot, 2 sonar operators)
Sensors: ASW role: APS-503 radar; UYS-503 sonobuoy processor; GPS; sonobuoys; ASQ-504 MAD; radio altimeter; marine markers, smoke floats. FLIR and EW equipment can also be installed, according to requirements
Weapons: Maximum of four Mk 46 torpedoes

PROPULSION

Specifications
System: Steam turbines
Main machinery: 2 Babcock & Wilcox boilers; 43.3 kg/cm² (600 psi); 454°C (850°F); 2 English Electric turbines; 22.4 MW (30,000 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The 'Annapolis' class ships were the last of a line of archetypical Canadian ASW frigates, extending back through the 'Mackenzie' and 'Restigouche' classes to the 'St Laurent' class of the 1950s. Two ships were ordered in 1959 and were completed in 1964.

DESIGN

The design incorporated all the lessons learnt during the previous decade of frigate development. The ships provided full facilities for a CH-124 Sea King helicopter, a remarkably large helicopter for a 3,000 t displacement hull.

The design of the upperworks was based on the belief of the designer of the 'St Laurent' class (Baker) that, since water could not be prevented from coming aboard, then it should be allowed to drain away as easily as possible, which resulted in well-rounded deck edges and a turtle-back forecastle. In addition, the lower part of the mast was plated over to delay the build-up of ice.

The principle ASW weapon system was the CH-124 Sea King, but the ship also carried a Mk 10 Limbo three-barrelled mortar and two triple Mk 32 324 mm torpedo tubes. Surface armament was a twin US Navy 76 mm (3 in)/50 Mk 33, which replaced the British twin 76 mm (3 in)/70 Mk 6 mounted in earlier classes, in order to save topweight.

MODERNISATION

The ships both entered service in 1964 and underwent their first modernisation in 1977-79. They then were put through the full DELEX (Destroyer Life Extension) programme in 1982-85, which included a new air surveillance radar and sonar, the Mk 60 gun fire-control system, together with improved communications and EW equipment.

In 1987/88 both ships had their VDS removed and replaced by a trials CANTASS (AN/SQR-501), which is still installed.

OPERATIONAL

Annapolis is based in the Pacific Fleet, *Nipigon* in the Atlantic. *Nipigon* had her main armament, air search and fire-control radars removed in 1994, but they were replaced in 1995.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84D-1A Block 1C Harpoon

Eight Harpoon anti-ship missile canisters are mounted immediately abaft the stack; there are two groups of four launchers each, with one group pointing across the ship to the opposite beam. The missiles are the Block 1C version, which has additional options, compared to previous blocks, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

Mk 48 Mod 0 VLS

There are two Mk 48 Mod 0 VLS. The units are made up of pairs of vertical canisters, each with its own efflux system, which turns the gases through 180°. Two eight-canister launch units are assembled from four sets of twin canisters and are mounted on the ship's side, abreast the stack, screened from the elements by a large rectangular plate. In war, two additional pairs of canisters would be added on each side, bringing the total number of missiles from 16 to 24.

Raytheon Sea Sparrow point-defence missile system

The system uses RIM-7M Sea Sparrow missiles and the Signaal VM 25 STIR fire-control system, with two directors. The system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg (85.1 lb) blast fragmentation warhead and a dual-purpose proximity-impact fuze.

Specifications
RIM-7M
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 226.8 kg (500 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturers/Contractors
Raytheon Company, Equipment Division (prime system contractor).
Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

TUBES

Two twin 324 mm US Mk 32 Mod 9 torpedo tubes are sited aft, at the forward end of the hangar, one pair on either beam. The current torpedoes are a mix of Mk 46 Mod 1 and Mk 46 Mod 5.

TORPEDOES

Alliant Techsystems Mk 46 Mod 1/5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

BOFORS SAK 57 L/70 Mk 2

The success of the Bofors SAK 57 L/70 Mk 1 led Bofors to develop an improved Mk 2 version, the SAK 57 L/70 Mk 2. This is intended to engage air and surface targets and to provide gunfire in support of troops ashore. It is housed inside a 'stealthy' shield.

Specifications
Calibre: 57 mm
Length of barrel: 70 calibres
Traverse: 360° at 55°/s
Elevation: −10 to +77° at 40°/s
Crew: 3
Range: 9 n miles (17 km)
Rate of fire: 220 rds/min
Projectile weight: 2.4 kg

Manufacturer/Contractor
Bofors, Sweden.

Hughes Mk 15 CIWS Phalanx

A single Hughes Mk 15 CIWS Phalanx close in weapons system (CIWS) is mounted on the roof of the hangar aft to provide the innermost layer of defence against anti-ship missiles. The 20 mm M61A1 Vulcan, six-barrel, Gatling-principle gun has a cylindrical magazine with the feed mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 3,000 rds/min
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor
Hughes Missile Systems, Tucson, Arizona, USA (system).

M2HB 12.7 mm (0.50 in) machine guns

Eight M2HB 12.7 mm machine guns are carried and can be mounted on flexible mounts.

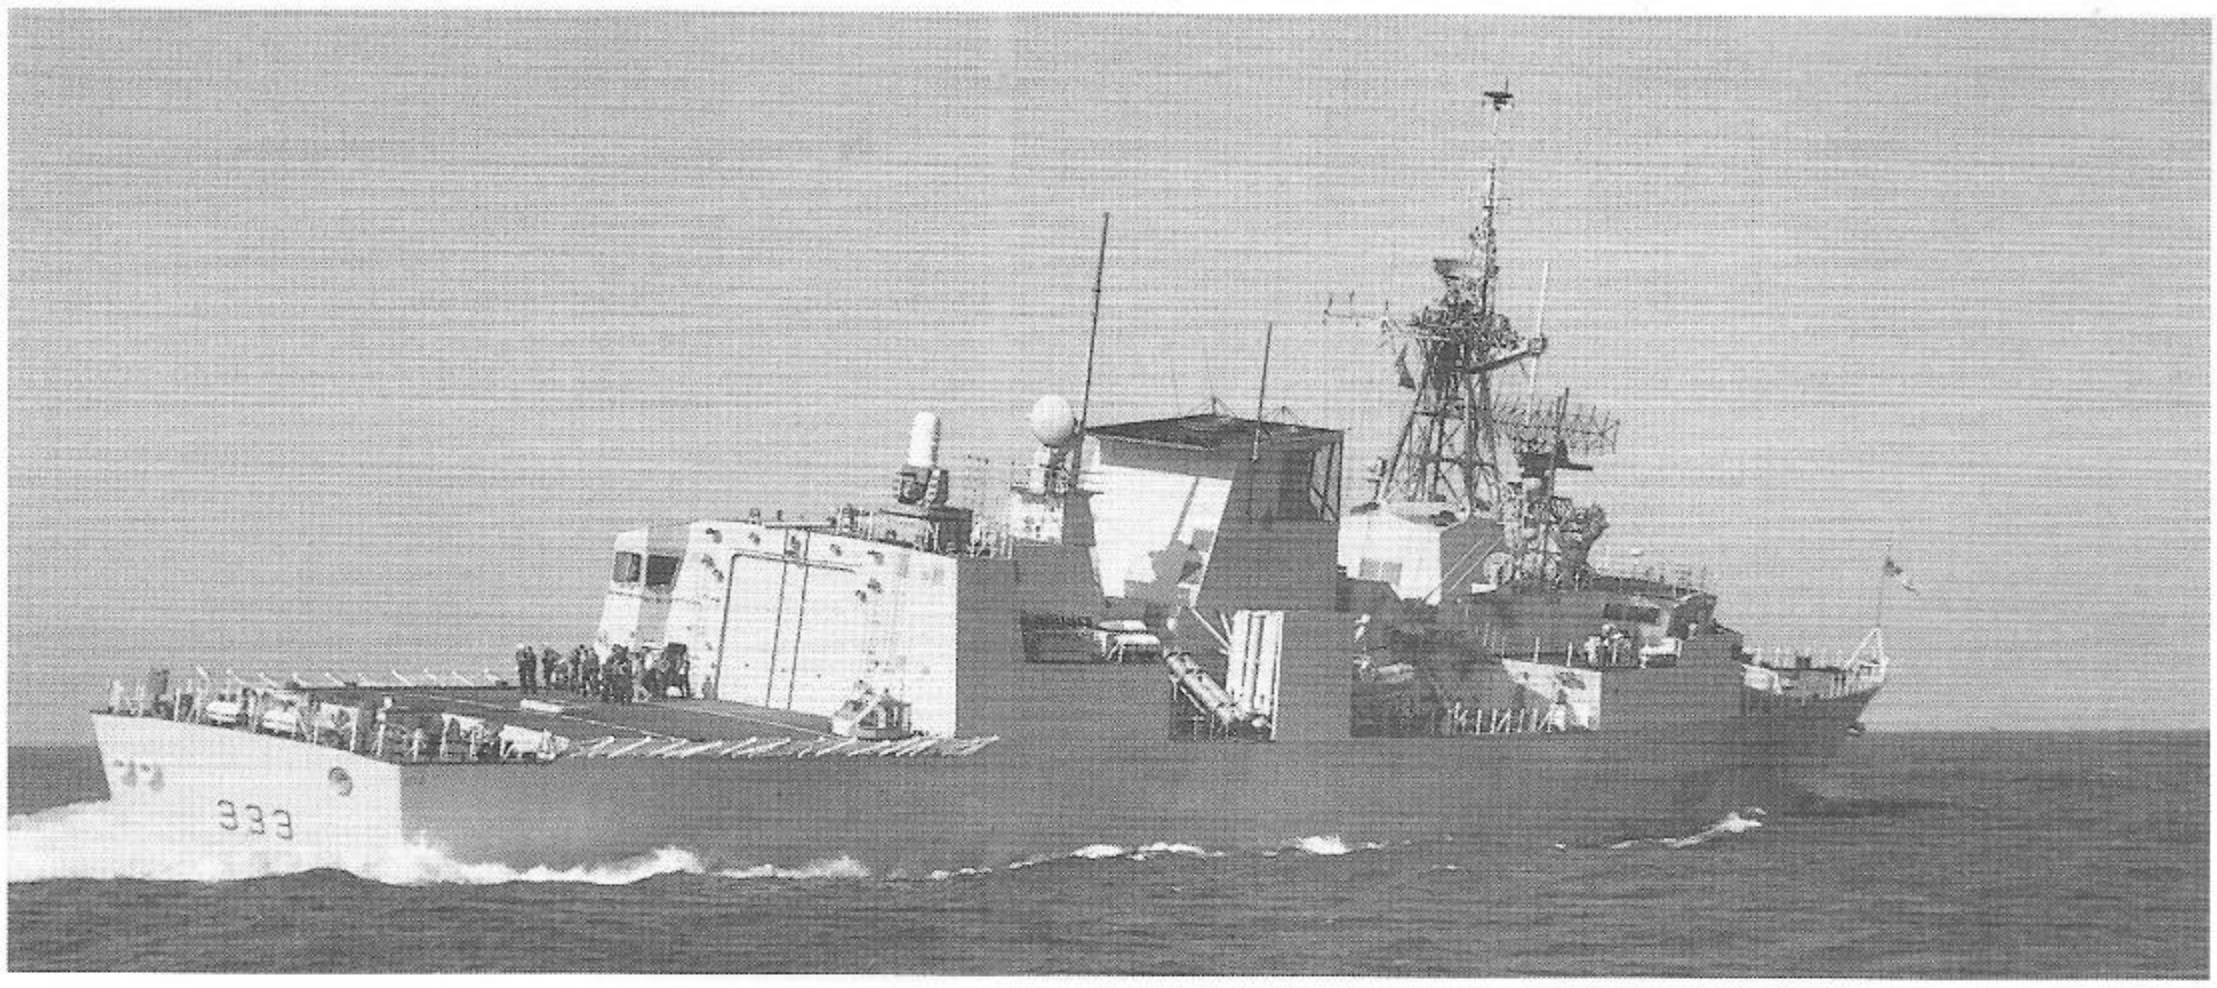
Specifications
Calibre: 12.7 mm (0.50 in)
Rate of fire: 450-550 rds/min
Muzzle velocity: 883 m/s (2,900 ft/s)
Max effective range:
anti-surface: 6,700 m (7,400 yd)
anti-air: 1,380 m (4,500 ft)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

AN/SLQ-501 (CANEWS I) radar warning system

CANEWS is a real-time radar detection and analysis system, covering the frequency band 0.5-18 GHz in five bands, each with its own receiver. It has four major subsystems: an IFM-based (instantaneous frequency measurement) antenna and receiver subsystem; a data transfer unit incorporating a high-speed digital processor; twin processors for real-time analysis, supervision and interfacing with the ship's command and control system; and a display console. A library holds data on numerous radar modes and signatures, and analysis of the detected RF signals identifies the radar type and platform, as well as providing an indication of the confidence level. Many of the functions are automatic to reduce operator workload, but AN/SLQ-501 also provides facilities for manual control if required, with one operator only required to control the complete



Toronto *(F 333). The fairleads in the transom are for AN/SLQ-25 Nixie (port) and CANTASS (starboard). The flight deck accommodates a Sikorsky CH-124 Seaking and, using the Indal RAST recovery system, can be used in extreme conditions in the north Atlantic* (Jane's/H M Steele)

ESM system. Lockheed Canada is leading a consortium of Canadian EW companies to define and develop CANEWS II, which will retain existing antennas and receivers, but add a new processor and further receivers to handle more complex threats, higher signal densities and wider operating frequencies. CANEWS II was tested in 1994-95 and is undergoing sea trials in 1996.

Manufacturer/Contractor
(CANEWS II) Lockheed Canada Inc, Kanata, Ontario, Canada (prime).

AN/SRD-502
Little is known about this equipment, except that its designation suggests that it has a communications direction-finding and intercept role

---

ELECTRONIC COUNTERMEASURES (ECM)

AN/SLQ-503 (RAMSES) ECM system
The AN/SLQ-503 Reprogrammable Advanced Multimode Shipborne ECM System (RAMSES) is a modular naval electronic countermeasures system designed principally to provide protection for ships against I/J-band radar threats. It is an integrated responsive jammer capable of long-range jamming of search radars and the deception of missiles once launched. In its normal mode of operation, RAMSES is interconnected to and controlled from a system such as the AN/SLQ-501 or similar ESM systems. A dedicated ECM operator is not therefore required. In the back-up mode, RAMSES can be manually controlled (target designation and jamming) from a remote-control panel located conveniently near the EW operator. RAMSES operates in I/J-band and is capable of high pulse and CW Effective Radiated Power (ERP). Multimode jamming operation is possible with multitarget handling capability. The system is reprogrammable and power management is provided. The antennas are fully trainable (port and starboard each through 180°) and are stabilised for roll and pitch.

Manufacturer/Contractor
Lockheed Canada Inc, Kanata, Ontario, Canada.

DECOYS

Plessey Shield Tactical Decoy System
There are four launchers, each with six barrels in two superimposed groups of three, for the Plessey Shield system. Two launchers are located on either beam, just forward of the foremast. Shield is a microprocessor-controlled, fully automatic missile decoy system, which is designed to provide effective protection for various sizes of ship, including fast attack craft, corvettes, frigates and destroyers. On detecting a threat, Shield selects the most appropriate response from up to six million scenarios held in its EPROM memory, using data obtained from onboard sensors such as radar and ESM and then automatically deploys the pattern of decoys that will give the highest probability of success. GEC-Marconi chaff rockets are fitted with a variable fuze which allows the chaff to be dispersed at optimum positions along the trajectory. To counter threats with a dual-mode capability, both chaff and infra-red decoys can be deployed automatically. Shield offers four protection modes — confusion; distraction; seduction/breaklock; and seduction dump — and uses two types of decoy — chaff and infra-red — which may be used on their own, or in combination with each other.

Manufacturer/Contractor
Plessey, UK.

AN/SLQ-25 Nixie noisemaker
One AN/SLQ-25 Nixie (Phase 1), solid-state, modular design electroacoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed through the transom or in a partially or totally enclosed location on the main deck. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm (3.10 ft) long, 15.24 cm (6 in) in diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body at a time is deployed.

Manufacturer/Contractor
Aerojet ElectroSystems, Sacramento, California, USA.

Prairie Masker
Two Prairie air masker belts are fitted, together with propeller masking systems.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

AN/UYC-501(V) SHINPADS (SHipboard INtegrated Processing And Display System)
SHINPADS is an automated command and weapon control system, with a distributed architecture, which is based on up to 18 32-bit computers using CMS-2M software language.

Links within the ship use the SHINPADS Serial Databus, which has a data transfer rate of 9.5 Mbits/s and a clock rate of 10-12 MHz. The databus itself is a low-loss, impedance-matched, double-shielded triaxial transmission line, accessed through nodes embedded in the processors and via Bus Access Modules (BAMs). The transmission protocol and levels comply with the MIL-STD-1397 specification for Type E NTDS communications.

The system uses 33 AN/UYK-507 computers, using replacement cards and with a minimum memory of 256 k static RAM (random access memory), expandable to 512 k, which can be further expanded to 8 M in dynamic RAM. The operating speed of the UYK-507 is 5 Mips. 28 of these are dedicated to the C2 task. One of the software functions is automatic reconfiguration of the system to bypass failed elements and the system will remain fully operational with just five AN/UYK-507 computers intact.

SHINPADS normally has 14 to 15 workstations including a bridge display and in the combat direction centre (CDC) there are workstations for the commanding officer, operations room officer, the sensor weapons controller (SWC) and assistant SWC.

WEAPONS CONTROL

AN/SWG-1A Harpoon Launch Control System (LCS)

AN/SWG-1A is the Harpoon Shipboard Command and Launch Control System HSCLCS), which activates the missile, selects the flight pattern and sets seeker search modes (with small, medium or large acquisition windows), as well as providing target range and bearing data. Alternatively, the missile can simply be launched along the bearing of the target, with the seeker activated early to scan a 90° sector; if, after a set time, no target has been acquired the missile commences a preset search pattern. SWG-1A takes account of other ships in the general target area and generates indirect flight plans for the missile, including waypoints to optimise angles of approach which will achieve the highest possibility of success while minimising the chances of the missile being destroyed by hostile fire. It can also be used to compute flight plans in a multiple attack so that several missiles, from either the same or different ships, arrive on target simultaneously, thus swamping the defences.

RADARS

SONARS

CDC AN/UYS-503(V)1

The AN/UYS-301(V)1 sonobuoy processing system receives signals from sonobuoys via the masthead antenna and the AN/ARR-75 receiver.

AN/SQS-505(V)6 sonar hull-mounted and VDS search and attack sonar

As built, the ships were fitted with an AN/SQS-505 (V)6 search and attack sonar in a retractable, hull-mounted dome. This is a deep water, omnidirectional, sonar surveillance system, but can also be operated in a directional mode when tracking a defined target. There are three selectable frequencies to enable several ships to operate in close proximity without cross-talk. In high sea states which result in excess roll and pitch of the ship, the AN/SQS-505(V)6 utilises transmit beam stabilisation, which delays transmission until near optimum roll and submergence conditions prevail, in order to minimise the chances of the target being missed altogether. The (V)6 differs from earlier versions in having a new transmitter and receiver, and is designed specifically to work with SHINPADS.

Specifications

Coverage: 360° (azimuth)
Range: 183-975 m (200-3,200 yd)
Doppler range: ±40 kts (7.2 kHz)
Displays: Range (A Scan); Bearing (B Scan); Doppler
Frequencies:
active: 6.4 kHz, 7.2 kHz, 8.0 kHz
passive: 4.5 kHz
Source levels: From 224.233 dB/µPa/m (transmission mode dependent)
Initial detection: 12 ping history of returns
Bearing accuracy: 1° RMS
Range accuracy: ±1% range reading
Transmission modes: Omni, TRDT, DT, ASPECT

Manufacturer/Contractor

Westinghouse Canada Inc, Burlington, Ontario, Canada.

AN/SQS-510 sonar

The ships are having their AN/SQS-505(V)6 progressively upgraded to AN/SQS-510(V) standard. The hull-mounted element is a 7 kHz medium-size search and attack sonar, which can be used in direct communication with a digital computer, either for the transfer of range and bearing information, or it can give assistance

to the operator in detection and tracking. It is a deep water, omnidirectional, surveillance system, but is also able to operate in a directional mode that can maintain search ability while tracking defined targets. Three selectable frequencies are available so that several ships can survey an area in close proximity without cross-talk.

Specifications
Coverage: 360° (azimuth)
Range: 183-3,000 m (200-3,200 yd)
Doppler range: ±40 kts (7.2 kHz)
Displays: Range (A Scan); Bearing (B Scan)
Doppler frequencies: 6.4, 7.2 and 8.0 kHz
Source levels: From 224.233 dB/µPa/m (transmission mode dependent)
Initial detection: 12 ping history of returns
Bearing accuracy: 1° RMS
Range accuracy: ±1% range reading
Transmission modes: Omni, TRDT, DT, ASPECT
Power level: High and low (10 dB reduction)

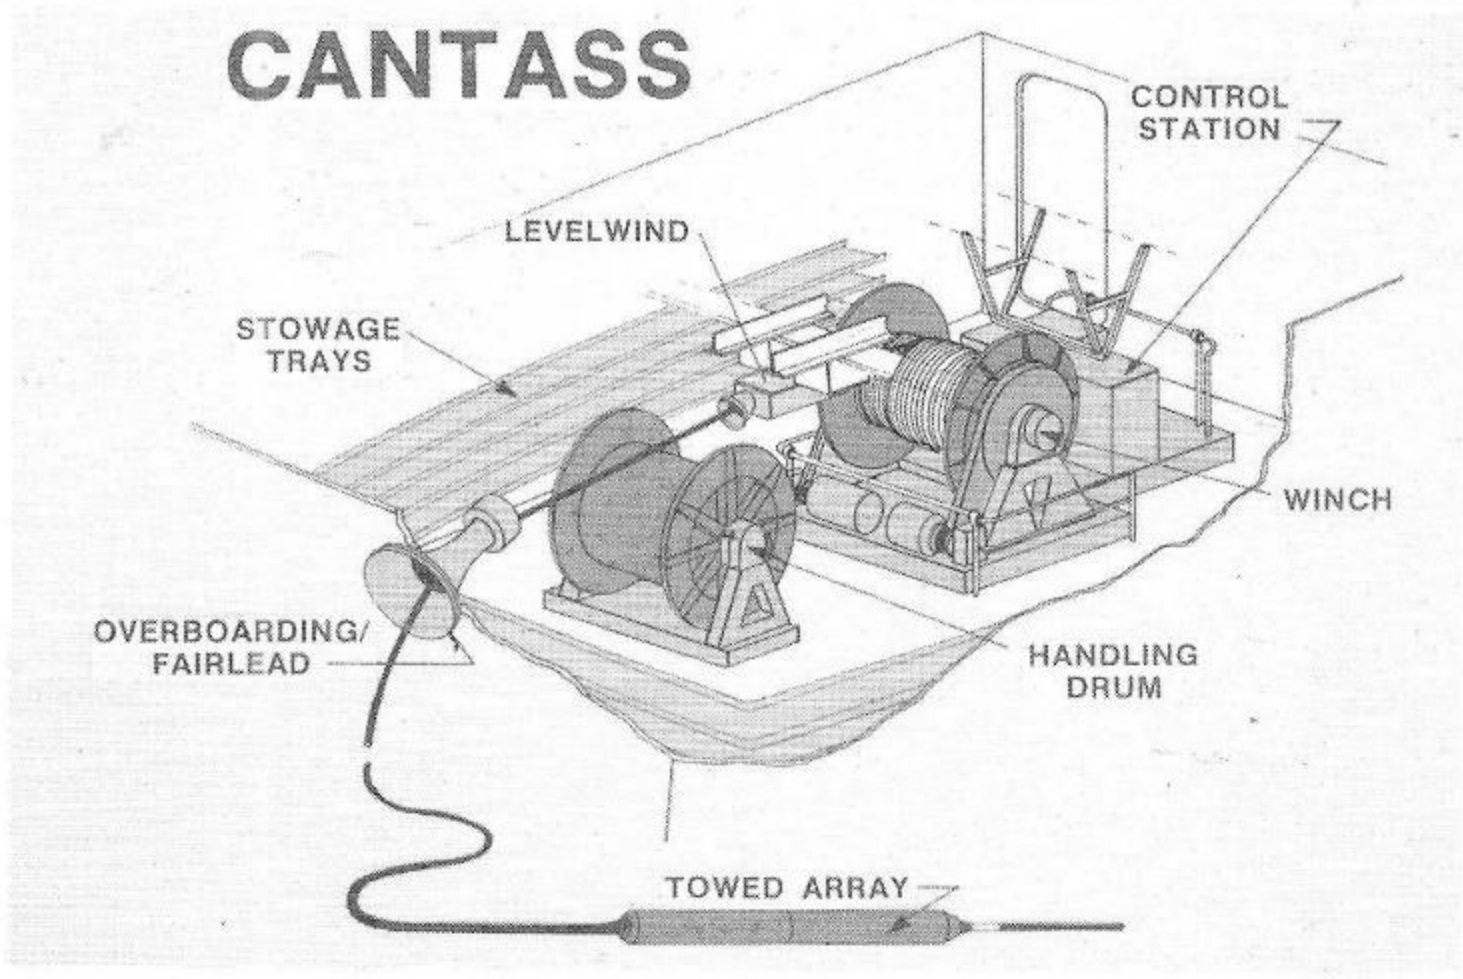
Westinghouse Canada Inc, Burlington, Ontario, Canada (sonars).

AN/SQR-501 CANTASS
The AN/SQR-501 is a passive, critical angle towed array consisting of a Computing Devices Canada display and processing subsystem, the Lockheed Martin AN/SQR-19A towed array and Indal Technologies OK-419 handling gear. The display subsystem uses two, four or six high-definition monochrome TV monitors specifically designed by Whittaker Electronics Inc for this application. The acoustic data processing system uses the Computing Devices AN/UYS-510 signal processor, modular interfacing and data management electronics. The acoustic data processing subsystem also provides for the storage and playback of raw acoustic data by means of a Sony DR 1000L high-density digital recorder.

The system provides frequency and bearing analysis of acoustic emissions from long ranges. Data are presented to the operator on programmable CRT displays in a variety of alternative formats. Audio data is presented as a further aid to detection and classification. Processing algorithms were developed by the Canadian Defence Research Establishment, Atlantic and implemented by Computing Devices Canada Ltd. Implementation of systems processing and data manipulation is entirely in software using Ada. The modular design offers a growth capability and adaptability to meet changing requirements.

The 'wet-end' is the AN/SQR-19A, with a 240 m (800 ft) array on a 1,700 m (5,600 ft) cable, which reaches depths of 360 m (1,200 ft).

Manufacturer/Contractor
Computing Devices Canada Ltd, Ottawa, Ontario, Canada (prime and processing elements).



CANTASS was developed specifically for the Canadian frigates (St John Shipbuilding)

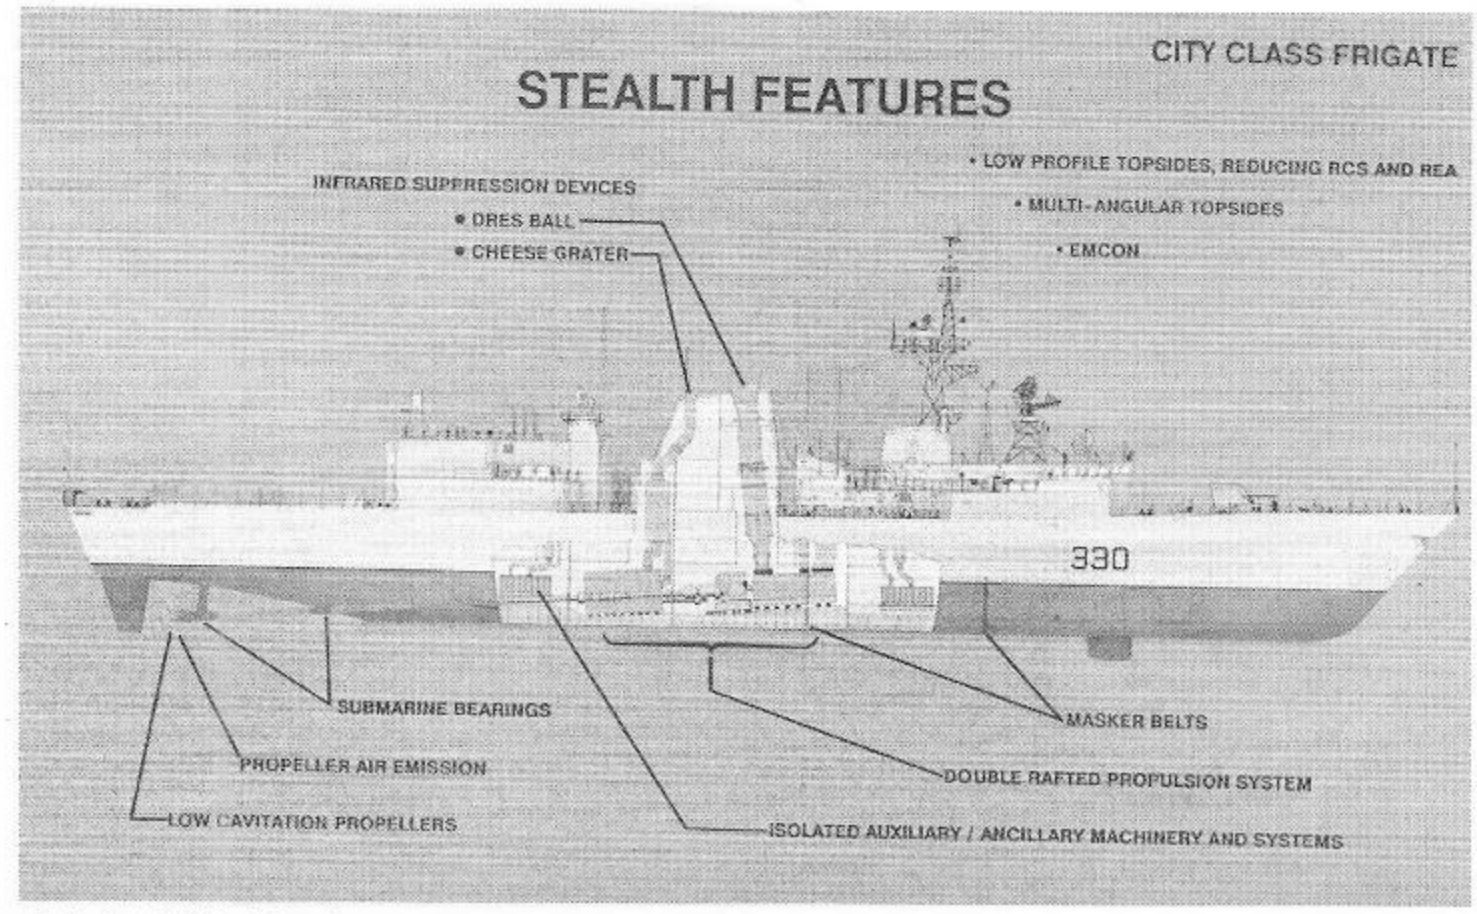
FURTHER INFORMATION

PROGRAMME

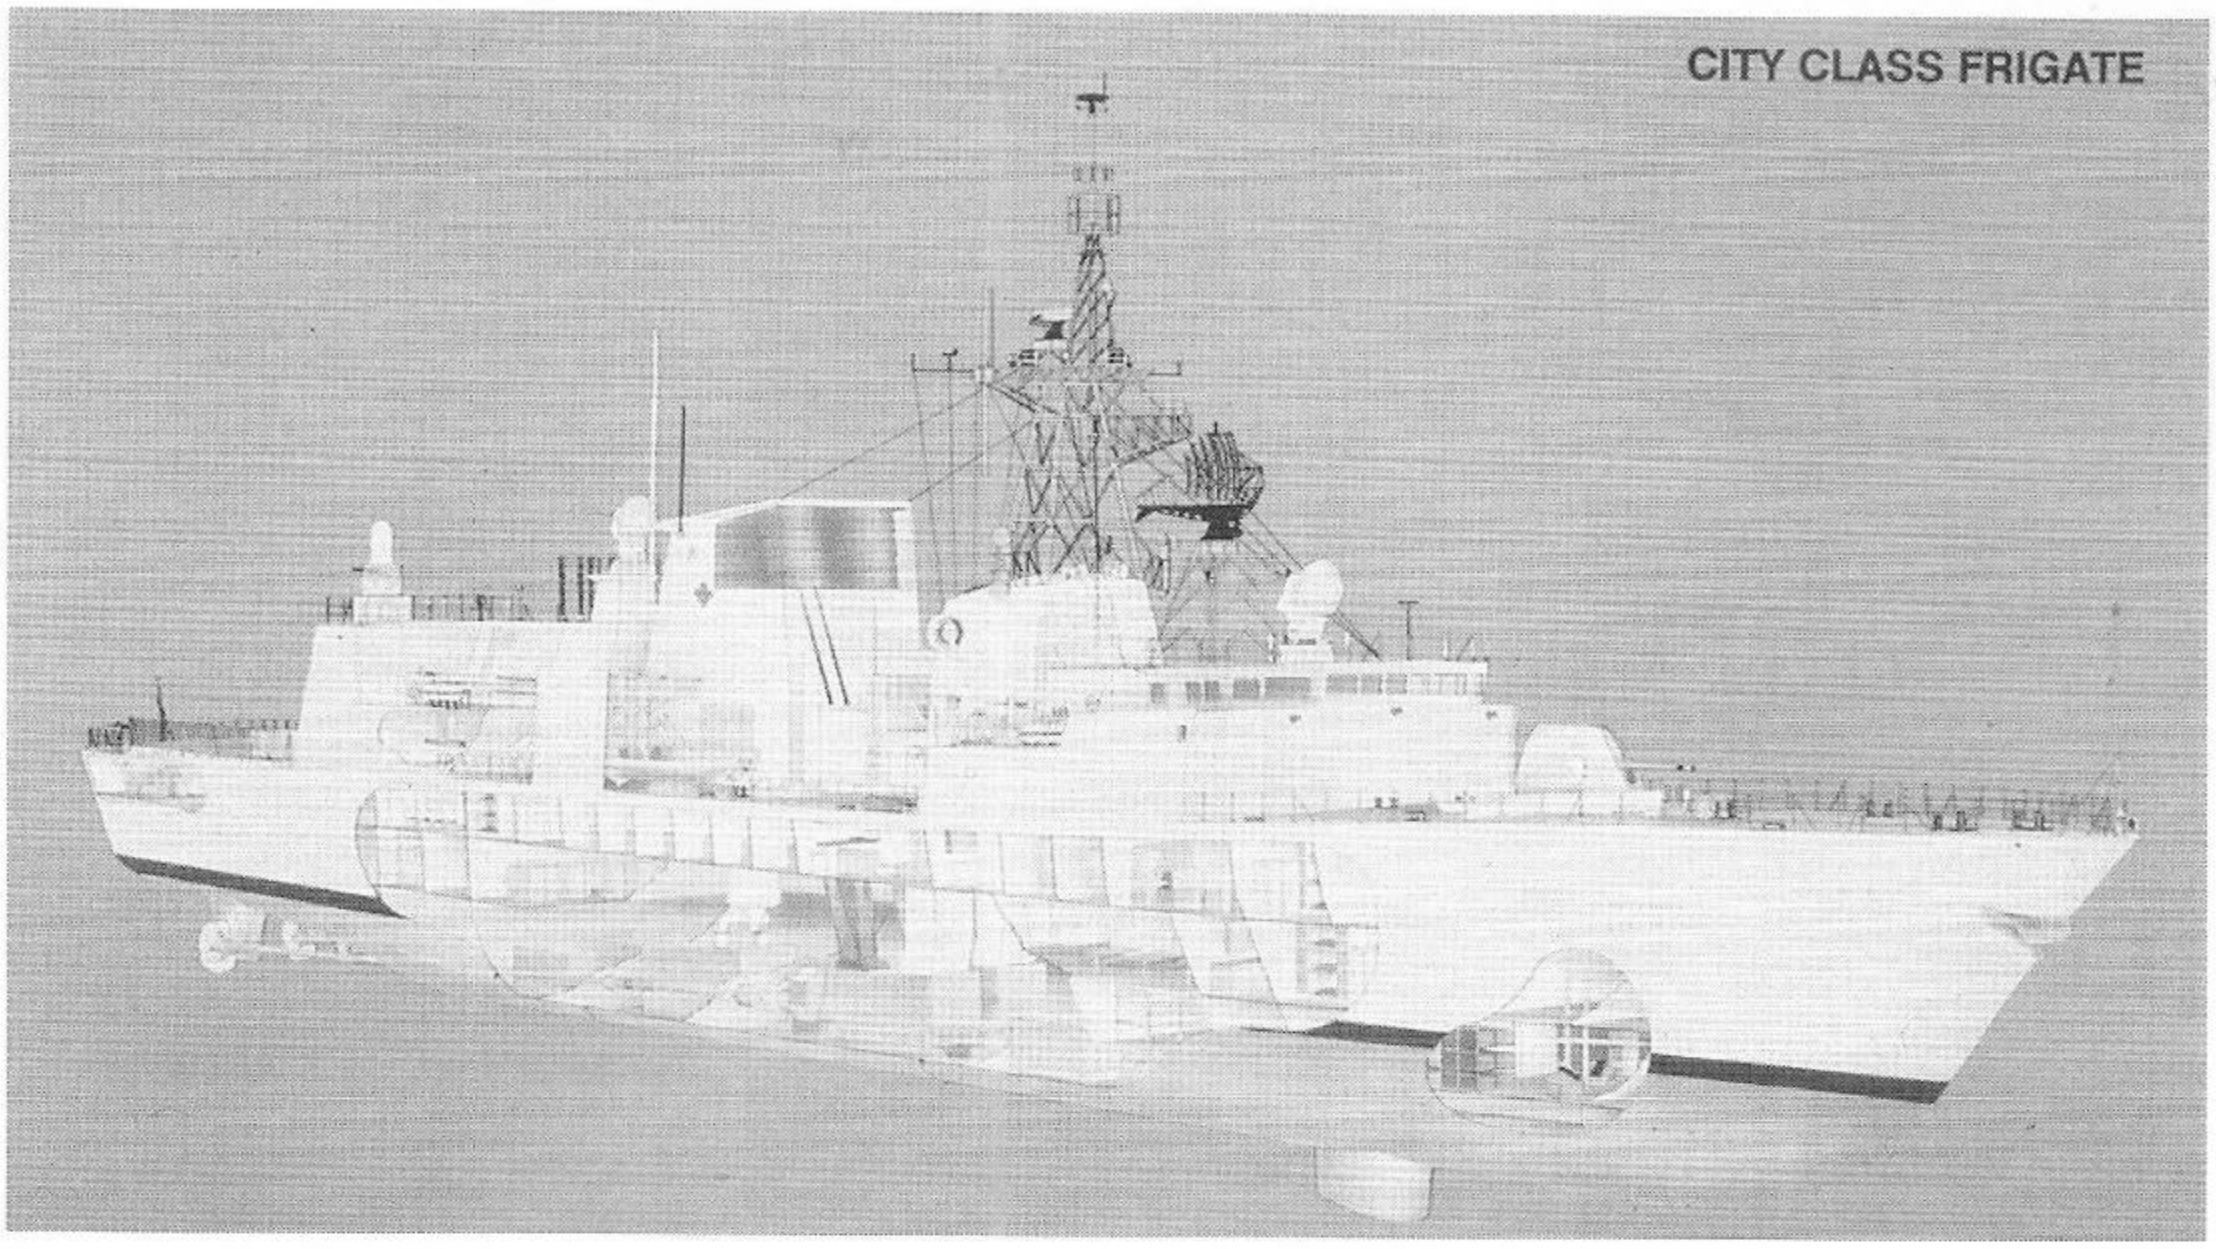
Although the decision to order this class was taken in December 1977 the order was not placed until 29 June 1983, when it was announced that the competition for the first six of a new class of patrol frigates had been won by St John Shipbuilding Ltd supported by Paramax Electronics Inc of Montreal, a subsidiary of Unisys Co. Three ships were then subcontracted to Marine Industries Ltd (now MIL-Davie) in Lauzon and Sorel, Canada. On 18 December 1987 six additional ships of the same design were ordered from St John SB Ltd with delivery by 1997. There have been problems keeping to the planned construction programme, but the dispute between St John and MIL was finally resolved in 1993. The original intention was for a class of twenty, but it appears highly unlikely that a further eight will be built.

DESIGN

The Canadian Forces Maritime Command (CFMC) has extensive experience of operating in the hostile environment of the North Atlantic, which has been brought to



(St John Shipbuilding)



Fredericton *(F 337)* (St John's Shipbuilding)

bear in this design. Deck wetness has been reduced by the high freeboard, flush deck and the broad beam, which is carried well forward, while the deep draught and fine lines of the bow prevent the sonar dome being lifted clear of the water. The same features also reduce slamming and minimise pitch and roll, which are of benefit to both helicopter operations, and to general crew comfort and efficiency.

The hull and superstructure are fabricated mainly from low-alloy, high-tensile steel, with selective use of high-yield steels to give additional strength in high-stress areas and for ballistic protection.

Considerable efforts have been made to enhance the ship's stealth characteristics, one element of which is reducing the radar cross-section (RCS) through careful design of the hull and superstructure. In the hull, the sides are flared and the transom is angled, while in the superstructure all vertical surfaces have been angled, the number of radar-reflecting corners has been minimised, the number of decks reduced, and the design of the mast carefully analysed to combine the necessary strength with minimum radar reflections.

The IR signature has been reduced in the 3-5 and 8-13 µm bands, with particular attention being paid to exhaust ducts and heat plumes. Among the cooling measures in use are the Canadian-designed DRESball (DRES = Defence Research Establishment Suffield) devices in the gas-turbine uptakes.

Since the ships' primary mission is ASW, particular attention has been paid to underwater radiated noise. The propellers are designed to maximise the speed at which cavitation occurs; gas turbines, diesels and gearboxes are raft-mounted and, where necessary, housed in acoustic enclosures; and both magnetic and heat signatures are carefully controlled. Resilient mountings and flexible connections are widely used. In addition, underwater hull openings have been kept to a minimum and those that are unavoidable are designed to reduce turbulence and resonance.

MODERNISATION

At one stage there was a plan to lengthen the second group of six hulls in order to increase SAM capacity and to improve living conditions (particularly in order to provide female accommodation), but these were shelved. This means that there is limited weight reserve for mid-life modernisation, the absolute displacement limit being reported as 5,100 tonnes.

OPERATIONAL

There were problems on first of class trials, which included higher than designed radiated noise levels, which were reported to be speed associated. These have been rectified.

DEPLOYMENT

Vancouver, Regina, Calgary, Winnipeg and *Ottawa* are based in the Pacific, the remainder in the Atlantic.

Vancouver *(F 331)* (H & L van Ginderen Collection)

JIANGHU CLASS

OVERVIEW

The 'Jianghu' class has been of considerable importance to the Chinese shipbuilding industry, being built in some numbers over many years, and introducing many new features novel to the PLA-N. Four Soviet-designed 'Riga' class frigates (1,488 t) were assembled in Chinese yards from kits supplied by the (then) USSR, being launched in 1956-57. These were followed by the 'Jiangnan' class (1,600 t) which was based on the Riga design but incorporated a number of Chinese ideas; five were built between 1965 and 1969. Next came two 'Jiandong' class ships, which were somewhat larger, displacing 2,200 t, and were the first to be armed with missiles, carrying two RQ-61 SAMs. Launched in 1973 and 1974, they appear to have been failures, probably because the designers were trying to do too much on a relatively small hull.

The first of the 'Jianghu' class was launched in 1975 and had the same hull as the 'Jiandong' class, but a considerably smaller displacement, and have proved to be a relative success, even though they are unsophisticated in comparison to most other contemporary international designs. Nevertheless, they provide an effective platform for the missions currently undertaken by the PLAN.

Design

There are a number of variants in the class, but all have the same length, 103.0 m (337.75 ft) with relatively minor variations in the beam and draught. The versions of the design are as follows:

Type I. This is the original version with four HY-2 SSMs and two 100 mm guns. Five variants have been reported:

Version 1. Oval stack and square bridge wings.
Version 2. Square stack with bevelled bridge face.
Version 3. Bevelled bridge face, but with octagonal stack.
Version 4. Bevelled bridge face, but with oval stack.
Version 5. Has a distinctive fluting arrangement with cowls on the funnel, as well as gunhouses on the 37 mm guns.

Some ships of all five versions have bow bulwarks, of which there appear to be two variations; *Zhenjiang* (514), for example, has a short bulwark, while that in *Zigong* (558) is much longer.

Type II. Commissioned in November 1986, the single Type II has a helicopter flight deck and hangar, and several foreign systems including a Creusot Loire 100 mm gun, Italian torpedo tubes and torpedoes, and US Mk 33 SRBOC decoy launchers.

Type III. The two Type IIIs have a raised shelter deck and are armed with the YJ-1 turbojet-powered missile in fixed container-launchers, in place of the earlier HY-2 rocket-powered missile in large, heavy, trainable launchers.

Type IV. The sole Type IV has the same hull form as the Type III, but is armed with the longer-range C-802 version of the HY-2 missile and with a slightly different arrangement of the launcher-containers.

Egyptian ships. The version exported to Egypt is essentially a Type I Version 4 with bevelled bridge screen and oval funnel, but with the important difference that the 100 mm gun turrets are replaced by twin 57 mm guns in open mounts.

Bangladesh ship. This is a Type I Version 1 with flat bridge front and oval stack, and does not have bow bulwarks.

Thai ships. The Thai ships are based on the Type III, but with the missile tubes at 90° to the centreline and there are two variants. Two ships have two twin 100 mm gun mounts and eight missiles, while the other two have one 100 mm mount and a new helicopter flight deck (but no hangar) aft.

Sales

Two were transferred to Egypt: one in September 1984, the other in March 1985.

One, *Xiangtan* 556, then serving with the PLA-N, was transferred to Bangladesh in November 1989.

Four have been sold to Thailand.

Two 'Jianghu' class frigates were to have been sold to Iraq in 1991 but this was prevented by the Gulf War and the subsequent embargo. The contract may, however, be honoured in due course.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

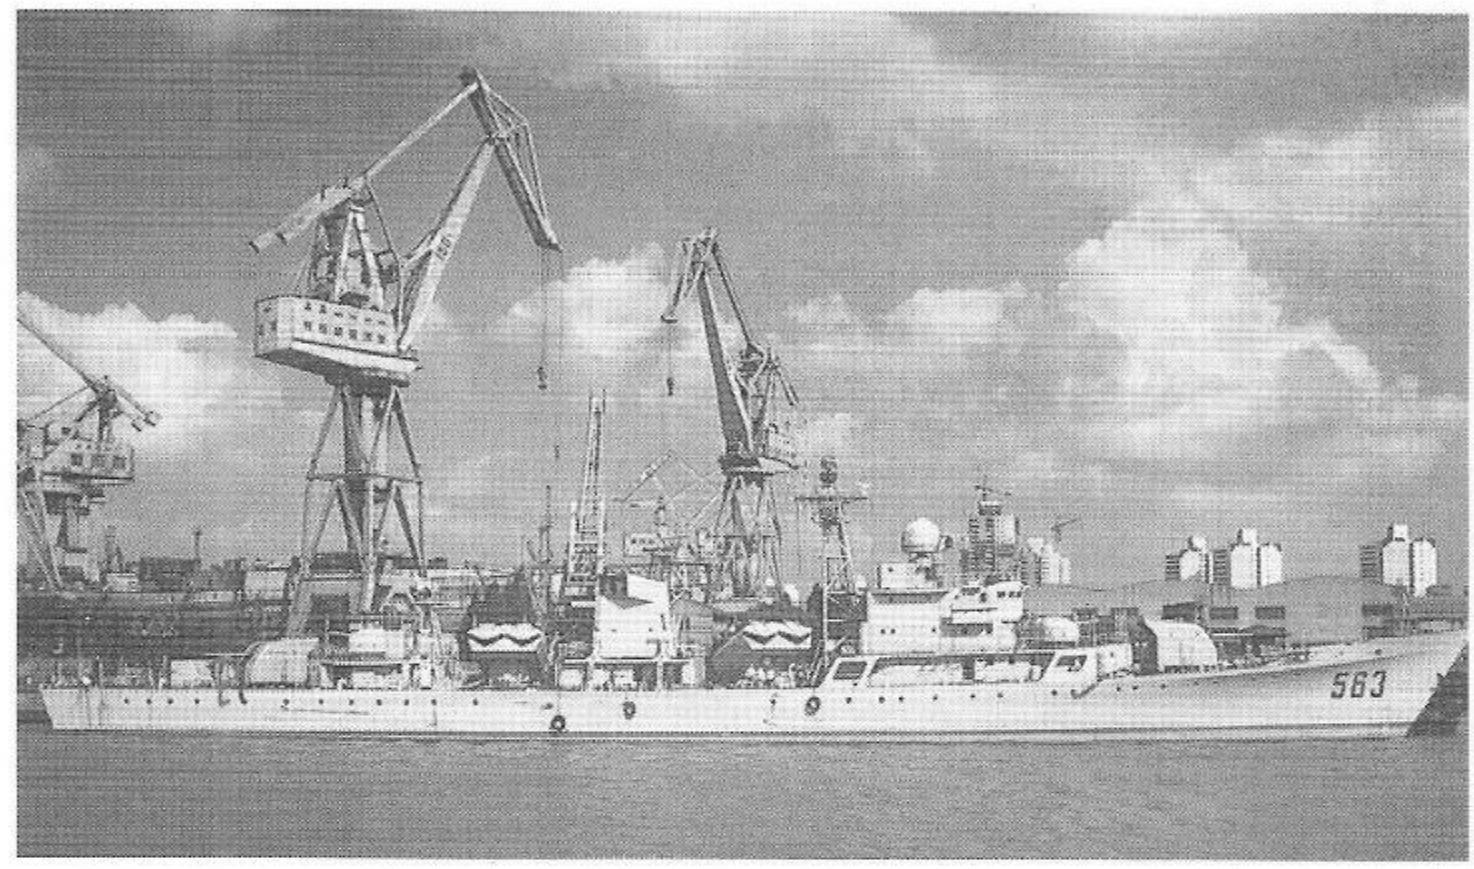
HY-2 (NATO = CSSC-3 'Seersucker') medium-range anti-ship missile

Jianghu I frigates are armed with four HY-2 (Hai Ying = Sea Eagle) (export designation = C-201) anti-ship missiles, mounted in two twin launchers. These launchers are located before and aft of the after stack and must be trained to either beam to fire, but are fixed in elevation. The HY-2 missile was developed from the HY-1, which, in its turn, was developed from the Soviet SS-N-2 Styx.

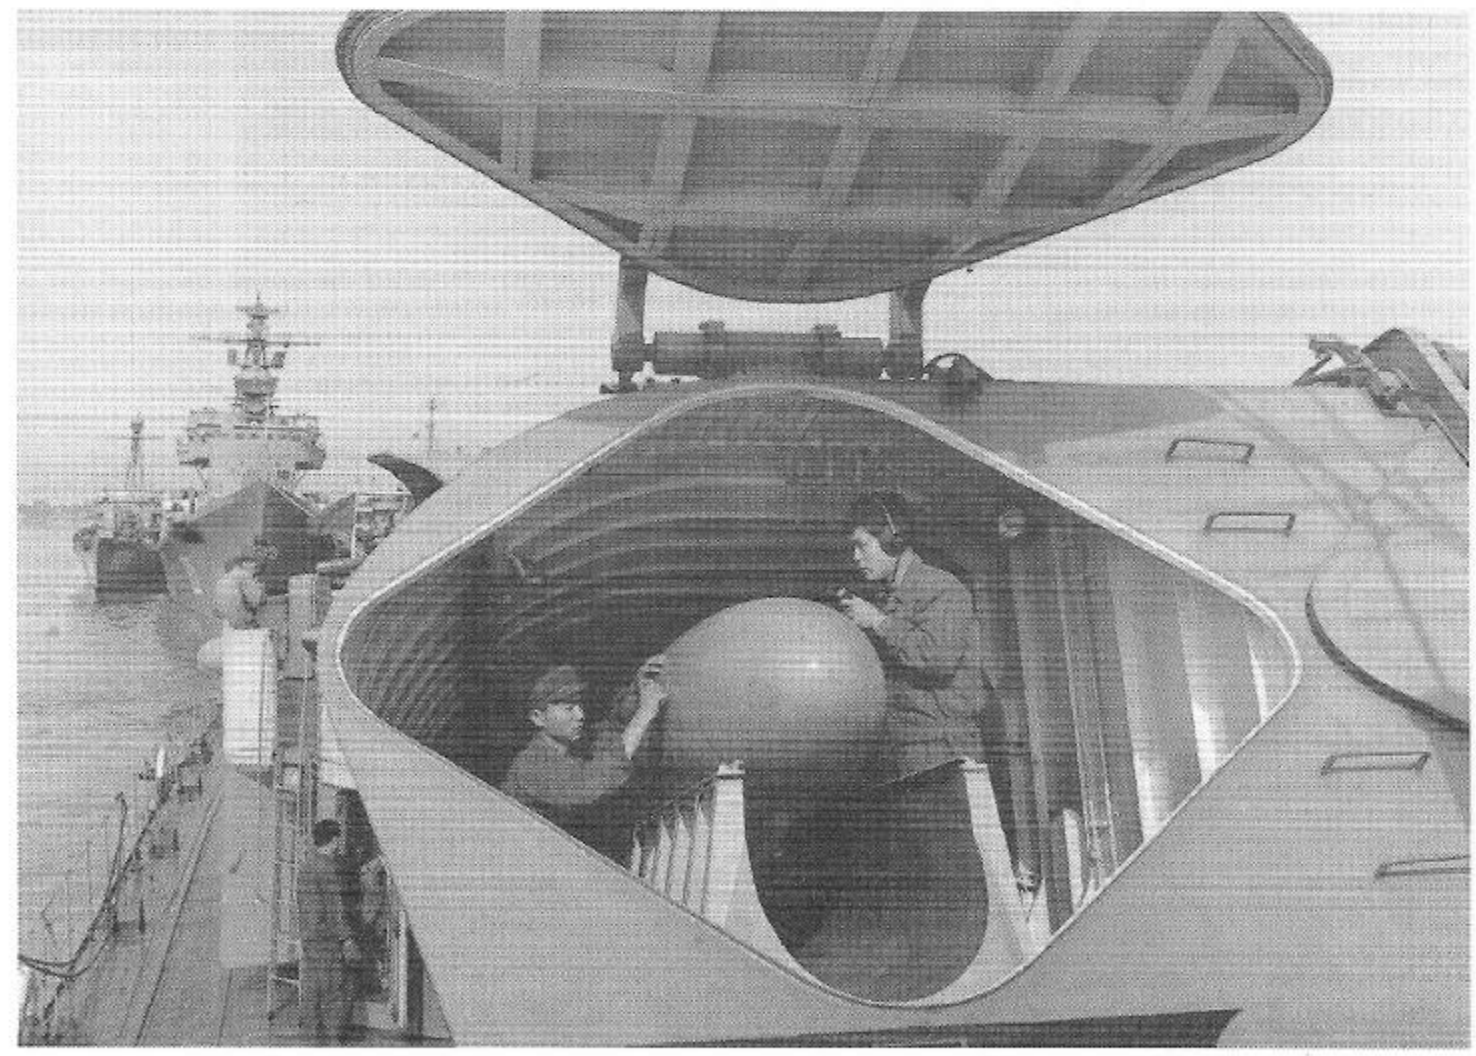
The firing sequence is operated from a dedicated console with its own analogue computer and ripple launches are possible. Once the target is confirmed as hostile the operator manually sets a range gate around it and feeds in location, speed and ballistic data. The computer then feeds the firing solution to the missile autopilot. After launch the HY-2 climbs to its cruise altitude of 30 m (100 ft), which it maintains until entering the terminal phase when it descends to about 8 m (26 ft).

Specifications
Length: 7.36 m (24.15 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.87 m)
Launch weight: 2,500 kg (5,511 lb)
Speed: Mach 0.9
Warhead: 454 kg (1,000 lb) hollow charge
Range: 51 n miles (95 km)
Guidance: Autopilot and active radar, with an alternative IR seeker instead of radar

Manufacturer/Contractor
China Precision Machinery Import and Export Corporation (CPMIEC), Beijing, China.



A Jianghu I *Version 5 with the unusual fluted funnel and four twin 37 mm with gunhouse* (Harald Carstens)



Technicians of the PLAN work on an HY-2 missile. The large size of the launchers is due to the fixed wings and rudder on the missile (CMIEC)

GUNS

100 mm L/56 medium-calibre dual-purpose gun

All Type I ships have two gun turrets, but some are single, others twin. The Chinese 100 mm L/56 is developed from the Soviet B34 100 mm gun, examples of which were supplied in the 1950s, and the same gun is used in both mounts.

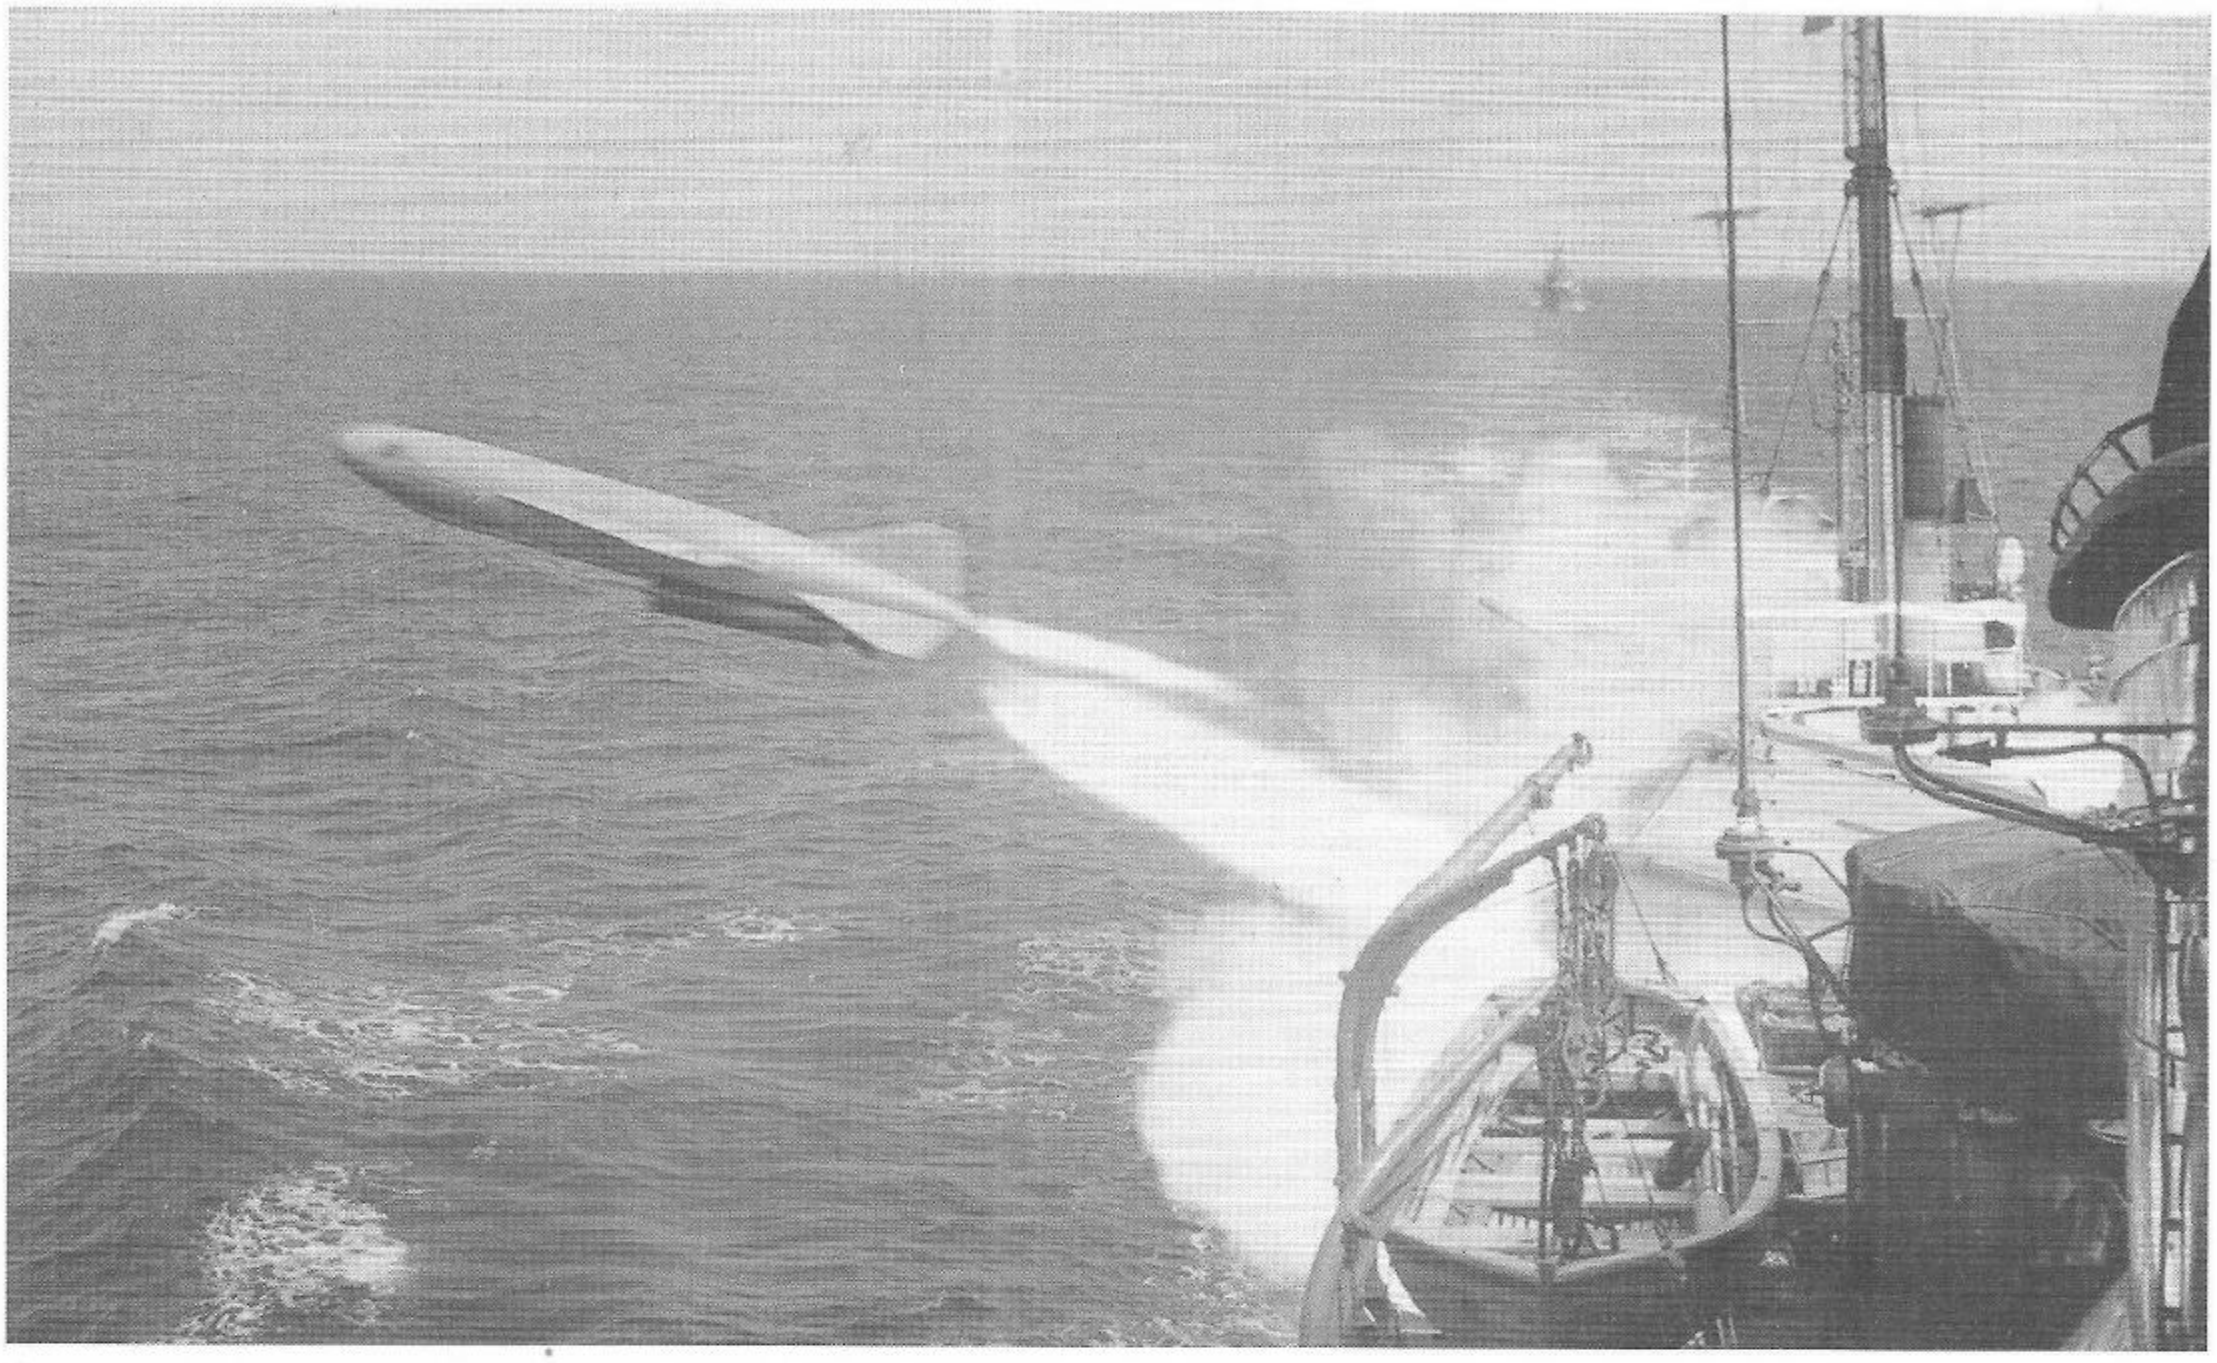
In the twin mounting the two barrels share a common cradle, with the trunnions set far back from the front of the turret to achieve high angles of fire. Spent rounds are ejected forward with the chutes running parallel to, but below, the guns. The turret is manned with a crew of five. Within the turret the gun captain occupies a position in front of, and on the left of, the trunnions.

Specifications
L/56 twin
Length of barrel: 56 calibres
Muzzle velocity: 900 m/s (2,953 ft/s)
Traverse: 360°
Elevation: −15 to + 85°
Weight of projectile: 6.31 kg (13.9 lb)
Rate of fire: 18 rds/min
Range:
anti-surface: 12 n miles (22 km)
anti-air: 15,000 m (49,000 ft)

37 mm (W-11-M) mountings

There are two fits: some ships have six twin 37 mm/62.8 mountings, others have four twin mountings. The barrels are enclosed in separate water jackets with exposed spring recuperators, and a hydraulic recoil buffer underneath the barrel. The loading mechanism consists of guides for ammunition, which is in five-round clips, the clips being automatically removed on the loading tray. The first round is loaded manually into the breech. The breech block rises and the gun fires when the firing pin strikes the cartridge percussion cap. Upon recoil, the breech block opens and extractor arms propel the case along the loading tray and down an ejection chute. The recoil forces activate the loading mechanism and allow following rounds to be rammed automatically into the breech.

Specifications
W-11-M
Calibre: 37 mm



An HY-2 is launched from a PLAN ship at sea, using both the main motor and the under-fuselage booster (CMIEC)

Length of barrel: 62.8 calibres
Muzzle velocity: 860 m/s (2,821 ft/s)
Traverse: 360° at 17°/s
Elevation: −10 to +85° at 13°/s
Rate of fire: 80 rds/min/barrel
Ammunition (projectile): 0.732 kg (1.61 lb)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 3,000 m (9,842 ft)
Crew: 3

Ammunition (HE-T)
Projectile Weight: 708 g (25 oz)
Explosive charge: 36 g (1.27 oz) (RDX/aluminium)

ANTI-SUBMARINE MORTARS

RBU 1200 5-tubed fixed launchers

Some ships have two RBU 1200 launchers, others four. This mounting is about 1.5 m (4.9 ft) high and has a pyramid-shaped pintle with five rocket launcher tubes; a row of three along the top and one each on either side. The tubes cannot be trained and have a maximum elevation of +65°. Each tube has a diameter of 250 mm (9.8 in), is 1.4 m (4.6 ft) long and is reloaded manually. The 70 kg (154 lb) RGB-12 rocket has a 34 kg (74.95 lb) warhead and a range of about 0.8 n miles. The RBU 1200 is associated with the old short-range HF (25-30 kHz), 'searchlight' attack sonar which was given the NATO codename Stag Ear and has the Soviet designation Tamir.

DEPTH CHARGES

There are two BMB-2 depth-charge projectors and two depth-charge racks.

MINES

These ships can carry up to 60 mines.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Jug Pair (Watch Dog)

There are two small domes on the foremast yard-arm. These are designated by NATO as Jug Pair, and appear to be a Chinese-produced version of the Russian Watch Dog radar warning system.

DECOYS

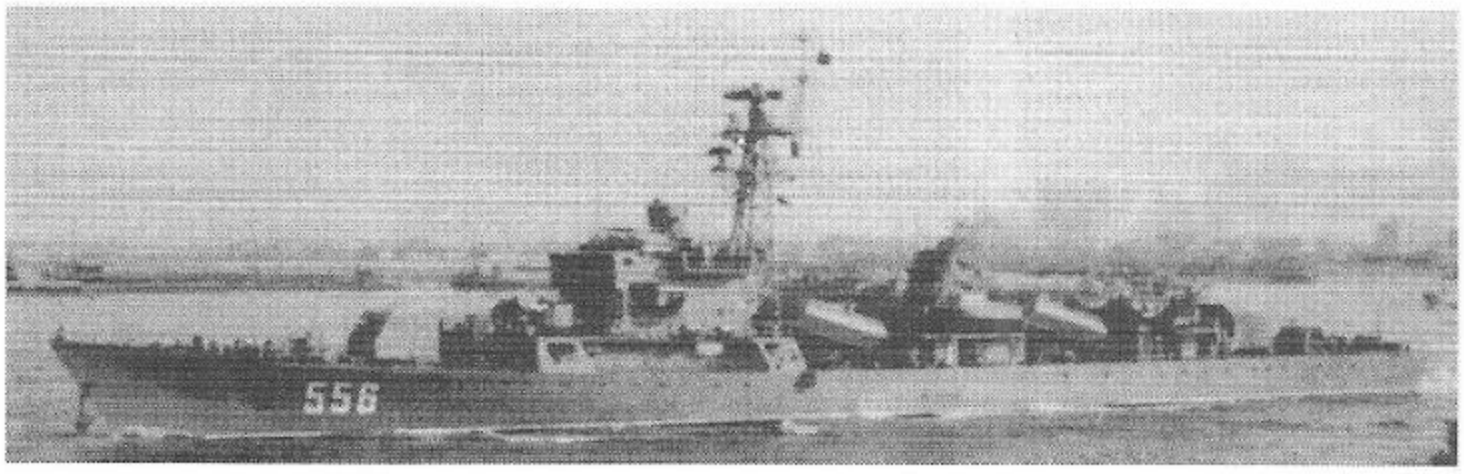
Mk 33 countermeasures system

There are either two Loral Hycor Mk 33 Rapid Bloom Offboard Countermeasures (RBOC) or two Chinese Type 945 26-barrelled launchers. Both launching systems comprise mortar launchers, countermeasures cartridges, and appropriate control and support arrangements.

Specifications (munitions)

	Dimensions (L × D)	Weight
CHAFFSTAR I	412.1 × 112.3 mm	4.15 kg
CHAFFSTAR II	1,067 × 112 mm	18.2 kg
GEMINI	434 × 112 mm	5.2 kg
HIRAM I	416.8 × 112.3 mm	4.1 kg
HIRAM II	889 × 203 mm	13.3 kg
LOROC	1,200 × 112 mm	14.74 kg

Manufacturers/Contractors
Loral Hycor Inc (launcher).
Lundy Electronics & Systems Inc (Mk 171 cartridges).



Jianghu I *Variant 1,* Xiangtan *(556), with oval stack and squared bridge wings. Note the Eye Shield air/surface search radar antenna at the masthead with the Square Tie surface search radar below and before the mast. This ship is now with the Bangladeshi Navy*

COMMAND CONTROL SYSTEMS

COMMUNICATIONS AND DATALINKS

IFF

High Pole A; Yard Rake; or Square Head.

WEAPONS CONTROL

Fire-control director

A small gunfire control director is installed in the bridge roof of some ships. Other ships have the large hemispherical director similar to the Russian Round Top.

RADARS

Eye Shield

Most 'Jianghu' class frigates have an Eye Shield antenna at the masthead. Also known as MX 902 and Type 354, Eye Shield is an air/surface search

Ningpo *(533), a Type I version 4 ship, with oval funnel and a variety of new sensors including Sun Visor fire control on the bridge roof and Knife Rest (partially obscured by exhaust smoke) atop the after deckhouse. The two triple launchers for the HY-2 missiles are clearly shown*

equipment which is reported to operate in the E band. This may be a development of the Russian Slim Net radar.

Rice Screen

Rice Screen is a 3D pulse-compression radar with a large, rectangular planar array antenna. According to brochures this can track ten targets and has a range of some 120 km. It has been fitted in ships 558 and 561.

Square Tie

Square Tie is an I-band, surface search and fire-control radar (also known as Type 352). The antenna is mounted on a small platform on the forward side of the mainmast.

Don 2, Fin Curve, Racal-Decca

The navigation set varies between ships. Don 2, Fin Curve and Racal-Decca (model unknown) sets have all been seen.

Rice Lamp

The Rice Lamp fire-control director is fitted in some ships. Operating in the I/J band, it is located aft, either atop a small deckhouse or at the head of a small tower in others.

Sun Visor

Sun Visor is an I-band, fire-control radar installed on the Round Top director, which is fitted in some ships.

Knife Rest

Some ships have a large open work antenna mounted either on a small tower on the forward edge of the stack or at the head of a similar tower on the after deckhouse. The Chinese Navy array has two side by side Yagi antennas and appears to be similar to the Knife Rest found on 1950s-vintage Soviet Navy ships. The (then) Soviet Army used Knife Rest B, which operated over the 79-93 MHz band, with a peak power of 100 kW and has an effective range of 185-280 km.

SONAR

Echo Type 5

One sonar set is fitted to all ships: the hull-mounted, active search and attack, Echo Type 5, operating in the medium-sonar frequency band. One ship has been seen with what may be a VDS or towed array, possibly as a trials installation.

PROPULSION

Specifications
System: diesel
Main machinery: 2 Type 12E 390V diesels; 10.6 MW (14,400 hp (m)) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These ships have all been built in Shanghai, but at three different yards at Hudong, Jiangnan and Huangpo. The first ship entered service in the mid-1970s and the ships then followed in the order: 515, 516, 517, 511, 512, 513, 514, 518, 509, 510, 519, 520, 551, 552, 533, 534, two for Egypt, 543, 553, 554, 555, 545, 556 (transferred to Bangladesh), 557, 544, 558, 560, 561, 559 and 563, with the last of the class, 564, completing in 1996.

DESIGN

The basic hull design is identical to that of the earlier Jiangdong frigate, an air defence ship, armed with a SAM system which appears to have been unsuccessful as it never entered service. The Jianghu I, however, differs in having two large twin SSM launchers.

A variety of versions of the Jianghu I have been observed.

There are various designs of stack. One design is square with a prominent rear 'lip', while another is slightly smaller, rounded and much more streamlined. In some of the most recently built ships, however, the stacks have a totally flat top, with the exhausts being led out through two 'wings'.

The earlier ships had a flat foredeck, which may have proved too wet in rough weather, as a number of ships have been seen with a bulwark, although the actual length appears to differ between ships.

Armament also differs. Some ships have two single 100 mm mountings while others have two twins. Similarly, there are differences in the 37 mm outfits, some ships having six twin mounts and others eight while the earlier ships have open mounts and the latest gunhouses.

The differences, all of which are relatively minor, may arise from the fact that the ships have been built in three different shipyards.

MODERNISATION

These ships are being modernised during a current refit programme. New fire-control and electronics equipment are being fitted, with Sun Visor and Rice Lamp being seen on newly refitted Type Is. One ship appears to be fitted with a VDS or towed sonar array, possibly as a trials installation.

DEPLOYMENT

Seven are based in the Eastern Fleet, five in the North and the remainder in the South.

DISPOSALS

Kaifeng (520) paid off in 1993.

GENERAL SPECIFICATIONS

Operator: China, People's Republic
Type: 053

Class: JIANGHU II

Built: 1
Active: 1

Displacement:
standard: 1,500 t
full load: 1,865 t

Dimensions
Length: 103.2 m (338.5 ft)
Beam: 10.8 m (35.4 ft)
Draught: 3.1 m (10.2 ft)

Speed: 26 kts
Range: 4,000 n miles at 15 kts; 2,700 n miles at 18 kts

Complement: 200 (30 officers)

SHIPS

SIPING (544)

Builder	Hudong Shipyard, Shanghai, China
Laid down	1984
Launched	Sep 1985
Commissioned	Nov 1986

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

HY-2 (NATO = CSSC-3 'Seersucker') medium-range anti-ship missile

The sole Jianghu II frigate is armed with two HY-2 (Hai Ying = Sea Eagle) (export designation = C-201) anti-ship missiles, mounted in one twin launcher. This launcher is located between the stack and the mast and must be trained to either beam to fire, but is fixed in elevation. The HY-2 missile was developed from the HY-1, which, in its turn, was developed from the Soviet SS-N-2 Styx.

The firing sequence is operated from a dedicated console with its own analogue computer and ripple launches are possible. Once the target is confirmed as hostile the operator manually sets a range gate around it and feeds in location, speed and ballistic data. The computer then feeds the firing solution to the missile autopilot. After launch the HY-2 climbs to its cruise altitude of 30 m (100 ft), which it maintains until entering the terminal phase when it descends to about 8 m (26 ft).

Specifications
Length: 7.36 m (24.15 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.87 m)
Launch weight: 2,500 kg (5,511 lb)
Speed: Mach 0.9
Warhead: 454 kg hollow charge
Range: 51 n miles (95 km)
Guidance: Autopilot and active radar, with an alternative IR seeker instead of radar

Manufacturer/Contractor
China Precision Machinery Import and Export Corporation (CPMIEC), Beijing, China.

Chinese HY-2 missile on a land-based launcher; the shipborne missile is identical, but uses a different launcher

TORPEDOES

B515 anti-submarine torpedo launching system

B515 (also known as ILAS) consists of three 324 mm diameter torpedo tubes mounted on the quarterdeck, with one installation on each side of the ship. The tubes are manually loaded and trained but remotely operated from the combat information centre, although emergency local operation is possible.

Specifications
Length: 3.4 m (11.15 ft)
Height: 1.2 m (3.94 ft)

Width: 1.285 m (4.22 ft)
Weight: 1,050 kg (2,315 lb) (unloaded)

Manufacturer/Contractor
Whitehead SpA, Salviano, Italy.

A244/S lightweight air-/surface-launched anti-submarine weapon
The torpedo used by the Jianghu II is the Whitehead A244/S.

Specifications
Length: 2.7 m (8.86 ft)
Diameter: 324 mm (12.75 in)
Weight: 215 kg (warshot version) (474 lb)
Warhead: 34 kg (75 lb) shaped charge HBX-3 HE
Propulsion: Electric; silver/zinc batteries
Range: 3.5 n miles (6 km)
Speed: 30 kts
Guidance: Active/passive sonar, self-adaptive programmed patterns

Manufacturer/Contractor
Whitehead SpA, Salviano, Italy.

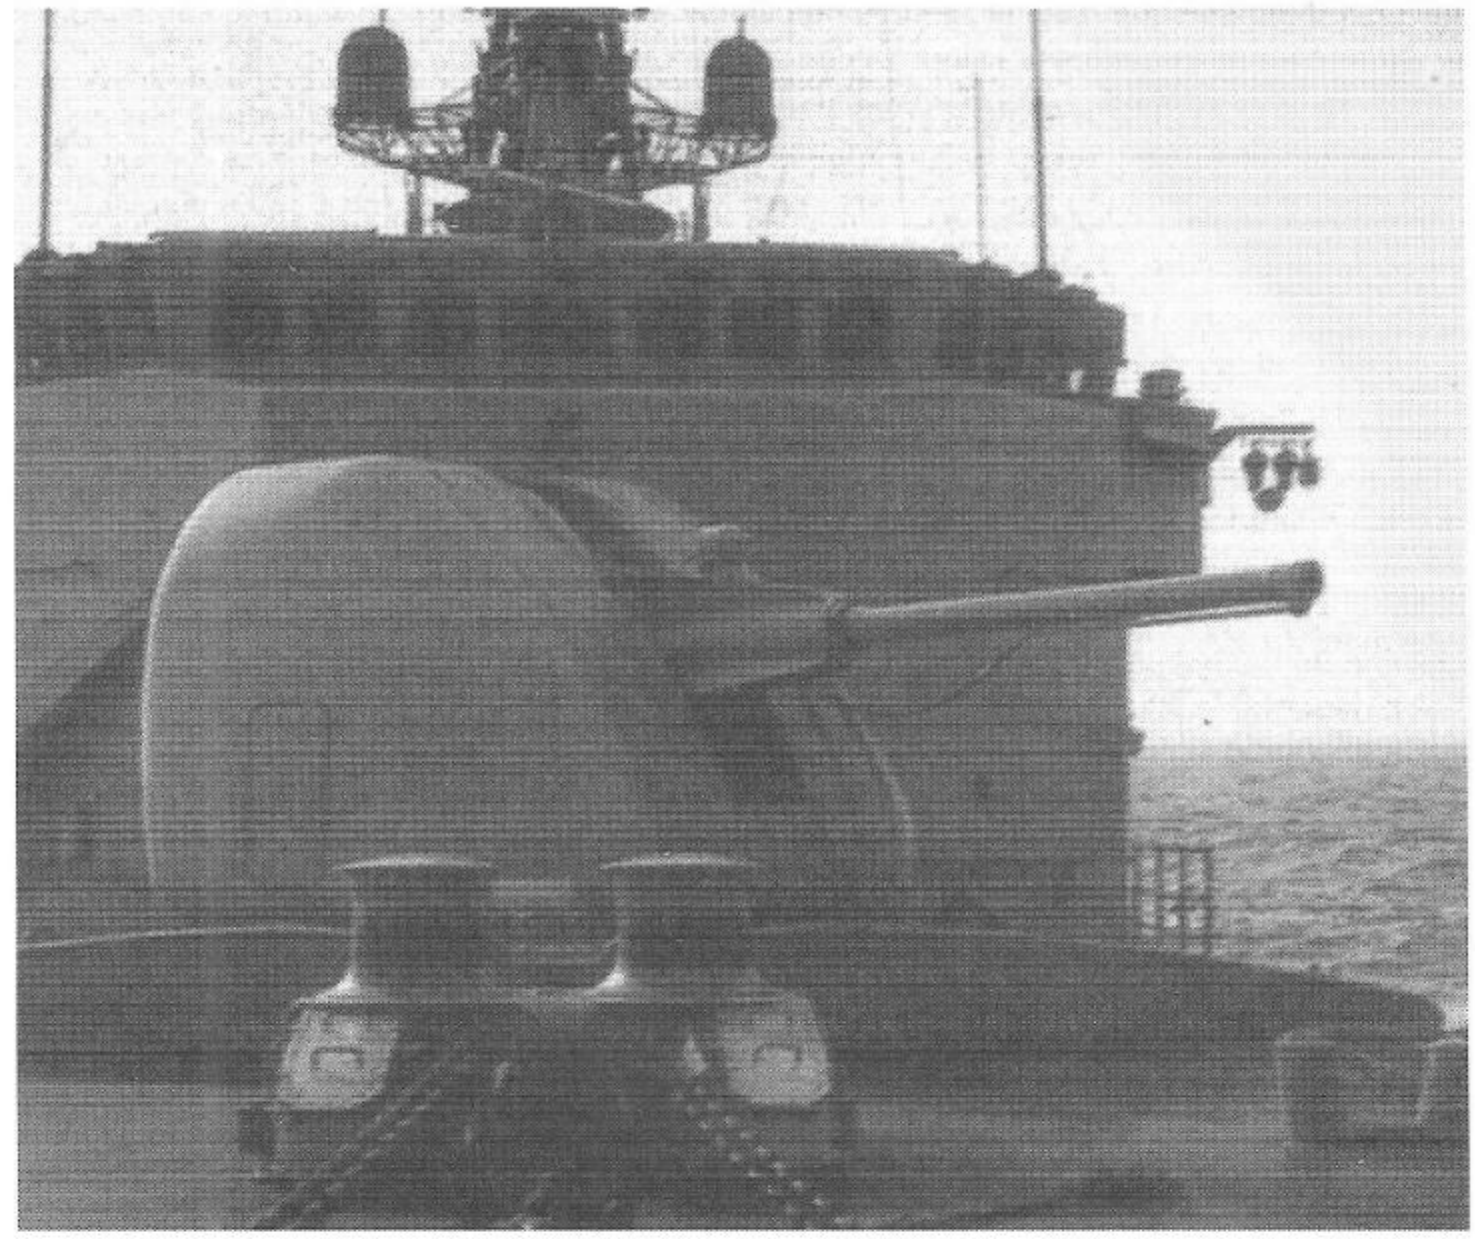
GUNS

Creusot-Loire 100 mm/55 Modèle 1968
There is a single 100 mm/55 Modèle 1968 dual-purpose mounting located on the foredeck ('A' position). This is normally operated in the fully automatic remote mode with an unmanned turret, although there is a fall-back manual mode, which requires two men in the turret. The mounting appears to be the CADAM *(CADence AMéliorée)* standard with improved recoil and feed systems, and a firing rate raised from 60 rds/min to 78 rds/min.

Specifications
Calibre: 100 mm
Length of barrel: 55 calibres
Muzzle velocity: 870 m/s (2,854 ft/s)
Traverse: 360° at 40°/s
Elevation: −15 to +80° at 25°/s
Crew: 2 (optional) and 2 loaders
Range:
anti-surface: 9.15 n miles (17 km)
anti-air: 8,000 m (26,000 ft)
Rate of fire: 78 rds/min
Ammunition: 13.5 kg (29.76 lb) (multipurpose projectile); 9.7 kg (21.4 lb) (charge)

Manufacturers/Contractors
Direction des Constructions Navales (DCN) (prime).
Mécanique Creusot-Loire, Marine Products (mountings).
DCN Ruelle (gun).
CSEE Défense (servo equipment).

37 mm (W-11-M) mountings
This ship has eight 37 mm/62.8 cannon in four twin mountings. The barrels are enclosed in separate water jackets with exposed spring recuperators, and a hydraulic recoil buffer underneath the barrel. The loading mechanism consists of guides for ammunition, which is in five-round clips, the clips being automatically removed on the loading tray. The first round is loaded manually into the breech. The breech block rises and the gun fires when the firing pin strikes the cartridge percussion cap. Upon recoil the breech block opens and extractor arms propel the case along the loading tray and down an ejection chute. The recoil forces activate the loading mechanism and allow following rounds to be rammed automatically into the breech.



The Creusot-Loire 100 mm/56 Compact mounting. Two such guns have been sold to China, but there is no production licence. One of the two is aboard Siping *(544)*

Specifications
W-11-M
Calibre: 37 mm
Length of barrel: 62.8 calibres
Muzzle velocity: 886 m/s (2,906 ft/s)
Traverse: 360° at 17°/s
Elevation: −10 to +85° at 13°/s
Rate of fire: 80 rds/min/barrel
Ammunition (projectile): 0.732 kg (1.61 lb)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 3,000 m (9,842 ft)
Crew: 3

Ammunition (HE-T)
Projectile Weight: 708 g (25 oz)
Explosive charge: 36 g (1.27 oz) (RDX/aluminium)

ANTI-SUBMARINE MORTARS

RBU 1200 5-tubed fixed launchers
There are two RBU 1200 launchers on the foredeck. This mounting is about 1.5 m (4.9 ft) high and has a pyramid-shaped pintle with five rocket launcher tubes; a row of three along the top and one each on either side. The tubes cannot be trained and have a maximum elevation of +65°. Each tube has a diameter of 250 mm (9.8 in), is 1.4 m (4.6 ft) long and is reloaded manually. The 70 kg (154 lb) RGB-12 rocket has a 34 kg (74.95 lb) warhead and a range of about 0.8 n miles. The RBU 1200 is associated with the old short-range HF (25-30 kHz), 'searchlight' attack sonar which was given the NATO codename Stag Ear and has the Soviet designation Tamir.

DEPTH CHARGES

There are two BMB-2 depth-charge projectors and two depth-charge racks.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Jug Pair (Watch Dog)
There are two small domes on the foremast yard-arm. These are designated by NATO as Jug Pair, and appear to be a Chinese-produced version of the Russian Watch Dog radar warning system.

DECOYS

Mk 33 countermeasures system
There are either two Loral Hycor Mk 33 Rapid Bloom Offboard Countermeasures (RBOC) or two Chinese Type 945 26-barrelled launchers. Both launching systems comprise mortar launchers, countermeasures cartridges, and appropriate control and support arrangements.

Specifications (munitions)

	Dimensions (L × D)	Weight
CHAFFSTAR I	412.1 × 112.3 mm	4.15 kg
CHAFFSTAR II	1,067 × 112 mm	18.2 kg
GEMINI	434 × 112 mm	5.2 kg
HIRAM I	416.8 × 112.3 mm	4.1 kg
HIRAM II	889 × 203 mm	13.3 kg
LOROC	1,200 × 112 mm	14.74 kg

Manufacturers/Contractors
Loral Hycor Inc (launcher).
Lundy Electronics & Systems Inc (Mk 171 cartridges).

COMMAND AND CONTROL SYSTEMS

COMMUNICATIONS AND DATALINKS

IFF
High Pole A. Yard Rake or Square Head.

WEAPONS CONTROL

Naja electro-optical/optical director
There is one Naja, which is used as a fire director for the 100 mm gun. Naja is an improved version of the Panda Mk 2 with CILAS TMY 113 high-repetition rate Nd:YAG laser rangefinder, an automatic tracking capability, local or remote control, a three-axis gyro unit and multiple weapon capability. The laser rangefinder operates in the 1.06 µm wavelength, has a peak power of >5 MW and a PRF of 20 pps.

Specifications
Naja
Height: 1.35 m (4.43 ft)
Width: 1.5 m (4.92 ft)
Weight: 480 kg (1,058 lb)
Elevation: −20 to +70°
Max velocity
(traverse): 60°/s
(elevation): 60°/s

Manufacturer/Contractor
CSEE Défense, Paris, France.

Fire director
There is a small fire director for the 100 mm gun on top of a small deckhouse on the bridge roof.

RADARS

Eye Shield
Jianghu II has an Eye Shield antenna at the masthead. Also known as MX 902 and Type 354, Eye Shield is an air/surface search equipment which is reported to operate in the E band. This may be a development of the Russian Slim Net radar.

Square Tie
Square Tie is an I-band, surface search and fire-control radar (also known as Type 352). The antenna is mounted on a small platform on the forward side of the mainmast.

Don 2, Fin Curve
The navigation set is either Don 2 or Fin Curve and is mounted on the mast between Eye Shield and Square Tie.

SONAR

Echo Type 5
One sonar set is fitted to all ships: the hull-mounted, active search and attack, Echo Type 5, operating in the medium-sonar frequency band. One ship has been seen with what may be a VDS or towed array, possibly as a trials installation.

AVIATION

AVIATION FACILITIES

Specifications
Flight deck: 19.3 × 10.8 m (63 × 35 ft)
Landing aid: Alcatel 'Safecopter'

HELICOPTERS

One Harbin Zhi-9A Haitun (Dauphin).

Specifications
Dimensions:
main rotor diameter: 11.94 m (39.17 ft)
Fenestron diameter: 1.10 m (3.61 ft)
length, overall: 13.68 m (44.88 ft)
height: 3.99 m (13.09 ft)
Weights:
empty (standard aircraft): 2,262 kg (4,987 lb)
max take-off: 4,250 kg (9,370 lb)
Radius of action:
anti-shipping mission: 4 missiles, 135 n miles (250 km); 2 missiles, 150 n miles (278 km)
search and rescue: 130 n miles (241 km)
Performance:
never-exceed speed (VNE): 160 kts (296 km/h)
cruising speed at sea level: 148 kts (274 km/h)
max rate of climb (sea level): 420 m (1,380 ft)/min
hovering ceiling (in ground effect): 2,600 m (8,530 ft)
Power plant: 2 Turbomeca Arriel 1M1 turboshafts, each giving 558 kW (749 shp) for take-off and 487 kW (653 shp) continuously
Accommodation: Pilot, co-pilot. The cabin can hold up to 10 passengers

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Type 12E 390V diesels; 10.6 MW (14,400 hp(m)) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

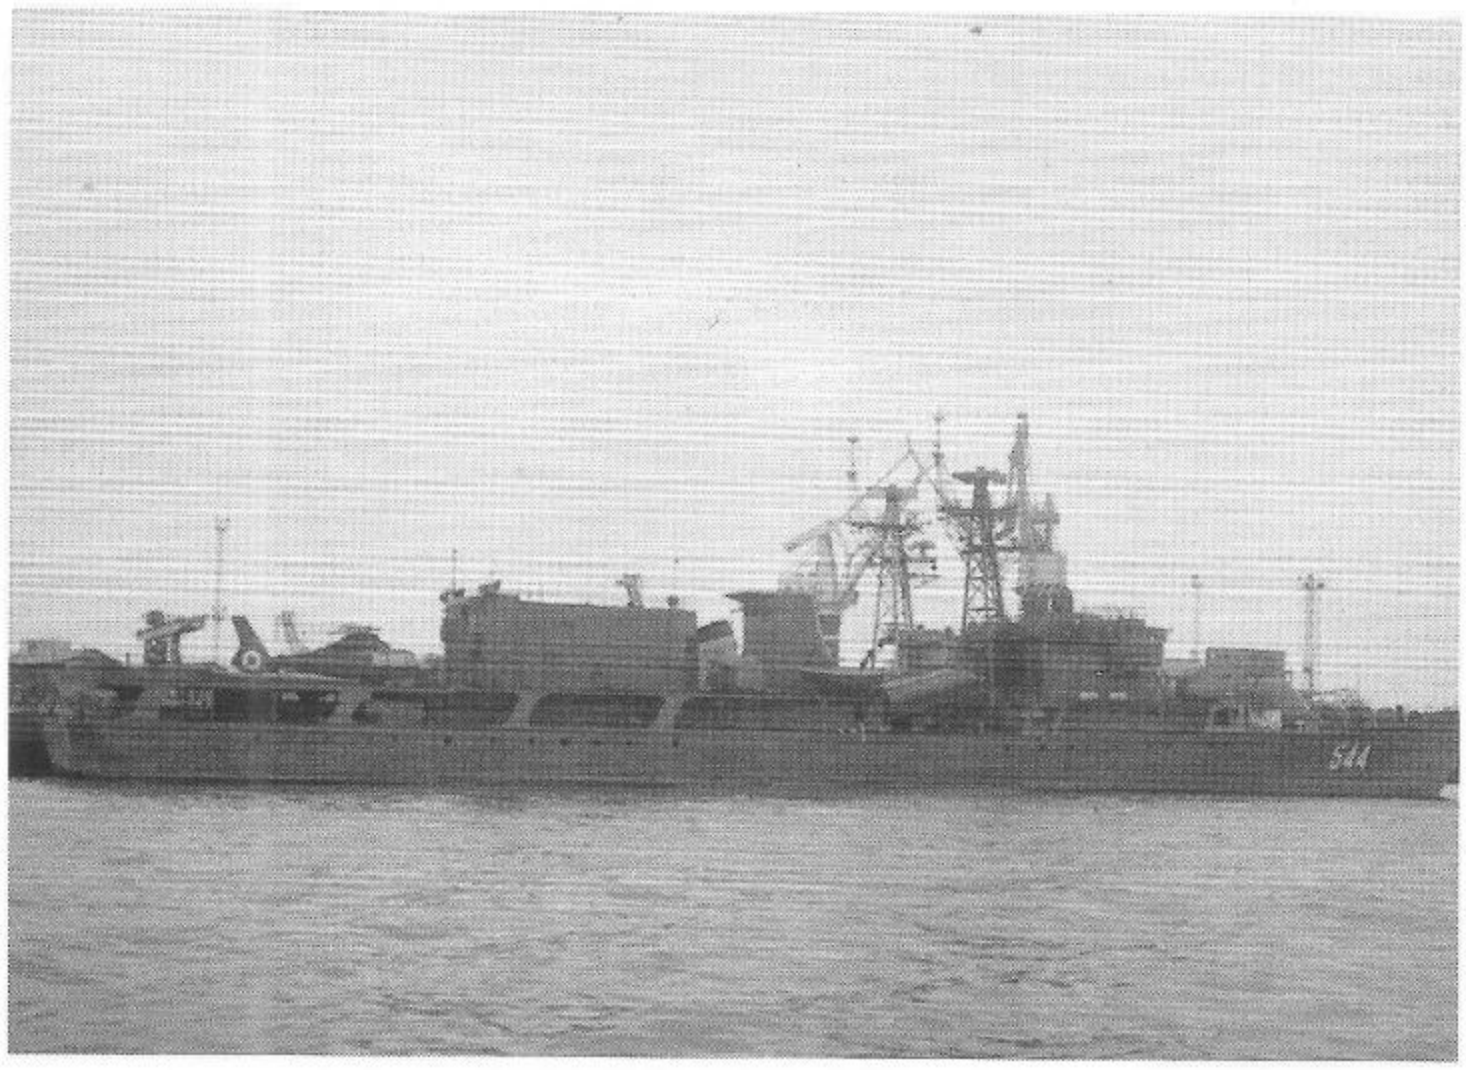
Siping (544) was built in 1984 as a standard Jianghu I and then converted, apparently before being commissioned. It was expected that more of the class would be converted, but it now appears that this was a 'one-off' trials ship for the aviation installation in the Jiangwei frigate design.

DESIGN

The after HY-2 missile launcher, deckhouse and gun found in the Jianghu I frigates have been deleted and replaced by a large hangar and flight deck.

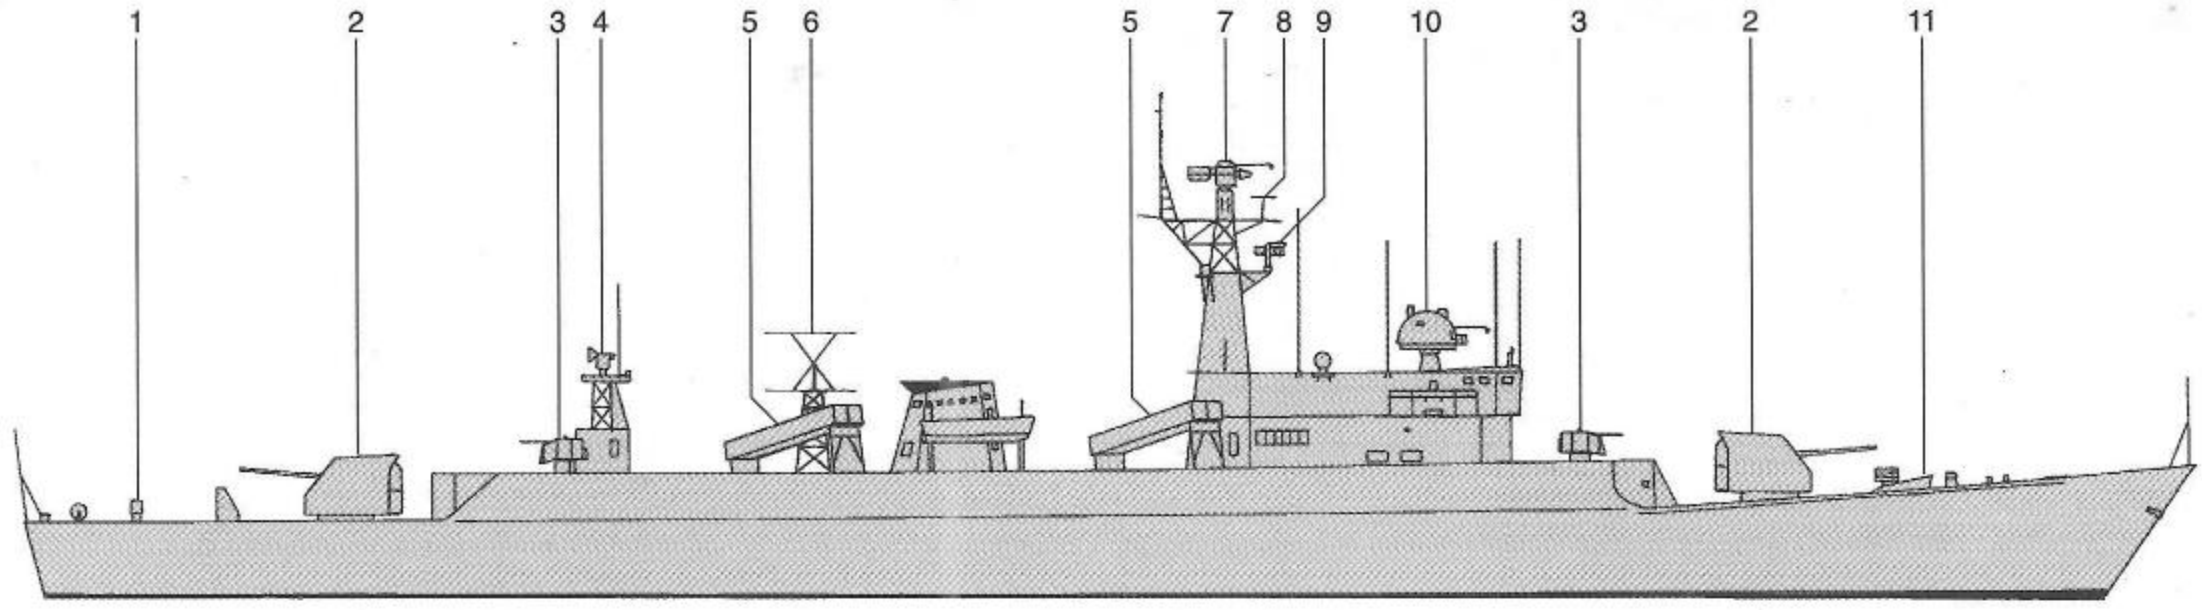
OPERATIONAL

Even though this appears to have been a trials ship, *Siping* (544) is a fully operational unit and is based in the North Sea Fleet.



Siping *(544) remains the only Jianghu II to be built*

JIANGHU III/IV



Zhoushan (Jianghu Type IV) (Ian Sturton)
1 *BMB-2 depth-charge projectors* **2** *Twin 100 mm (3.9 in)/56 guns* **3** *Twin 37 mm/63 anti-aircraft cannon in open mounts* **4** *Rice lamp fire-control director* **5** *Twin YJ-1 (C-801) anti-ship missile launcher* **6** *Knife Rest-type radar array* **7** *Eye Shield air/surface search radar* **8** *Navigation radar* **9** *Square Tie surface search/fire-control radar* **10** *Sun Visor B fire-control director* **11** *RBU-1200 anti-submarine rocket launcher*

Type IV
ZHOUSHAN (537)

WEAPONS SYSTEMS

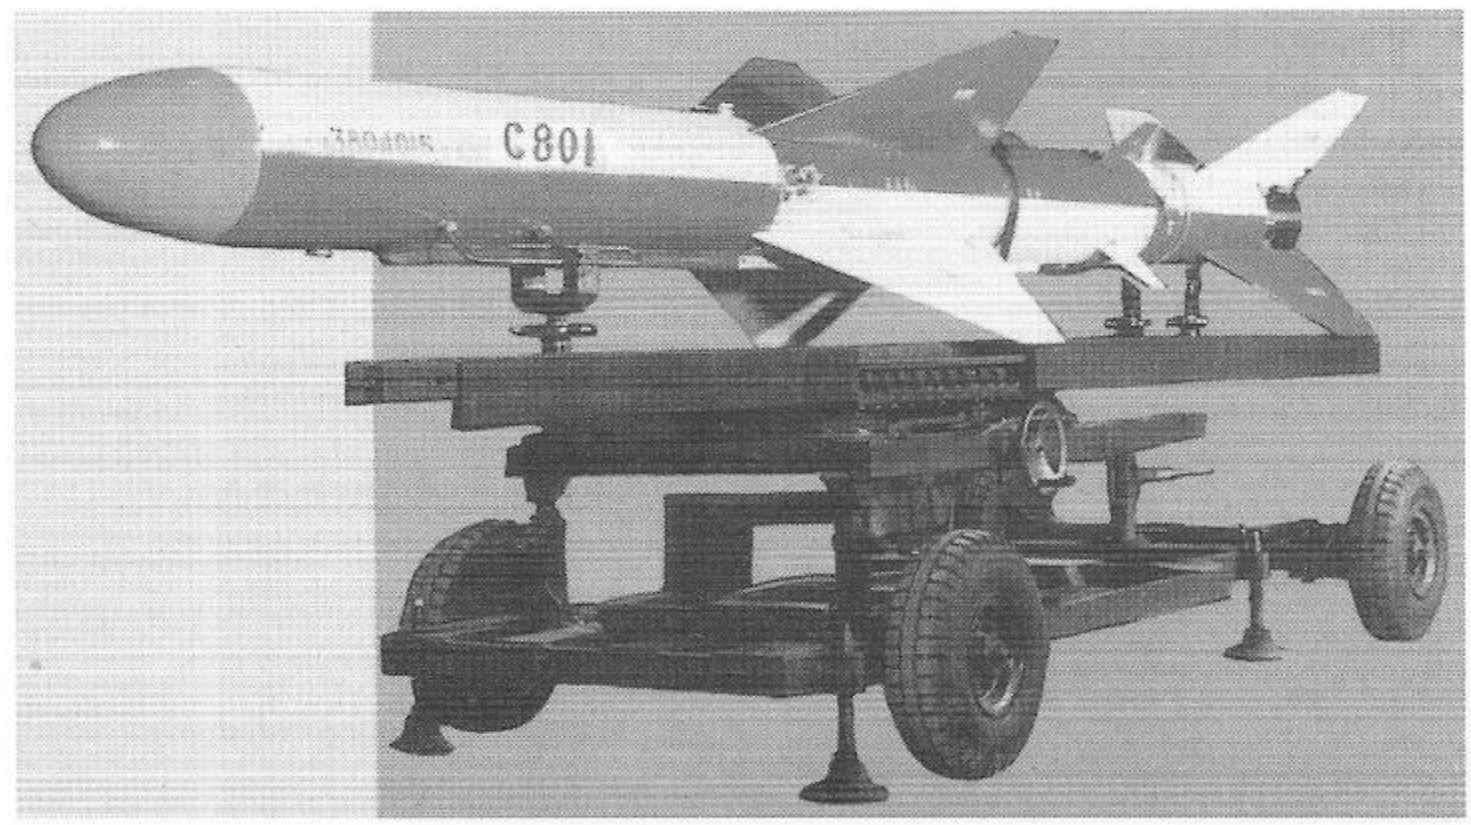
SURFACE-TO-SURFACE MISSILES (SSM)

Ying Ji (Eagle Strike) YJ-1 (C-801) missiles

Jiangu III only. There are eight container-launchers for Ying Ji-1 (YJ-1) (export designation = C-801) SSMs. These container-launchers are mounted in two groups of four, with the forward group located between the stack and the mainmast and the after group abaft the stack. In each group, two container-launchers face to port and two to starboard, pointing forward at an angle of about 30° to the centreline, and with each pair staggered. The YJ-1 is rocket-propelled with a rocket booster, and on launch it climbs to about 50 m (160 ft) then descends to 20-30 m (66-100 ft) until its radar seeker has acquired the target. It then descends to 5-7 m (16-23 ft) using the nose-mounted, monopulse (probably J-band) radar seeker for the terminal approach phase.

Specifications
Length: 5.81 m (19.06 ft)
Diameter: 36 cm (14.17 in)
Wing span: 1.18 m (3.87 ft)
Propulsion: Rocket motor
Weight: 815 kg (1,797 lb)
Range: 8-42 km (4.5-23 n miles)
Speed: Mach 0.9
Guidance: Inertial and active radar
Warhead: 165 kg (363.7 lb) semi-armour-piercing

Manufacturer/Contractor
China Precision Machinery Import and Export Corporation (CPMIEC), Beijing, China.



YJ-1 (C-801) missile on transporter. The missile is 5.81 m (19.06 ft) long (CPMIEC)

YJ-2 (C-802) medium-range anti-ship missile

Jianghu IV only. *Zhoushan* (537) has the same layout for the eight container-launchers as in the Jianghu III, except that in each pair the two container-launchers are close together and side by side, rather than staggered. Also, in the Jianghu IV the missile is the new YJ-2 missile, not the earlier YJ-1. The YJ-2 has the Chinese export designation C-802 and is known to NATO as CSSC-X-8 Saccade. The missile is generally similar to the YJ-1 but is powered by a turbojet with paraffin-based fuel to give a considerable increase in range. To accommodate the new power-plant the fuselage has been extended forward of the wing leading edge with the fuel tank behind the instrument compartment, and an air intake is fitted between the wings on the underside. The wings are slightly modified and now fold, while the launch rail fittings are on the sides, all of which result in a very much slimmer container-launcher. Few details are available about performance but it is reported that it is similar to that of the C-801 but with a lower terminal phase. On launch the missile climbs to about 50 m (160 ft) then descends to 20-30 m (66-100 ft) until the radar seeker has acquired the target. It then descends to wave-top height for the terminal approach phase using the nose-mounted, monopulse (probably J-band), radar seeker.

Specifications
YJ-2 (C-802)
Length: 6.39 m (20.96 ft)
Diameter: 36 cm (14.17 in)
Wing span: 1.18 m (3.87 ft)
Propulsion: Turbojet
Weight: 715 kg (1,576 lb)
Range: 15-120 km (14.5-65 n miles)
Speed: Mach 0.9
Guidance: Inertial and active radar

Manufacturer/Contractor
China Precision Machinery Import and Export Corporation (CPMIEC).

GUNS

100 mm L/56 medium-calibre dual-purpose gun

All Type III and IV ships have two twin-gun turrets. The Chinese 100 mm L/56 is developed from the Soviet B34 100 mm gun, examples of which were supplied in the 1950s. The air-cooled B34 barrel is 5.6 m (18.4 ft) long and of monobloc construction with a horizontal sliding breech block and fits into a sleeve. The recoil cylinder is housed under the gun which fires a 15.6 kg (34.4 lb) shell (6.31 kg (14 lb) projectile) and features a pneumatic rammer. The two barrels share a common cradle, with the trunnions set far back from the front of the turret to achieve high angles of fire. Spent rounds are ejected forward with the chutes running parallel to, but below, the guns. The turret is manned with a crew of five. Within the turret the gun captain occupies a position in front of, and on the left of, the trunnions. It is mounted on a pedestal and originally had an E-band ranging radar, with the NATO codename 'Egg Cup B', on the right at the front.

Specifications

L/56 twin
Length of barrel: 56 calibres
Muzzle velocity: 900 m/s (2,953 ft/s)
Traverse: 360°
Elevation: −15 to +85°
Weight of projectile: 6.31 kg (13.9 lb)
Rate of fire: 18 rds/min
Range:
anti-surface: 12 n miles (22 km)
anti-air: 15,000 m (49,000 ft)

37 mm (W-11-M) mountings

Both Type III and Type IV have four twin 37 mm/62.8 mountings. The barrels are enclosed in separate water jackets with exposed spring recuperators, and a hydraulic recoil buffer underneath the barrel. The loading mechanism consists of guides for ammunition, which is in five-round clips, the clips being automatically removed on the loading tray. The first round is loaded manually into the breech. The breech block rises and the gun fires when the firing pin strikes the cartridge percussion cap. Upon recoil the breech block opens and extractor arms propel the case along the loading tray and down an ejection chute. The recoil forces activate the loading mechanism and allow following rounds to be rammed automatically into the breech.

Specifications

W-11-M
Calibre: 37 mm
Length of barrel: 62.8 calibres
Muzzle velocity: 860 m/s (2,821 ft/s)
Traverse: 360° at 17°/s
Elevation: −10 to +85° at 13°/s
Rate of fire: 80 rds/min/barrel
Ammunition (projectile): 0.732 kg (1.61 lb)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 3,000 m (9,842 ft)
Crew: 3

Ammunition (HE-T)
Projectile Weight: 708 g (25 oz)
Explosive charge: 36 g (1.27 oz) (RDX/aluminium)

YJ-2 (C-802) anti-ship missile leaves a land-based launcher (CPMIEC)

ANTI-SUBMARINE MORTARS

RBU 1200 5-tubed fixed launchers

Both Type III and Type IV ships have two RBU 1200 launchers. This mounting is about 1.5 m (4.9 ft) high and has a pyramid-shaped pintle with five rocket launcher tubes; a row of three along the top and one each on either side. The tubes cannot be trained and have a maximum elevation of +65°. Each tube has a diameter of 250 mm (9.8 in), is 1.4 m (4.6 ft) long and is reloaded manually. The 70 kg (154 lb) RGB-12 rocket has a 34 kg (74.95 lb) warhead and a range of about 0.8 n miles. The RBU 1200 is associated with the old short-range HF (25-30 kHz), 'searchlight' attack sonar which was given the NATO codename Stag Ear and has the Soviet designation Tamir.

DEPTH CHARGES

There are two BMB-2 depth-charge projectors and two depth-charge racks.

MINES

These ships can carry up to 60 mines.

Wu Hu *(536), a Jianghu III. The neat layout of the launchers for the YJ-1 (C-801) missile is in marked contrast to the large, bulky — and heavy — launchers for the earlier HY-2 (C-201) missiles*

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Newton-Beta EW suite

All three ships are fitted with an Elettronica Newton-Beta system consisting of an ESM section and an ECM section, with the related antennas, controlled from an operator console. The ESM section provides 100 per cent intercept probability, passive surveillance, automatic instantaneous warning of programmed threat, automatic analysis of threat parameters, automatic identification and tracking of threats, a synthetic data display, instantaneous DF, and broad frequency coverage. The ECM section provides self-protection by noise jamming using an Elettronica jammer.

Manufacturer/Contractor

Elettronica SpA, Rome, Italy.

DECOYS

Type 945 26-barrelled chaff launchers

There are two Chinese-designed and manufactured Type 945 26-barrelled chaff launchers. Their specifications are not known.

COMMAND AND CONTROL SYSTEMS

COMMUNICATIONS AND DATALINKS

IFF

High Pole A. Square Head

WEAPONS CONTROL

Round Top

There is a large hemispherical fire-control director, similar to the Russian Round Top with a Sun Visor antenna, as found in some of the Jianghu Is.

RADARS

Eye Shield

Jianghu III/IV ships have an Eye Shield antenna at the masthead. Also known as MX 902 and Type 354, Eye Shield is an air/surface search equipment which is reported to operate in the E band. This may be a development of the Russian Slim Net radar.

Square Tie

Square Tie is an I-band, surface search and fire-control radar (also known as Type 352). The antenna is mounted on a small platform on the forward side of the mainmast.

Fin Curve

The navigation set is the Chinese Fin Curve.

Rice Lamp

The Rice Lamp fire-control director, operating in the I/J band, is located aft at the head of a small tower.

Sun Visor B

Sun Visor B is an I-band, fire-control radar installed on the Round Top director.

Knife Rest

***Zhoushan* (537) only.** *Zhoushan* has a large open work antenna mounted either on a small tower on the forward edge of the stack or at the head of a similar tower on the after deckhouse. The Chinese Navy array has two side by side Yagi antennas and appears to be similar to the Knife Rest found on 1950s-vintage Soviet Navy ships. The (then) Soviet Army used Knife Rest B, which operated over the 79-93 MHz band, with a peak power of 100 kW and has an effective range of 185-280 km.

SONAR

Echo Type 5

One sonar set is fitted to all ships: the hull-mounted, active search and attack, Echo Type 5, operating in the medium sonar frequency band.

PROPULSION

Specifications

System: Diesel
Main machinery: 2 Type 18E 390V diesels; 17.6 MW sustained
Auxiliary engines: 4—400 kW; 1—120 kW
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These ships were hulls number 27, 28 and 30 in the Jianghu construction programme and are referred to by the PLA-N as New Missile Frigates. *Huangshi* (535) was commissioned on 14 December 1986 and *Zhoushan* (537), currently the only Jianghu IV, was completed in early 1993. A fourth of the class may be building, but this cannot be confirmed.

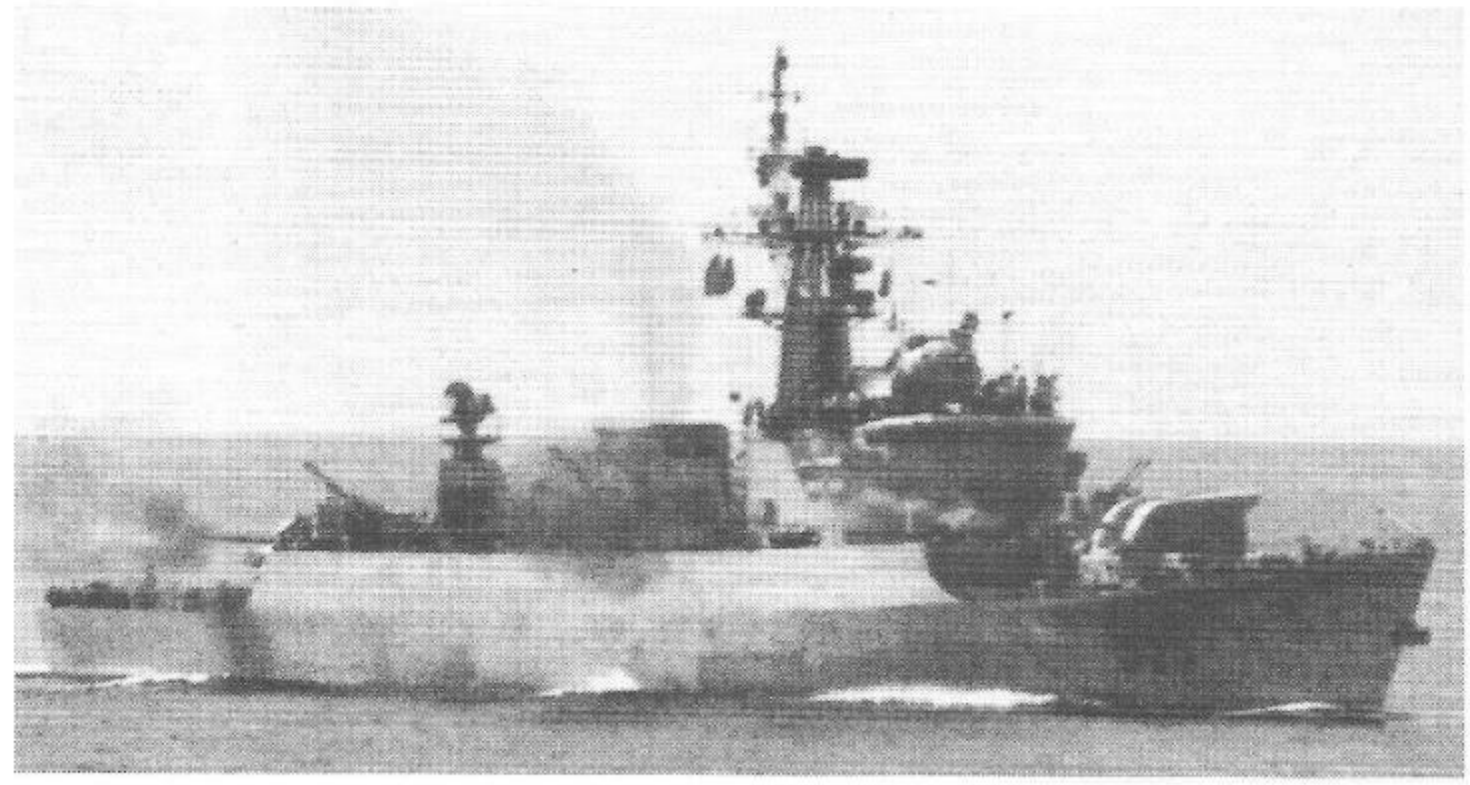
DESIGN

Hull dimensions are identical with Jianghu I and II but the centre section of the main deck is raised by one deck level for about two-thirds of the ship's length. This has enabled the entire working part of the ship to be enclosed and air conditioned for the first time in a Chinese warship.

The lower half of the mast is plated over, but, somewhat surprisingly, the bulwarks fitted in earlier ships are not to be found in these three ships.

MODERNISATION

It has been reported that a CIWS mounting designated PL-8H may be fitted in place of some of the twin 37 mm guns. The same reports indicate that this weapon is a combined 37 mm and SAM system, with the missiles using IR homing.



Huangshi *(535) on a firepower demonstration* (Chien Chung)

OPERATIONAL

All four units are based in the East Sea Fleet.

EXPORTS

Four modified Type III were delivered to Thailand in 1991/92.

Two versions are on general offer for export. Version 1 is virtually identical to that delivered to Thailand. Version 2 is powered by four MTU 20V1163B TB 83 diesels and has a helicopter landing deck, but not a hangar.

OSMAN (JIANGHU I)

Laid down	—		

WEAPONS SYSTEMS

HY-2 (NATO = CSSC-3 'Seersucker') medium-range anti-ship missile

The Bangladeshi ship is fitted with four HY-2 (Hai Ying = Sea Eagle) (export designation = C-201) anti-ship missiles, mounted in two twin launchers, which must be trained to either beam to fire, but are fixed in elevation. The HY-2 missile was developed from the HY-1, which, in its turn, was developed from the Soviet SS-N-2 Styx. The firing sequence is operated from a dedicated console with its own analogue computer and ripple launches are possible. Once the target is confirmed as hostile the operator manually sets a range gate around it and feeds in location, speed and ballistic data. The computer then feeds the firing solution to the missile autopilot. After launch the HY-2 climbs to its cruise altitude of 30 m (100 ft), which it maintains until entering the terminal phase when it descends to about 8 m (26 ft).

Specifications

Length: 7.36 m (21.15 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.87 m)
Launch weight: 2,500 kg (5,511 lb)
Speed: Mach 0.9
Warhead: 454 kg (1,000 lb) hollow charge
Range: 51 n miles (95 km)
Guidance: Autopilot and active radar, with an alternative IR seeker instead of radar

Manufacturer/Contractor

China Precision Machinery Import and Export Corporation (CPMIEC), Beijing, China.

GUNS

100 mm L/56 medium-calibre dual-purpose gun

Osman has the same fit as PLA-N ships, with two twin Chinese 100 mm L/56. The air-cooled B34 barrel is 5.6 m (18.4 ft) long and of monobloc construction with a horizontal sliding breech block and fits into a sleeve. The recoil cylinder is housed under the gun which fires a 15.6 kg (34.4 lb) shell (6.31 kg (14 lb) projectile) and features a pneumatic rammer.

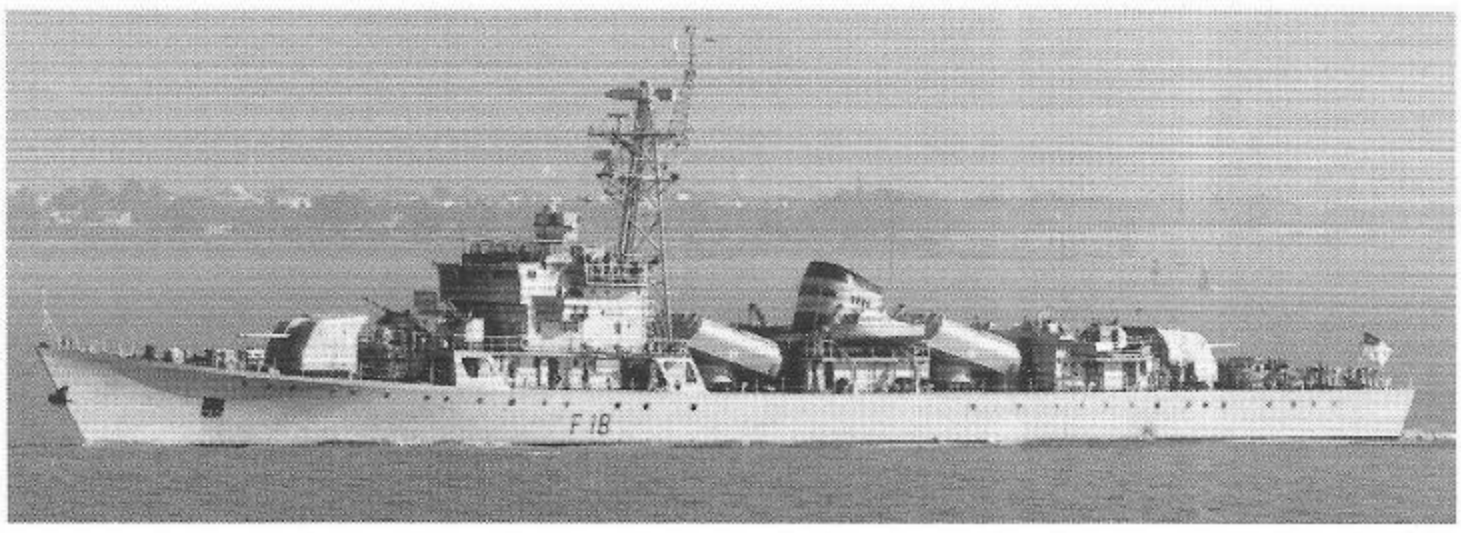
In the twin mounting the two barrels share a common cradle, with the trunnions set far back from the front of the turret to achieve high angles of fire. Spent rounds are ejected forward with the chutes running parallel to, but below, the guns. The turret is manned with a crew of five. Within the turret the gun captain occupies a position in front of, and on the left of, the trunnions. The turret weighs about 15 tonnes and is 6 m (10 ft) high, 7 m (23 ft) long and 5 m (16.4 ft) wide.

Specifications

L/56 twin
Length of barrel: 56 calibres
Muzzle velocity: 900 m/s (2,952 ft)
Traverse: 360°
Elevation: −15 to +85°
Weight of projectile: 6.31 kg (13.9 lb)
Rate of fire: 18 rds/min
Range:
anti-surface: 12 n miles (22 km)
anti-air: 15,000 m (49,000 ft)

37 mm (W-11-M) mountings

Osman has four twin 37 mm/62.8 mountings. The barrels are enclosed in separate water jackets with exposed spring recuperators, and a hydraulic recoil buffer underneath the barrel. The loading mechanism consists of guides for ammunition, which is in five-round clips, the clips being automatically removed on the loading tray. The first round is loaded manually into the breech. The breech block rises and the gun fires when the firing pin strikes the cartridge percussion cap. Upon recoil the breech block opens and extractor arms propel the case along the loading tray and down an ejection chute. The recoil forces activate the loading mechanism and allow following rounds to be rammed automatically into the breech.



Osman *is a Jianghu I Version 4 ship. Unlike the Egyption Jianghu Is, this ship has twin 100 mm guns in gunhouses, rather than 57 mm guns in open mounts*

Specifications
W-11-M
Calibre: 37 mm
Length of barrel: 62.8 calibres
Muzzle velocity: 860 m/s (2,821 ft/s)
Traverse: 360° at 17°/s
Elevation: −10° at 13°/s
Rate of fire: 80 rds/min/barrel
Ammunition (projectile): 0.732 kg (1.61 lb)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 3,000 m (9,842 ft)
Crew: 3

Ammunition (HE-T)
Projectile Weight: 708 g (25 oz)
Explosive charge: 36 g (RDX/aluminium) (1.27 oz)

ANTI-SUBMARINE MORTARS

RBU 1200 5-tubed fixed launchers
Some ships have two RBU 1200 launchers, others four. This mounting is about 1.5 m (4.9 ft) high and has a pyramid-shaped pintle with five rocket launcher tubes; a row of three along the top and one each on either side. The tubes cannot be trained and have a maximum elevation of +65°. Each tube has a diameter of 250 mm (9.8 in), is 1.4 m (4.6 ft) long and is reloaded manually. The 70 kg (154 lb) RGB-12 rocket has a 34 kg (74.95 lb) warhead and a range of about 0.8 n miles. The RBU 1200 is associated with the old short-range HF (25-30 kHz), 'searchlight' attack sonar which was given the NATO codename Stag Ear and has the Soviet designation Tamir.

DEPTH CHARGES

There are two BMB-2 depth-charge projectors and two depth-charge racks.

MINES

These ships can carry up to 60 mines.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Jug Pair (Watch Dog)
There are two small domes on the foremast yard-arm. These are designated by NATO as Jug Pair, and appear to be a Chinese-produced version of the Russian Watch Dog radar warning system.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher
There are two Mk 36 SRBOC (Super Rapid Bloom Off-board Countermeasures) units.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)

Rounds
Diameter: 130 mm (5.1 in)
Length, weight:
Mk 182: 1,209 mm; 22.7 kg
Super Chaffstar: 1,209 mm; 20.9 kg
Super Gemini: 451 mm; 5.5 kg
Super Hiram III: 1,220 mm; 13.6 kg
Super Hiram IV: 467 mm; 3.8 kg
Super Loroc: 734 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

COMMAND AND CONTROL SYSTEMS

COMMUNICATIONS AND DATALINKS

IFF
High Pole A. Yard Rake or Square Head.

WEAPONS CONTROL

Wok Won
The fire director on the bridge roof is designated Wok Won.

RADARS

Eye Shield
Jianghu III/IV ships have an Eye Shield antenna at the masthead. Also known as MX 902 and Type 354, Eye Shield is an air/surface search equipment which is reported to operate in the E band. This may be a development of the Russian Slim Net radar.

Square Tie
Square Tie is an I-band, surface search and fire-control radar (also known as Type 352). The antenna is mounted on a small platform on the forward side of the mainmast.

Fin Curve
The navigation set is the Chinese Fin Curve.

SONAR

Echo Type 5
One sonar set is fitted to all ships: the hull-mounted, active search and attack, Echo Type 5, operating in the medium sonar frequency band.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Type 12 E 390V diesels; 10.6 MW (14,400 hp(m)) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

Osman was transferred from the PLAN to the Bangladeshi Navy on 26 September 1989 and arrived in Bangladesh waters on 8 October 1989. It was expected that a second ship would transfer in 1991, but this did not take place and whether it was postponed or cancelled has not been established.

DESIGN

This is a Jianghu Type I (version 4) hull with twin 100 mm guns, a Wok Won director and a rounded stack. It is noteworthy that this ship has the same twin 100 mm guns as the ships in the PLA-N and not the 57 mm guns in open mounts that are in the ships sold to Egypt.

OPERATIONAL

Osman was in collision with a merchant ship in August 1991. Damage was extensive and included one 37 mm mounting uprooted, and several SSM and RBU mountings misaligned. The ship was repaired in 1992/93 and has returned to service.

GUNS

Type 76 57 mm L/70

There are two twin Type 76 57 mm/70 calibre mounts: one in 'A' position on the foredeck, the other in 'Y' position aft. The Chinese Type 76 is a twin barrelled, water-cooled weapon in an open 'bucket' gun mount. It is reported to have an ammunition hoist, feeding and ramming system. Tracking, laying and engagement are either automatic or semi-automatic with manual back-up. The Fog Lamp fire-control device is mounted on the bridge roof.

Specifications
Type 76
Calibre: 57 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Traverse: 360°
Elevation: −5 to +85°
Traverse speed: 25°/s
Elevation speed: 40°/s
Crew: 5

Range:
anti-surface: 4.52 n miles (8.4 km)
anti-air: 4,500 m (15,000 ft)
Rate of fire: 120 rds/min/barrel
Ammunition: 2.81 kg (6.2 lb)

Manufacturer/Contractor
Norinco, Beijing, China.

37 mm (W-11-M) mountings

There are twelve 37 mm/62.8 cannon in six twin mountings. The barrels are enclosed in separate water jackets with exposed spring recuperators, and a hydraulic recoil buffer underneath the barrel. The loading mechanism consists of guides for ammunition, which is in five-round clips, the clips being automatically removed on the loading tray. The first round is loaded manually into the breech. The breech block rises and the gun fires when the firing pin strikes the cartridge percussion cap. Upon recoil, the breech block opens and extractor arms propel the case along the loading tray and down an ejection chute. The recoil forces activate the loading mechanism and allow following rounds to be rammed automatically into the breech.

Specifications
W-11-M
Calibre: 37 mm

El Nasser *(956) in 1994. Note the open mounts for both 37 mm and 57 mm guns* (Camil Busquets i Vilanova)

Length of barrel: 62.8 calibres
Muzzle velocity: 886 m/s (2,906 ft/s)
Traverse: 360° at 17°/s
Elevation: −10 to +85° at 13°/s
Rate of fire: 80 rds/min/barrel
Ammunition (projectile): 0.732 kg (1.61 lb)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 3,000 m (9,840 ft)
Crew: 3

Ammunition (HE-T)
Projectile weight: 708 g
Explosive charge: 36 g (RDX/aluminium)

ANTI-SUBMARINE MORTARS

RBU 1200 5-tubed fixed launchers

There are two RBU 1200 launchers on the foredeck. This mounting is about 1.5 m (4.9 ft) high and has a pyramid-shaped pintle with five rocket launcher tubes; a row of three along the top and one each on either side. The tubes cannot be trained and have a maximum elevation of +65°. Each tube has a diameter of 250 mm, is 1.4 m (4.6 ft) long and is reloaded manually. The 70 kg (154 lb) RGB-12 rocket has a 34 kg (81.6 lb) warhead and a range of about 0.8 n miles. The RBU 1200 is associated with the old short-range HF (25-30 kHz), 'searchlight' attack sonar which was given the NATO codename Stag Ear and has the Soviet designation Tamir.

DEPTH CHARGES

There are two BMB-2 depth-charge projectors and two depth-charge racks.

MINES

These ships can carry up to 60 mines.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Newton-Beta EW suite

An Elettronica EW suite was fitted after these two ships arrived in Egypt. The Newton-Beta system consists of an ESM section and an ECM section, with the related antennas, controlled from an operator console. The ESM section (ELT/211 receiver) provides 100 per cent intercept probability, passive surveillance, automatic instantaneous warning of programmed threat, automatic analysis of threat parameters, automatic identification and tracking of threats, a synthetic data display, instantaneous DF, and broad frequency coverage. The ECM section provides self-protection by noise jamming using the ELT/318 jammer.

Manufacturer/Contractor
Elettronica SpA, Rome, Italy.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

There is an optical fire-control director on the bridge roof.

RADARS

Eye Shield

Both frigates have an Eye Shield antenna at the masthead. Also known as MX 902 and Type 354, Eye Shield is an air/surface search equipment which is reported to operate in the E band. This may be a development of the Russian Slim Net radar.

Square Tie

Square Tie is an I-band, surface search and fire-control radar (also known as Type 352). The antenna is mounted on a small platform on the forward side of the mainmast.

Racal-Decca RM 1290A

There are two RM 1290A I-band navigation radar antennas: one is on the yard-arm, the other on the after deckhouse.

SONAR

Echo Type 5

One sonar set is fitted to all ships: the hull-mounted, active search and attack, Echo Type 5, operating in the medium-sonar frequency band.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Type 12 E 390V diesels; 10.6 MW (14,400 hp(m)) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

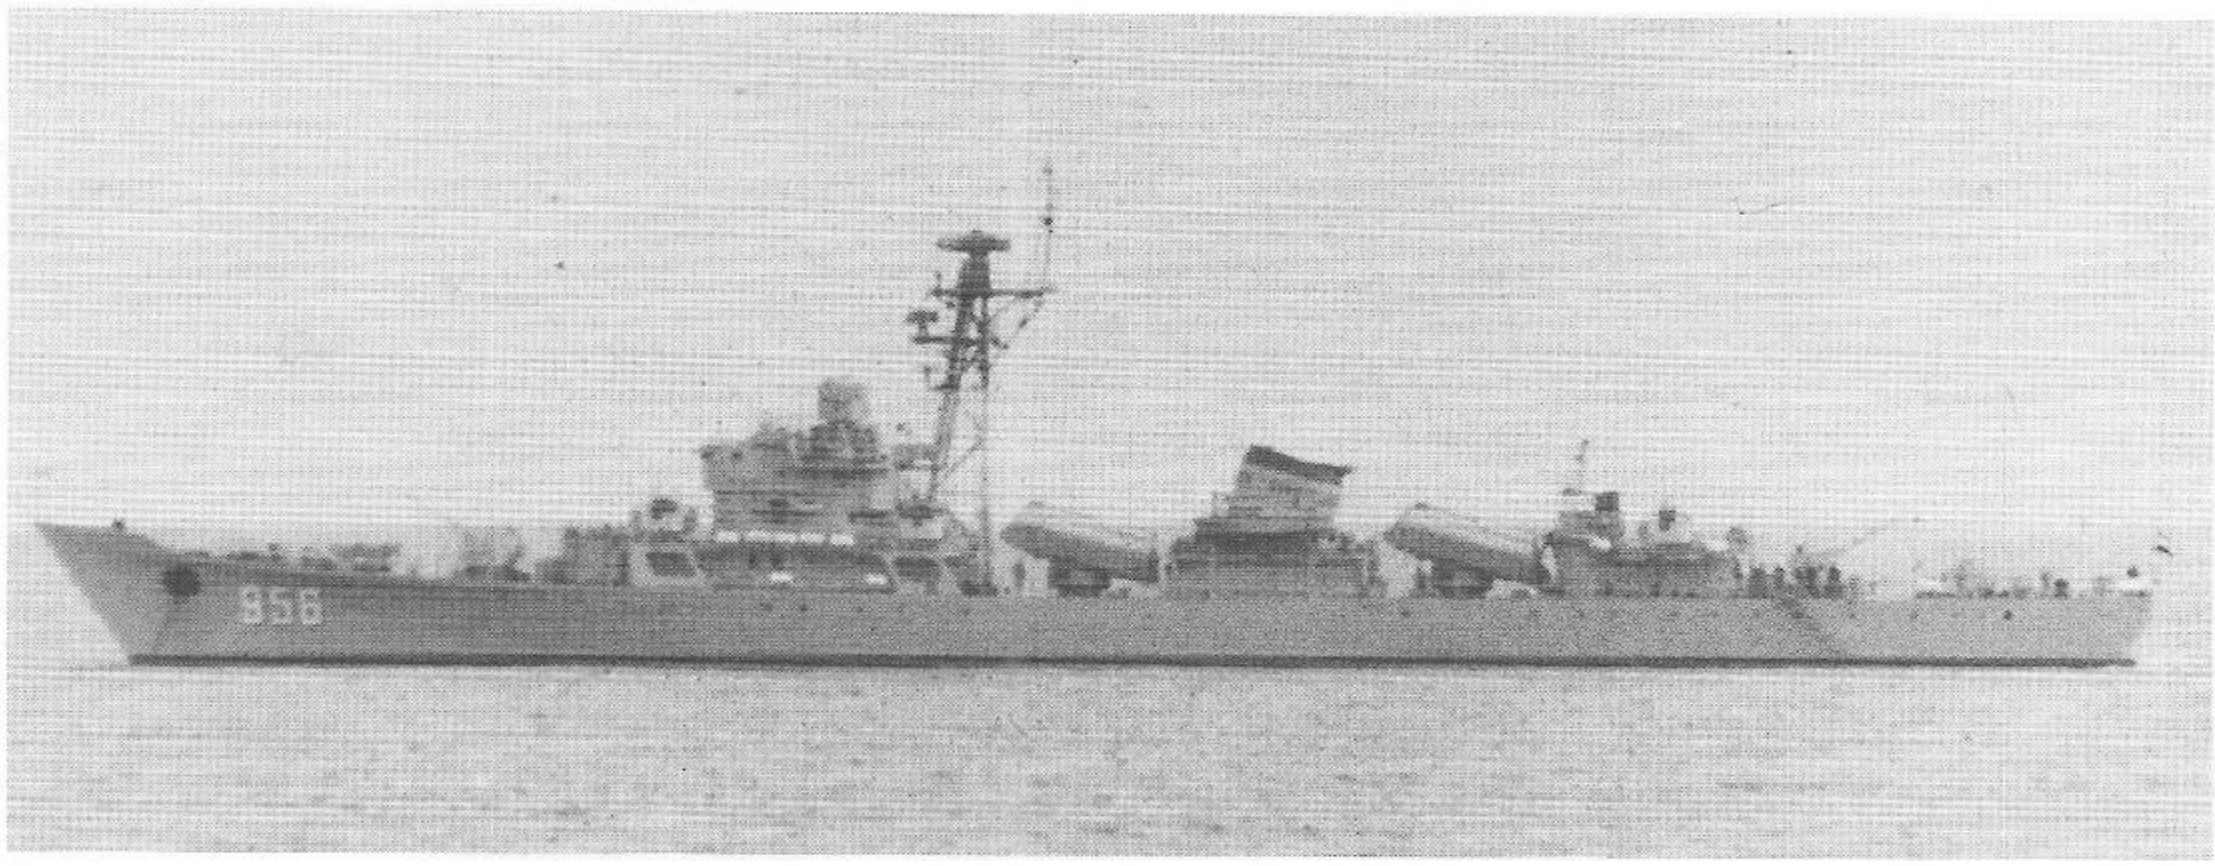
These two ships were ordered from China in 1982 and were taken from the PLA-N's production line; they were the 17th and 18th in the series. Following modifications, they were delivered in 1984/85.

DESIGN

The 'Najim al Zaffer' class is basically a Jianghu I frigate design, but with some major modifications. Instead of the 100 mm guns in the Chinese originals, the Egyptian ships are fitted with two twin 57 mm mounts, which, in addition to being a somewhat elderly design and very light for this size of ship, have no gun housing or radar control. Operating under local control and in the open, their efficiency, especially at night or in bad weather must be impaired. The funnel is the rounded version of the 'Jianghu' class and the short-type bulwarks are fitted.

MODERNISATION

The Egyptian Navy has wanted to modernise these ships for some years, but has been frustrated by a lack of money. Funds are now believed to be available and a combat data system is to be fitted, together with CSEE Naja electro-optic fire-control directors. There are also plans, confirmed in October 1994, to remove the after superstructure and guns and build a flight deck for an SH-2G Seasprite helicopter.



El Nasser *(956). The Egyptian Navy has been seeking to modernise these ships for some years, but has been frustrated by lack of funds* (Jane's/H M Steele)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Ying Ji (Eagle Strike) YJ-1 (C-801) missiles

There are eight container-launchers for Ying Ji-1 (YJ-1) (export designation = C-801) SSMs. The mountings differ from those in the PLA-N's Jianghu IIIs in that they point outwards at 90° to the centreline, as opposed to some 30° in the Chinese ships. The YJ-1 is rocket-propelled with a rocket booster, and on launch it climbs to about 50 m (160 ft) then descends to 20-30 m (66-100 ft) until its radar seeker has acquired the target. It then descends to 5-7 m (16-23 ft) using the nose-mounted, monopulse (probably J-band) radar seeker for the terminal approach phase.

Specifications

Length: 5.81 m (19.06 ft)
Diameter: 36 cm (14.17 in)
Wing span: 1.18 m (3.87 ft)
Propulsion: Rocket motor
Weight: 815 kg (1,797 lb)
Range: 4.5-45.9 n miles (8-85 km)
Speed: Mach 0.9
Guidance: Inertial and active radar
Warhead: 165 kg (363.7 lb) semi-armour-piercing

Manufacturer/Contractor

China Precision Machinery Import and Export Corporation (CPMIEC), Beijing, China.

GUNS

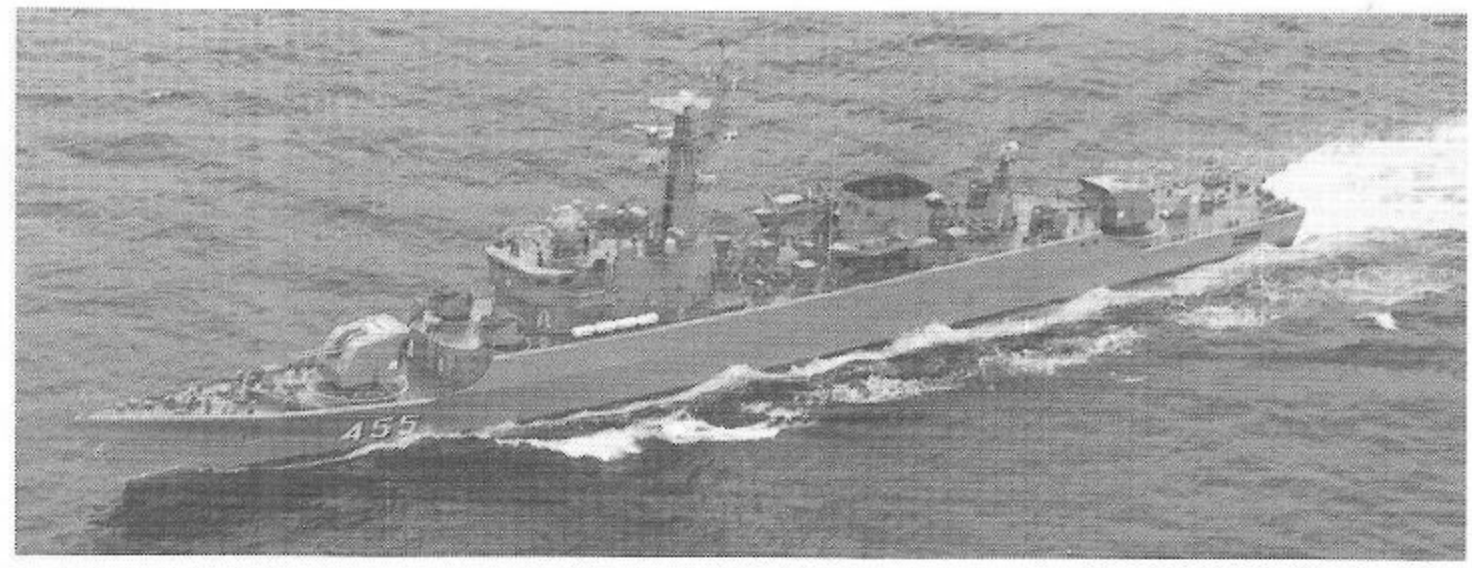
100 mm L/56 medium-calibre dual-purpose gun

455, 456 — two twin 100 mm L/56; 457, 458 — one twin 100 mm L/56. Two of the Thai ships have two twin turrets, one in 'A' position, the other in 'Y' position. The other two ships have a single turret in 'A' position. The air-cooled B34 barrel is 5.6 m (18.4 ft) long and of monobloc construction with a horizontal sliding breech block and fits into a sleeve. The recoil cylinder is housed under the gun which fires a 15.6 kg (34.4 lb) shell (6.31 kg (14 lb) projectile) and features a pneumatic rammer. The two barrels share a common cradle, with the trunnions set far back from the front of the turret to achieve high angles of fire. Spent rounds are ejected forward with the chutes running parallel to, but below, the guns. The turret is automatic.

Specifications
L/56 twin
Length of barrel: 56 calibres
Muzzle velocity: 900 m/s (2,953 ft/s)
Traverse: 360°
Elevation: −15 to + 85°
Weight of projectile: 6.31 kg (13.9 lb)
Rate of fire: 18 rds/min
Range:
anti-surface: 12 n miles (22 km)
anti-air: 15,000 m (49,000 ft)

37 mm (W-11-M) mountings

There are four twin 37 mm/62.8 cannon in open mountings. The barrels are enclosed in separate water jackets with exposed spring recuperators, and a hydraulic recoil buffer underneath the barrel. The loading mechanism consists of guides for ammunition, which is in five-round clips, the clips being automatically removed on the loading tray. The first round is loaded manually into the breech. The breech block rises and the gun fires when the firing pin strikes the cartridge percussion cap.



Chao Phraya *(455), one of four 'Jianghu' class frigates purchased by Thailand. The YJ-1 (C-801) missiles normally sited abaft the mast are not fitted on this occasion*

Upon recoil the breech block opens and extractor arms propel the case along the loading tray and down an ejection chute. The recoil forces activate the loading mechanism and allow following rounds to be rammed automatically into the breech.

Specifications
W-11-M
Calibre: 37 mm
Length of barrel: 62.8 calibres
Muzzle velocity: 886 m/s (2,906 ft/s)
Traverse: 360° at 17°/s
Elevation: −10 to +85° at 13°/s
Rate of fire: 80 rds/min
Ammunition (projectile): 0.732 kg (1,61 lb)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 3,000 m (9,842 ft)
Crew: 3

Ammunition (HE-T)
Projectile Weight: 708 g (25 oz)
Explosive charge: 36 g (1.27 oz) (RDX/aluminium)

ANTI-SUBMARINE MORTARS

RBU 1200 5-tubed fixed launchers

There are two RBU 1200 launchers on the forecastle. This mounting is about 1.5 m (4.9 ft) high and has a pyramid-shaped pintle with five rocket launcher tubes; a row of three along the top and one each on either side. The tubes cannot be trained and have a maximum elevation of +65°. Each tube has a diameter of 250 mm, is 1.4 m (4.6 ft) long and is reloaded manually. The 70 kg (154 lb) RGB-12 rocket has a 34 kg (74.95 lb) warhead and a range of about 0.8 n miles. The RBU 1200 is associated with the old short-range HF (25-30 kHz), 'searchlight' attack sonar which was given the NATO codename Stag Ear and has the Soviet designation Tamir.

DEPTH CHARGES

There are two BMB-2 depth-charge projectors and two depth-charge racks.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Type 923(1) intercept/Type 981(3) jammer

The EW suite is reported to be of Italian design but Chinese manufacture.

DECOYS

Type 945 26-barrelled chaff launchers

There are two Chinese-designed and manufactured Type 945 26-barrelled chaff launchers. Their specifications are not known.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Type ZKJ-3 action data automation

All four ships are reported to be fitted with an action data automation system of Chinese design and manufacture. This may be the same as (or similar to) the system known as the Type 88.

COMMUNICATIONS AND DATALINKS

The communications system is reported to be of German design and Chinese manufacture.

IFF

Type 651.

RADARS

Type 354 (NATO = Eye Shield)

All four Thai ships have a Type 354 (Eye Shield) antenna at the masthead. Also known as MX 902, the Type 354 is an air/surface search equipment which is reported to operate in the E band. This may be a development of the Russian Slim Net radar.

Type 352C (NATO = Square Tie)

Type 352C is an I-band, surface search radar, which also serves as the fire-control radar for the YJ–1 SSMs. The antenna is mounted on a small platform on the forward side of the mainmast.

Type 343 (NATO = Sun Visor)

The Type 343 is an I-band fire-control radar for the 100 mm guns. It is located on the Round House fire director.

Type 341 (NATO = Rice Lamp)

The Rice Lamp fire-control director for the 37 mm guns, operates in the I/J band, and is located aft at the head of a small tower.

Racal-Decca 1290 A/D ARPA

The navigation radar is a Racal-Decca 1290 equipment working in the I band.

SONAR

Type SJD-5A

Type SJD-5A is a hull-mounted, active search and attack, medium-frequency sonar. (It should be noted that a model in a CSSC brochure of a ship very similar to the Thai helicopter-carrying frigate appears to have no hull-mounted dome, but does have a bow dome.)

AVIATION

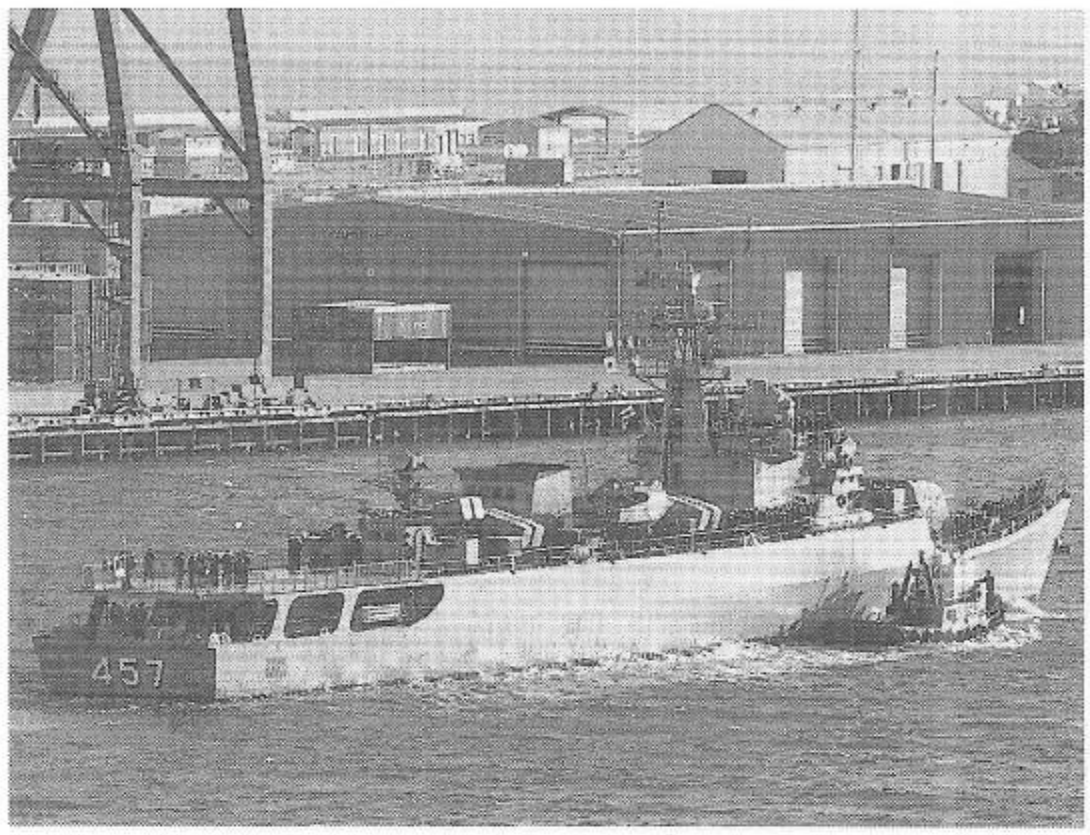
AVIATION FACILITIES

Specifications

Flight deck: *Kraburi* (457) and *Saiburi* (458) only are fitted with a flight deck but there is no hangar .

HELICOPTERS

The RTN operates a number of Bell Model 212 multi-role helicopters and took delivery of its first S-70B7 in late 1996. Either of these types could use the flight deck, although the SH-2Gs, reported to be on order, would appear more suitable. The Thai ships do not, however, currently have the appropriate datalinks and terminal systems necessary to operate the LAMPS I or III systems.



Kraburi *(457) showing the helicopter deck fitted on two of the four Thai ships*
(P. Lewis, RAN)

Kraburi *(457) with Bell 212 helicopter aboard; there is no hangar*

PROPULSION

Specifications

System: Diesel
Main machinery: 4 MTU 20V 1163 TB83 diesels; 21.6 MW (29,440 hp(m)) sustained
Shafts: 2
Propellers: cp

FURTHER INFORMATION

PROGRAMME

The contract was signed on 18 July 1988 for the delivery of four modified 'Jianghu' class frigates to be built by the China State Shipbuilding Corporation (CSSC). These were delivered in 1991 and 1992 but, on arrival in Thailand, each ship had to be docked to make good poor shipbuilding standards and to improve the damage control capabilities. It was also planned to build two more Type 053 HT(H) in Thailand in due course, but this plan appears to have been postponed, if not cancelled.

STRUCTURE

Thailand would have preferred only the hulls so that it could outfit the ships themselves, but China insisted on supplying them fully armed. Two of the ships are the Type III variant with 100 mm guns, fore and aft, while the other two are a variation with a helicopter platform replacing the after 100 mm gun.

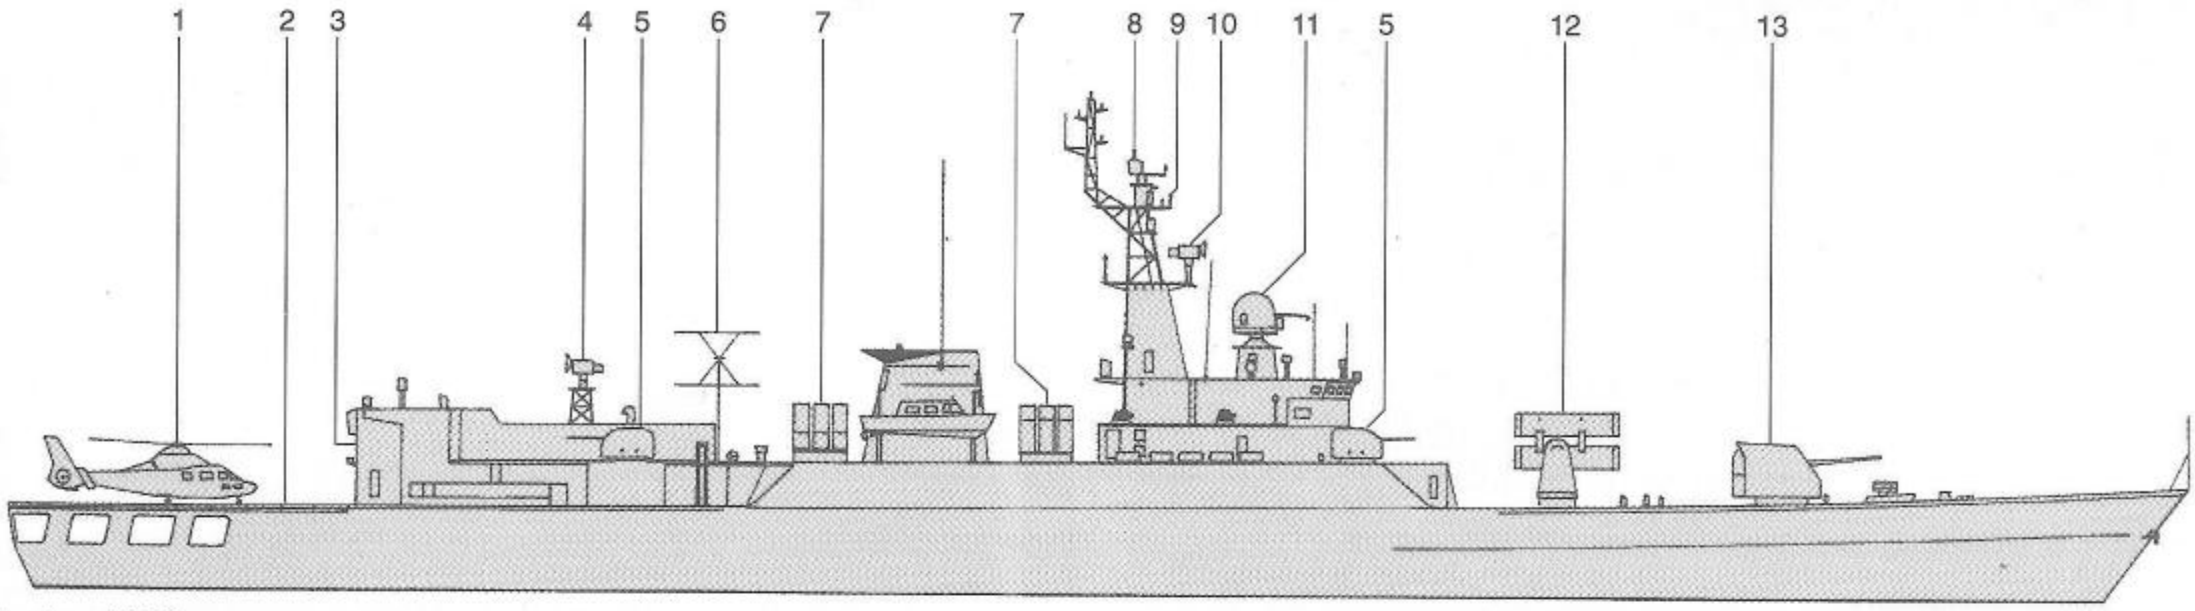
MODERNISATION

It is possible that an HQ-61 launcher for PL-9 will be fitted in due course.

OPERATIONAL

Currently, these ships are mostly used for rotating monthly to the coastguard, and for training.

JIANGWEI



Anqing *(539)*
1 *Harbin Z-9A (licence-built AS 365 Dauphin 2)* **2** *Flight deck* **3** *Hangar* **4** *Rice Lamp fire control (for 37 mm cannon)* **5** *Chinese twin 37 mm/63 (enclosed mounts)* **6** *Knife Rest long-range air search radar* **7** *Triple launchers for YJ-1 (Eagle Strike) anti-ship missiles* **8** *Eye Shield air/surface search radar* **9** *Racal-Decca 1290 navigation radar* **10** *Fog Lamp fire control (for SAM)* **11** *Sun Visor fire-control director* **12** *HQ-61 six-tube launcher for PL-9 SAM* **13** *Chinese twin 100 mm (3.9 in)/56 guns (enclosed mount)*

Huainan. *The unique six-tube launcher for PL-9 SAMs is on the foredeck. The system is large and there are no reloads, but it gives the PLA-N a seaborne SAM capability for the first time. Note also the Sun Visor fire-control director on the bridge roof* (H & L van Ginderen Collection)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Ying JI (Eagle Strike) YJ-1 (C-801) missiles

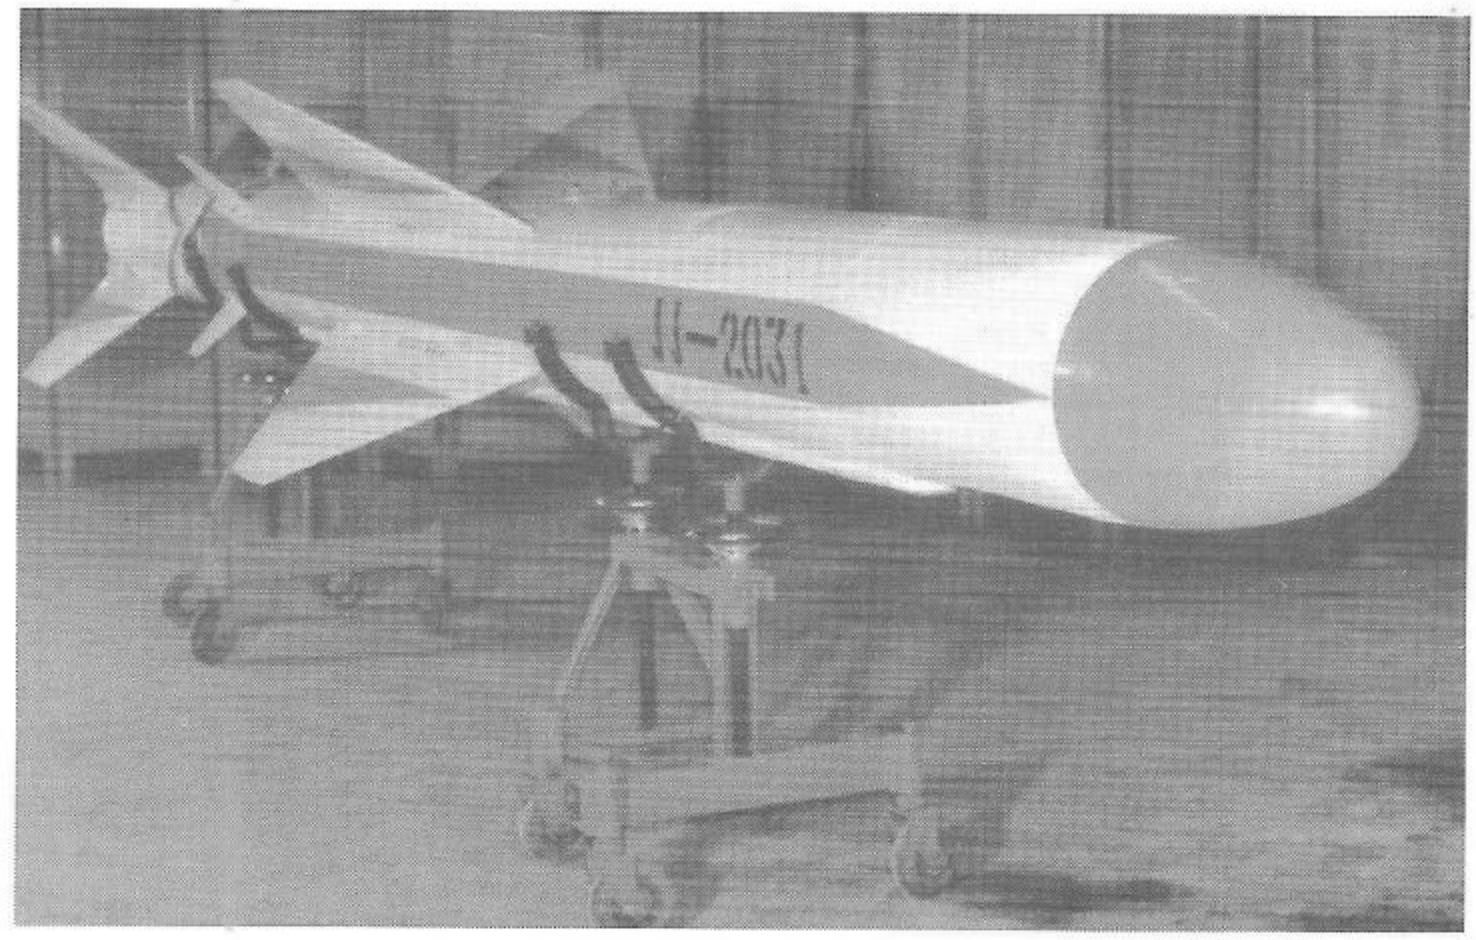
There are six container-launchers for Ying Ji-1 (YJ-1) (export designation = C-801) SSMs in two groups of three before and abaft the stack. The mountings differ from those in the PLA-N's Jianghu IIIs in that they point outwards at 90° to the centreline, as opposed to some 30° in the earlier ships. The YJ-1 is rocket-propelled with a rocket booster, and on launch it climbs to about 50 m (160 ft) then descends to 20-30 m (66-100 ft) until its radar seeker has acquired the target. It then descends to 5-7 m (16-23 ft) using the nose-mounted, monopulse (probably J-band) radar seeker for the terminal approach phase. If the extended range YJ-2 (C-802) is fitted, range is increased to 66 n miles (120 km).

Specifications

Length: 5.81 m (19.06 ft)
Diameter: 36 cm (14.17 in)
Wing span: 1.18 m (3.87 ft)
Propulsion: Rocket motor
Weight: 815 kg (1,797 lb)
Range: 4.5-45.9 n miles (8-85 km)
Speed: Mach 0.9
Guidance: Inertial and active radar
Warhead: 165 kg (363.7 lb) semi-armour-piercing

Manufacturer/Contractor

China Precision Machinery Import and Export Corporation (CPMIEC), Beijing, China.



C-801 anti-ship missile

SURFACE-TO-AIR MISSILES (SAM)

SD-1 (CSA-N-2) point defence system

SD-1, the naval version of the land-based HQ-61, consists of the missile, a launcher-handling system and a radar fire-control system. The missile has cruciform control surfaces and there appears to be at least one command link antenna between the tail surfaces and another may be found on the other side of the body. There is a CW semi-active radar seeker in the nose which is claimed to be extremely accurate and to have an anti-jamming capability. Behind it is an impact/proximity fuze, with a 'chain fragment type' warhead behind the wings. The missile is powered by a solid propellant booster-sustainer rocket motor.

Earlier versions of the missile were launched from a twin-arm launcher, using two massive steel beams, but in the 'Jiangwei' class there is a new launcher with six large cylinders. There appear to be no reloads.

Chinese officials state that a vertical launch version is installed in the 'Jiangwei' class frigates, but there is no evidence of such an installation. However, the missile tubes are raised to nearly 90° for launch and it may be that this is meant rather than a vertical launch system as found in the US Mk 41 GMVLS.

The system apparently uses the 'Fog Lamp' fire-control radar, which is a Chinese development of the Soviet 'Screech' family of fire-control radars. It is an H/I-band system with dish-shaped antenna and illuminating feed support assembly. There appears to be a transmitter-receiver housing behind the antenna, which is probably stabilised. The antenna assembly is mounted at the head of a tall steel plinth. Targets are designated through the air search radar which, in the case of the Jiangwei is the 'Rice Screen' G-band 3D radar.

Specifications

Length: 3.99 m (13.1 ft)
Diameter: 28.6 cm (11.26 in)
Wing span: 99.7 cm (39.25 in)
Launch weight: 320 kg (705 lb)
Speed: Mach 3
Range: 1.4-6.5 n miles (2.5-12 km)
Altitude: 10,000 m (33,000 ft)
Guidance: Command with semi-active radar terminal homing

Manufacturer/Contractor

China Precision Machinery Import and Export Company (CPMIEC), Beijing, China.

GUNS

100 mm L/56 medium-calibre dual-purpose gun

There is a single, twin-gun, automatic turret in 'A' position. The air-cooled B34 barrel is 5.6 m (18.4 ft) long and of monobloc construction with a horizontal sliding breech block and fits into a sleeve. The recoil cylinder is housed under the gun which fires a 15.6 kg (34.4 lb) shell (6.31 kg (14 lb) projectile) and features a pneumatic rammer. The two barrels share a common cradle, with the trunnions set far back from the front of the turret to achieve high angles of fire. Spent rounds are ejected forward with the chutes running parallel to, but below, the guns.

Specifications

L/56 twin
Length of barrel: 56 calibres
Muzzle velocity: 900 m/s (2,953 ft/s)
Traverse: 360°
Elevation: −15 to + 85°
Weight of projectile: 6.31 kg (13.9 lb)
Rate of fire: 18 rds/min
Range:
anti-surface: 12 n miles (22 km)
anti-air: 15,000 m (49,000 ft)

37 mm (W-11-M) mountings

There are four twin 37 mm/62.8 cannon in automatic mountings. The barrels are enclosed in separate water jackets with exposed spring recuperators, and a hydraulic recoil buffer underneath the barrel. The loading mechanism consists of guides for ammunition, which is in five-round clips, the clips being automatically removed on the loading tray. The first round is loaded manually into the breech. The breech block rises and the gun fires when the firing pin strikes the cartridge percussion cap. Upon recoil the breech block opens and extractor arms propel the case along the loading tray and down an ejection chute. The recoil forces activate the loading mechanism and allow following rounds to be rammed automatically into the breech.

Specifications

Calibre: 37 mm
Length of barrel: 63 calibres
Muzzle velocity: 886 m/s (2,906 ft/s)
Traverse: 360° at 17°/s
Elevation: −10 to +85° at 13°/s
Rate of fire: 80 rds/min/barrel
Ammunition (projectile): 0.732 kg (1.61 lb)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 3,000 m (9,842 ft)
Crew: 3

Ammunition (HE-T)
Projectile Weight: 708 g (25 oz)
Explosive charge: 36 g (1.27 oz) (RDX/aluminium)

ANTI-SUBMARINE MORTARS

RBU 1200 5-tubed fixed launchers

There are two RBU 1200 launchers on the forecastle. This mounting is about 1.5 m high and has a pyramid-shaped pintle with five rocket launcher tubes; a row of three along the top and one each on either side. The tubes cannot be trained and have a maximum elevation of +65°. Each tube has a diameter of 250 mm, is 1.4 m (4.6 ft) long and is reloaded manually. The 70 kg (154 lb) RGB-12 rocket has a 34 kg (74.95 lb) warhead and a range of about 0.8 n miles. The RBU 1200 is associated with the old short-range HF (25-30 kHz), 'searchlight' attack sonar which was given the NATO codename Stag Ear and has the Soviet designation Tamir.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

RWD-8/NJ81-3

The EW suite consists of an RWD8 radar intercept and warning system, and an NJ81-3 jammer. There are two flat-topped domes on the yard-arm, similar to the Russian Top Hat, which may be the jammer antennas.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher

There are two Mk 36 SRBOC (Super Rapid Bloom Off-board Countermeasures) units.

Specifications

Launcher

Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)

Weight: 173 kg (381.4 lb)

Range: 2.2 n miles (4 km)

Rounds

Diameter: 130 mm (5.1 in)

Length, weight:

Mk 182: 1,209 mm; 22.7 kg

Super Chaffstar: 1,209 mm; 20.9 kg

Super Gemini: 451 mm; 5.5 kg

Super Hiram III: 1,220 mm; 13.6 kg

Super Hiram IV: 467 mm; 3.8 kg

Super Loroc: 734 mm; 13.2 kg

Manufacturers/Contractors

Loral Hycor Inc, Woburn, Maryland, USA.

Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

Type 945 26-barrelled chaff launchers

In addition to the two Mk 36 SRBOC launchers, there are also two Chinese-designed and manufactured Type 945 26-barrelled chaff launchers. Their specifications are not known.

COMMAND AND CONTROL SYSTEMS

RADARS

Type 354 (Eye Shield)

As in the Jianghu frigates, there is a Type 354 (Eye Shield) antenna at the masthead. Also known as MX 902, the Type 354 is an air/surface search equipment which is reported to operate in the E band. This may be a development of the Russian Slim Net radar.

Knife Rest

There is a large open work antenna mounted on a small mast at the forward edge of the hangar. This Chinese Navy array consists of two side by side Yagi antennas and appears to be similar to the Knife Rest found on 1950s-vintage Soviet Navy ships. The (then) Soviet Navy used Knife Rest B, which operated over the 79-93 MHz band, with a peak power of 100 kW, and had an effective range of 100-150 n miles (185-280 km).

Sun Visor

Sun Visor is the I-band, fire-control radar installed on the Round Top gunfire-control director on the bridge roof.

Fog Lamp

The Fog Lamp fire-control radar, a Chinese development of the Soviet 'Screech' family of fire-control radars, is mounted on a platform on the mast (at the top edge of the plating). This is an H/I-band system with a dish-shaped antenna and illuminating feed support assembly. There appears to be a transmitter-receiver housing behind the antenna, which is probably stabilised. Targets are designated through the Eye Shield air search radar.

Type 341 (Rice Lamp)

The Rice Lamp fire-control director for the 37 mm guns operates in the I/J band, and is located aft at the head of a small tower.

Racal-Decca 1290

The Racal-Decca 1290 is an I-band navigation set, with the antenna mounted on a small platform on the mast, below the Eye Shield antenna.

SONAR

Echo Type 5

One sonar set is fitted to all ships: the hull-mounted, active search and attack, Echo Type 5, operating in the medium sonar frequency band.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 17.9 × 12.1 m (58.6 × 40 ft)

HELICOPTERS

One Harbin Zhi-9A Haitun (Dauphin)

Specifications

Dimensions:

main rotor diameter: 11.94 m (39.17 ft)

Fenestron diameter: 1.10 m (3.61 ft)

length, overall: 13.68 m (44.88 ft)

height: 3.99 m (13.09 ft)

Weights:

empty (standard aircraft): 2,262 kg (4,987 lb)

max take-off: 4,250 kg (9,370 lb)

Radius of action:

anti-shipping mission: 4 missiles, 135 n miles (250 km); 2 missiles, 150 n miles (278 km)

search and rescue: 130 n miles (241 km)

Performance:

never exceed speed (VNE): 160 kts (296 km/h)

cruising speed at sea level: 148 kts (274 km/h)

max rate of climb (sea level): 420 m (1,380 ft)/min

hovering ceiling (in ground effect): 2,600 m (8,530 ft)

Power plant: 2 Turbomeca Arriel 1M1 turboshafts, each giving 558 kW (749 shp) for take-off and 487 kW (653 shp) continuously

Accommodation: Pilot, co-pilot. The cabin can hold up to 10 passengers

Huainan. *A stern view of the Chinese frigate showing the flight deck and spacious hangar. On the hangar roof is Rice Lamp fire-control director for the 37 mm guns beside it. Note also the Knife Rest radar array above the after YJ-1 SSM launchers* (H & L van Ginderen Collection)

PROPULSION

Specifications
System: Diesel
Main machinery: 4 MTU 20V1163 TB83 diesels
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The design of this class started in the early 1980s and the first of class was laid down in 1988, launched in 1991 and started running trials later that year. Four were then completed at a rate of one per year, but there appears to have been a break in the programme, with the fifth and sixth ships not entering service in 1995 and 1996, as expected.

DESIGN

The Jiangwei hull is slightly larger all round than that of the Jianghu, and displacement has increased by 326 t. The Jiangwei represents a steady evolution with full aviation facilities, including both a flight deck and a hangar, as trialled in the sole Jianghu II. The one totally new equipment is the SD-1 SAM system, although this underwent a very protracted development in the abortive 'Jiangdong' class frigates.

The SD-1 (CSA-N-2) finally gives the PLA-N an at-sea air defence capability, although with only six missiles per ship (there are no reloads) it is still limited in scope.

There is a possibility that CY-1 anti-submarine missiles may also be launched from the YJ-1 launchers as in Luda III.

Huainan (H & L van Ginderen Collection)

PROPULSION

It was originally estimated that these ships were powered by two Chinese Type 12E diesels. However, the export version of this ship (described in brochures as 'Guided Missile Frigate Version 2') has four MTU diesels on two shafts and it is believed that this is the more likely power plant.

DEPLOYMENT

All are currently based in the East Sea Fleet.

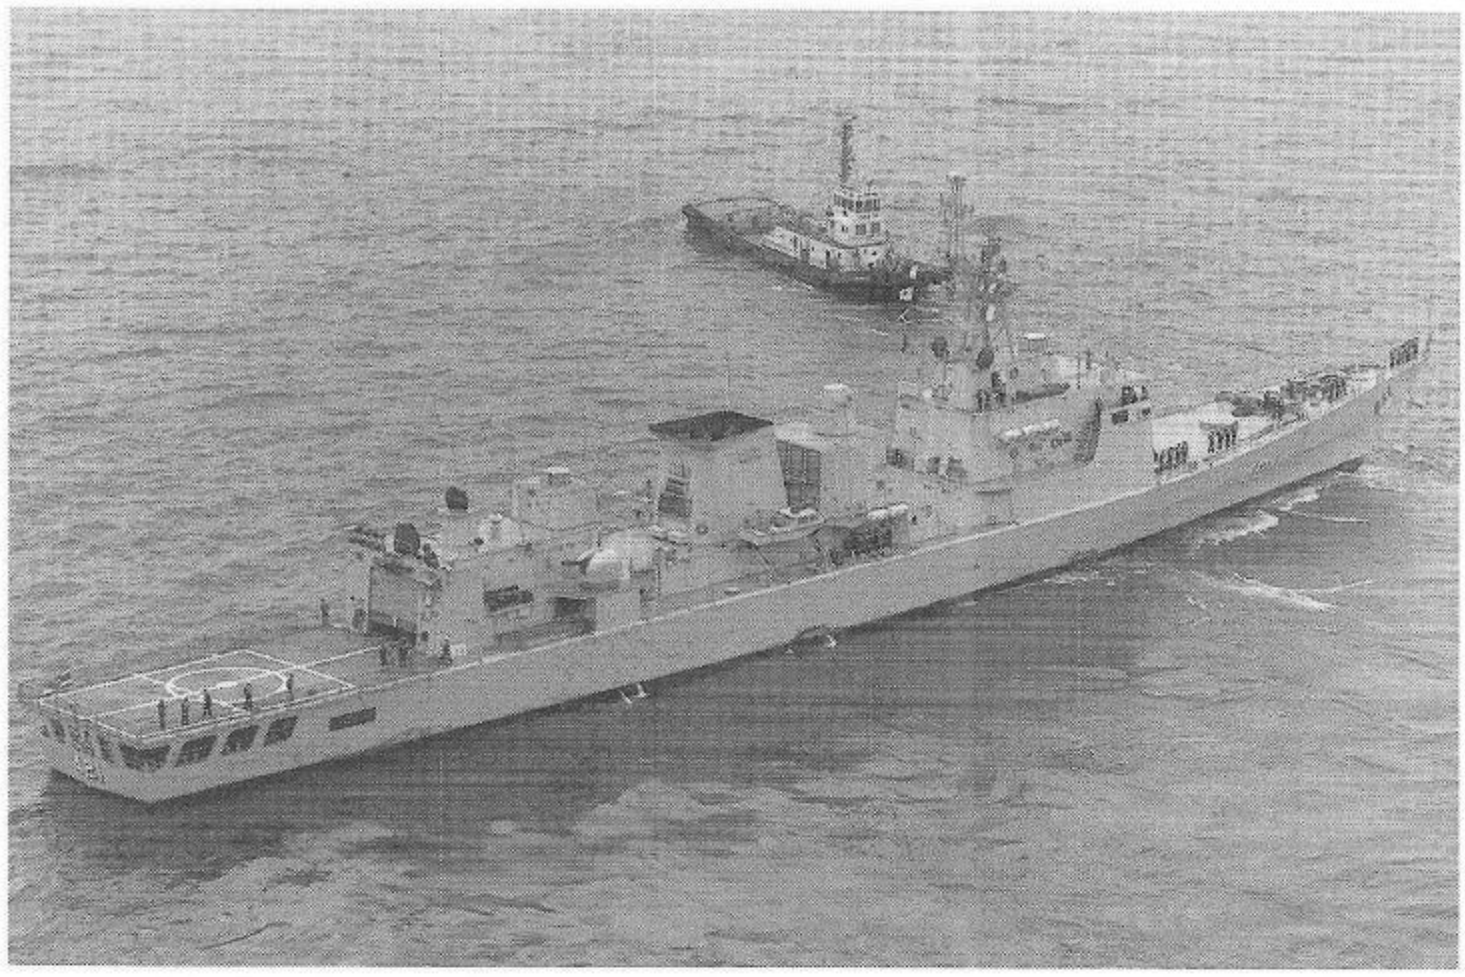
Naresuan *in 1996. These ships were built in China, have US missiles and launchers; US 127 mm gun; Italian anti-aircraft guns made under licence in China; Italian ESM/ECM equipment; a mixture of Dutch, Chinese and US radars; and a CODOG propulsion system with US gas turbines and German diesels* (Royal Thai Navy)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas UGM-84B Harpoon

Eight Harpoon anti-ship missile canisters are mounted in the gap immediately abaft the bridge structure. There are two groups of four launchers each, with one group pointing to either beam. The missiles are either Block 1B or Block 1C versions, the latter having a similar performance to the Block 1B but with certain additional options, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.



Naresuan *in 1995. At this stage the 127 mm gun, Mk 41 VLS and Signaal radars had not been fitted. The anti-aircraft guns either side of the hangar are reported to be OTOBREDA 40 mm guns made under licence in China, firing Chinese 37 mm ammunition and controlled by a Chinese version of the Dardo system* (Dr Giorgio Arra)

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

Mk 41 GMVLS
There is a Lockheed Martin Mk 41 Guided Missile Vertical Launch System (GMVLS), with one eight-cell module located under the foredeck. Firing rate is reported to be about 1 missile per second.

Raytheon Sea Sparrow point defence missile system
The ships carry eight Sea Sparrow point defence missiles.

The system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg (85 lb) blast fragmentation warhead and a dual-purpose proximity impact fuze.

Specifications
RIM-7M
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 226.8 kg (500 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturers/Contractors
Raytheon Company, Equipment Division (prime system contractor).
Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

TORPEDOES

324 mm Mk 32 Mod 5 triple torpedo launchers
Two triple Mk 32 Mod 5 torpedo launchers are mounted, one on either beam, on the main deck abreast the stack.

Specifications
Mk 46 Mod 5
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight: 230 kg (507 lb)
Speed: 40 kts
Range: 6 n miles (11.2 km)
Homing: Active/passive acoustic homing
Warhead: Mk 103 Mod 1; 44 kg; PBXN-103
Motor: 5-cylinder liquid mono-propellant (Otto) motor

Manufacturer/Contractor
Loral Defense Systems, Akron, Ohio, USA.

GUNS

Mk 45 Mod 2 single 127 mm (5 in) L/54 gun mounting
One United Defense single 127 mm (5 in) Mk 45 Mod 2 gun is mounted forward, firing semi-fixed ammunition with point detonating, proximity (variable time or infrared), mechanical time and electronically set fuzes. The theoretical rate of fire is 20 rounds per minute and a gun crew of six is required, all below decks, of which four are ammunition handlers.

Specifications
Calibre: 127 mm (5 in)
Length of barrel: 54 calibres
Muzzle velocity: 807 m/s (2,646 ft/s) (new barrel), 762 m/s (2,500 ft/s) (mid-life)
Crew: 6 (1 mount captain, 1 panel operator, 4 ammunition handlers)
Traverse: 340° at 30°/s
Elevation: −15 to +65° at 20°/s
Range:
anti-surface: 12.39 n miles (23 km)
anti-air: 15,000 m (49,000 ft)
Rate of fire: 16-20 rds/min
Ammunition weight: 31.75 kg (70 lb) (projectile)

Manufacturer/Contractor
United Defense, Armament Systems Division, Minneapolis, Minnesota, USA.

37 mm/63 Model 76 mountings
There are two twin 37 mm/62.8 cannon in automatic mountings, mounted either side of the forward end of the hangar. The barrels are enclosed in separate water jackets with exposed spring recuperators, and a hydraulic recoil buffer underneath the barrel. The loading mechanism consists of guides for ammunition, which is in five-round clips, the clips being automatically removed on the loading tray. The first round is loaded manually into the breech. The breech block rises and the gun fires when the firing pin strikes the cartridge percussion cap. Upon recoil the breech block opens and extractor arms propel the case along the loading tray and down an ejection chute. The recoil forces activate the loading mechanism and allow following rounds to be rammed automatically into the breech.

Specifications
Calibre: 37 mm
Length of barrel: 63 calibres
Muzzle velocity: 886 m/s (2,906 ft/s)
Traverse: 360° at 17°/s
Elevation: −10 to +85° at 13°/s
Rate of fire: 80 rds/min/barrel
Ammunition (projectile): 0.732 kg (1.61 lb)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 3,000 m (9,842 ft)
Crew: 3

Ammunition (HE-T)
Projectile Weight: 708 g (25 oz)
Explosive charge: 36 g (1.27 oz) (RDX/aluminium)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Newton-Beta EW suite
Both ships are fitted with an Elettronica Newton-Beta system consisting of an ESM section and an ECM section, with the related antennas, controlled from an operator console. The ESM section provides 100 per cent intercept probability, passive surveillance, automatic instantaneous warning of programmed threat, automatic analysis of threat parameters, automatic identification and tracking of threats, a synthetic data display, instantaneous DF, and broad frequency coverage. The ECM section provides self-protection by noise jamming using an Elettronica jammer.

Manufacturer/Contractor
Elettronica SpA, Rome, Italy.

DECOYS

Type 945 GPJ 26-barrelled chaff launchers
There are two Chinese-designed and manufactured Type 945 26-barrelled chaff launchers. Their specifications are not known.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

JM-83H optical director

There is one JM-83H optical director mounted at the after end of the hangar roof.

SONAR

SJD-7

SJD-7 is a Chinese-manufactured, hull-mounted, active search and attack sonar, operating at medium frequencies.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 23 × 13 m (76 × 43 ft)

HELICOPTERS

The Royal Thai Navy intends to operate one Kaman SH-2F Seasprite from these ships.

Specifications

Main rotor:
diameter: 13.51 m (44.33 ft)
disc area: 143.41 m^2 (1,543.66 sq ft)

Tail rotor:
diameter: 2.46 m (8.15 ft)
disc area: 4.77 m^2 (51.32 sq ft)
Length overall (both rotors turning): 16.08 m (52.75 ft)
Fuselage length: 12.19 m (40.00 ft)
Height to rotor head: 4.58 m (15.00 ft)
Weights:
empty: 3,447 kg (7,600 lb)
max take-off: 6,124 kg (13,500 lb)
Max level speed at sea level: 138 kts (256 km/h)
Typical cruising speed: 120 kts (222 km/h)
Service ceiling: 7,285 m (23,900 ft)
Range with max standard fuel: 478 n miles (885 km)
Power plant: 2—1,285 kW (1,723 shp) General Electric T700-GE-401 turboshafts

Accommodation: crew of 3 in ASW role (pilot, co-pilot/tactical co-ordinator, sensor operator
Weapons: 1/2 Mk 46 or Mk 50 torpedoes; 8 Mk 25 marine smoke markers. provision for pintle-mounted 7.62 mm MG in both doorways

PROPULSION

Specifications

System: combined diesel or gas turbine (CODOG)
Main machinery: 2 General Electric LM-2500 gas turbines, 41 MW (55,000 hp) sustained; 2 MTU 20 V 1163 TB83 diesels, 10.84 MW (14,730 hp(m)) sustained
Shafts: 2
Propellers: cp

FURTHER INFORMATION

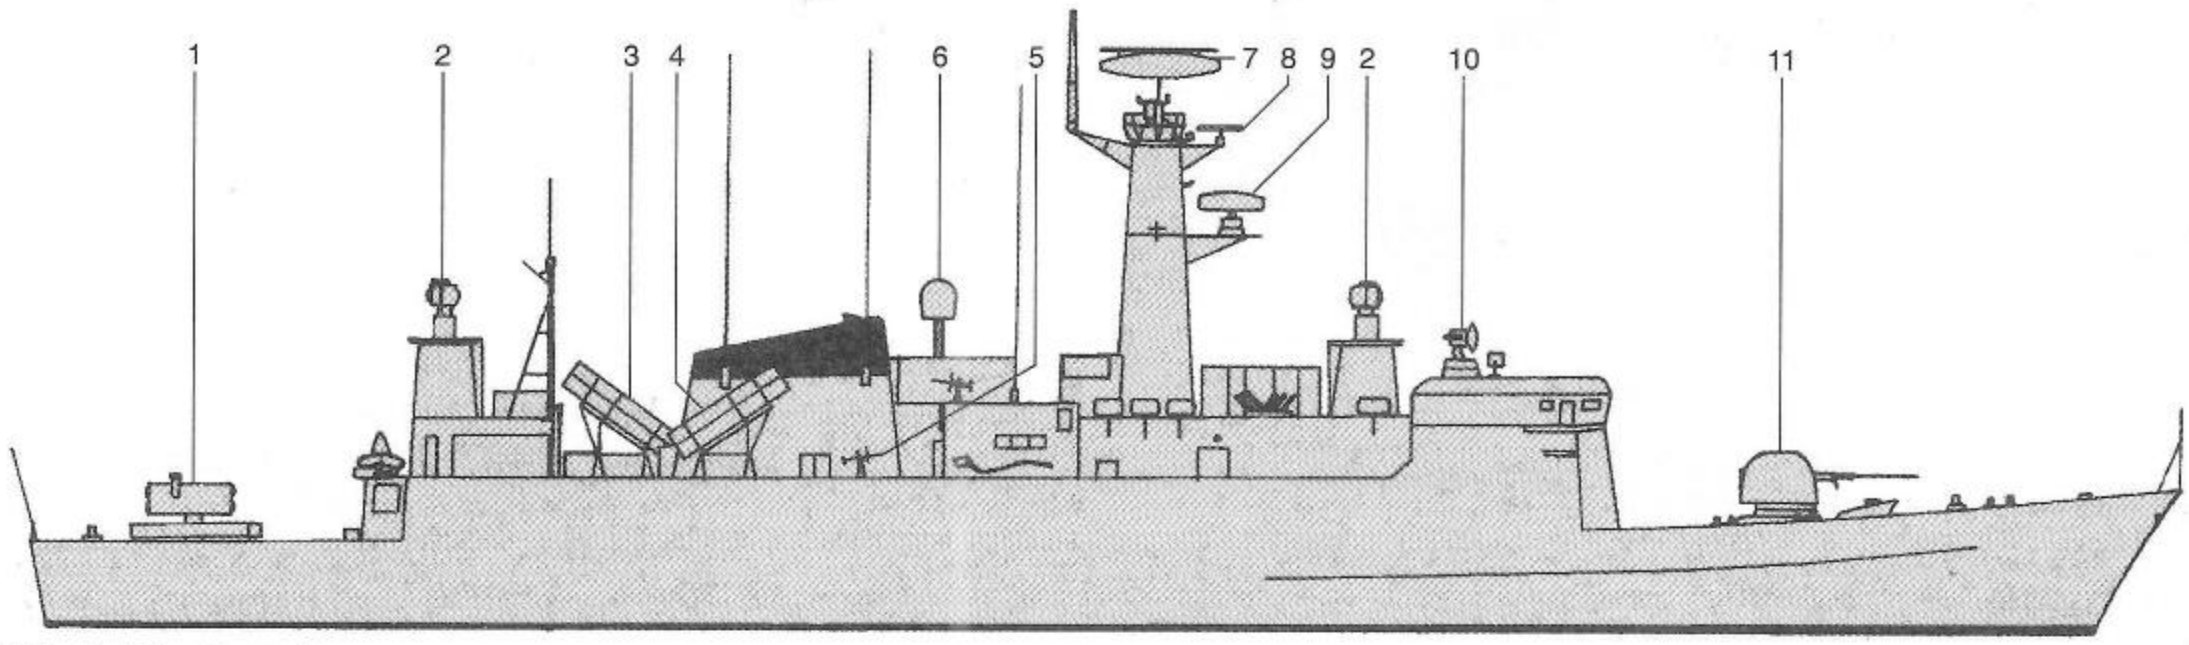
PROGRAMME

Despite its not entirely satisfactory experiences with the 'Chao Phraya' class frigates, the Royal Thai Navy signed a contract on 21 September 1989 for two frigates to a new design. These were to be built by the China State Shipbuilding Corporation (CSSC) with delivery in 1994, following which US and European weapon systems would be fitted in Thailand. By early 1993 the programme had slipped by 12 months and the first ship eventually sailed for Bangkok without most of its weapon systems in January 1995. A series of photographs of the ship was issued in 1993, but it later transpired that most of the systems shown were wooden mock-ups and, as late as 1995, both ships were to be seen without their 127 mm guns, Harpoon missiles and most of their sensors.

STRUCTURE

These ships were jointly designed by the Royal Thai Navy and the China State Shipbuilding Corporation (CSSC) and the design incorporates a considerable amount of Western machinery and equipment, providing enhanced capabilities in comparison with the earlier Type 053 ships. The anti-aircraft guns are OTO-BREDA 40 mm with 37 mm ammunition and they are controlled by a Chinese-manufactured RTN-20 Dardo tracker.

NIELS JUEL



Niels Juel (Ian Sturton)
1 *Mk 29 eight-cell launcher for NATO Sea Sparrow* **2** *Mk 95 tracked illuminator (for SAM)* **3** *Four Harpoon anti-ship missiles (port side, facing aft)* **4** *Four Harpoon anti-ship missiles (starboard side, facing forward)* **5** *20 mm Oerlikon* **6** *Satcom* **7** *Plessey AWS-5 (being replaced by DASA TRS-3D)* **8** *Terma Scanter navigation radar* **9** *CelsiusTech 9GR 600* **10** *CelsiusTech 9LV 200* **11** *OTOBREDA 76 mm/62 Compact*

GENERAL SPECIFICATIONS

Operator: Denmark
Type: KV72

Class: NIELS JUEL (FFG)

Built: 3
Active: 3

Displacement:
standard: 1,190 t
full load: 1,320 t

Dimensions
Length: 84 m (275.5 ft)(oa) 80.0 m (262.5 ft)(wl)
Beam: 10.3 m (33.8 ft)
Draught: 3.1 m (10.2 ft)

Speed: Gas turbines – 29 kts; diesels – 20 kts
Range: 2,500 n miles at 18 kts

Complement: 98 (18 officers)

SHIPS

NIELS JUEL (F 354)
Builder Aalborg Vaerft, Aalborg, Denmark
Laid down 20 Oct 1976
Launched 17 Feb 1978
Commissioned 26 Aug 1980

OLFERT FISCHER (F 355)
Builder Aalborg Vaerft, Aalborg, Denmark
Laid down 6 Dec 1978
Launched 10 May 1979
Commissioned 16 Oct 1981

PETER TORDENSKIOLD (F 356)
Builder Aalborg Vaerft, Aalborg, Denmark
Laid down 3 Dec 1979
Launched 30 Apr 1980
Commissioned 2 Apr 1982

Peter Tordenskiold *(F 356) is one of three 'Niels Juel' class frigates of the Royal Danish Navy. They entered service between 1980 and 1982 and are undergoing mid-life refits between 1997 and 1999 which will enable them to serve well into the 21st century* (Royal Danish Navy via Hans Harboe-Hansen)

WEAPONS SYSTEMS

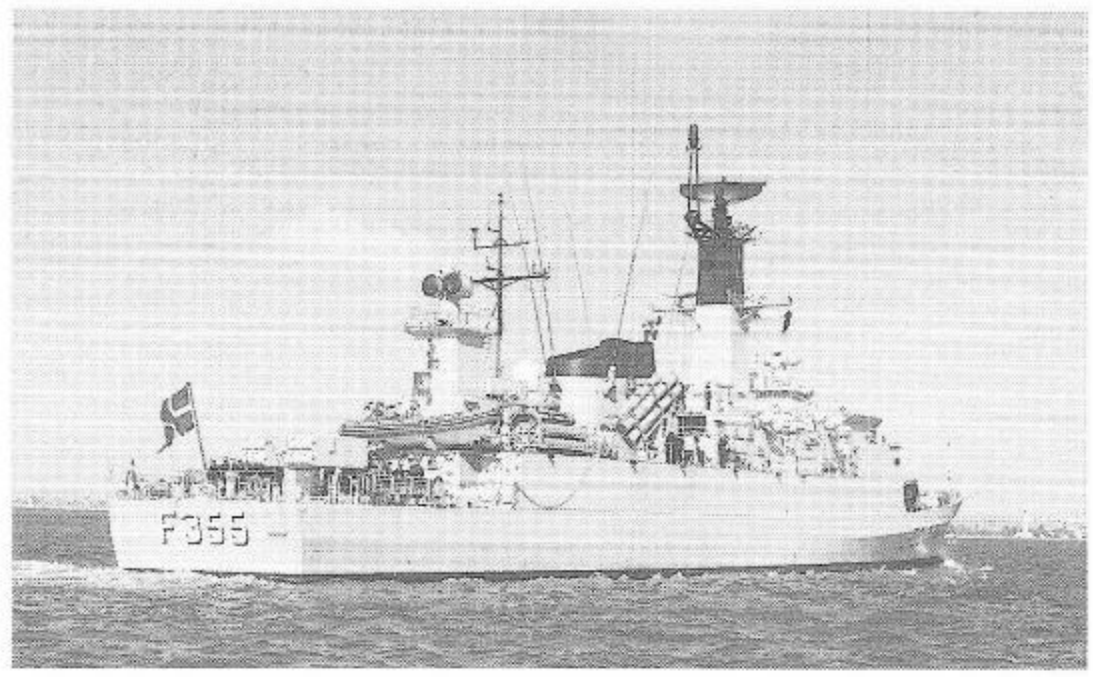
SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84B Harpoon

Eight Harpoon anti-ship missile canisters are mounted either side of the stack, but in an unusual arrangement, with the starboard group of four pointing forwards and the port set pointing aft. The missiles are the Block 1C version with additional options, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).



Olfert Fischer *(F 355). These ships are very well armed for their size and carry eight Harpoon anti-ship missiles. As seen here, however, their arrangement is unique, with the four starboard Harpoons pointing forwards while the four port tubes point aft* (H & L van Ginderen Collection)

SURFACE-TO-AIR MISSILES (SAM)

Raytheon Sea Sparrow point-defence missile system

There is a single Mk 29 octuple launcher for the Sea Sparrow system, which is located aft on the quarterdeck. The system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg (85.1 lb) blast fragmentation warhead and a dual-purpose proximity-impact fuze. The RIM-7M missiles originally carried are being replaced by RIM-7P during the current mid-life refits, the new installation including improved electronics and a computer with significantly increased capacity. There are no reloads.

Specifications

RIM-7P
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 226.8 kg (500 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturers/Contractors

Raytheon Company, Equipment Division (prime system contractor).
Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

GUNS

OTOBREDA 76 mm (3 in)/62 Compact

There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck for use in either air defence or anti-surface roles. If the weapon is designated to the air-defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission.

Specifications

Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.

Oerlikon 20 mm

Four single Oerlikon 20 mm guns are mounted in a very close group amidships. There is one immediately ahead of each of the two Harpoon launchers, and one on each corner of the deckhouse abaft the mast.

Specifications

Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +55°

DEPTH CHARGES

There is one rack for depth charges on the stern.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Cutlass B1 ESM system

Cutlass B1 is designed for operation in very dense signal environments, receiving signals in the 1 to 18 GHz frequency range, measuring their parameters, comparing these with those in the radar library which contains the parameters of 2,000 radars, and displaying the information — all within one second. The EW operator is presented with a tabular display for threat identity and threat evaluation, and a tactical display giving a pictorial representation of the RF environment. Selected digital outputs can be sent to other local systems, and hard copy printout of the intercepted radar is also available. The tabular display can indicate 150 intercepts, in the order of priority. Cutlass is wide open in both bearing and frequency: that is, it does not employ sweep techniques, giving a very high intercept probability (nearly 100 per cent). Cutlass B1 uses the Cutlass processor and an Instantaneous Frequency Measurement (IFM) receiver. It has a 32-element array antenna to provide bearing measurement by phase analysis techniques. This antenna also provides RF for the IFM. In both systems the processor is provided with fast and accurate information on incoming pulses.

Specifications

Frequency coverage: 2-18 GHz (Cutlass B1); 0.6-18 GHz (Cutlass Type 242)

Cutlass B1
Accuracy: 2° RMS in bearing
Coverage: 360° azimuth; +40 to −10° elevation
Pulse density capability: 500,000/s
Radar store capacity: 2000 modes

Cutlass Type 242
Accuracy: 3.5° RMS
Sensitivity: −60 dBm
Dynamic range: 60 dB
Coverage: 360° azimuth, +30 to −10° elevation
Pulse density capability: 1 Mpps
Radar store capacity: 2000 modes

Manufacturer/Contractor

Racal Radar Defence Systems Ltd, Chessington, Surrey, UK.

DECOYS

NATO Sea Gnat

There are two six-barrel launchers for Sea Gnat, NATO's new long-range chaff/infra-red (IR) decoy launching system. It consists of a control unit, a launcher with 130 mm tubes and munitions. The control unit provides for the launching of the most effective combination of rounds for distraction and centroid/seduction given the type, speed and direction of the threat, the ship's speed and heading as well as wind direction and speed. There are three types of round:

Mk 214 RF seduction
Mk 216 RF distraction
Mk 245 IR seduction

Manufacturers/Contractors

Thorn EMI/AB Precision Ltd, UK (control unit).
Chemring Ltd, UK (munitions).

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

CelsiusTech CEPLO (Computerised Electronic Plotting System)

CEPLO (Computerised Electronic Plotting System) provides target detection, identification and tracking facilities together with movement prediction, threat evaluation, weapon co-ordination and unit deployment. There is an optional torpedo fire-control element and the CCIS has built-in facilities for simulation and training. The system features a mainframe architecture using two Censor 932E 32-bit, 512 k memory computers, one of which provides redundancy. Peripherals include an input/output device, data recorder and either a printer or a plotter. Software is written in the Assembler language and involves some 240,000 lines of code.

The system is linked through a single or duplicated CCIS bus to the display system, up to four radars

(through a plot extractor), weapon control systems, navigation and communications systems. A datalink terminal may be incorporated in the system.

The modular display system features three monochrome or colour display units; horizontal or vertical Local Operations Consoles (LOC) and a vertical General Operations Plot (GOP) all with CRT PPI screens. These consoles present a raw radar picture with track symbols, labels and bearing-vector lines. They are primarily for compiling the tactical situation as well as for target allocation to weapon systems. They can also be used for weapon co-ordination and control. The MMI allows the selection of one of four radars and one of the three video channels. It consists of a rollerball, 11 function keys (each of which may have 12 functions), together with page select, mode select, display select and alphanumeric keys.

The GOP, which is intended to assist command and control, features a 40.64 cm (16 in) or 58.42 cm (23 in) circular screen upon which is presented synthetic radar data, map and chart data together with bearing-vector lines. An alphanumeric display may be integrated into the screen or alternatively presented in a separate plasma display. The GOP may be controlled either through a dedicated MMI or by another operator's MMI. Generally, there are two LOCs and a GOP in larger warships, of corvette size and above, while a single vertical LOC is used in fast attack craft. In CEPLO there are two 61 cm (24 in) vertical and three 40.64 cm (16 in) horizontal displays.

A previous plan to replace the CEPLO by the Philips 9LV Mk 3 during the forthcoming mid-life update has been dropped.

Manufacturer/Contractor

CelsiusTech AB, Sweden.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 11

Satcom: Satcoms can be fitted forward or aft of the stack and were installed during the Gulf deployments.

WEAPONS CONTROL

9LV 200 Mk 1 (RAKEL) fire-control system

The basic 9LV 200 system is an air defence (LV = Luftvarn anti-aircraft), surface fire and torpedo fire-control system, which is known in the Danish Navy as RAKEL *(RAdar KanonenELdledning)*. It can direct one or more guns against one or more targets simultaneously and includes a CelsiusTech 9GR600 radar. The 9LV 200 has a mainframe architecture, using Philips P800 minicomputers with a memory of 128 k which may be expanded to 512 k.

The normal configuration includes a tactical display and missile control console together with gun control consoles (usually one for surface engagements and one for air engagements) and optional torpedo control console. The tactical display and missile control unit is a three-man console (tactical picture compiler, principal warfare officer and the commanding officer) with 40.64 cm (16 in) tactical displays and two alphanumeric displays for surveillance, target acquisition and target designation. There is automatic track-while-scan of up to 16 air and surface targets with weapon systems exchanging target data. Also available is an external VHF/UHF voice channel and short burst transmission for exchanging target data with other ships. The principal warfare officer designates surface targets to either guns or missiles but also launches missiles either from integrated controls or a nearby missile firing panel. Surface targets to be engaged by gunfire are transferred to the appropriate gun console depending upon whether or not the target is to be tracked by the director or by track-while-scan, if the search radar is used.

The gun control consoles feature a 30.48 cm (12 in) PPI and there is optional pulse Doppler processing for MTI and track-while-scan facilities. The console is used to control the air defence function against either aircraft or missiles. Once the decision is taken to engage the target then target acquisition, tracking and ballistic calculations are conducted automatically. The guns are fired by a pedal beneath the console. For simultaneous engagement of two independent targets a surface gun console manned by the assistant gunnery officer may be included. This is similar to the gun control console but has no alphanumeric display. Its prime role is to engage surface targets using track-while-scan but it has a secondary role of assisting in the air search.

The basic electro-optic sensor is a Si-Vidicon TV camera with a field of view of 32 × 42 mrad and 300 mm lens. The camera produces a 625-line picture which is refreshed at 25 frame/s. The TV camera can be augmented by an 8-12 µm FLIR with CCIR-standard output and a 10 Hz Nd:YAG laser rangefinder.

A typical 9LV 200 installation features a tactical display, two gun control consoles (with primary air defence and surface engagement roles respectively), two optical target designators and a wind sensor.

The Mk 1 system is for warships of 80 tonnes or more and features an analogue version of the P800 processor. This directs 40-120 mm dual-purpose guns and anti-ship weapons including missiles and wire-guided torpedoes. It receives data from the surveillance and tracking radars, although there is also provision for inputs from a D-band air warning radar with integrated Mk 10 IFF.

Manufacturer/Contractor

CelsiusTech AB, Linkoping, Sweden.

Mk 91 Mod 1 air defence fire-control system

The Mk 91 fire-control system operates in either automatic or semi-automatic modes from target acquisition to interception. It is a mainframe system using an NFT (*Norsk Forsvarsteknologi*) Mk 157 digital computer which performs all necessary calculations, stores data and is responsible for data distribution. There are two Mk 91 Mod 3 directors — one is on the bridge roof, the other atop a small tower aft — using the Mk 95 radar.

Because of its I-band frequency the Mk 91 will detect sea-skimming missiles sooner than lower-frequency search radars; the system can thus be fully autonomous, conducting search, detection and engagement automatically. It can also accept outside designations from radar, EW or optic sources. Radar data from the director is passed to the signal data processor to provide range and angle tracking data. This data is passed to the firing officer's console from where prelaunch data and firing commands are relayed to the Mk 29 trainable launcher and missile. The launcher then trains in azimuth to the intercept point and in superelevation to optimum angle to maximise missile kinetic energy. Should the correct azimuth be blocked by the ship's superstructure, the launcher trains to the nearest clear azimuth and commands the missile to 'fly around the corner' to the direct path to the intercept. On launch, the missile flies a proportional navigation path (lead angle intercept) directly to the intercept point in a lofted trajectory which maximises energy and minimises image effects.

Manufacturer/Contractor

Raytheon Company, Equipment Division (prime).

AN/SWG-1A Harpoon Launch Control System (LCS)

SWG-1A is the Harpoon weapons control system, which activates the missile, selects the flight pattern and sets seeker search modes (with small-, medium- or large-acquisition windows), as well as providing target range and bearing data. Alternatively, the missile can simply be launched along the bearing of the target, with the seeker activated early to scan a 90° sector; if, after a set time, no target has been acquired the missile commences a preset search pattern. SWG-1A takes account of other ships in the general target area and generates indirect flight plans for the missile, including waypoints to optimise angles of approach which will achieve the highest possibility of success while minimising the chances of the missile being destroyed by hostile fire. It can also be used to compute flight plans in a multiple attack so that several missiles, from either the same or different ships, arrive on target simultaneously, thus swamping the defences.

RADARS

DASA TRS-3D/16

TRS-3D/16 is a multimode acquisition radar for surveillance and weapon assignment. The most recent member of the C-band radar family performs Automatic Detection and Tracking (ADT) of surface and air targets even in heavy clutter and under severe ECM conditions. The highly stable coherent transmitter has a solid-state driver stage and a TWT output stage. A number of preset frequencies can be set from pulse to pulse. It is claimed to be highly resistant to ECCM. The modes of operation are:

- self-defence mode — combined long- and short-range scanning with high-elevation coverage. May be used in sea and ground clutter environment and in light rain; scan time is 2 seconds
- self-defence/clutter mode — offers an adapted waveform for severe clutter or chaff conditions; scan time is 3.5 seconds
- surveillance mode — provides 92 km instrumented range with 17 km altitude coverage. It is useful up to medium-clutter conditions, scan time is 6 seconds
- long-range mode — gives an instrumented range of 180 km for duct conditions with a scan time of 6 seconds.

The antenna group comprises a primary G/H-band planar phased-array antenna, an IFF antenna and an optional I-band navigation radar antenna. The G/H-band radar incorporates a full pulse-to-pulse polarisation agility. Scanning in elevation is performed with a single agile pencil beam; the antenna is scanned in bearing mechanically using a fully stabilised platform rotating at 30 rpm. With the use of MTD Doppler processing, small targets (such as sea-skimmers and diving missiles) can be detected and target data determined. There are separate air and surface target channels, each with adaptive detection thresholds and a jamming detector. Helicopter classification is also provided, as is a quick reaction technique to detect pop-up targets.

Manufacturer/Contractor

Daimler-Benz Aerospace AG, Sensor Systems Division, Ulm, Germany.

CelsiusTech 9GR600

The 9GR600 D/I/J-band (8-18 GHz) is the radar element of the 9LV 200 fire-control system. It features two stabilised parabolic antennas: the 2,700 × 700 mm 9GA218 for search; and the monopulse cassegrain 9GA209 on the director for fire control. Both can be used in broadband frequency agility mode or in a fixed frequency mode for MTI operations. The director has an elevation of −25 to +85° and an angular speed of 85°/s in both azimuth and elevation.

The search element operates in D-band (1.01-1.11, 1.25-1.35 GHz) and I-band (8.5-9.6 GHz) with a pulse peak power of 200 kW and a frequency agility of 450 MHz. Horizontal beamwidths are 6-8° in D-band and 1° at I-band while vertical beamwidths are 20-25° at D-band and 3° at I-band. The antenna rotates at 30 or 60 rpm. The radar can conduct track-while-scan upon 16 surface targets simultaneously.

The fire-control element operates in J-band (15.9-17.1 GHz) at a pulse peak power of 65 kW and a frequency agility of 670 MHz. The horizontal beamwidth is 1.1° and the vertical one is 7°. The antenna rotates at up to 60 rpm.

Mk 95 tracker-illuminator

There are two Mk 95 tracker-illuminators: one is on the bridge roof, the other atop a small tower at the after end of the superstructure. Mk 95 consists of a Mk 78 radar director with separate transmitting and receiving antennas, a director controller (Mk 106) and a low-light TV camera (Mk 6) with 2.4 × 2.4° and 10 × 10° fields of view. The I-band radar directs the Sea Sparrow missile to fly a lead angle course to the intercept point enabling the ship to protect both itself and other ships in company. Inboard equipment includes a Mk 73 continuous wave illuminator transmitter, a signal data processor (Mk 17), a signal data converter (Mk 80) and a director controller (Mk 106). There is a radar set console (Mk 83), with Bell Aerospace low-light television monitor and a firing officer's console (Mk 86).

Terma Skanter Mil 009

The navigation radar is the Terma Skanter Mil 009. This set operates in the I/J-band and there are two horizontal slotted waveguide antennas on the yard-arms.

Specifications

Antenna: 4 m (13 ft) (I/J-band)
Polarisation: Horizontal
Horizontal beamwidth: <2.0°
Vertical beamwidth: 20° ±1°
Gain: >28.5 dB
Scanner rotation
(1 or 2 speed): Up to 30 rpm

Receiver/Transmitter unit
Transmitter frequency: 9,375 ±30 MHz (I/J-band)
PRF
Short pulse: Max 4,400 Hz
Long pulse: Max 2,200 Hz
Pulse length: 0.06 ±0.01/µs, or 0.6 ±0.1/µs
Peak power: 20 kW I/J-band; 25 kW E/F-band

Manufacturer/Contractor

Terma Elektronik, Lystrup, Denmark.

SONAR

GEC-Marconi PMS-26 hull-mounted passive sonar

PMS 26 is a self-contained system providing 360° coverage in four steps of 90° and may be manually controlled to cover a particular sector, or set to carry out automatic search procedure. It incorporates a 'maintenance of close contact' (MCC) facility for tracking close or deep targets. The single operator controls the sonar through a special console and is provided with three sources of sonar information: audio, visual Doppler, and visual sector.

The Doppler facility provides increased initial detection range and improved classification capabilities compared with conventional small ship sonars. The PMS 26 transducer array is mounted within a hull outfit with a retractable glass-reinforced plastic dome.

PMS-26 was designed specifically for use in smaller warships. Operating frequencies are 9.5, 10 and 10.5 kHz and effective range is of the order of 4-5 km.

Manufacturer/Contractor

GEC-Marconi Naval Systems, Sonar Systems Division, Templecombe, Somerset, UK

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 1 General Electric LM-2500 gas turbine; 18.35 MW (24,600 hp) sustained; 1 MTU 20 V 956 TB82 diesel; 3.83 MW ((5,210 hp(m)) sustained
Shafts: 2
Propellers: 2 SMM, five-bladed, cp
Auxiliary power: 2 Frichs/van Kaich 500 kW diesel generators; plus 1–5 kW diesel generator for emergency power

FURTHER INFORMATION

PROGRAMME

These ships could be classified as corvettes, but are classified by the Danish Navy as frigates and have 'F' pennant numbers. The contract for three ships was signed on 5 December 1975 and the ships entered service between 1979 and 1981.

DESIGN

The design was prepared under contract by Y-ARD (Yarrow - Admiralty Research Department) an independent consultancy based in Scotstoun, near Glasgow, in Scotland. The design was prepared against overriding time, cost and displacement constraints. Among the requirements were the ability to operate in all weather conditions, including specified icing in close conjunction with other Danish and NATO warships, and also to serve as task group flagship, if required. Operational characteristics required included a maximum continuous speed of 30 knots, and the ability to use all weapons, in a Force 6 wind. Other requirements included a cruise speed of 20 knots, a roll not exceeding 15°, an endurance of seven days, and the ability to operate and maintain speed in shallow waters.

There were three additional programme restraints. First, the lead ship had to be handed over by December 1978; second, the cost (including weapons) was not to exceed Kr150 million per ship at 1973 prices; and the displacement was not to exceed 1,300 tonnes. Finally, provision was to be made for future weapons and equipment to increase the displacement by 5 per cent.

Not surprisingly, the initial design study failed to meet this very ambitious requirement, exceeding the design displacement by some 300 tonnes. A rigorous re-examination resulted in reducing the main propulsion system to one gas turbine and one diesel on a single-shaft propulsion system, reducing the auxiliary power system from four to three diesel generators and reducing length and beam. Yet further study showed that the single-shaft configuration could cause excessive vibration, with a consequent influence on the stern-mounted SAM launcher, so the twin shaft arrangement was reinstated and the weight penalty accepted.

The result is a very small ship, with a 1,320 tonne full load displacement, but which nevertheless manages to accommodate a considerable number of weapons and sensor systems.

MODERNISATION

Having entered service between 1980 and 1982, these three ships have undergone periodic in-service improvements. The seaboat was replaced by a rigid inflatable in 1989 and the new NATO Sea Gnat launchers have also been installed. All three ships are about to undergo a mid-life update, with *Peter Tordenskiold* (F 356) due to complete in 1997, *Olfert Fischer* (F 355) in 1998; and *Niels Juel* (F 354) in 1999. The work will include installing the TST TRS-3D air search radar to replace the Plessey AWS-5 and other new communications equipment.

Various other plans have been shelved. It was planned from the start to fit ASW torpedo tubes (presumably, either US pattern Mk 33 or British STWS-1) but this has never happened. It was also intended to fit two ten-missile RAM launchers and a 9LV Mk 3 combat data system, but this, too, has been shelved.

The capability of these ships is constrained by their relatively small size. They mount a surprisingly wide variety of weaponry including a 76 mm gun, eight Harpoon SSMs, a Sea Sparrow SAM launcher and four 20 mm Oerlikons but, there are no reloads for the Sea Sparrow SAM system and ASW armament is limited to one depth-charge rack.

DEPLOYMENT

Olfert Fischer (F 355) took part in the Gulf operation in 1990-91.

Peter Tordenskiold *(F 356)* (R Dan N via Hans Harboe-Hansen)

GENERAL SPECIFICATIONS

Operator: Denmark

Class: THETIS

Built: 4
Active: 4

Displacement:
standard: 2,600 t
full load: 3,500 t

Dimensions
Length: 112.5 m (369.0 ft) (oa); 99.8 m (327.4 ft) (wl)
Beam: 14.4 m (47.2 ft)
Draught: 6.0 m (19.7 ft)

Speed: 20 kts; 8 kts on thrusters
Range: 8,500 n miles at 15.5 kts

Endurance: 124 days
Complement: 61 (11 officers) plus 12 spare berths

SHIPS

THETIS (F 357)
Builder Svenborg Skibsvaerft, Svenborg, Denmark
Laid down 10 Oct 1988
Launched 14 Jul 1989
Commissioned 1 Jul 1991

TRITON (F 358)
Builder Svenborg Skibsvaerft, Svenborg, Denmark
Laid down 27 Jun 1989
Launched 16 Mar 1990
Commissioned 2 Dec 1991

VAEDDEREN (F 359)
Builder Svenborg Skibsvaerft, Svenborg, Denmark
Laid down 19 Mar 1990
Launched 21 Dec 1990
Commissioned 9 Jun 1992

HVIDBJØRNEN (F 360)
Builder Svenborg Skibsvaerft, Svenborg, Denmark
Laid down 2 Jan 1991
Launched 11 Oct 1991
Commissioned 30 Nov 1992

WEAPONS SYSTEMS

GUNS

OTOBREDA 76 mm (3 in)/62 Super Rapid

There is one OTOBREDA 76 mm (3 in)/62 calibre Super Rapid gun in a single turret immediately forward of the bridge.

Specifications
Elevation: −15 to +85°
Training speed: 60°/s
Elevation speed: 35°/s
Muzzle velocity: 925 m/s (3,034 ft/s)
Rate of fire: 120 rds/min
Weight of shell: 6 kg (13.23 lb)
Range: 8.5 n miles (15.75 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Oerlikon 20 mm

One or two single Oerlikon 20 mm guns may be mounted.

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (3,800 ft)

Hvidbjørnen *(F 360), one of four Danish frigates/patrol ships. Gun armament is one 76 mm and consideration is being given to Harpoon and Sea Sparrow missiles* (Royal Danish Navy via Hans Harboe-Hansen)

Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +55°

DEPTH CHARGES

There are two rails in a stern compartment which can launch depth charges through a door in the transom.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Cutlass B1 ESM system

Cutlass B1 is designed for operation in very dense signal environments, receiving signals in the 1 to 18 GHz frequency range, measuring their parameters, comparing these with those in the radar library which contains the parameters of 2,000 radars, and displaying the information — all within one second. The EW operator is presented with a tabular display for threat identity and threat evaluation, and a tactical display giving a pictorial representation of the RF environment. Selected digital outputs can be sent to other local systems, and hard copy printout of the intercepted radar is also available. The tabular display can indicate 150 intercepts, in the order of priority. Cutlass is wide open in both bearing and frequency: that is, it does not employ sweep techniques, giving a very high intercept probability (nearly 100 per cent). Cutlass B1 uses the Cutlass processor and an Instantaneous Frequency Measurement (IFM) receiver. It has a 32-element array antenna to provide bearing measurement by phase analysis techniques. This antenna also provides RF for the IFM. In both systems the processor is provided with fast and accurate information on incoming pulses.

Specifications

Frequency coverage: 2-18 GHz (Cutlass B1); 0.6-18 GHz (Cutlass Type 242)

Cutlass B1
Accuracy: 2° RMS in bearing
Coverage: 360° azimuth; +40 to −10° elevation
Pulse density capability: 500,000/s
Radar store capacity: 2,000 modes

Cutlass Type 242
Accuracy: 3.5° RMS
Sensitivity: −60 dBm
Dynamic range: 60 dB
Coverage: 360° azimuth, +30 to −10° elevation
Pulse density capability: 1 Mpps
Radar store capacity: 2,000 modes

Manufacturer/Contractor

Racal Radar Defence Systems Ltd, Chessington, Surrey, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Terma TDS

The Terma Tactical Data System (TDS) is designed to meet the requirements of combat information systems for small and medium-sized surface warships. Its functions include: picture compilation, situation assessment, tactical manoeuvre calculations and weapons deployment. It provides a standard tactical datalink to exchange track and ESM information as well as plain text messages, utilising existing onboard radio equipment, but may also be supplied with NATO Link 11 or other customer-specified datalink. The system incorporates a Bofors 9LV 200 Mk 3 electro-optic director.

Manufacturer/Contractor

Terma Elektronik, Lystrup. Denmark.

SONAR

Thomson-CSF TSM 2643 (Salmon)

TSM 2643 (Salmon) sonar consists of an acoustic array of 24 staves housed in a streamlined fish, a towing winch, a transmitter and a receiver unit, and an operator console equipped with a multicolour display. Embedded facilities include passive listening, sound ray tracer, integrated onboard simulator, and an acoustic propagation prediction for the day and a recording system. There is also a hull-mounted transducer.

Specifications

Acoustic array: 24 identical staves of 7 transducers
Frequency: 19 kHz (approx)

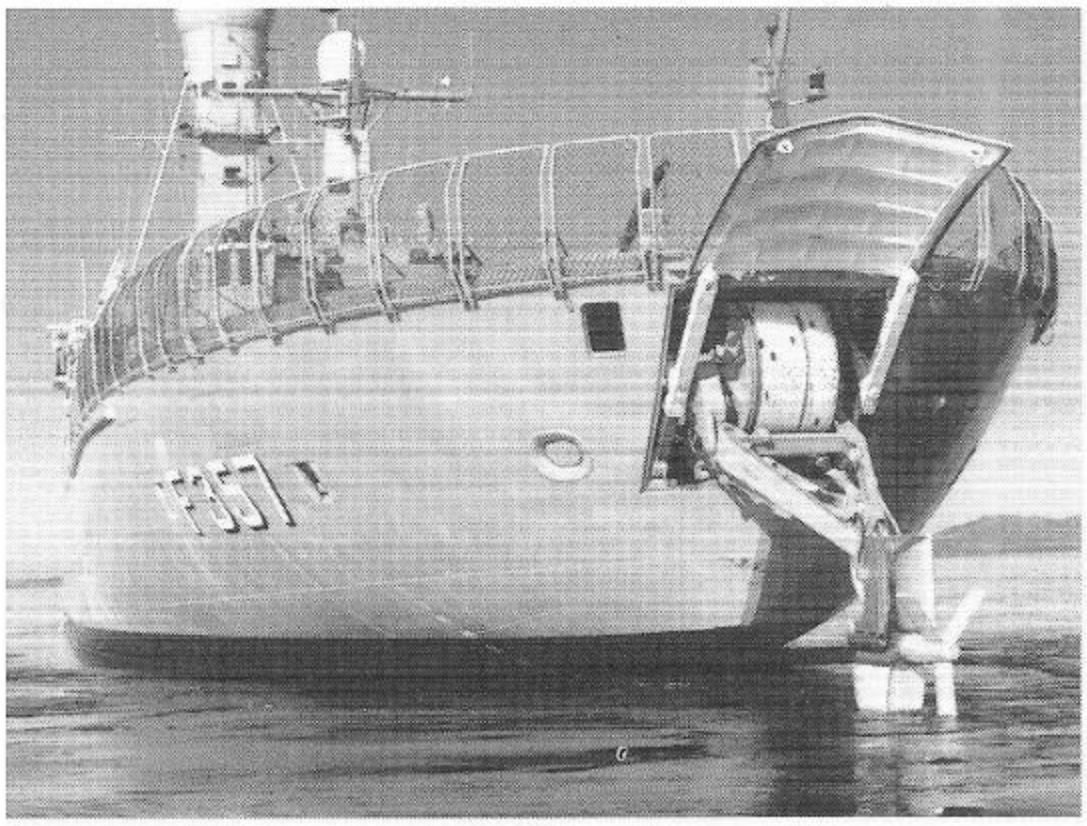
RADARS

Set	AWS-6	Scanter Mil	FR1505DA	9LV Mk 3
Company	Plessey	Terma	Furuno	CelsiusTech
Role	Air/surface search	Surface search	Navigation	Fire control
Band	G	I	I	I/J
Range	48 n miles (88 km)	—	—	
Beam	1.5°	1°		
Peak power	49 kW	20 kW		
Gain	29 dB	30 dB		
Pulsewidth	0.1/4.3 µs	0.06/0.6 µs		
PRF		4,400/2,200 pps		
Scan rate	30/30 rpm	24/48 rpm		

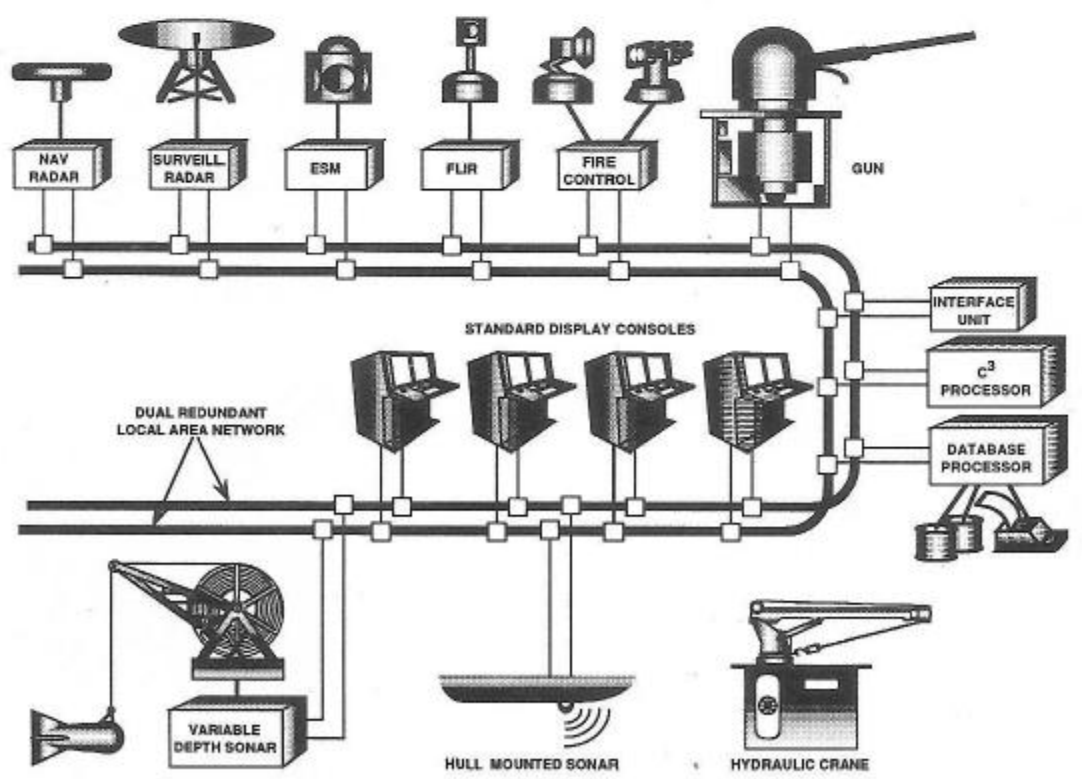
Transmitter: Omnidirectional transmission in CW or FM modes
Receiver: 36 preformed beams
Video processing: Data processing in FM and CW modes: automatic detection and tracking; simultaneous multitrack extraction (up to 64); target analysis (apparent length, Doppler measurement)
Display: 2 high-resolution flicker-free colour TV monitors

Manufacturer/Contractor

Thomson Sintra Activités Sous-Marines, Sophia Antipolis Cedex, France.



The Thomson-CSF Salmon VDS fish and drum aboard Thetis *(F 357)* (Royal Danish Navy)



A schematic view of the Terma TDS installed in the 'Thetis' class. There are dual redundent Ethernet (IEEE 802.3) databuses with a series of intelligent nodes. Programming language is Ada (Royal Danish Navy)

AVIATION

AVIATION FACILITIES

Specifications
Flight deck: 28 × 14 m (92 × 46 ft). The flight deck is strengthened to take helicopters up to Sea King or Merlin size
Helicopter: 1 Westland Lynx Mk 91

Westland Lynx Mk 19 aboard Hvidbjørnen *(F 360)* (H M Steele)

PROPULSION

Specifications
System: Diesel
Main machinery: 3 MAN/Burmeister & Wain Alpha 12V 28/32A diesels; 7.94 MW (10,800 hp(m)) sustained
Shafts: 1
Propellers: 1 KaMeWa cp
Thrusters: Brunvoll bow thruster, 647 kW (880 hp(m)); Brunvoll azimuth thruster, 800 kW (1,100 hp(m))
Ship services: 3 GM Detroit diesel/Volund generator sets, each 480 kW; one 127 kW emergency generator

FURTHER INFORMATION

PROGRAMME

The Royal Danish Navy has developed a particular type of vessel which is part patrol ship and part warship. The patrolling function stems from the Danish territories in Greenland and the Faroes, which involves fishery protection and EEZ surveillance, under extremely adverse conditions. The warship function requires a ship that can be used in keeping the narrow waters of the Baltic clear in times of crisis or war.

The four strong 'Hvidbjørnen' class was constructed between 1961 and 1963. These 'inspection vessels' displaced 1,650 tonnes and were armed with one 76 mm (3 in) gun, a depth-charge rack and an ASW helicopter (originally an Alouette, later a Lynx). The ships also had a radar suite and a sonar.

These were followed by *Beskytteren* (F 340), which was slightly larger and designated 'Modified Hvidbjørnen' class. It is still in service.

The 'Thetis' class was built to replace the 'Hvidbjørnen' class and a preliminary study by Y-ARD in 1986 led to Dwinger Marine Consultants being awarded the contract for a detailed design, which was completed in mid-1987. An order for all four was then placed in October 1987 and they were completed between 1991 and 1992.

The hull has an ice-breaking bow and is capable of proceeding through 80 cm (31 in) of ice. The smooth upper surfaces and rounded corners are designed to resist the formation of ice, although the total amount of ice allowed is 375 tonnes (Royal Danish Navy via Hans Harboe-Hansen)

DESIGN

The hull is some 30 m (98.43 ft) longer than the 'Hvidbjørnen' class to improve sea-keeping qualities and allow considerable extra space for additional armament. As with the contemporary Stanflex 300 design ('Flyvefisken' class) considerable use is made of containerisation, enabling equipment to be shipped depending on role.

The hull is ice strengthened to enable penetration of 1 m (3.28 ft) thick ice and there is a double skin up to 2 m (6.5 ft) above the waterline which is subdivided by ten watertight bulkheads. *Thetis* is regularly employed in seismological surveys off the Greenland coast and for this role a 4,000 m (13,124 ft) towed array has been installed in the stern. This is used to receive signals generated by pneumatic noise guns towed 800 m (2,625 ft) astern. The mast is of unusual design, with a very large radome for the Plessey AWS-6 and an elaborate lookout position. The bridge and operations room are combined.

Anchor equipment, bollards and winches are stowed below the upper deck, the sides are angled and corners rounded-off to minimise ice formation, but this also has 'stealth' benefits.

WEAPONS FIT

The design has built-in flexibility and weight allowances to enable it to be developed into a fully armed frigate in due course. The following systems have been considered: Harpoon, VLS Sea Sparrow, triple torpedo tubes, RAM, PDMS, SRBOC or Sea Gnat decoys, Nixie, fire-control radars and a passive sonar towed array.

DEPLOYMENT

The primary role for all four ships in peacetime is fishery protection. In addition, *Thetis* is employed for some three to four months in each year doing seismological surveys in the Greenland EEZ.

MODIFIED HVIDBJOERNEN

Beskytteren, the sole surviving 'Modified Hvidbjørnen' class ship is now used solely for patrol and fishery protection duties and will be included in the 'Patrol Ship' section.

COMANDANTE JOÃO BELO

WEAPONS SYSTEMS

TUBES

Following the mid-1990s modernisation these ships now have two triple 324 mm US Mk 32 torpedo tubes located in the waist, with one set on either beam.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

Manufacturer/Contractor
GEC-Marconi Naval Systems, UK.

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

100 mm Modèle 1953 multipurpose gun

As built, the ships had three 100 mm Modèle 1953 mountings in 'A,' 'X' and 'Y' positions. F 482 is being converted for non-military roles, but F 480, F 481 and F 483 have had 'X' turret removed. The remaining guns are all original Modèle 1953, a design which has been in service since 1959 and is normally operated in the fully automatic remote mode, although it can be operated manually in an emergency. The magazine is below the deck, the replenishment system consisting of a 10-cell loader drum feeding rounds directly to a hydraulically operated hoist, which lifts the round into the turret through a curved chute finally bringing it into a horizontal position; handling speed is 35 rds/min. The round is then transferred to a 10-round, hydraulically driven intermediate magazine which remains parallel to the elevating mass. Once the fuze has been set, the shell is transferred to a horizontal curved chute from where it is rammed into the open breech. After the gun has fired the expended cartridge is ejected downwards and through the front of the turret, while fresh water is automatically sprayed into the barrel together with a jet of compressed air. The total mounting capacity is 30 rounds; 10 in the loading drum, two in the hoist and 18 within the turret loading system.

Specifications
Calibre: 100 mm
Length of barrel: 55 calibres
Muzzle velocity: 1,870 m/s (6,133 ft/s)
Traverse: 360° at 40°/s
Elevation: −15 to +80° at 25°/s
Mounting weight: 21 t
Crew: 2 (optional) and 2 loaders
Range:
anti-surface: 9.15 n miles (17 km)
anti-air: 8,000 m (26,240 ft)
Rate of fire: 60 rds/min
Ammunition: 13.5 kg (30 lb) (multipurpose projectile); 9.7 kg (21.4 lb) (charge)

Manufacturers/Contractors
Direction des Constructions Navales (prime).
Mécanique Creusot-Loire, Marine Products (mounting).
DCN Ruelle (gun).
CSEE Défense (servo equipment).

Bofors 40 mm/60

Two Bofors 40 mm guns are mounted in single mounts abreast the stack.

Specifications
Gun
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity:
new barrel: 881 m/s (2,890 ft/s)
mid-life: 850 m/s (2,788 ft/s)
Rate of fire: 120 rds/min (cyclic)
Max range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,630 ft)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

ANTI-SUBMARINE MORTARS

The original 305 mm Mortier anti-submarine mortar which was mounted in 'B' position has been removed during modernisation.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Argo 700

An Argo 700 system has been installed during modernisation. This provides surveillance, radar warning and targeting information over the 2-18 GHz band.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher

There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units which have been fitted during modernisation.

Specifications

Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturers/Contractors

Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

AN/SLQ-25 Nixie noisemaker

One AN/SLQ-25 Nixie, solid-state, modular design electroacoustic countermeasures decoy system has been installed to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed through the transom. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm long (3.10 ft), 15.24 cm (6 in) in diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body at a time is deployed.

Manufacturer/Contractor

Aerojet ElectroSystems, Sacramento, California, USA.

Comandante Roberto Ivens *(F 482) in the mid-1980s showing the pre-modernisation weapons and sensors of the 'Comandante João Belo' class. Note the gun-like turret of the 304 mm ASW mortar in 'B' position* (Portuguese Navy)

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

SEWACO FD command and fire-control system

SEWACO FD (FD = Fully Distributed) is an automatic threat evaluation, weapon assignment and sensor allocation system, which can also be used as a planning aid through inputs of intelligence data and decision support facilities. SEWACO FD has been developed from the SEWACO system, with distributed processing power replacing the centralised computer complexes. The processing power is formed by SIGMA (SIGnaal Modular Architecture) nodes, one of which is built into every MOC (Multifunction Operator Console) and Bus Terminal Server (BTS). These SIGMA nodes consist of a number of SUN-1S type processor boards each with 16 Mbyte RAM and capable of 12.5 Mips. These nodes are housed in both Multifunction Operator Consoles (MOCs) and Bus Terminal Servers (BTS).

The software package is written in Ada but includes SPLICE (Subscription Paradigm for the Logical Interconnection of Concurrent Engines) distributed database and data communication modules, which operate alongside Unix. The hardware is linked through a dual Ethernet (IEEE 802.3) standard LAN (local area network), with subsystems either linked directly to the LAN through a digital data interface bustap, or through a BTSs interface. These BTS also have spare processing power which they bring into use automatically to compensate for failures in standard processor nodes.

Manufacturers/Contractors

Thomson-CSF, Systèmes Défense et Controle, France.
Hollandse Signaalapparaten BV, Netherlands.

COMMUNICATIONS AND DATALINKS

Link 11

Link 11 has been fitted during the recent refits.

WEAPONS CONTROL

CTA

CTA *(Conduit de Tir Analogue)* was the first of the French computer-based fire-control systems to enter service and it controls the ship's 100 mm guns in operations against air, surface and shore targets. These are designated by the ship's search radar through the combat information centre. CTA uses an analogue computer with CS-1 software language and a single four-axis optical director. The CTA is supported by DRBV-22 I-band monopulse radar, which can track a 0.1 m² target at 8 n miles (15 km). Presumably there is a digital/analogue interface to enable CTA and SEWACO FD to interoperate.

Manufacturer/Contractor

DCN International, Paris, France.

SAGEM DMAa optical secondary director

DMAa is an optical-only director for use in air defence operations.

Manufacturer/Contractor

SAGEM, France.

RADARS

Type	DRBV 22A	DRBV 50	KH 1007	DRBC 31D
Company	Thomson-CSF	Thomson-CSF	Kelvin Hughes	Thomson-CSF
Role	Air/surface search/target designation	Surface search	Navigation	Fire control for 100 mm guns
Band	D	G	I	I
Beam	2.5 × 50°		1.0 × 18°	
Peak power	2 MW		25 kW	
Gain	28 dB		31 dB	
Pulsewidth	2.5 µs		0.08/0.3/0.8 µs	
PRF	450 pps		1,600/800/400 pps	
Scan rate	7.5/15 rpm		26 rpm	

SONARS

AN/SQS-510(V) sonar

The Computing Devices of Canada (CDC) AN/SQS-510(V) is being installed in these three ships during their refits and will achieve commonality with the Portuguese Navy's 'Vasco da Gama' (MEKO) class frigates, which already have this sonar. AN/SQS-510(V) is a development of the Canadian Westinghouse AN/SQS-505 sonar, combined with the AN/SQR-501 towed array. The hull-mounted element is a 7 kHz medium-size search and attack sonar, which can be used in direct communication with a digital computer, either for the transfer of range and bearing information, or it can give assistance to the operator in detection and tracking. It is a deep water, omnidirectional, surveillance system, but is also able to operate in a directional mode that can maintain search ability while tracking defined targets. Three selectable frequencies are available so that several ships can survey an area in close proximity without cross-talk. The 'wet end' is AN/SQR-501 (also known as the Canadian Towed Sonar Array (CANTASS), which is itself a combination of a US Navy AN/SQR-19 array and a Computing Devices of Canada signal processor.

Specifications

AN/SQS-501
Coverage: 360° (azimuth)
Range: 183-3,000 m (200-3,200 yd)
Doppler range: ±40 kts (7.2 kHz)
Displays:
range: A Scan
bearing: B Scan
Doppler frequencies: 6.4, 7.2 and 8.0 kHz
Source levels: From 224.233 dB/µPa/m (transmission mode dependent)
Initial detection: 12 ping history of returns
Bearing accuracy: 1° RMS
Range accuracy: ±1% range reading
Transmission modes: Omni, TRDT, DT, ASPECT
Power level: High and low (10 dB reduction)

Manufacturers/Contractors

Computing Devices, Ottawa, Canada (prime and software).

PROPULSION

Specifications

System: Diesel
Main machinery: 4 SEMT-Pielstick 12 PC2.2 V 400 diesels; 11.8 MW (16,000 hp(m)) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These were the first French-designed ships to be acquired by the Portuguese Navy and were generally similar to the French 'Commandant Rivière' class, but with additional emphasis on the requirements of tropical service. The four ships were built in French yards between 1965 and 1969. There was a plan to give all the ships a major mid-life modernisation in the mid-1980s, but this was shelved for economic reasons, although some work was done. A new plan has, however, been agreed and the ships were modernised in the mid-1990s.

Comandante Roberto Ivens has been converted to become a non-combatant ship for employment on training and SAR roles. The other three will remain front-line units.

MODERNISATION

Although the major work for the 1980s modernisation was cancelled, the modernisation of external communications, sensors and electronics was undertaken between 1987 and 1990, which included fitting Mk 36 SRBOC.

Further work was undertaken between 1993 and 1996 which included replacing the hull sonar and torpedo tubes, removing the anti-submarine mortar, and fitting the Nixie torpedo decoy system. The ESM equipment was also updated.

In 1996/97 further work is being undertaken on the three front-line units, but not *Comandante Roberto Ivens.* This work is generally aimed at improving their ASW capability and includes installing a combat data system and Link 11 data communications enabling the ships to interoperate with the destroyers of the 'Vasco da Gama' class.

At least one ship, *Comandante Hermenegildo Capelo,* has had both 'B' and 'X' 100 mm mountings removed, and 'X' mounting is also scheduled to be removed in the other two. These steps will considerably reduce topweight, but a plan to remove both after 100 mm guns and replace them with either a flight deck and hangar for a helicopter or by SSM has been shelved.

Comandante João Belo, *name ship of the class of four in the Portuguese Navy* (D + B Teague)

Builder	Arsenal de Lorient, Lorient, France
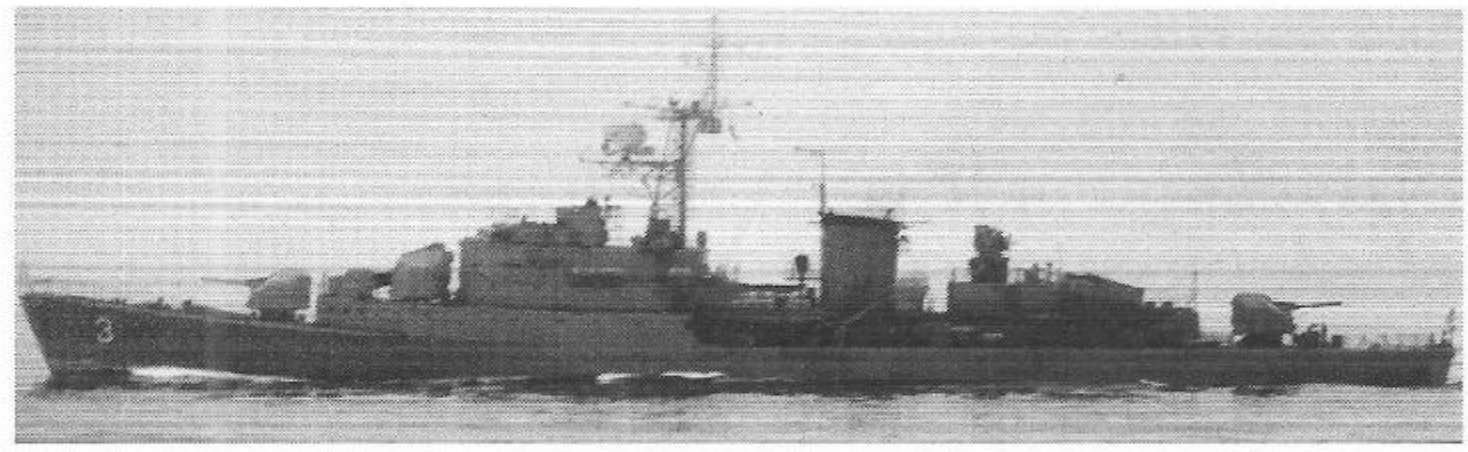
Laid down	Oct 1957
Launched	11 Oct 1958
Commissioned (France)	15 Oct 1962 (*Victor Schoelcher* (F 725))
Purchased by Uruguay	30 Sep 1988
Recommissioned (Uruguay)	9 Jan 1989 (*General Artigas* (2))



Montevideo *(3)*

MONTEVIDEO (3)*

Builder	Arsenal de Lorient, Lorient, France
Laid down	Nov 1958
Launched	12 Mar 1960
Commissioned (France)	14 Dec 1962 (*Amiral Charner* (F 727))
Purchased by Uruguay	14 Mar 1990
Recommissioned (Uruguay)	28 Jan 1991 (*Montevideo* (4))*

***Note**
On first commissioning in the Uruguayan Navy *Montevideo* had the pennant number '4' but this has subsequently been changed to '3'.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 38 medium-range anti-ship missile

The original Exocet missile launchers were removed in France prior to the transfer to Uruguay. Four ITS *(Installation de Tir Standard)* launchers per ship for MM 38 missiles were, however, reinstalled in 1992. These launcher-containers point outwards and are inclined at an angle of 12° to the horizontal. Targets are acquired by the ship's DRBV-22A radar and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence. This involves turning on the thermal battery, releasing the mechanical safety locks, igniting the booster, and, finally, breaking the umbilical cord; the total process takes some 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change of course during its flight. The attack consists of three phases: cruise, approach and terminal. A salvo may be fired in 12-20 seconds.

Specifications
MM 38
Length: 5.21 m (17 ft)
Diameter: 35 cm (13.8 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 2-22.5 n miles (4-42 km)
Guidance: Inertial and active radar
Sustainer motor: SNPE Eole alloy-cased CDB; weight 151 kg (333 lb); max burn time 93 s
Booster: 100 kg (220 lb) SNPE Epervier boost motor, burn time of 2.4 s.
Warhead: Luchaire 165 kg (364 lb) fragmentation warhead
Fuzes: delayed impact fuze and autopilot-controlled proximity fuze

Manufacturer/Contractor
Aerospatiale Tactical Missiles, Chatillon Cedex, France.

TUBES

There are two triple sets of 550 mm (21.6 in) tubes.

TORPEDOES

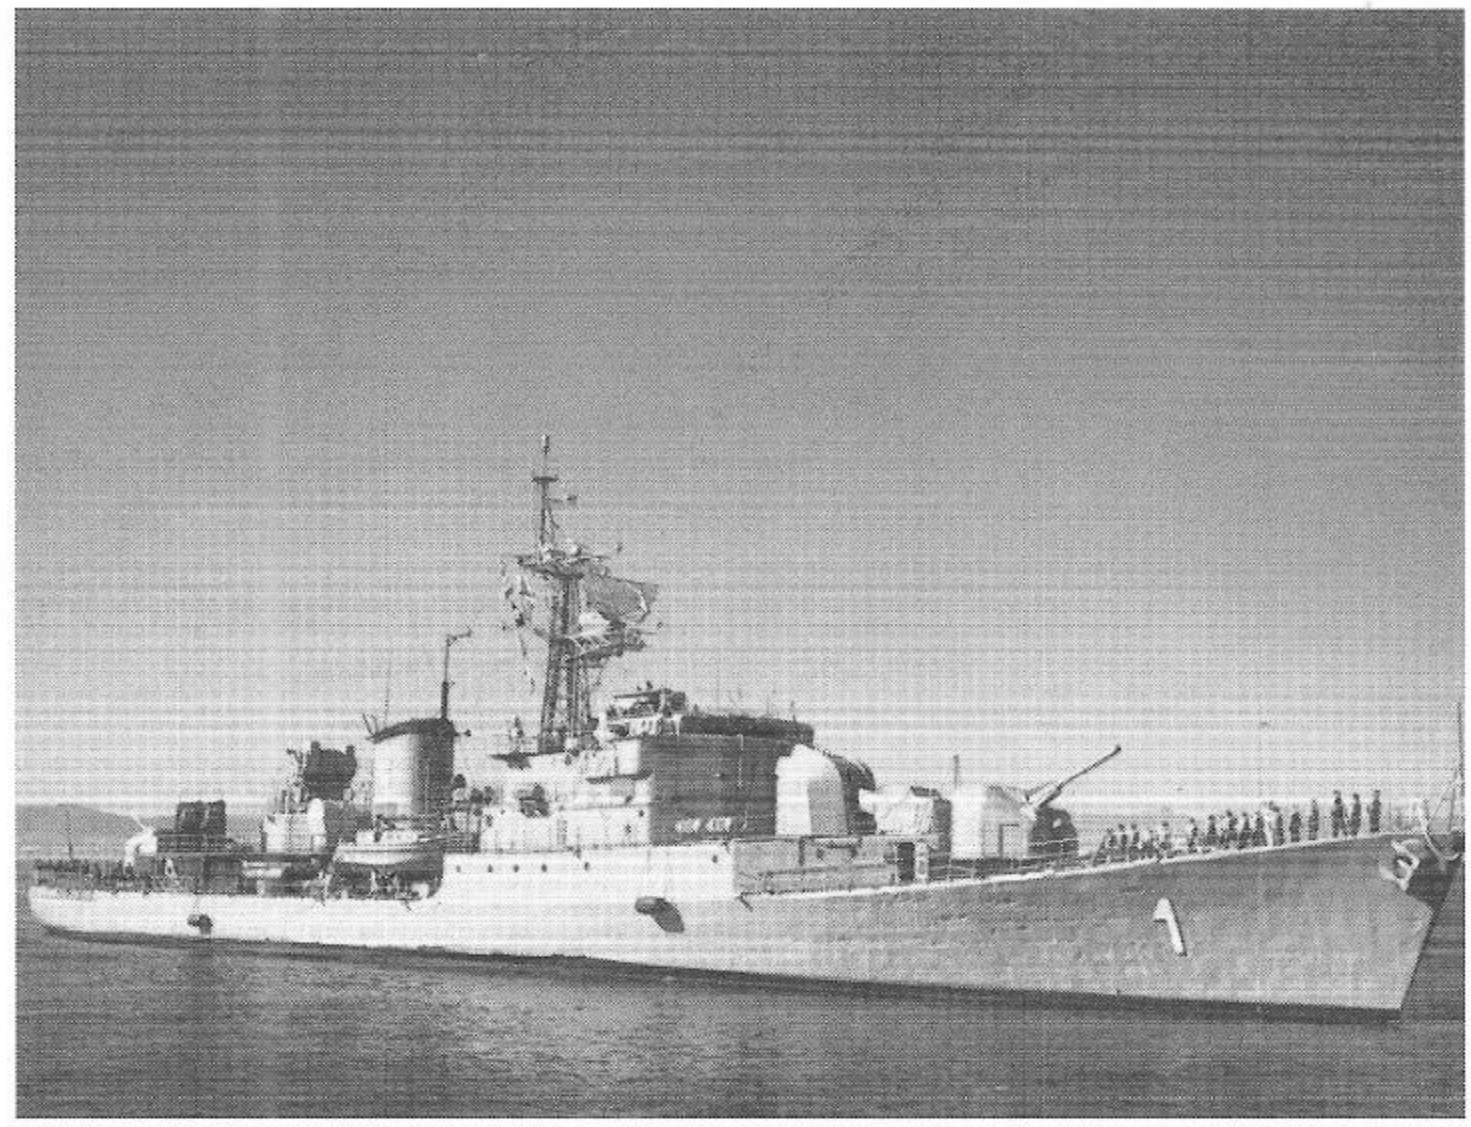
L3 heavyweight anti-submarine torpedo

These Uruguayan ships are among the last to use the French 550 mm (21.6 in) torpedoes. The L3 guidance system uses an active sonar seeker with a range of approximately 600 m (1,968 ft), behind which is the warhead with a 200 kg (441 lb) charge of Tolite A1 with

an impact fuze. The weapon can attack submarines moving at speeds up to 20 kts at a maximum depth of 300 m (984 lb). Distance and track data are provided by the fire-control system before discharge and upon leaving the tube the automatic pilot provides the appropriate heading and depth. Using this data the weapon travels some 2 n miles (4 km) as the onboard guidance system is warmed up, the latter being completed about 350 m (1,148 ft) before this phase is complete. The torpedo then begins the search phase adopting a zig-zag approach at an approach heading of 20° and the safety and arming mechanism is activated. The zig-zag approach is used so the seeker may cover a greater area. When the target is acquired, the onboard guidance system calculates the most effective ballistic course with the fuze detonating the warhead 3.5 seconds after the seeker has ensured the target is within 20 m (65.6 ft).

Specifications
Length: 4.3 m (14.1 ft)
Diameter: 550 mm (21.6 in)
Weight: 910 kg (2,006 lb)
Speed: 25 kts
Range: 3 n miles (5.5 km)
Depth: 300 m (984 ft)

Manufacturer/Contractor
DCN International, Paris, France.



Uruguay *(1), the former French* Commandant Bourdais, *is now the lead ship in a class of three in the Uruguayan Navy. The weapons and sensors are virtually the same as when in French service* (Peter Humphries)

GUNS

100 mm Modèle 1953 multipurpose gun
As built, the ships had three 100 mm Modèle 1953 mountings in the customary 'A,' 'X' and 'Y' positions, but the 'X' turret was subsequently removed to create space for the MM 38 launchers. The two guns in these three ships are both original Modèle 1953, a design which has been in service since 1959 and is normally operated in the fully automatic remote mode, although it can be operated manually in an emergency. The magazine is below the deck, the replenishment system consisting of a 10-cell loader drum feeding rounds directly to a hydraulically operated hoist, which lifts the round into the turret through a curved chute finally bringing it into a horizontal position; handling speed is 35 rds/min. The round is then transferred to a 10-round, hydraulically driven intermediate magazine which remains parallel to the elevating mass. Once the fuze has been set, the shell is transferred to a horizontal curved chute from where it is rammed into the open breech. After the gun has fired, the expended cartridge is ejected downwards and through the front of the turret, while fresh water is automatically sprayed into the barrel together with a jet of compressed air. The total mounting capacity is 30 rounds; 10 in the loading drum, two in the hoist and 18 within the turret loading system.

Specifications
Calibre: 100 mm
Length of barrel: 55 calibres
Muzzle velocity: 1,870 m/s (6,134 ft/s)
Traverse: 360° at 40°/s
Elevation: −15 to +80° at 25°/s
Mounting weight: 21 t
Crew: 2 (optional) and 2 loaders
Range:
anti-surface: 9.15 n miles (17 km)
anti-air: 8,000 m (26,240 ft)
Rate of fire: 60 rds/min
Ammunition: 13.5 kg (29.8 lb) (multipurpose projectile); 9.7 kg (21.4 lb) (charge)

Manufacturers/Contractors
Direction des Constructions Navales (prime).
Mécanique Creusot-Loire, Marine Products (mountings).
DCN Ruelle (gun).
CSEE Défense (servo equipment).

Hispano Suiza 30 mm/70
Each of these ships is armed with two single 30 mm/70 in power-operated, turreted mountings. These would appear to be CAS 62 mountings which were produced in the 1960s and installed in the 'Commandant Riviére' class as built but removed in the late 1970s and replaced by 40 mm mountings in all except *Victor Schoelcher* (F 725), *Balny* (F 729), *Protet* (F 748) and *Enseigne de Vaisseau Henry* (F 749).

Specifications
Calibre: 30 mm
Barrel length: 70 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Rate of fire: 600 rds/min
Range
max: 8,500 m (9,300 yd)
effective: 2,800 m (3,100 yd)
Elevation: −18 to +83° at 40°/s
Training: 360° at 50°/s

ANTI-SUBMARINE MORTARS

Mortier 305 mm ASW mortar
As built, all the Commandant Riviére and Comandante Joao Belo ships included a Mortier 305 mm ASW mortar in their armament, but this weapon has now been removed from all except for the four ships sold to Uruguay. The French Mortier is a 304 mm weapon and should not be confused with the contemporary 375 mm rocket launcher, which is also found on French ships of this period, and was built by Creusot-Loire under licence from Bofors.

The Mortier weapon is mounted in a turret, which in these ships is in 'B' position, and which, from a distance appears to be another gun turret. The weapon itself has four tubes and fires two types of bomb. The ASW bomb weighs 230 kg (507 lb) and has a range bracket of 400 to 2,750 m (1,312 to 9,020 ft), while that used for shore bombardment weighs 100 kg (220 lb) and has a maximum range of 6,000 m (19,680 ft). One salvo can be fired every 25 seconds, with the four tubes firing one second apart.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

ARBR 16 radar warning receiver
ARBR 16 is an analysis receiver associated with the Dagaie chaff system. It detects radio frequency signals (pulse, continuous wave and frequency hoppers) and compares them with a 1,000-signal library, giving an audio signal where analysis indicates that jamming is necessary. There is a single omnidirectional antenna plus six direction-finding antennas

Manufacturer/Contractor
Thomson-CSF, Paris Cedex, France.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

CTA
CTA *(Conduit de Tir Analogue)* was the first of the French computer-based fire-control systems to enter service and it controls the ship's 100 mm guns in operations against air, surface and shore targets. These are designated by the ship's search radar through the combat information centre. CTA uses an analogue computer with CS-1 software language and a single four-axis optical director. The CTA is supported by DRBC 32C I-band monopulse radar, which can track a 0.1 m^2 target at 8 n miles (15 km).

Manufacturer/Contractor
DCN International.

SAGEM DMAa optical secondary director
DMAa is an optical-only director for use in air defence operations.

Manufacturer/Contractor
SAGEM, France.

RADARS

Type	DRBV 22A	Type 1226	DRBC 32C
Company	Thomson-CSF	Racal-Decca	Thomson-CSF
Role	Air/surface search/target designation for MM 38	Surface search	Fire control for 100 mm guns

Scan rate	7.5/15 rpm	28 rpm	

SONARS

EDO AN/SQS-17

The AN/SQS-17 is a 1950s-vintage sonar, which was designed by EDO and built under licence in France. It is a hull-mounted, active search set, working at 12, 13 and 14 kHz, using a 24-stave 50 cm diameter array.

Thomson-CSF DUBA-3

The DUBA-3 is a searchlight, high-frequency, active attack sonar, which is used to control the Bofors ASW mortar. It occupies the same dome as the AN/SQS-17.

Manufacturer/Contractor
Thomson-CSF, Paris, Cedex, France.

PROPULSION

Specifications
System: 4 SEMT-Pielstick 12 PC series diesels; 11.8 MW; (16,000 hp(m))
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These are the largest warships ever operated by the Uruguayan Navy. The first one was bought from France through SOFMA on 30 September 1988, followed by the other two on 14 March 1990. All were refitted before transfer.

NAMES

The three ships have patriotic names of the country, the capital city and the hero of the war of independence. *Montevideo* was originally given the pennant number '4' but this was later changed to '3'.

STRUCTURE

Exocet and Dagaie were removed before transfer but the SSM casings were retained. Both systems were restored in 1991/92.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 38/40 medium-range anti-ship missile

As built, the ships were fitted for, but not with, Exocet, with the requisite base-plates mounted on the decks. Initially, two MM 38 Exocets were installed in a few ships, but the position now is that all carry either two MM 38 in metal ITS *(Installation de Tir Standard)* launchers or four MM 40 in glass-fibre ITL *(Installation de Tir Légère)* launchers.

TUBES

There are four fixed KU-64A torpedo tubes mounted at the forward end of the after deckhouse. There are no reloads.

TORPEDOES

ECAN L5 Mod 4 533 mm (21 in) torpedoes

L5 is an ASW torpedo, which can be used for direct or indirect attacks. The weapon is of conventional design with a light alloy body, four fins and twin contrarotating propellers, and a blunt nose made of a laminated material. The torpedo is electrically propelled using silver/zinc batteries. They have passive/active seekers which have various operating modes including direct attack or programmed search.

Specifications
Mod 4
Length: 4.4 m (14.43 ft)
Diameter: 533.4 mm (21 in)
Weight: 935 kg (2,061 lb)
Speed: 35 kts
Range: 5 n miles (9.54 km)
Depth: 555 m (1,820 ft)
Warhead: 150 kg (331 lb)

Manufacturers/Contractors
DCN International (prime).
ECAN, Saint Tropez, France.

GUNS

100 mm/55 Modèle 1968 CADAM

There is one single 100 mm/55 Modèle 1968-II CADAM dual-purpose mounting located on the foredeck. This is normally operated in the fully automatic remote mode with an unmanned turret, although there is a fall-back manual mode, which requires two men in the turret. The turrets have been taken from an old ship and upgraded to CADAM (CADence AMéliorée) standard with improved recoil and feed systems, raising the firing rate from 60 rds/min to 78 rds/min.

Specifications
Calibre: 100 mm
Length of barrel: 55 calibres
Muzzle velocity: 870 m/s (2,854 ft/s)
Traverse: 360° at 40°/s
Elevation: −15 to +80° at 25°/s
Crew: 2 (optional) and 2 loaders
Range:
anti-surface: 9.15 n miles (17 km)
anti-air: 8,000 m (26,000 ft)

Specifications

	MM 38	MM 40 Block 1	MM 40 Block 2
Length	5.21 m (17 ft)	5.78 m (19 ft)	5.80 m (19 ft)
Diameter	35 cm (13.8 in)	35 cm (13.8 in)	35 cm (13.8 in)
Wing span	1.00 m (3.28 ft)	1.13 m (3.7 ft)	1.13 m (3.7 ft)
Weight	735 kg (1,620 lb)	855 kg (1,885 lb)	870 kg (1,918 lb)
Speed	Mach 0.9	Mach 0.9	Mach 0.9
Range	2-22.5 n miles (4-42 km)	2-38 n miles (4-70 km)	2-40.5 n miles (4-75 km)
Warhead	165 kg (364 lb) HE frag	165 kg (364 lb) HE frag	155 kg (342 lb) HE frag
Fuze	Delayed impact/ proximity (autopilot-controlled)	Delayed impact/ proximity	Impact/proximity
Guidance	Inertial and active radar	Inertial and active radar	Inertial and active radar

Rate of fire: 78 rds/min
Ammunition: 13.5 kg (28 lb) (multipurpose projectile); 9.7 kg (21.4 lb) (charge)

Manufacturers/Contractors
Direction des Constructions Navales (DCN) (prime).
Mécanique Creusot-Loire, Marine Products (mountings).
DCN Ruelle (gun).
CSEE Défense (servo equipment).

GIAT 20 mm F2 Type A (M 693) multipurpose cannon

There are two manually operated 20 mm cannon either side of the deckhouse immediately before the mack.

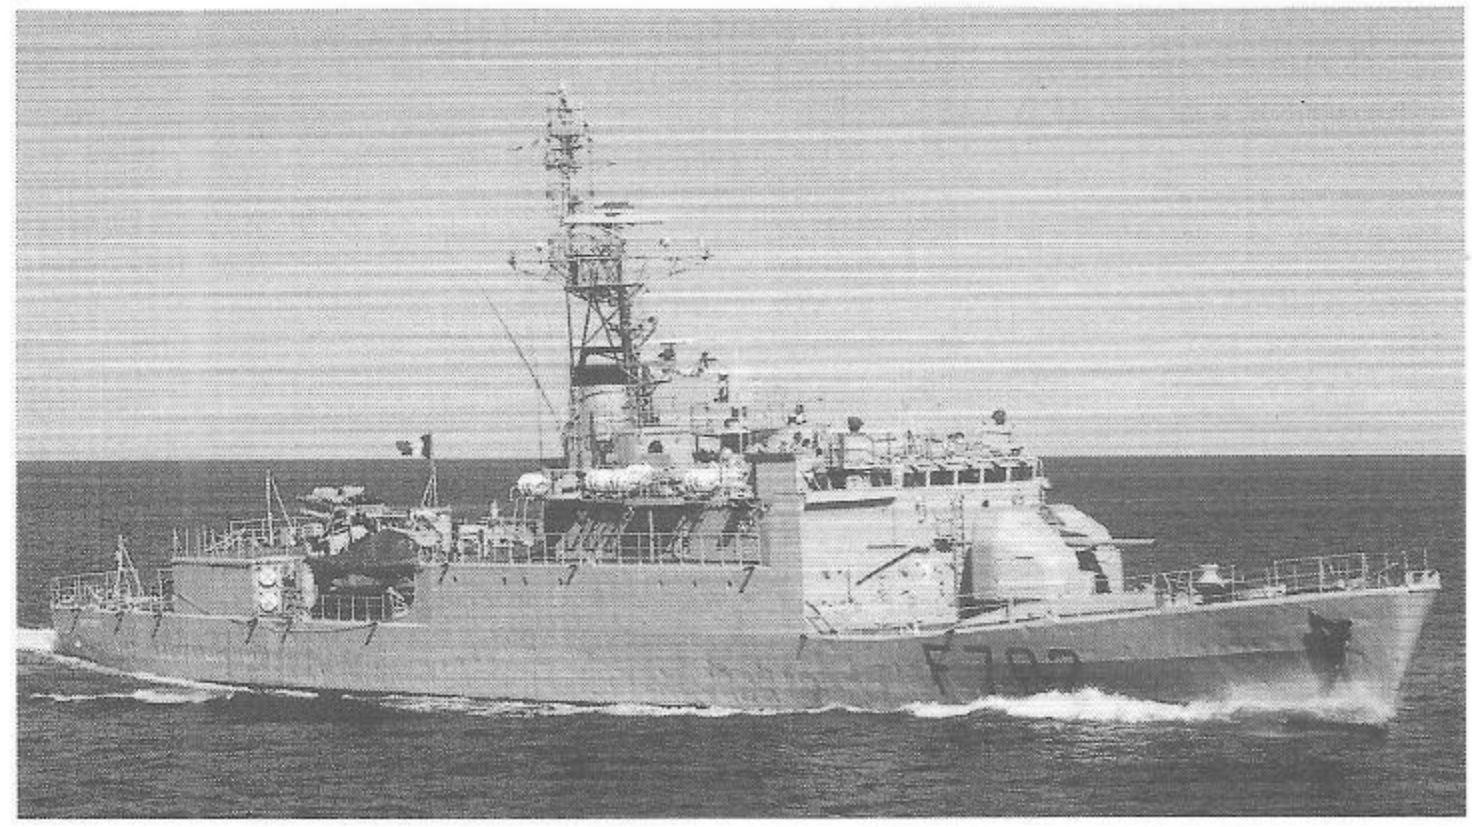
Specifications
Calibre: 20 mm
Length of barrel: 90 calibres
Rate of fire: 720 rds/min
Muzzle velocity: 1,050-1,250 m/s (3,445-4,100 ft/s)
Traverse: 325°
Elevation: −15 to +80°
Weight of shell: 0.25 kg (0.55 lb)
Crew: 2
Range: 3.5-5.5 n miles (6.75-10 km)

Manufacturer/Contractor
Giat, France.

M2HB 12.7 mm machine guns

There are four Creusot-Loire P127A mounts for M2HB 12.7 mm machine guns. The mounting is a simple, adjustable pintle type on top of a steel tube with four braces at its base, which are bolted to the deck.

Specifications
Calibre: 12.7 mm (0.50 in)
Rate of fire: 450-550 rds/min



Amyot d'Inville *(F 782). These ships are well armed for their size, including a 100 mm gun on the foredeck, 375 mm ASW mortar aft and four 533 mm torpedo tubes (two at each forward corner of the after deckhouse)* (French Navy)

Muzzle velocity: 883 m/s (2,900 ft/s)
Max effective range:
anti-surface: 6,700 m (7,400 yd)
anti-airborne: 1,380 m (4,500 ft)

ANTI-SUBMARINE MORTARS

Creusot Loire 375 mm Modèle 54 6-tubed ASW mortar

There is a single, six-tube Type 71 ASW rocket launcher mounted on the roof of the after deck house. This has, however, already been removed from F 792, F 793, F 794 and will be removed from the others in due course. The Creusot Loire Modèle 54 is a licence-produced adaptation of the Bofors 375 mm rocket system. The system consists of a rocket launcher, a handling system, the ship sonar and a fire-control system.

The Modèle 54 has six launch tubes mounted in an arc with the hydraulic laying machinery underneath and a flame deflector in the rear. Each system features an automatic electrohydraulic handling system. The 72 rounds are stored vertically in a magazine two decks under the mounting and selected by an operator. A grab on a roof-mounted rail picks up the round by the nose and transfers it to the loading table. A hoist brings the rounds up a hoist, passing vertically through the torpedo compartment, and then through the deck hatch to where the launch tubes have been elevated to their loading position. The rounds are then inserted through the rear of the launch tube. The magazine holds 72 rounds and reload time is three minutes, each tube being loaded separately. The rate of fire is one round a second and rockets may be fired singly or in salvos. There are two types of rocket, both with Hexotonal filling. The Type E (Erika) rocket has Stidar time and impact fuzes, while the Type N (Nelli) uses the Zambo proximity and impact fuzes.

Specifications

Launcher
Tubes: 4
Traverse: 260° at 18°/s
Elevation: −15 to +90° at 18°/s
Crew: 4

Rockets

	Type E	Type N
Weight	250 kg (551 lb)	230 kg (507 lb)
Muzzle velocity	130 m/s (427 ft/s)	205 m/s (673 ft/s)
Explosive weight	107 kg (236 lb)	80 kg (176 lb)
Range	0.35-0.87 n miles (0.65-1.63 km)	0.85-2.11 n miles (1.58-3.62 km)
Sinking speed	10.7 m/s (35.1 ft/s)	9.2 m/s (30.2 ft/s)

Manufacturer/Contractor

Mécanique Creusot-Loire, France.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

ARBR 16 radar warning receiver

ARBR 16 is an analysis receiver associated with the Dagaie chaff system (see above). It detects radio frequency signals (pulse, continuous wave and frequency hoppers) and compares them with a 1,000-signal library, giving an audio signal where analysis indicates that jamming is necessary. There is a single omnidirectional antenna plus six direction-finding antennas

Manufacturer/Contractor

Thomson-CSF, Paris Cedex, France.

ELECTRONIC COUNTERMEASURES (ECM)

DAGAIE countermeasures system

There are two DAGAIE ten-barrelled, trainable launchers mounted on top of the bridge structure, just forward of the DRBC-32E director, which can be loaded with either IR or chaff rockets. The firing sequence runs automatically, once triggered by a missile alarm from a variety of sources, such as radar, ESM systems, or optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, windspeed and direction, ship heading and speed data.

The launching of radar and IR decoys is so arranged that advanced mixed-guidance missile systems cannot discriminate them and thus collocation of both decoys is achieved. The installation is a double mounting and comprises two trainable mountings carrying 10 replaceable containers (suitcases), each of which is loaded with either 3-5 and 8-14 µm IR or I/J-band chaff projectiles.

A wide range of ammunition is provided by Etienne Lacroix Défense providing seduction, distraction and seduction/dissimulation modes. The electromagnetic decoys are normally based upon aluminised fibreglass chaff with rapid bloom time and they cover the I and J frequency bands. The infra-red decoys cover both the 3-5 and the 8-14 µm bands.

Specifications

Traverse: 330° at 21°/s
Average reaction time: Within 4 s
REM rocket dimensions: 850 × 127 mm (33.5 × 5 in)
Rocket weight: 13 kg (28.66 lb)
Container dimensions: 900 × 130 mm (35.4 × 5.1 in)
Container weight: 20 kg (44.1 lb)
LIR/LEM container dimensions: 780 × 630 × 134 mm (30 × 24.8 × 5.3 in)

Manufacturer/Contractor

CSEE Défense, Paris, France.

DECOYS

AN/SLQ-25 Nixie noisemaker

All ships carry one AN/SLQ-25 Nixie solid-state, modular design electroacoustic countermeasures decoy system, which is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed through the transom or in a partially or totally enclosed location on the main deck. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm long (3.10 ft), 15.24 cm (6 in) in diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body at a time is deployed.

Manufacturer/Contractor

Aerojet ElectroSystems, Sacramento, California, USA.

COMMAND AND CONTROL SYSTEMS

COMMUNICATIONS AND DATALINKS

Syracuse II Satcom

Three ships — *Commandant Blaison* (F 793), *Enseigne de Vaisseau Jacoubet* (F 794) and *Premier Maitre l'Her* (F 792) — have had the Creusot-Loire Modèle 54 ASW mortar removed and replaced by a large pedestal mount for a SYRACUSE II Satcom antenna.

Inmarsat

Several ships have been observed (for example, *Drogou* (F 783)) with a small Inmarsat radome, immediately before (but not in place of) the Modèle 54 ASW mortar.

WEAPONS CONTROL

Thomson-CSF VEGA command and weapon control system

The Vega command and weapon control system uses the DRBV 51A search and the DRBC 32E fire-control radars to provide versatility and resistance to enemy ECM through the use of different frequency bands, with both radars featuring linear digital filtering for improved performance and reliability. DRBV 51A (also known as Triton II) is used for air/surface search, target designation and navigation (although there is also a DRBN 32 (Decca 1226)), with a roll-stabilised antenna. It is claimed to detect a 2 m² air target at distances of 16 n miles (30 km) and altitudes of 6,000 m, while 10 m² surface targets can be detected at 24.25 n miles (45 km). The DRBV-51A can be used for fire-control purposes, but this task is normally allocated to the DRBC 32E. Reaction time is 6 seconds in automatic mode and 12 seconds in semi-automatic mode. However, the track-while-scan capability is limited to two targets.

Manufacturer/Contractor

Thomson-CSF.

DLT-4D torpedo fire-control system

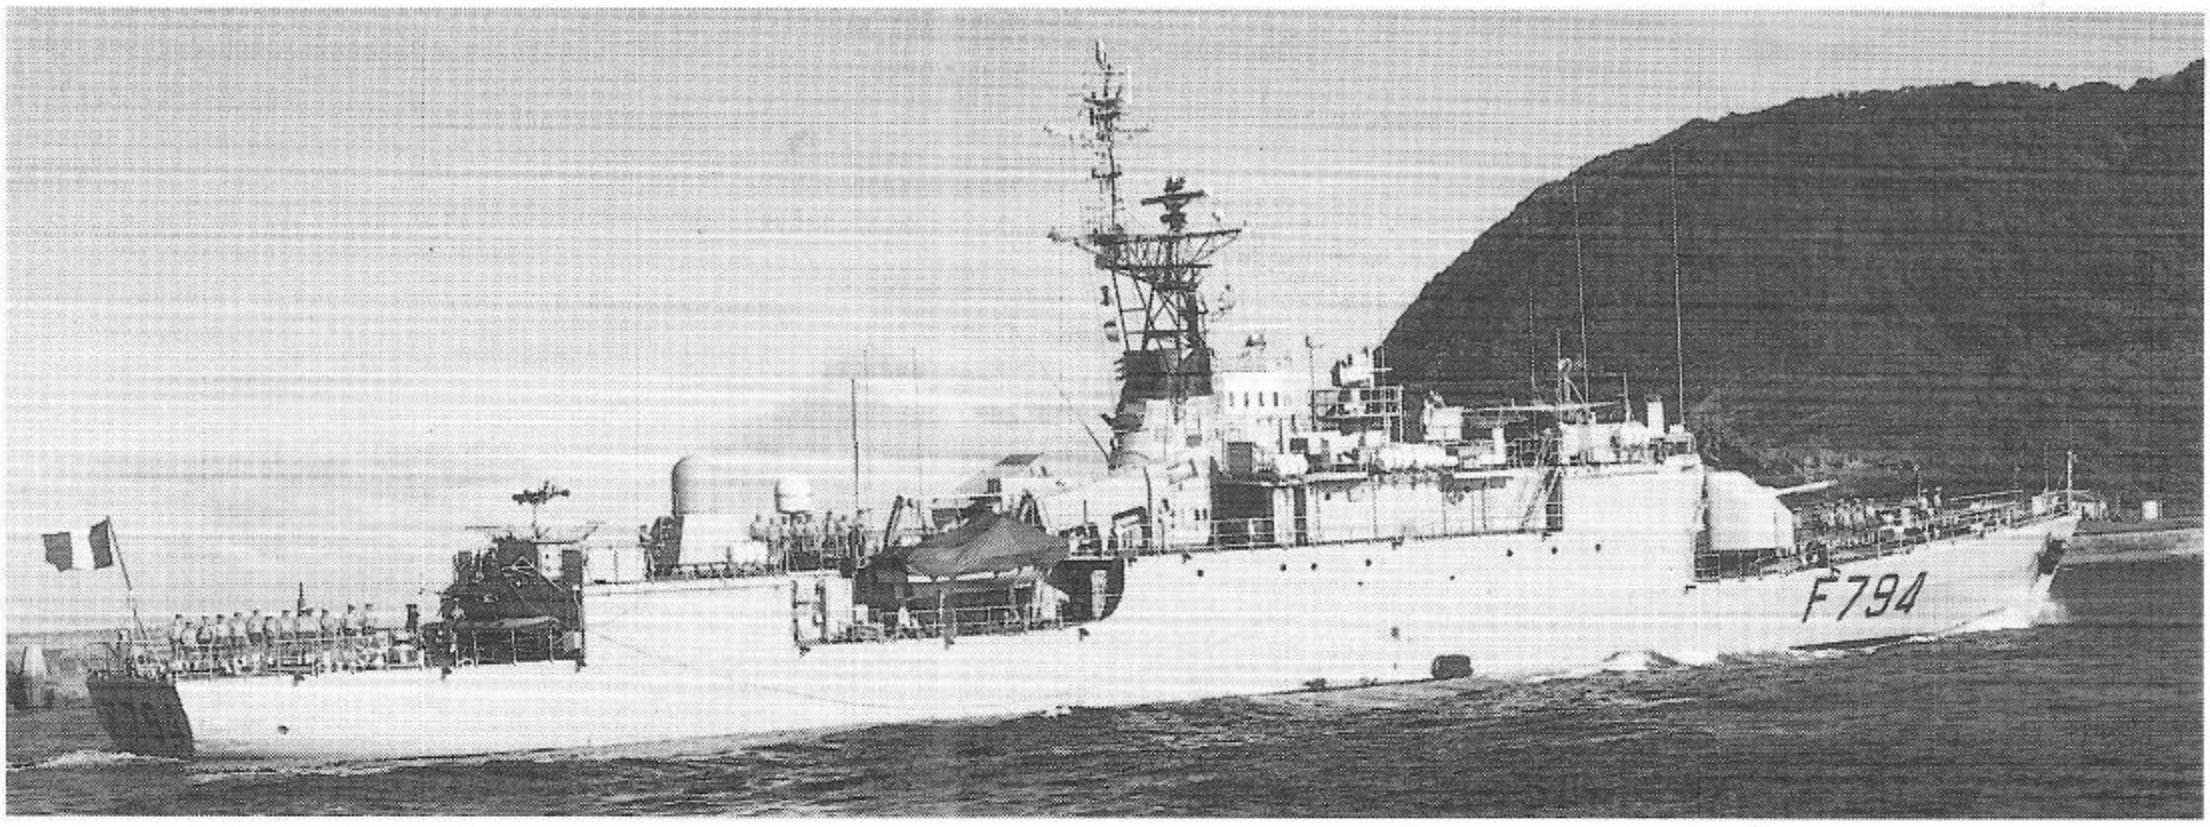
DLT-4D *(Direction de Lancement de Torpilles)* torpedo fire-control systems are installed in all ships of the class. This consists of a torpedo launch control station in the combat information centre and interface boxes which provide the electrical supply and control links to the mechanical elements. The control console has a single display. Sonar data is received in the launch control station where it is processed. The most suitable tube or tubes are then selected and ballistic data is calculated before being transmitted to the weapon. The data provided includes gyro-deflection angle, time of trajectory and target depth.

Manufacturer/Contractor

Thomson-CSF, Paris Cedex, France.

CSEE Panda Mk 2 optical director

These ships are fitted with Panda Mk 2 autonomous deck-mounted optical directors for use in air defence operations. Panda rotates through a nominal 360° and consists of the binocular optical unit with auxiliary sight, gyrometric units, bearing and elevation electrical units, servo controls, a ballistics computer, and control and communications units. The optical sensor offers ×8 and ×2.5 magnification with fields of view of 19° and 6° respectively and operates in two modes: surveillance/



Enseigne de Vaisseau Jacoubet *(F 794). Note that this ship has a large radome for the Syracuse French national satellite system on the roof of the after deckhouse, displacing the 375 mm ASW mortar normally carried. The usual Inmarsat radome is, however, retained as well* (H & L van Ginderen Collection)

target tracking and fire control. In the former the target may be designated by the ship's radar and the director slews to face it. The target is acquired visually, identified and then tracked by the operator who moves the director with a joystick. In fire-control mode the operator selects air or surface engagement and inserts target range data. The relevant guns are then slaved to the director whose operator then conducts the engagement. Panda Mk 2 is a development of Panda Mk 1, in which the Mk 1's purely optical system is supplemented by a low-light television camera.

Specifications
Panda
Height: 1.35 m (4.43 ft)
Width: 1.5 m (4.92 ft)
Weight: 480 kg (1,058 lb)
Elevation: −25 to +65°
Max velocity
traverse: 60°/s
elevation: 60°/s

Manufacturer/Contractor
CSEE Défense, France.

SONARS

DUBA 25 hull-mounted active panoramic sonar system
The DUBA 25 Tarpon (TSM-2400) hull-mounted, medium-frequency, active, attack sonar is fitted only in this class of ships. It provides them with all-round surveillance, acquisition and attack facilities for ASW operations. The power employed is sufficient for operating ranges of several kilometres. The transducer array consists of 36 staves arranged to form a cylinder 115 cm (45 in) in diameter and provided with roll stabilisation. The array is housed in a fixed keel dome which is located just forward of amidships. Operating frequencies are 8 kHz, 9 kHz and 10 kHz and the system was designed specifically for use in depths of less than 200 m (656 ft).

Manufacturer/Contractor
Thomson Sintra Activités Sous-Marines, Sophia Antipolis Cedex, France.

PROPULSION

Specifications
System: Diesel
Main machinery:
all except F 791: 2 SEMT-Pielstick 12 PC2 V 400 diesels; 8.82 MW (12,000 hp(m)); 2 shafts; cp props
***Commandant L'Herminier* (F-791):** 2 SEMT-Pielstick 12 PA6 V 280 BTC diesels; 10.6 MW (14,400 hp(m)) sustained
Auxiliary power: 2–320 kW diesel alternators; 1–200 kW alternator
Shafts: 2
Propellers: cp

Commandant L'Herminier *(F 791). Alone in the class, this ship is powered by two SEMT-Pielstick 12PA6 BTC diesels* (French Navy)

FURTHER INFORMATION

PROGRAMME

This class was the fourth in a series of designs known in the French Navy as 'Avisos.' It was originally intended that there should be two types with a common hull: Type A 69 for coastal ASW, and the Type A 70 for surface operations, with a heavier anti-ship missile armament. An eventual total of 35 ships was planned which would have replaced the 'Le Corse' (E 50), 'Le Normand' (E 52) and 'Commandant Riviére' classes. In the event, only the Type A 69 was built.

The initial order was for 14 Type A 69, which was followed by an order for another three. The South African Navy then ordered two and, in order to achieve a prompt delivery, two ships already under construction for the French Navy, *Le Henaff* and *L'Herminiere,* were allocated. This order was, however, cancelled by the French Government to comply with the UN embargo and the two ships were subsequently sold to Argentina (see next entry). Meanwhile, two further hulls had been laid down to complete the French Navy's order for 17, and these were given the same names and hull numbers as those originally held by the two sold overseas.

TYPE

The designation 'aviso' is unique to the French Navy and is derived from the Spanish term *'barca de aviso,'* which translates literally as 'boat of notice'. Historically, these were small, fast vessels used to carry messages overseas and the term developed in French usage into a small vessel used for overseas missions and escort duties. The type is approximately equivalent to the British 'sloop' which displaced some 1,000-2,000 tonnes and was intended as a general purpose unit for use in colonial territories.

DESIGN

The Type A 69 is designed to undertake anti-submarine warfare in coastal waters (inside the 200 m line) and lengthy patrols in colonial waters. They are also required to be used in sea training. The emphasis in the operational requirement is endurance rather than speed. The result is a maximum speed of 23 kts, but a range of 4,500 n miles at 15 kts and an endurance of 30 days.

Everything about the ships emphasises simplicity, ruggedness and reliability, all of which are of especial importance for their deployments in distant waters, where the ships must be self-reliant for long periods.

Problems were experienced with the exhaust gases in the first four ships which led to the raising of the stack in *Jean Moulin* (F 785) and subsequent ships. This proved successful and the modification was later retrofitted to the earlier ships, as well.

At one stage there was a proposal to install a flight deck and hangar for a Dauphin helicopter in *Commandant Blaison* (F 793) and *Enseigne de Vaisseau Jacoubet* (F 794). Adaptable as these small ships are, it appears that this would have stretched them beyond their limits, and the plan was shelved.

TROOP ACCOMMODATION

Part of the duties of an 'aviso' is the ability, in distant water, to deploy a small party of troops to deal with minor colonial troubles. It was thus intended that there should be accommodation for a landing party of one officer and 17 soldiers, but this appears not to have been implemented, as in the 1990s a modification was made to introduce accommodation for nine soldiers in some of the class.

PROPULSION TRIALS

As two ships already laid down for the French order were diverted to meet foreign sales (see above) two more ships had to be laid down for the French Navy. It was decided to take this unexpected opportunity to use the second of these, *Commandant L'Herminier* (F 791), to test the new engines which were to be fitted in the 'Cassard' (C 70AA) class. Thus, this ship alone among the 'avisos' is powered by two SEMT-Pielstick 12 PA 6 BTC diesels, with infra-red suppressors. It will be noted in the 'Ships' section above that this ship took no less than five years between launching and commissioning, compared with 1-2 years for the remainder, and this was primarily due to problems experienced with the engine installation.

MODERNISATION

The class underwent a mid-life modernisation during the late 1980s. The work included fitting facilities for MM38/40 Exocet, upgrading the 100 mm guns to CADAM standard and installing AN/ALQ-25 Nixie.

DEPLOYMENT

Ten are normally assigned to GASM, the remainder to Commander Mediterranean Flotilla or abroad.

SALES

Two were originally sold to South Africa, but were eventually sold to Argentina, together with a third — see Guerrico.

FUTURE

The service lives of these ships has been extended to 2000 and beyond.

A French Navy Alouette III carrying out a VERTREP (vertical replenishment) on the quarterdeck of Amyot d'Inville *(F 782)* (French Navy)

Launched	28 Jun 1980
Completed	22 Jun 1981

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 38 medium-range anti-ship missile

There are four Aerospatiale MM 38 Exocets in two sets of twin launchers immediately abaft the mack in individual ITS *(Installation de Tir Standard)* launcher-containers. Two launchers point to port, two to starboard. Targets are acquired by the ship's DRBV-15A search radar and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence. This involves turning on the thermal battery, releasing the mechanical safety locks, igniting the booster, and, finally, breaking the umbilical cord; the total process takes some 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change of course during its flight.

The attack consists of three phases:

Cruise phase. The cruise phase starts as the missile clears the container and the missile, powered by the sustainer motor, flies towards the general location of the target at a height of about 100 m which is low enough to reduce the chance of detection but adequate for target acquisition. This phase can be as long as 22 km and ends when the seeker acquires the target. This seeker is a Dassault Electronique ADAC (Auto Directeur Anti-Clutter) active monopulse radar, working in the I-band (8-10 GHz), which has a typical range of 13 n miles (24 km) against FACs.

Approach phase. On detecting the target the missile descends to 9-15 m (30-50 ft) in the approach phase.

Terminal phase. During this final phase the missile descends to 8 m (26 ft) (2-5 m (6-6.16 ft) in a calm sea) for a sea-skimming run in to the target.

A salvo may be fired in 12-20 seconds.

Specifications

MM 38
Length: 5.21 m (17.1 ft)
Diameter: 35 cm (13.8 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 2-22.5 n miles (4-42 km)
Guidance: Inertial and active radar
Sustainer motor: SNPE Eole alloy-cased CDB; weight 151 kg (333 lb); max burn time 93 s
Booster: SNPE Epervier boost motor, weight 100 kg, burn time of 2.4 s
Warhead: Luchaire 165 kg (364 lb) fragmentation warhead
Fuzes: Delayed impact fuze and autopilot-controlled proximity fuze

Manufacturer/Contractor

Aerospatiale Tactical Missiles, Chatillon Cedex, France.

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited on the quarterdeck.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

A244/S lightweight air-/surface-launched anti-submarine weapon

The Whitehead A244/S torpedo has an Alenia CIACIO-S seeker, capable of active, passive or mixed modes, which can discriminate between decoys and real targets in the presence of heavy reverberations, using specially emitted pulses and signal processing. It has a series of programmable search patterns and tactical manoeuvres (including re-attack procedures). The seeker has a large search volume covered by multiple preformed beams following a number of self-adaptive search patterns and is reported capable of target detection at −5 dB in good acoustic conditions. The computerised homing system also provides for presettable combinations of signal processing, spatial filtering and tactical torpedo manoeuvring. The software can be reprogrammed to meet new tactical conditions. Upon launching the A244/S initially steers a straight course and, if the target is not detected, it starts searching using either a spiral pattern between preselected depths or a helix.

Specifications
Length: 2.7 m (8.86 ft)
Diameter: 324 mm (12.75 in)
Weight: 215 kg (474 lb) (warshot version)
Warhead: 34 kg (75 lb) shaped charge HBX-3 HE
Propulsion: Electric; silver/zinc batteries
Range: 3.5 n miles (6 km)
Speed: 30 kts
Guidance: Active/passive sonar, self-adaptive programmed patterns

Manufacturer/Contractor
Whitehead SpA, Salviano, Italy.

GUNS

100 mm/55 Modèle 1968
There is one single Creusot-Loire 100 mm (3.9 in) Modèle 1968 dual-purpose gun located on the foredeck which is normally operated in the fully automatic remote mode with an unmanned turret, although there is a fall-back manual mode, requiring two men in the turret.

Specifications
Calibre: 100 mm
Length of barrel: 55 calibres
Muzzle velocity: 870 m/s (2,854 ft/s)
Traverse: 360° at 40°/s
Elevation: −15 to +80° at 25°/s
Crew: 2 (optional) and 2 loaders
Range:
anti-surface: 9.15 n miles (17 km)
anti-air: 8,000 m (26,000 ft)
Rate of fire: 60-78 rds/min
Ammunition: 13.5 kg (29.77 lb) (multipurpose projectile); 9.7 kg (21.4 lb) (charge)

Manufacturers/Contractors
Direction des Constructions Navales (DCN) (prime).
Mécanique Creusot-Loire, Marine Products (mountings).
DCN Ruelle (gun).
CSEE Défense (servo equipment).

OTOBREDA 40 mm L/70 Compact (Type 70) twin mounting
A single twin 40 mm turret is mounted aft in 'C' position.

It is not known whether this is a Type A mount, which would have 736 rounds, or a Type B (444 rounds).

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −13 to +85° at 60°/s
Rate of fire: 600 rds/min
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Oerlikon 20 mm cannon
There are two single Oerlikon 20 mm cannon, one either side of the superstructure, just forward of the mack.

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 1.5 km (1,640 yd)
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g (8.5 oz)
Projectile: 122 g (4.3 oz)
Elevation: −15 to +90°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

DR 2000 ESM receiver/Dalia 500 threat analyser
Thomson-CSF's DR 2000 ESM system detects pulse and continuous wave (CW) signals, and when coupled with the Dalia analyser is used as a basic ESM suite, under the company designation TMV 434. There are six DF antennas and one omnidirectional antenna and a processing control/display console in the combat information centre. It provides a virtual 100 per cent probability of detection over the complete 360° of azimuth and gives instantaneous audio and video alerts. In the Argentine ships DR 2000 works in conjunction with the Dalia 500 analyser which holds a library of radar modes and parameters and is easily reprogrammable (the figure 500 gives the number of threat modes held in the library).

Manufacturer/Contractor
Thomson-CSF, RCM, Elancourt, France.

DECOYS

DAGAIE countermeasures system
There are two DAGAIE launchers which can be loaded with either IR or chaff rockets. The firing sequence runs automatically, once triggered by a missile alarm from a variety of sources, such as radar, ESM systems, or optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, windspeed and direction, ship heading and speed data.

The launching of radar and IR decoys is so arranged that advanced mixed-guidance missile systems cannot discriminate them and thus collocation of both decoys is achieved. The installation is a double mounting and comprises: (a) two trainable mountings carrying 10 replaceable containers (suitcases), each of which is loaded with either 3-5 and 8-14 μm IR or I/J-band chaff projectiles.

A wide range of ammunition is provided by Etienne Lacroix Défense providing seduction, distraction and seduction/dissimulation modes. The electromagnetic decoys are normally based upon aluminised fibreglass chaff with rapid bloom time and they cover the I and J frequency bands. The infra-red decoys cover both the 3-5 and the 8-14 μm bands.

Specifications
Traverse: 330° at 21°/s
Average reaction time: Within 4 s
REM rocket dimensions: 850 × 127 mm (33.5 × 5 in)
Rocket weight: 13 kg (28.66 lb)
Container dimensions: 900 × 130 mm (35.4 × 5.1 in)
Container weight: 20 kg (44.1 lb)
LIR/LEM container dimensions: 780 × 630 × 134 mm (30 × 24.8 × 5.3 in)
Container weight: 54 kg (119 lb)

Manufacturer/Contractor
CSEE Défense, Paris, France.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Thomson-CSF Vega command and weapon control system
The Vega command weapon control system uses the DRBV 51A search and the DRBC 32E fire-control radars to provide versatility and resistance to enemy ECM through the use of different frequency bands, with both radars featuring linear digital filtering for improved performance and reliability. DRBV 51A (also known as Triton II) is used for air/surface search, target designation and navigation (although there is also a Decca 1226). It is claimed to detect a 2 m² air target at distances of 16 n miles (30 km) and altitudes of 6,000 m, while 10 m² surface targets can be detected at 24.25 n miles (45 km). The DRBV-51A can be used for fire-control purposes, but this task is normally allocated to the DRBC 32E.

The manufacturer claims that the system will detect surface targets at ranges of 28-32 km and low-level Mach 1 strike aircraft at 26 km in the most unfavourable cases. Against aircraft, the system's reaction time was six seconds in automatic mode and 12 seconds in semi-automatic mode. However, the track-while-scan capability was limited to two targets.

Manufacturer/Contractor
Thomson-CSF.

SONARS

Thomson Sintra Diodon hull-mounted sonar

Diodon is a panoramic medium-frequency sonar. Embedded facilities include passive listening, sound ray tracer, an acoustic propagation prediction for the day and a recording system that can be used for debriefing and training.

Specifications

Acoustic array: 24 identical staves
Frequencies: 11 kHz, 12 kHz, 13 kHz
Transmitter: Omnidirectional transmission in CW and FM modes
Receiver: 36 preformed beams; advanced processing with replica correlator in FM and spectrum analysis (FFT) in CW
Video processing:
Data processing in FM and CW modes: Automatic detection and tracking; simultaneous multitrack extraction (up to 64); target analysis (apparent length, Doppler measurement).
Range scales: 15,000 m max
Display: High-resolution flicker-free colour TV monitors
Total weight: 1,500 kg (3,307 lb)

Manufacturer/Contractor

Thomson CSF, Sophia Antipolis Cedex, France.

PROPULSION

Main machinery: 2 SEMT-Pielstick 12 PC2.2 V 400 diesels; 8.82 MW (12,000 hp(m))
Shafts: 2
Propellers: cp

FURTHER INFORMATION

PROGRAMME

The first two ships were originally laid down in 1976 for the French Navy as *Lieutenant de Vaisseau le Henaff* (F 789) and *Commandant l'Herminier* (F 791). Whilst still under construction they were sold to the South African Navy, where they would have been named *Good Hope* and *Transvaal*, respectively. The UN embargo on sales of defence equipment prevented that sale and they were purchased by Argentina in September 1978 and given the names *Drummond* (31) and *Guerrico* (32); they arrived in Argentina on 2 November 1978. The third ship, *Granville* (33), was ordered as a new build, being laid down on 1 December 1978 and commissioned on 22 June 1981.

MODERNISATION

Drummond has had her armament updated to the same standard as the other two, replacing the Bofors 40/60.

OPERATIONAL

These ships are very economical to operate, with particularly good fuel consumption and have proved very popular ships in the Argentine Navy. All three played very active parts in the Falklands (Malvinas) war in 1992. *Guerrico* took part in the operations off the island of South Georgia in April 1982 and, on venturing too close to the shore, was damaged by land-based troops during the taking of Grytviken, being hit by a rocket from a Carl Gustav rocket launcher and machine-gun fire. The damage was not severe and *Guerrico* returned to Argentina unaided and was repaired within three days. *Drummond* and *Granville* supported the main landings on the Falkland Islands.

Recently, at least one of these ships took part in the operations off Haiti in 1994.

Granville *(33) one of the three A 69 Avisos bought from France in the late 1970s* (Maritime Photograhic)

Madina *(702) lead ship of a class of four, built in France for the Royal Saudi Navy, and commissioned in 1985-86* (DCNI/Jean Biaugeaud)

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

Thomson-CSF Crotale EDIR octuple launcher

The single octuple Thomson-CSF Crotale launcher is mounted on the forward end of the hangar roof. The system comprises a combined director and missile-launching mounting, a fire-control room with supporting electronics and a supervising console in the combat information centre. There is also a missile handling and storage system. The system obtains search information from the Thomson-CSF Sea Tiger radar, while the director's own sensors are a two-axis stabilised Castor IIC radar antenna, a missile guidance antenna, an infrared localiser and a TV for low-level tracking.

The VT-1 missile attains a speed of Mach 3-plus some 2.5 seconds after launch, can manoeuvre at up to 25 *g* in each axis. System reaction time from target acquisition to launch is a minimum of 4.5 seconds and an average of 6 seconds. Maximum range is about 10 km. The system is capable of intercepting four separate targets simultaneously and there are two types of fuze: infra-red (V3N) and RF (V3S). The J-band monopulse radar has a peak power of 80 kW to give it a range in excess of 8.5 n miles (16 km) and has an accuracy of 0.3 mrad in tracking and 0.1 m in missile-to-target differential deviation measurement. The RIC has a deviation measurement accuracy of 1 mrad and is designed to gather the Crotale missile for the command link.

The second ship onwards were fitted with Crotale EDIR 'as built', but the system was retrofitted into *Madina* in Saudi Arabia.

Specifications

Missile VT-1
Length: 2.34 m (7.68 ft)
Diameter: 16.5 cm (6.5 in)
Wing span: n/k
Weight: 73 kg (161 lb)
Speed: Mach 3.5
Warhead: 14 kg (30.9 lb)
Lethal radius: 8 m (26.25 ft)
Range: 10 km (11,000 yd)
Altitude: 4,000 m (13,120 ft)

Manufacturer/Contractor

Thomson-CSF, Division Systèmes Electroniques, Paris, France.

ANTI-SHIP MISSILES (ASM)

OTOBREDA/Matra Otomat Mk 2 ERATO

Eight Otomat Mk 2 launchers are mounted in two sets of four in the waist; four point to port, four to starboard at 90° to the ship's centreline. The Otomat missile has folding wings and is powered by a turbojet with solid fuel rocket boosters. The warhead is a semi-armour-piercing type, which is claimed to penetrate up to 8 cm of nickel-chromium armour.

The target may be acquired by the ship's radar, by the radars of friendly ships or by helicopter radars. Data on the target's location are transmitted to the missile's autopilot and the turbojet is started. Once it has reached full power the boosters are ignited and the missile is launched, but as the missile can turn through angles of up to ±200° the warship does not have to be facing the target during the launch phase. Once launched, the missile climbs to 150 m (492 ft) accelerated by the boosters which burn for 4 seconds until reaching cruising speed at a distance of some 2.15 n miles (4 km) from the launch point, where the boosters are jettisoned. If OTH targeting is not being used, the missile then descends to a cruising altitude of 15-20 m (49.2-65.6 ft), a compromise between ensuring good communications with the mothership and making detection by the target difficult. The missile continues towards the target with mid-course guidance correction until the radar seeker is activated at a predetermined point and scans a 40° sector, acquiring the target at a range of about 6.5 n miles (12 km).

The French Mk 2 system, known as ERATO (ERATO = Extended Range Automatic Targeting of Otomat), is designed for over-the-horizon targeting using a co-operating helicopter, and, while generally similar to the Italian Teseo system, has several important differences. The launching sequence is similar to that for Teseo, but for engaging a target at ranges of over 35 n miles (65 km) the missile cruises at an altitude of 900 m (2,952 ft), but it only drops to a height of 15 m (49.2 ft) for the sea-skimming final approach after receiving mid-course guidance from the SA 365F helicopter with its Agrion 15 I/J-band radar. In the terminal phase the French missile seeker operates in both azimuth and elevation, and a dive-attack capability is added. In this case the missile approaches to within 4 n miles (7 km) of the target and then 'pops-up' to a height of about 2,000 m before diving at an angle of about 7°. The ERATO system can launch up to four missiles in a salvo and can control six missiles in flight.

Specifications

Length: 4.46 m (14.6 ft)
Diameter: 46 cm (18 in)
Wing span: 1.36 m (4.5 ft)
Weight:
  without boosters: 762 kg (1,680 lb)
  with boosters: 770 kg (1,698 lb)
Range: 86 n miles (160 km)
Speed: Mach 0.9
Guidance: Inertial and active radar homing
Propulsion: Turbomeca TR 281 Arbizon III turbojet; 400 kg (882 lb) st
Boosters: 2 SNPE solid-propellant boosters; 3,500 kg (7,716 lb) st each
Warhead: Semi-armour-piercing; 210 kg (463 lb); HE 65 kg (143 lb)
Fuzes: Impact, proximity

Manufacturer/Contractor

OTOBREDA, Italy.

TUBES

There are four single 533 mm (21 in) torpedo tubes mounted on the quarterdeck and launching the torpedoes over the transom which is a relatively unusual arrangement. The only other ship to employ such a technique is the Italian 'Maestrale' class frigate.

TORPEDOES

ECAN F17P torpedo

F 17P (P = *polvelope*) can be used against surface and submarine targets and is normally wire-guided during the early part of its run and is given commands on course and depth to be achieved at the end of the wire-guided operation. It can also, however, be launched in the 'free-running' mode. During the terminal phase the torpedo uses passive search only throughout attacks against surface ships, but against submarine targets the passive mode is used until the terminal phase when the seeker goes active. The F 17P has a maximum operating depth in excess of 500 m (1,640 ft) and a search depth of 6 to 20 m (19.6 to 65.6 ft).

Specifications

F17 P1
Length: 5.91 m (19.3 ft)
Diameter: 533.4 mm (can be increased to 550 mm if required)
Weight: 1,428 kg (3,148 lb)
Warhead: 250 kg (551 lb) HBX3
Propulsion: Electric
Speed: 35 kts
Range: 10 n miles (18.5 km)
Guidance: Wire and automatic homing

Manufacturer/Contractor

DCN International, Paris, France.

GUNS

100 mm/55 Modèle 1968

There is one single 100 mm/55 Modèle 1968 dual-purpose mounting located on the foredeck in 'A' position. This is normally operated in the fully automatic remote mode with an unmanned turret, although there is a fall-back manual mode, which requires two men in each turret.

Specifications

Calibre: 100 mm
Length of barrel: 55 calibres
Muzzle velocity: 870 m/s (2,853 ft/s)
Traverse: 360° at 40°/s
Elevation: −15 to +80° at 25°/s
Mounting weight: 21 t
Crew: 2 (optional) and 2 loaders
Range:
  anti-surface: 9.15 n miles (17 km)
  anti-air: 8,000 m (26,000 ft)
Rate of fire: 78 rds/min
Ammunition: 13.5 kg (29.7 lb) (multipurpose projectile); 9.7 kg (21.4 lb) (charge)

Manufacturers/Contractors

Direction des Constructions Navales (DCN) (prime).
Mécanique Creusot-Loire, Marine Products (mountings).
DCN Ruelle (gun).
CSEE Défense, (servo equipment).

OTOBREDA 40 mm L/70 Compact

Four Bofors 40 mm guns (two twin) are installed in mountings in the waist either side of the stack.

Specifications

Traverse: 360° (nominal) at 90°/s
Elevation: −13 to +85° at 60°/s
Rate of fire: 600 rds/min
Muzzle velocity: 1,000 m/s
Max range:
  anti-surface: 6.75 n miles (12.5 km)
  anti-air: 4,000 m (13,120 ft)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Thomson-CSF DR 4000

DR 4000 is a highly sensitive crystal IFM ESM receiver covering the C to J bands. The display shows the tactical situation in the upper part and intercept parameters below. The system is interfaced with decoy dispensers and jammers, and automatically controls their operation. The system offers threat warning, surveillance, emitter identification, ELINT, and automatic EW system control capabilities. The antenna system of the DR 4000S includes two DF arrays (2 × 6 DF channels), one omni-antenna (frequency channel) and modules housing RF amplifiers. The two sets of DF antennas correspond to two complementary frequency bands, H to J (high band) and C to G (low band).

Specifications

Frequency coverage: C to J band
Bearing accuracy: approx ±5°
Dimensions and weight
Omni-antenna: 415 mm high × 300 mm diameter; 9 kg
DF antenna: 425 mm high × 480 mm diameter; 2 × 22 kg
IFM processor: 316 × 360 × 520 mm; 25 kg

Madina *(702) and the other three ships are now undergoing major modifications and modernisation at Toulon under 'Project Mouette'. This will involve modernising all electronic and weapon systems, and installing the Samahe helicopter handling system* (DCNI/Jean Biaugeaud)

Console: 590 × 1,100 × 1,543 mm; 310 kg

Manufacturer/Contractor
Thomson-CSF, Radars and Countermeasures Division, Elancourt, France.

Telegon VI
There is a Telegon VI radio direction-finder and HF communications jammer.

Manufacturer/Contractor
DASA, Ulm, Germany.

ELECTRONIC COUNTERMEASURES (ECM)

JANET jammer
The Janet naval ECM system is designed to jam locked-on missile radar seekers and surveillance radars operating in the H, I and J bands. The receiver is used for accurate target bearing and frequency measurement following an alert from the associated DR 4000 radar warning receiver. The computer controls the signal generator and selects the type of jamming used. This high flexibility in jamming modes programming and selection provides a variety of noise signals, including continuous or pulsed noise, as well as dual mode (noise/deception), complex deception and repeater signals. The system has been designed to store received target signals in order to recreate identical ones for deception purposes.

Janet is modular, comprising: up to four modules, each of which is a complete and autonomous jammer with its own two-horn receive antenna for tracking; radar detector; computer/signal generator; and two TWTs/directional transmit antennas. One TWT/directional antenna combination is used for noise jamming and the other for deception jamming, enabling the system to jam two radar threats simultaneously, even if they are arriving from completely different directions. Each jammer module can also jam two signals if these are located close to each other.

Manufacturer/Contractor
Thomson-CSF, Elancourt, France.

DECOYS

CSEE Défense DAGAIE countermeasures system
There are two DAGAIE launchers located either side of the mast. These can be loaded with either IR or chaff rockets. The firing sequence runs automatically, once triggered by a missile alarm from a variety of sources, such as radar, ESM systems, or optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, windspeed and direction, ship heading and speed data.

The launching of radar and IR decoys is so arranged that advanced mixed-guidance missile systems cannot discriminate them and thus collocation of both decoys is achieved. The installation is a double mounting and comprises: (a) two trainable mountings carrying 10 replaceable containers (suitcases), each of which is loaded with either 3-5 and 8-14 µm IR or I/J-band chaff projectiles.

A wide range of ammunition is provided by Etienne Lacroix Défense providing seduction, distraction and seduction/dissimulation modes. The electromagnetic decoys are normally based upon aluminised fibreglass chaff with rapid bloom time and they cover the I and J frequency bands. The infra-red decoys cover both the 3-5 and the 8-14 µm bands.

Specifications
Traverse: 330° at 21°/s
Average reaction time: Within 4 s
REM rocket dimensions: 850 × 127 mm (33.5 × 5 in)
Rocket weight: 13 kg (28.66 lb)
Container dimensions: 900 × 130 mm (35.4 × 5.1 in)
Container weight: 20 kg (44.1 lb)
LIR/LEM container dimensions: 780 × 630 × 134 mm (30 × 24.8 × 5.3 in)
Container weight: 54 kg (119 lb)

Manufacturer/Contractor
CSEE Défense, Paris, France.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Thomson-CSF TAVITAC
The Thomson-CSF Naval Tactical Data Systems TAVITAC (TAVITAC = *Traitement Automatique et Visualisation Tactique*) is a federated system linked by a local area network (LAN) based on a Gina databus, with the associated sensors and weapons being connected directly to the LAN or via a network interface unit. The system uses two CIMSA Sintra 15M125 computers (32-bits; modular memory of 64-512 k words; operating speed of 1 Mips) and one CIMSA Sintra 15M05 (16-bit; 64 k memory), with programming using the LTR 2 language.

TAVITAC performs all the necessary tactical functions for the ship, and can carry up to 800 tracks, and can also provide a limited advisory capability in evaluating the tactical situation. In addition, using ruggedised disk storage, TAVITAC can provide a database management capability for other functions such as map display, ship resources and management. TAVITAC is integrated with the Vega fire-control system to create the Thomsea system

Manufacturer/Contractor
Thomson-CSF, Systèmes Navals de Combat, Bagneux, France.

COMMUNICATIONS AND DATALINKS

The ships are capable of receiving Link 11.

WEAPONS CONTROL

Vega (CTH) weapon control system

The Vega weapon control system uses the DRBV 15 search and the DRBC 32E and CASTOR IIC fire-control radars to provide versatility and resistance to enemy ECM through the use of different frequency bands, with both radars featuring linear digital filtering for improved performance and reliability. DRBV-15 is used for air/surface search, target designation and navigation (although there are also two Decca 1226s), with a roll-stabilised antenna. The DRBV-15 can be used for fire-control purposes, although this task is normally allocated to the DRBC 32E.

Manufacturer/Contractor

Thomson-CSF, Elancourt, France.

Naja electro-optical directors

There are three Naja electro-optical directors. Naja is an evolutionary development of Panda Mk 2 (designated DMAb by the French Navy) with a CILAS TMY 113 high repetition rate Nd:YAG laser rangefinder, an automatic tracking capability, local or remote control, a three-axis gyro unit and multiple weapon capability. The laser rangefinder operates in the 1.06 μm wavelength, has a peak power of >5 MW and a PRF of 20 pps.

Specifications

Naja
Height: 1.35 m (4.4 ft)
Width: 1.5 m (4.9 ft)
Weight: 480 kg (1058 lb)
Elevation: −20 to +70°
Max velocity
traverse: 60°/s
elevation: 60°/s

Manufacturer/Contractor

CSEE Défense, Paris, France.

DLT-5 torpedo fire-control system

The DLT-5 *(Direction de Lancement de Torpilles)* torpedo fire-control system consists of a torpedo launch control station in the combat information centre and interface boxes which provide the electrical supply and control links to the mechanical elements. The control console has a single display. Sonar data is received in the launch control station where it is processed. The most suitable tube or tubes are then selected and ballistic data is calculated before being transmitted to the weapon. The data provided includes gyro-deflection angle, time of trajectory and target depth. There are two launching modes; normal with automatic calculation of launch parameters, and emergency in which manual calculation of displayed parameters is undertaken.

Manufacturer/Contractor

Thomson-CSF, Paris Cedex, France.

RADARS

Type	Sea Tiger (DRBV 15)	TM 1226	Castor IIB (TRS 3200)	DRBC 32C
Company	Thomson-CSF	Racal-Decca	Thomson-CSF	Thomson-CSF
Role	Air/surface search/IFF	Surface search	Fire control	Fire control (100 mm gun)

PRF	2,200/1,100 pps	—	4,000-8,000 pps (stepped)	
Scan rate	15/30 rpm	28 rpm	—	
Range	60 n miles (110 km) for 2 m² target		8 n miles (15 km) for 1 m² target	

SONAR

Diodon/Sorel sonar (TSM 2630)

Diodon is a hull-mounted sonar and Sorel the associated variable-depth sonar (VDS). They produce a panoramic medium-frequency sonar signal and a common data handling and sonar processing system provide target classification, automatic detection and tracking, and a man/machine interface. Embedded facilities include passive listening, sound ray tracer, an acoustic propagation prediction for the day and a recording system that can be used for debriefing and training.

Specifications

Acoustic array: 24 identical staves
Frequencies: 11 kHz, 12 kHz, 13 kHz
Transmitter: Omnidirectional transmission in CW and FM modes
Receiver: 36 preformed beams; advanced processing with replica correlator in FM and spectrum analysis (FFT) in CW
Video processing: Data processing in FM and CW modes: automatic detection and tracking; simultaneous multitrack extraction (up to 64); target analysis (apparent length, Doppler measurement)
Range scales: max 15,000 m
Display: High-resolution flicker-free colour TV monitors
Total weight: 1,500 kg

Manufacturer/Contractor

Thomson CSF, Sophia Antipolis Cedex, France.

AVIATION

AVIATION FACILITIES

Specifications

Fight deck: 17 × 12.5 m (57 × 41 ft)

1 Eurocopter AS 365F Dauphin 2 (ASW and light liaison)

Specifications

Dimensions:
rotor diameter: 13.29 m (43.6 ft)
fuselage length: 11.41 m (37.43 ft)
height to rotor head: 4.0 m (13.12 ft)
Weights:
empty: 2,262 kg (4,987 lb)
max take-off: 4,250 kg (9,370 lb)
Performance:
max speed (never exceed): 160 kts (296 km/h)
cruising speed (sea level): 148 kts (274 km/h)
rate of climb (sea level): 420 m (1,380 ft)/min
hovering ceiling (in ground effect): 2,600 m (8,530 ft)
Engines: 2 Turbomeca Ariel 1M1 turboshafts; take-off, 558 kW (749 shp); continuous, 487 kW (653 shp)
Accommodation: 2-man crew; 10 passengers

The Saudi Arabian ships are currently being modernised and one element is the installation of the French Samahe helicopter handling system (DCNI)

Samahe assists in both the recovery and the handling of helicopters (DCNI)

PROPULSION

Specifications
System: Combined diesel-and-diesel (CODAD)
Main machinery: 4 SEMT-Pielstick 16 PA6 280V BTC diesels; 28 MW (38,400 hp(m)) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

As with the land and air forces, the Royal Saudi Navy (RSN) has sought to modernise its systems but without becoming too dependent on any one external source. Thus, smaller surface combatants are of US origin, MCMVs are currently being constructed by the UK, and the major surface units have been built in France. The first of these were the four units of the 'Madina' class which were ordered from France in 1980, as part of the Sawari I contract, which provides for continuing French naval supplies and technical help.

The first of class was completed in 1985 and was followed by the other three in 1985 to 1986.

DESIGN

The F 2000 frigate was designed to be a multipurpose warship, but with a primary anti-surface role. A raised foredeck was originally envisaged, but a continuous deck was finally chosen, with the upper deck, which extends to the after end of the flight deck, as the strength deck. This gives a deep hull girder, with a high resistance to longitudinal stress.

One major factor in the design is that the ships spend virtually their entire operational lives in a very hot, dry and sandy environment. To cope with these, the ships are fitted with three air conditioning plants, each rated at 14,700 MJ/h (350,000 kcal/h), and there is also a wash-down system which is used to cleanse the superstructure of the fine-grained sand which is encountered.

The CODAD propulsion system was chosen for its simplicity, light weight and low fuel consumption. Each of the two shafts is driven by two reversible SEMT Pielstick 16PA6 BTC engines, linked to a reduction gearbox and mounted on a shock-absorbing raft.

Snach/Saphir retracting fin stabilisers are also fitted.

MODERNISATION

French national shipbuilders, DCN International (DCNI), signed an agreement in February 1994 with the Saudi Government, which involved all four frigates (plus two replenishment ships) being refitted and modernised. Known as 'Project Mouette' the first ship, *Madina,* was in the DCNI facility at Toulon from December 1995 to December 1996 and is being followed by one frigate per year until 1999.

The major changes involve upgrading the TAVITAC system, upgrading the Otomat missiles, upgrading the sonar system, and replacing the existing helicopter-handling system with the DCN Samahé. All other systems, including the engines, will be refurbished.

DEPLOYMENT

All four frigates are based at Jiddah, Saudi Arabia.

OPERATIONAL

It is reported that these four ships spend only a few weeks a year at sea. *Madina* had a severe engine-room fire in August 1991, but repairs were completed in December 1993 and the ship was operational again in May 1994.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 40 anti-ship missiles

Eight MM 40 Exocet anti-ship missile launchers are installed on the superstructure roof, immediately before the main mast. Unlike most other tube-launched SSM installations these are not located so that they fire across the ship with their efflux going straight overboard, but rather face outwards in two groups of four at an angle of 90° to the centreline and at +12° to the horizontal. There is a central deflection plate which redirects the rocket efflux upwards.

The missiles are Block 2, featuring a new J-band (10-20 GHz) seeker with improved ECCM performance, associated electronics and a new guidance computer. The new electronics permit the missile to optimise its sea-skimming height, allowing it to operate in conditions to Sea State 7 even in severe ECM conditions. The fire-control system has also been adapted with the development of the Cat-Visac console which can operate with two types of the Exocet missile simultaneously. The new fire-control system allows improved target selectivity, attacks upon multiple targets by diverging and converging salvos. Targets for the missiles are acquired by the ship's sensors, and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence which can take up to 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change in the course of its flight. Once the missile has cleared the launcher-container, the sustainer carries it into the cruise phase and it then travels towards the general location of the target at a height of about 100 m (330 ft) which is low enough to reduce the chance of detection but adequate for target acquisition. Once the target is detected the missile descends to 9-15 m (30-50 ft) in the approach phase before descending to 8 m (26 ft) (2-5 m (6.5-16.4 ft) in a calm sea) for a sea-skimming terminal phase. A salvo may be fired in 12-20 seconds.

Specifications

MM 40 Block 2
Length: 5.80 m (19.2 ft)
Diameter: 35 cm (13.78 in)
Wing span: 1.13 m (3.7 ft)
Weight: 870 kg (19.8 lb)
Speed: Mach 0.9
Range: 2-40.5 n miles (4-75 km)
Warhead: 55 kg (121 lb) HE frag
Fuze: Impact/proximity
Guidance: Inertial and active radar

Manufacturers/Contractors

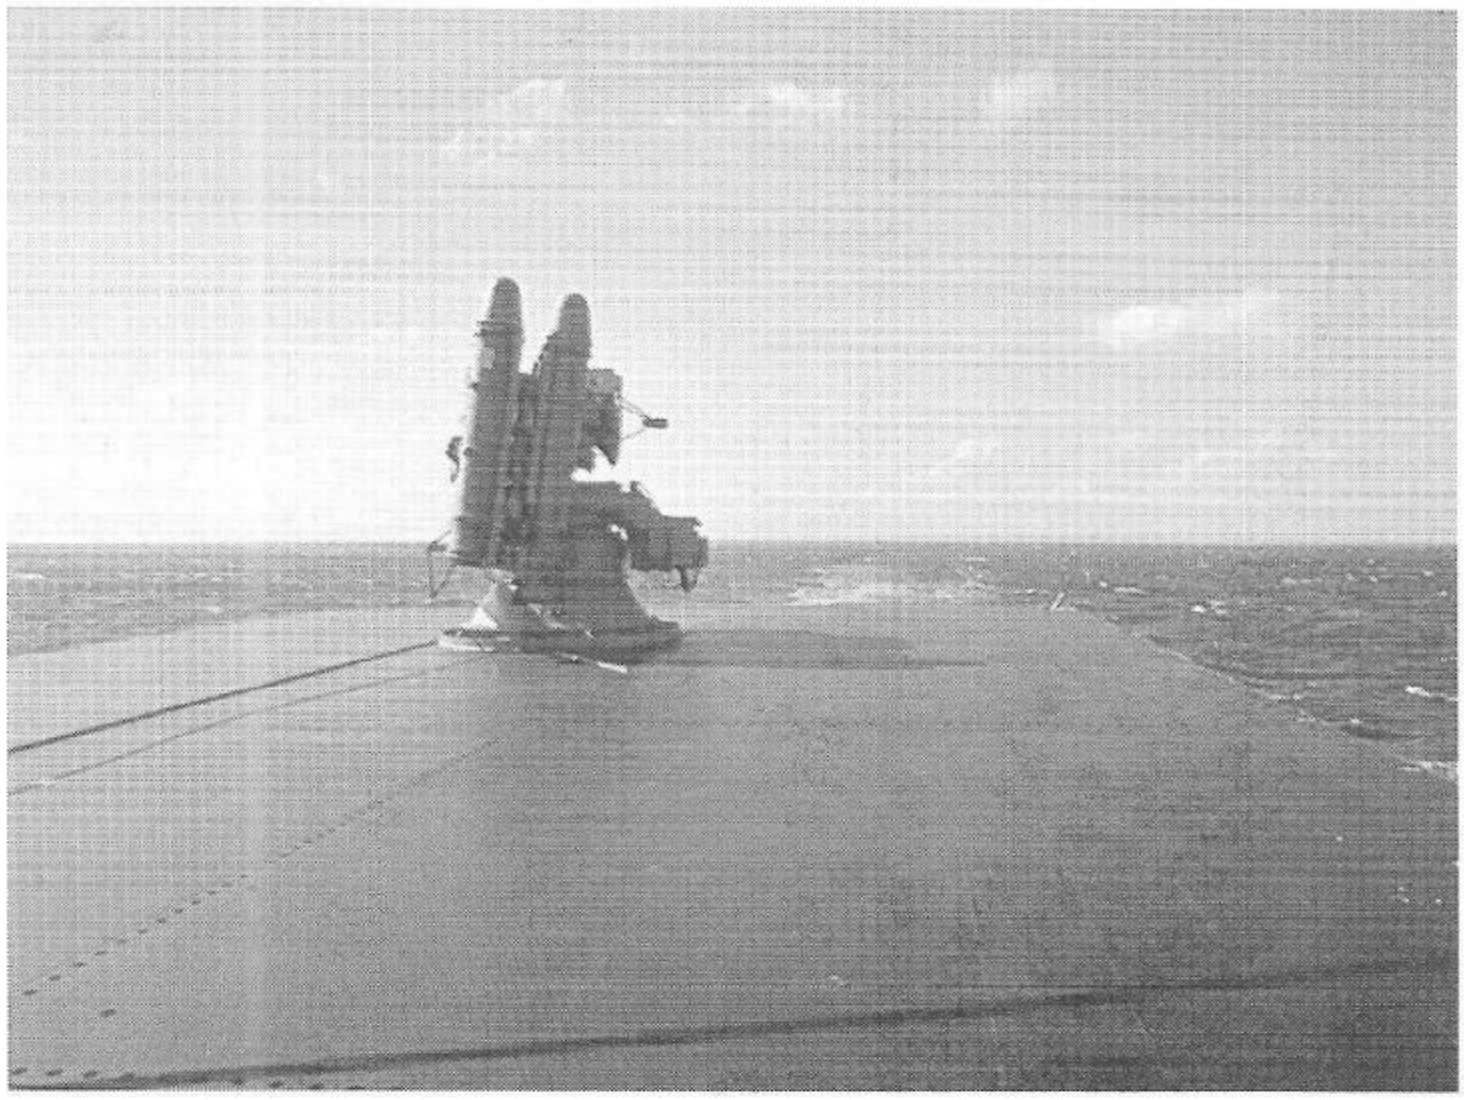
SURFACE-TO-AIR MISSILES (SAM)

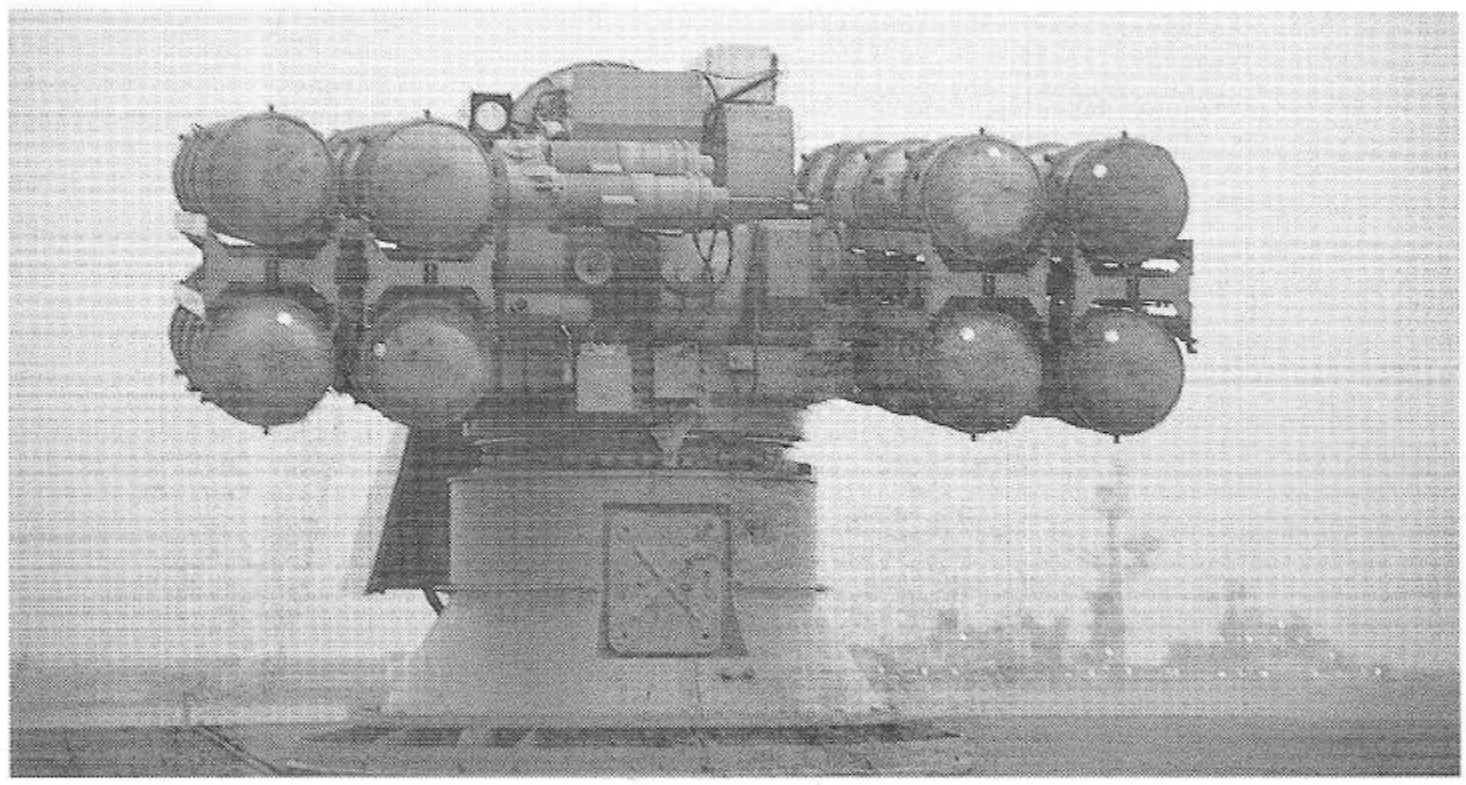
Crotale CN2

There is one Crotale CN2 launcher mounted at the after end of the hangar roof; a total of 16 missiles is carried. Crotale CN2 is based upon the new VT1 missile which can manoeuvre at up to 35 g, and is stored in a new, slimmer, launcher-container. The fire-control system, which can control two missile launchers and the 100 mm gun, is based upon the lightweight Castor radar director, which employs a 12-18 GHz J-band radar with four-horn antenna on one side and a daylight TV camera with SAT IR tracker on the other side. The launcher itself has six launch tubes on either side of the mounting and 'a TV escartometer' which helps automatically to bring the missile into line of sight with the target. The electronics fit weighs 2.6 tonnes while the loading system, which has only eight reloads weighs 3.2 tonnes.

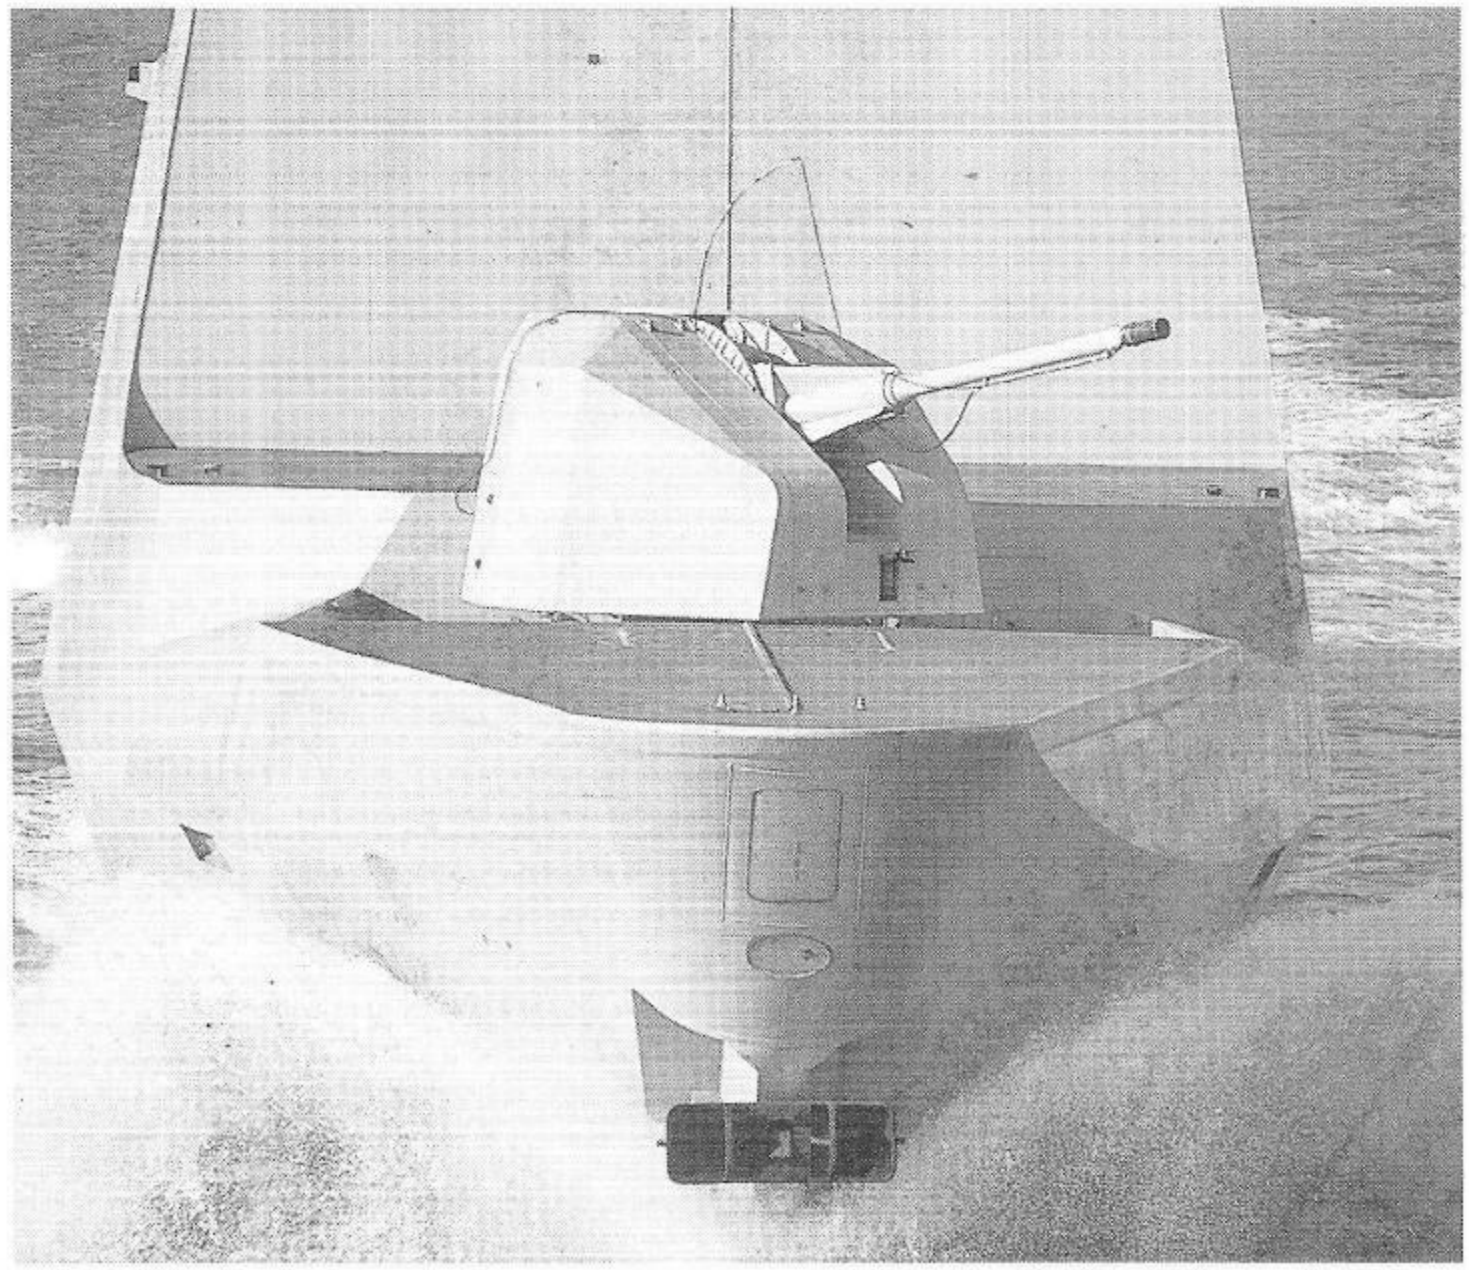
Specifications

Missiles: VT-1
Length: 2.34 m (7.68 ft)
Diameter: 16.5 cm (6.5 in)
Wing span: n/k
Weight: 73 kg (161 lb)
Speed: Mach 3.5
Range: 5 n miles (10 km)
Altitude: 4,000 m (13,000 ft)





Crotale is fitted to the first three ships, but is replaced by Aster in the fourth ship onwards (DCN)



Gun is a 100 mm/55 Modèle 1968-II CADAM. It has a 600 round magazine

Fuze: RF proximity fuze
Warhead: 13 kg (28.7 lb) focused fragment
Guidance: Command/line of sight
Homing: Radar/IR

Manufacturer/Contractor
Thomson-CSF, Division Systèmes Electroniques.

GUNS

100 mm/55 Modèle 1968
There is a single 100 mm/55 Modèle 1968-II CADAM dual-purpose mounting on the foredeck. This is normally operated in the fully automatic remote mode with an unmanned turret, although there is a fall-back manual mode, which requires two men in each turret. The turret was taken from an old ship and upgraded to CADAM (CADence AMéliorée) standard with improved recoil and feed systems, raising the firing rate from 60 rds/min to 78 rds/min.

Specifications
Calibre: 100 mm
Length of barrel: 55 calibres
Muzzle velocity: 870 m/s (2,854 ft/s)
Traverse: 360° at 40°/s
Elevation: −15 to +80° at 25°/s
Mounting weight: 21 t
Crew: 2 (optional) and 2 loaders
Range:
anti-surface: 9.15 n miles (17 km)
anti-air: 8,000 m (26,000 ft)
Rate of fire: 78 rds/min
Ammunition: 13.5 kg (29.8 lb) (multipurpose projectile); 9.7 kg (21.4 lb) (charge)

Manufacturers/Contractors
Direction des Constructions Navales (DCN) (prime).
Mécanique Creusot-Loire, Marine Products (mountings).
DCN Ruelle (gun).
CSEE Défense, Paris, France (servo equipment).

Giat 20mm F2 (20F2) Type A (M693) multipurpose cannon
Two Giat 20F2 cannon are mounted in the bridge wings.

Specifications
Calibre: 20 mm
Length of barrel: 90 calibres
Muzzle velocity: 1,050-1,250 m/s (3,445-4,100 ft/s)
Traverse: 325°
Elevation: −15° to +80°
Mounting weight, loaded: 470 kg (1,036 lb)
Weight of shell: 0.25 kg (0.55 lb)
Crew: 2
Range: 3.5-5.5 n miles (6.75-10 km)
Rate of fire: 720 rds/min
Power requirement: 26 V (7A)

Manufacturer/Contractor
Giat, France

M2HB 12.7 mm (0.50 in) machine guns
Two M2HB 12.7 mm machine guns are carried and can be mounted when required.

Specifications
Calibre: 12.7 mm (0.50 in)
Rate of fire: 450-550 rdm/min
Muzzle velocity: 883 m/s (2,900 ft/s)
Max effective range:
anti-surface: 6,700 m (7,400 yd)
anti-air: 1,380 m (4,500 ft)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

ARBR 21 (DR-3000S) ESM receiver
The ARBR-21 ESM suite is a high-performance radar detection, analysis and threat warning system, covering conventional radar threat frequencies (that is, C- to J-bands). The system analyses the measured radar parameters and uses these characteristics to determine other parameters such as the radar's type and identity. There are two antenna assemblies, both on the mainmast. One is an omnidirectional array providing initial detection and threat frequency, and carrying out primary analysis, while below this are two eight-port directional antennas to provide more accurate bearing and frequency information. The antenna assemblies contain preamplifiers for improved performance.

Manufacturer/Contractor
Thomson-CSF, France.

DIBV 1A VAMPIR IR detector
VAMPIR (Veille Air-Mer Panoramique Infra-Rouge) is a passive surveillance and search system for both sea and low-level air targets. The equipment consists of a cylindrical housing carried on a vertically stabilised mount which is fixed on the ship's superstructure in a high position to ensure maximum range and freedom from obstruction. Stabilisation of the housing automatically compensates against ship motion, while the rotating optical head provides all-round scanning of the horizon. The equipment is a bi-spectral device operating in two distinct IR bands, thus achieving a very low false alarm rate in the presence of environmental noise. The two separate channels also enable target detection in a variety of weather conditions. A CSEE subsystem performs the signal processing. (Ships are currently 'fitted for but not with' VAMPIR.)

Specifications
Wavelength: 4-5 and 8-13 µm (simultaneous channels)
Field of view: 360° × 0 to +24° elevation
Detection range: <10 km for frontal attack by missile/aircraft
Target designation accuracy: 1 mrad in elevation and bearing
Sensor cooling: Joule Thompson cycle to about 80 K
Dimensions of stabilised unit: 125 × 60 cm diameter
Rotation rate: 60 rpm

Manufacturer/Contractor
CSEE Défense, Paris, France

ELECTRONIC COUNTERMEASURES (ECM)

ARBB 33 jammer
The ARBB 33 high-performance jammer has a multiple threat capability and is able to counter up to four threats simultaneously. It can jam all modern threats: target designation radars as well as pulsed fire-control radars and seeker heads. It has a wide range of jamming modes: continuous noise, pulsed noise, cover pulse jamming, synchronous and asynchronous false echoes, and range gate pull off. The system can be alerted initially by a threat detection equipment, but also possesses an autonomous detection subassembly. It provides a 360° coverage in azimuth by means of electronically switched antennas for both detection and jamming, instead of the conventional directional assembly, in order to allow faster reaction time in any direction. (Ships are currently fitted for but not with ARBB 33)

Specifications
Frequency: H, I and J-bands
Azimuth coverage: 2 sectors of 180°
Reaction time: <0.5 s
Output power: <100 kW
Threat handling: Two simultaneously
Detection sensitivity: Better than −50 dBm
Bearing accuracy: Better than 5° RMS

Manufacturer/Contractor
Thomson-CSF, France

DECOYS

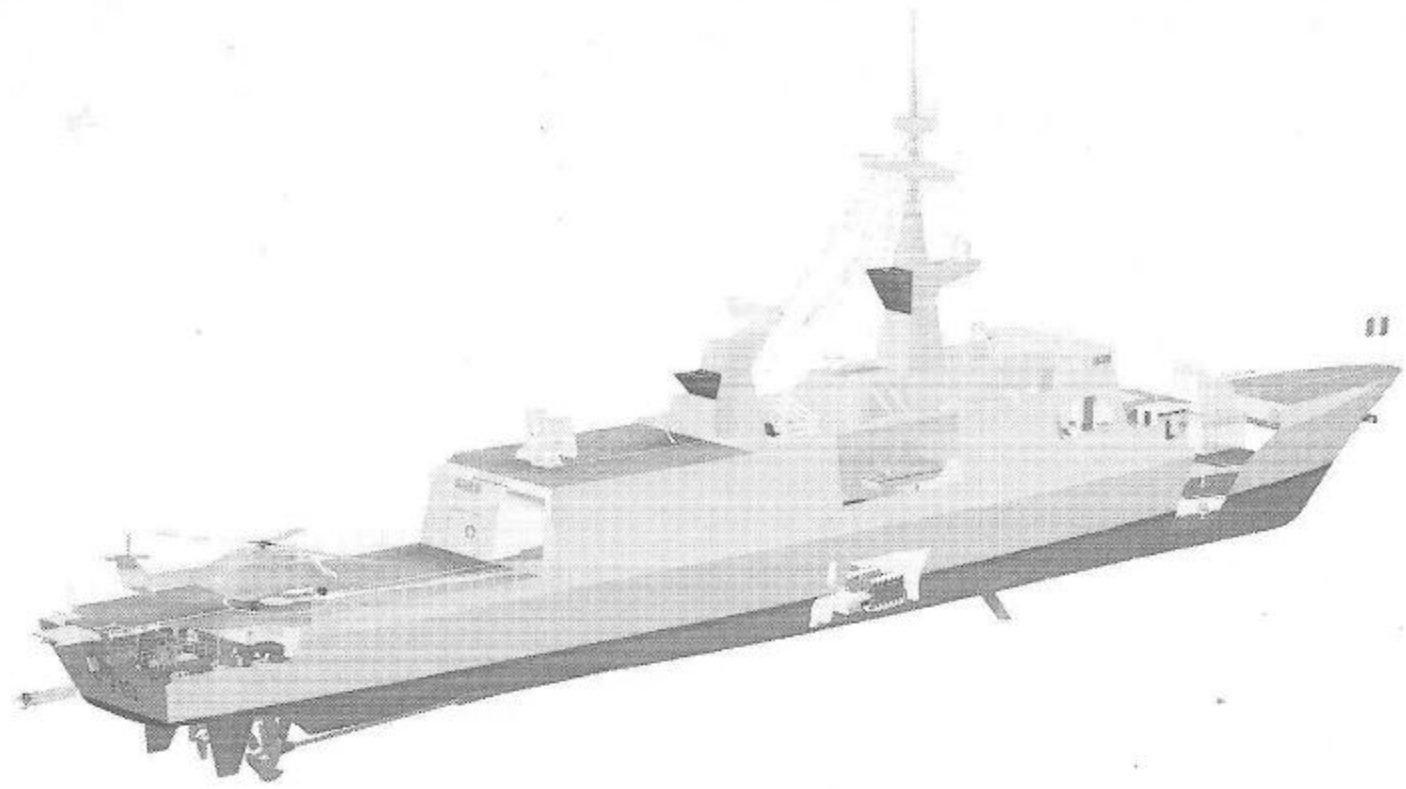
DAGAIE CS Mk 2 countermeasures system
There are two DAGAIE CS Mk 2 launchers mounted on the upper deck immediately below the foremast. These

The Dagaie launcher can fire a variety of decoys to provide seduction, distraction and seduction/dissimulation

can be loaded with either IR or chaff rockets, and the firing sequence runs automatically, once triggered by a missile alarm from a variety of sources, such as radar, ESM systems, or optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, windspeed and direction, ship heading and speed data.

The launching of radar and IR decoys is so arranged that advanced mixed-guidance missile systems cannot discriminate between them and thus collocation of both decoys is achieved. The installation is a double mounting and comprises: (a) two trainable mountings carrying 10 replaceable containers (suitcases), each of which is loaded with either 3-5 and 8-14 µm IR or I/J-band chaff projectiles.

A wide range of ammunition is provided by Etienne Lacroix Défense providing seduction, distraction and seduction/dissimulation modes. The electromagnetic decoys are normally based upon aluminised glass fibre chaff with rapid bloom time and they cover the I and J frequency bands. The infra-red decoys cover both the 3-5 and the 8-14 µm bands.



The stern gallery under the flight deck is used by the marines and accommodates three Gemini-type inflatables. The gallery door in the transom opens upwards and the Gemini is launched/removed using an overhead rail (DRN)

Specifications

Traverse: 330° at 21°/s
Average reaction time: Within 4 s
REM rocket dimensions: 850 × 127 mm (33.5 × 5 in)
Rocket weight: 13 kg (28.66 lb)
Container dimensions: 900 × 130 mm (35.4 × 5.1 in)
Container weight: 20 kg (44.1 lb)

LIR/LEM container dimensions: 780 × 630 × 134 mm (30 × 24.8 × 5.3 in)
Container weight: 54 kg (119 lb)

Manufacturer/Contractor

CSEE Défense, Paris, France

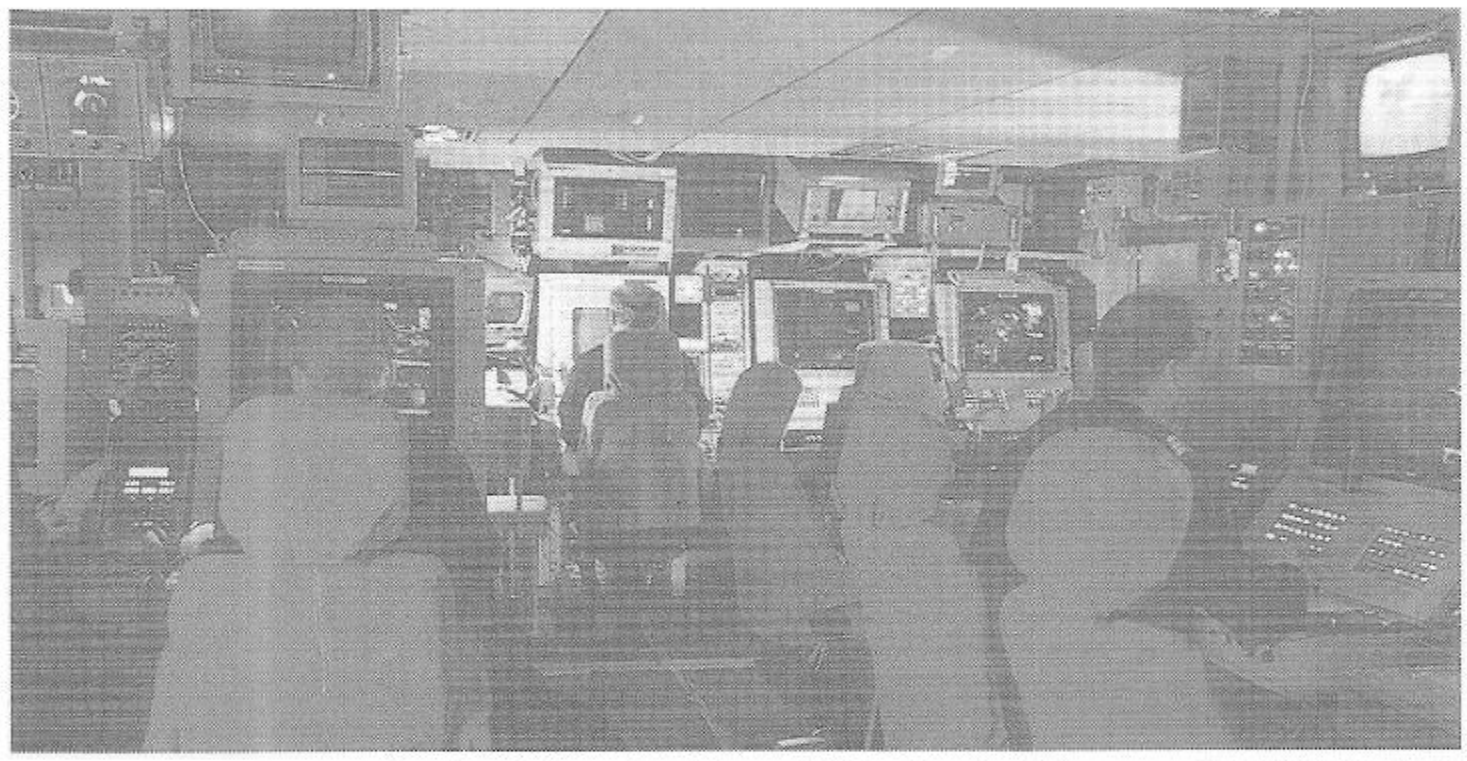
COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

THOMSON-CSF TAVITAC 2000

TAVITAC 2000 (TAVITAC = *Traitement Automatique et VIsualisation TACtique*) is a tactical picture compilation system which uses data from ship sensors and integrates data from offboard sensors through a Link 11 datalink system. It also designates targets to weapon systems. In the 'La Fayette' class TAVITAC 2000 controls:

- Thomson-CSF Sea Tiger Mk 2 2D radar
- Thomson-CSF ARBR 17 ESM suite
- Two Racal-Decca Type 1226 navigation and helicopter control radars
- Syracuse-2 Satcom systems
- Exocet MM 40 missiles
- 100 mm gun with radar fire-control unit
- Sea Crotale CN2
- Two 20 mm automatic cannon
- Two CSEE Dagaie Mk 2 decoy launchers



Officers operating in the Combat Information Centre (CIC) using the Thomson-CSF TAVITAC 2000 system

The TAVITAC 2000 system has a distributed architecture using the Thomson-CSF MLX-32 computers which are built around a Motorola 68030 microprocessor. The system uses Ada software language, the UNIX System V operating system and features a duplicated VMEbus 5 Mbyte/s Ethernet-standard local area network. A ruggedised disk storage system offers a database management capability for map displays, ship resources and management. The system includes the Vista raster scan software-driven display consoles which incorporate the Motorola 68020 microprocessor. The consoles, with high-resolution colour displays and a powerful radar scan converter, allow the radar video data to be superimposed upon the graphic picture. The displays use a 48.26 cm (19 in) colour 1,024 × 1,280 pixel screen, which is increased to 2,000 × 2,000 pixels at the graphic controller.

The Vista console is capable of processing up to 800 tracks and displaying 300 of them together with 30 circles, 30 ellipses, 500 vectors and 2,000 shoreline vectors. Options include a second 19 in television monitor. The MMI facilities include two programmable keyboards and a rollerball, with four associated buttons. Features which may be added include a second radar scan converter for window displays of further raw radar video and further MMI facilities.

Up to 15 display consoles and network interface units can be run from two computers. In the 'La Fayette' class there are two MLX-32 computers, one of which provides redundancy, and another two to interface with sensor and weapon systems as well as Link 11. There are six Vista consoles and a Precilec E8000 tactical

Satcom: Syracuse 2

Combat support system

The OPSMER combat support system is installed.

WEAPONS CONTROL

Thomson-CSF CTM radar/IR system. Sagem TDS 90 optical director and laser rangefinder.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 31.5 × 15.4 m (103 × 50 ft)
Helicopters: The ship facilities, flight deck and hangar are designed to accept and accommodate helicopters of up to 10 tonnes. Current plans are to operate one Aerospatiale AS 565 MA Panther, but an NH-90 in due course. The flight deck can accept a Super Frelon. Although the Panther is not armed it carries the equipment necessary to conduct over-the-horizon operations with MM 40 Exocet.

Eurocopter AS 365 Panther

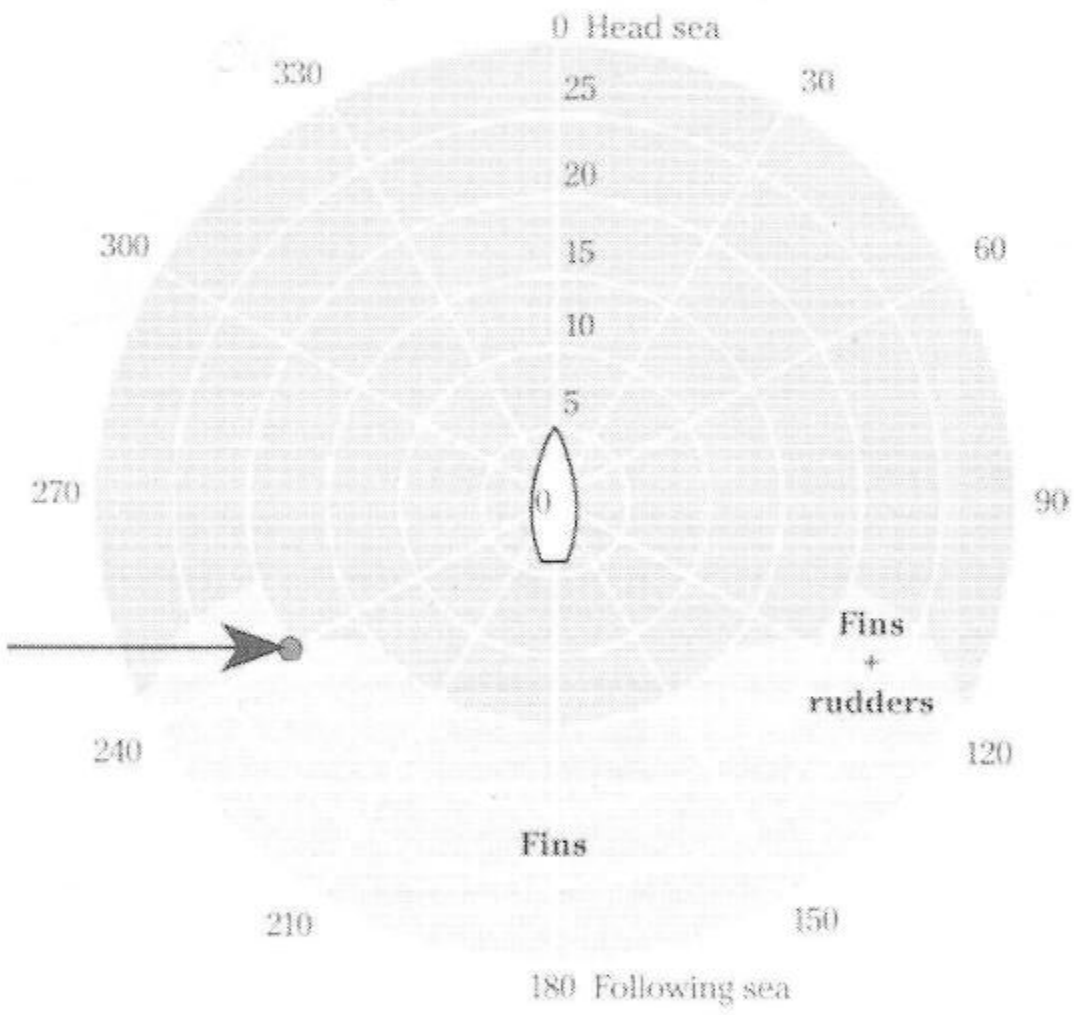
Specifications

Rotor diameter: 13.29 m (43.6 ft)
Fuselage length: 11.41 m (37.43 ft)
Height to rotor head: 4.0 m (13.12 ft)
Weights
empty: 2,262 kg (4,987 lb)
take-off: 4,250 kg (9,370 lb)
Performance
max speed (never exceed): 160 kts (296 km/h)
cruising speed (sea level): 148 kts (274 km/h)
rate of climb (sea level): 420 m (1,380 ft)/min
hovering ceiling (in ground effect): 2,600 m (8,530 ft)
Engines: 2 Turbomeca Ariel 1M1 turboshafts; take-off — 558 kW (749 shp), continuous — 487 kW (653 shp).
Accommodation: Two-man crew; cabin can hold 10 passengers.

PROPULSION

Specifications

System: Combined diesel and diesel (CODAD)
Main machinery: 4 SEMT-Pielstick 12PA 6V 280STC diesels; 15.52 MW (21,107 hp(m)) sustained;
Shafts: 2
Propellers: five-bladed, cp
Bow thruster: 1 bow thruster
Ship's services: 3 diesel-generator sets; each 750 kW



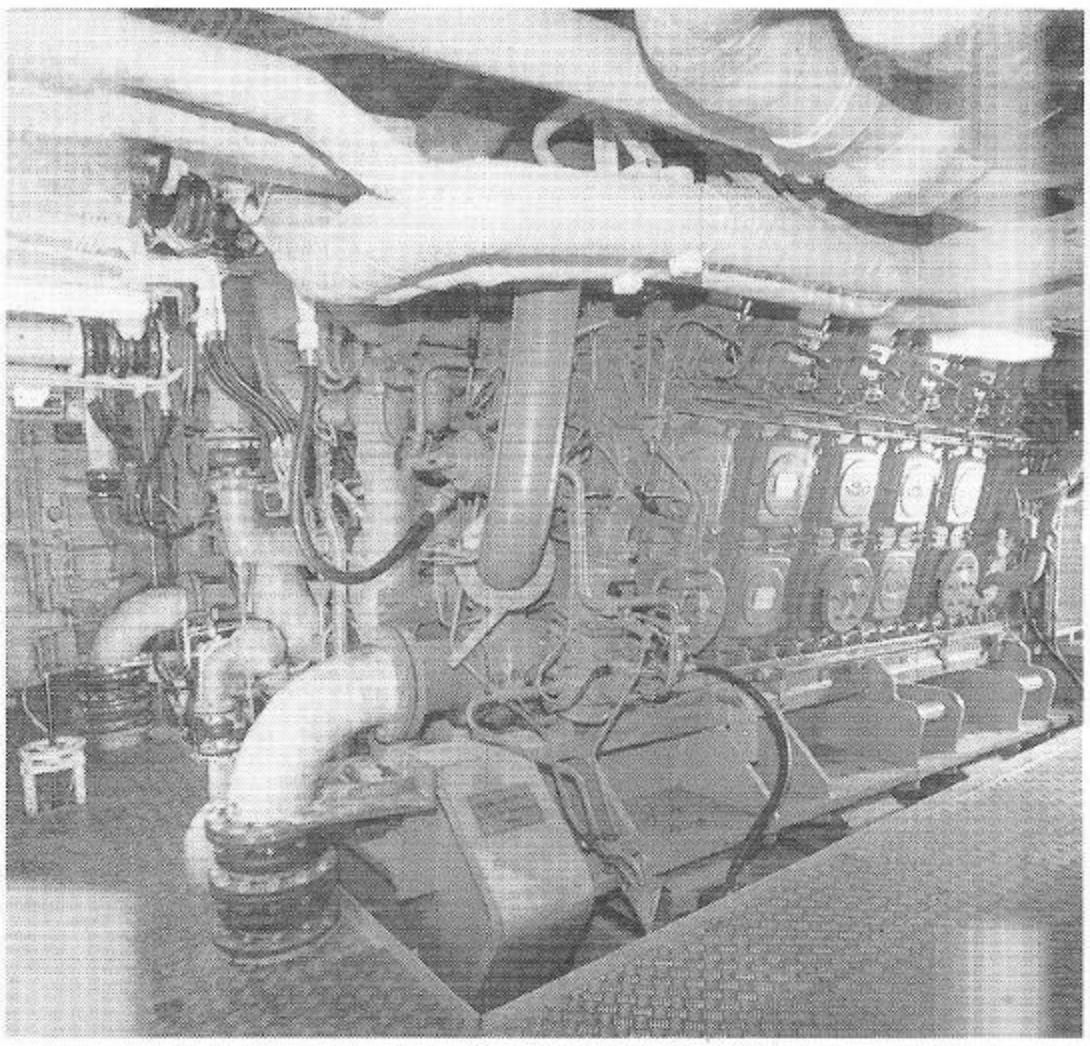
La Fayette

One of the ships for Taiwan; note the new coaming surrounding the foredeck platform

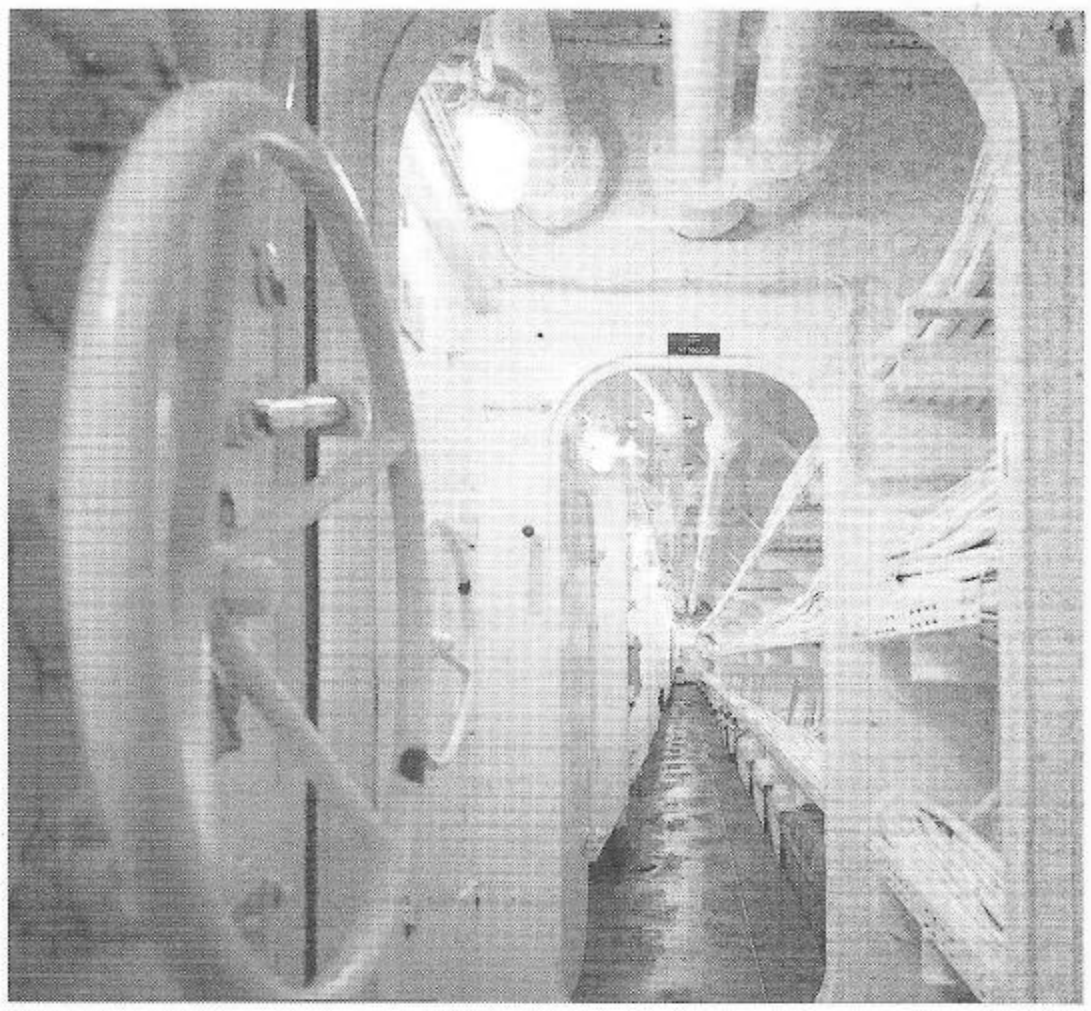
FURTHER INFORMATION

PROGRAMME

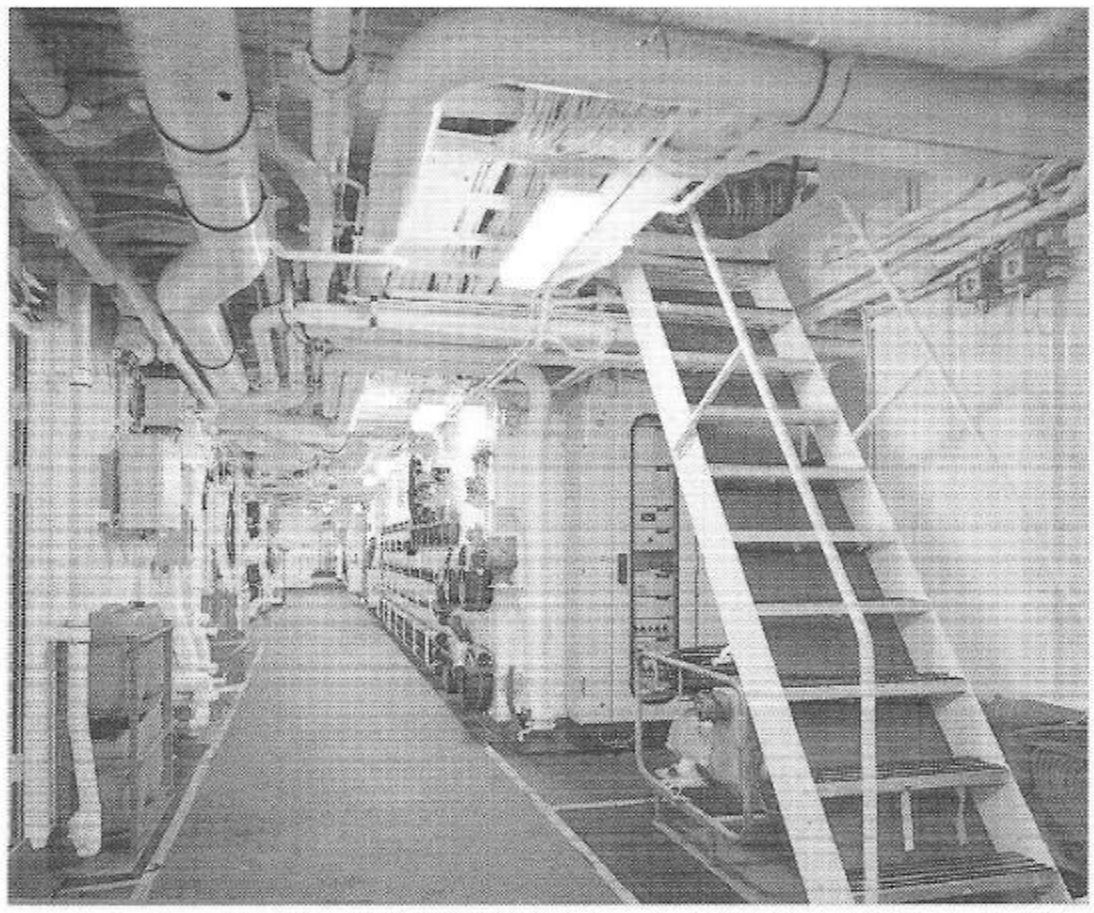
French naval analysis in the mid-1980s of its future tasks suggested that it will be more likely to become embroiled in crisis management and peacekeeping missions than in all-out war at sea, although the latter remains the ultimate threat. But ships engaging in convoy duties or imposing blockades still require considerable offensive power and defensive hardening, since even unsophisticated navies can mount serious attacks on warships, as events in the Gulf over the past ten years have shown. Sea-skimming missiles can be launched from aircraft, small boats or coastal batteries, guns, even when fitted to small vessels can do great damage, and mines can wreak havoc. Such problems are exacerbated by the fact that most rules of engagement will enable the 'other side' to fire first, before retaliatory action can be taken.



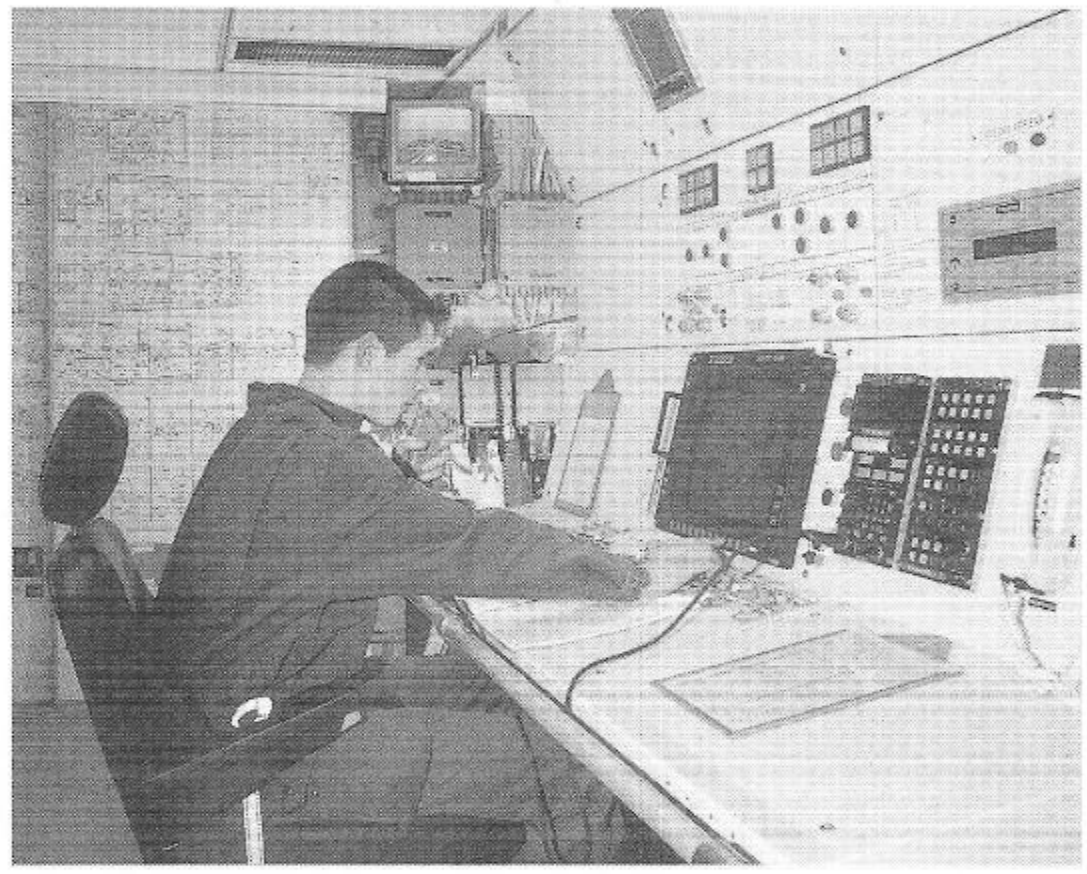
One of the four SEMT-Pielstick 12PA 6V 280 diesels, which use sequential supercharging to produce high performance in all torque regimes (DCN)



On the inner side of the hull there is a series of 'lateral galleries' which provide additional protection for the crew. The outer plates of the galleries are fabricated from armoured steel and the galleries themselves act as a form of spaced armour (DCN)



The main passageway runs down the centre of the ship and provides rapid and easy access to any location (DCN)



Damage Control HQ uses a computerised system to monitor the status throughout the ship, although the traditional large-scale paper diagrams can still be seen on the far bulkhead. There are three Damage Control Zones (DCN)

The missions which the La Fayette is designed to fulfil are:

Forward deployment and sea-control in sensitive areas
Intelligence collection
Participation in allied and international operations
Shadowing, deterrence and, when required, attack on hostile ships
Rescue of threatened French citizens
Landing special forces
Support of amphibious operations
Humanitarian missions
Search and rescue

The outcome of these analyses was the 'La Fayette' class, the first three of which were ordered for the French Navy on 25 July 1988, followed on 24 September 1992 by an order for three more. Current French plans call for a total of ten, but in view of the present round of severe cuts this may well be reduced to six.

DESIGNATION

The class was originally designated 'Frégates Légéres' (light frigates), but this was changed in 1992 to 'Frégates type La Fayette'.

DESIGN

The criteria laid down for the design were : stealth, reduced vulnerability to hits; good seakeeping; flexibility; a high degree of automation; and moderate costs. The result is a ship with a unique appearance.

The radar cross-section has been reduced by streamlining the hull, superstructure and masts, with all openings being covered by hatches, and the foredeck and stern completely covered in. All external vertical surfaces are inclined at 10° and there is a pronounced knuckle in the hull. Even the opening for the ship's boats is covered by a large roller blind, constructed of metallic links similar in design to mediaeval chain-mail. Radiation absorbing material and paint are used where needed. All reflecting equipment, such as capstans, bollards and fairleads have been placed under cover.

To reduce the acoustic signature, all four diesels are mounted on individual rafts and the gearboxes and propellers have been specially designed. The propellers have a bleed-air device and there is a noise suppression device which is described as 'Prairie/Masker-type' which suggests that it is French-designed, but using similar principles to the US original.

Vulnerability measures include redundancy, system dispersion, steel armour protection for vulnerable spots, advanced damage control and NBC protection.

The sea-keeping aspects of the design were very carefully considered, the result being a new hull form combining the economical U-form with the better sea-keeping of the V-form. A fully automated system correlates the operation of the fin stabilisers with that of the oversized rudders. As a result the ship can operate a 10 tonne helicopter up to Sea State 6 and can reverse course in 560 m (612 yd) at 20 knots with 30° rudder.

COMMANDOS

There is accommodation space for a maximum of 12 commandos. The stern gallery under the flight deck has storage space for the commandos' equipment and boats, and an upward-opening hatch in the transom lifts to allow the boats to be run out under a crane and lowered into the water for very quick and clandestine launches and recoveries.

THE FUTURE

A large number of future developments is planned for these ships. These include:

- Installing a SAAM launcher with a magazine holding 16 Aster 15 missiles forward of the bridge, which will enable the Crotale launcher to be removed from the hangar roof. This is planned to be

installed in F 713, F 714 and F 715 in build and to be retrofitted in the first three at their earliest refit.
- Replacing the Sea Tiger Mk 2 radar on the after mack by Arabel.
- Installing the SLAT anti-torpedo system, when available.
- A magazine for AM 39 Exocet and AS 15 missiles for the NFH-90 helicopter will be installed before the new aircraft enters service.
- Thomson-CSF TAVITAC 2000 will be replaced by SENIT 7 (the system developed for the nuclear carrier *Charles De Gaulle*).

Plans to fit sonar have been dropped, but it remains possible to produce an ASW version. Such a ship would have hull and towed array sonars, K 69 lightweight torpedo launchers, and an ASW configured helicopter.

DEPLOYMENT

La Fayette started full sea trials on 27 September 1993, followed by *Surcouf* on 4 July 1994 and *Courbet* on 14 September 1995.

As these frigates are designed for out of area operations on overseas stations, the first three have been assigned to the Indian Ocean squadron of the Force d'Action Navale (FAN).

SALES

Two of an improved design have been ordered by Saudi Arabia and six are being built for shipping to Taiwan for completion: see next two entries.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 40 anti-ship missiles
Eight MM 40 Exocet anti-ship missile launchers will be installed on the superstructure roof, immediately abaft the forward mack. Unlike most other tube-launched SSM installations these will not be located so that they fire across the ship with their efflux going straight overboard, but rather face outwards in two groups of four at an angle of 90° to the centreline and at +12° to the horizontal. There will be a central deflection plate to redirect the rocket efflux upwards.

Specifications
MM 40 Block 2
Length: 5.80 m (19 ft)
Diameter: 35 cm
Wing span: 1.13 m (3.70 ft)
Weight: 870 kg (1,918 lb)
Speed: Mach 0.9
Range: 2-40.5 n miles (4-75 km)
Warhead: 155 kg (341 lb) HE frag
Fuze: Impact/proximity
Guidance: Inertial and active radar

Manufacturers/Contractors
Aerospatiale Missiles, Paris Cedex, France (prime).
Luchaire Défense, Versailles Cedex, France (warhead).

SURFACE-TO-AIR MISSILES (SAM)

Crotale CN2
The Saudi Navy has opted for Crotale CN2 with one launcher mounted at the after end of the hangar roof, and a total of 16 missiles being carried. Crotale CN2 is based upon the new VT1 missile which can manoeuvre at up to 35 *g*, and is stored in a new, slimmer, launcher-container. The fire-control system, which will control two missile launchers and the 100 mm gun, will be based upon the lightweight Castor radar director, which employs a 12-18 GHz J-band radar with four-horn antenna on one side and a daylight TV camera with SAT IR tracker on the other side.

Specifications
Missiles: VT-1
Length: 2.34 m (7.6 ft)
Diameter: 16.5 cm
Wing span: n/k
Weight: 73 kg (161 lb)
Speed: Mach 3.5
Range: 5.4 n miles (10 km)
Altitude: 4,000 m (13,120 ft)
Fuze: RF proximity fuze
Warhead: 13 kg (28.7 lb) focused fragment
Guidance: Command/line of sight
Homing: Radar/IR

Manufacturer/Contractor
Thomson-CSF, Division Systèmes Electroniques.

GUNS

100 mm/55 Modèle 1968 CADAM
There will be a single 100 mm/55 Modèle 1968-II CADAM dual-purpose mounting on the foredeck. This is normally operated in the fully automatic remote mode with an unmanned turret, although there is a fall-back manual mode, which requires two men in each turret. The turret was taken from an old ship and upgraded to CADAM (CADence AMéliorée) standard with improved recoil and feed systems, raising the firing rate from 60 rds/min to 78 rds/min.

Specifications
Calibre: 100 mm
Length of barrel: 55 calibres
Muzzle velocity: 870 m/s (2,854 ft/s)
Traverse: 360° at 40°/s
Elevation: −15 to +80° at 25°/s
Mounting weight: 21 t
Crew: 2 (optional) and 2 loaders
Range:
anti-surface: 9.15 n miles (17 km)
anti-air: 8,000 m (26,000 ft)

Rate of fire: 78 rds/min
Ammunition: 13.5 kg (29.7 lb) (multipurpose projectile); 9.7 kg (21.4 lb) (charge)

Manufacturers/Contractors
Direction des Constructions Navales (DCN) (prime).
Mécanique Creusot-Loire, Marine Products (mountings).
DCN Ruelle (gun).
CSEE Défense (servo equipment).

Giat 20 mm F2 (20F2) TYPE A (M693) multipurpose cannon
Two Giat 20F2 cannon will be mounted in the bridge wings.

Specifications
Calibre: 20 mm
Length of barrels: 90 calibres
Rate of fire: 720 rds/min
Muzzle velocity: 1,050-1,250 m/s (3,444-4,100 ft/s)
Traverse: 325°
Elevation: −15 to +80°
Mounting weight, loaded: 470 kg (1,036 lb)
Weight of shell: 0.25 kg
Crew: 2
Range: 5.5 n miles (10 km)
Power requirement: 26 V (7A)

Manufacturer/Contractor
Giat, France

M2HB 12.7 mm (0.50 in) machine guns
Two M2HB 12.7 mm machine guns will also be carried to be mounted when required.

Specifications
Calibre: 12.7 mm (0.50 in)
Rate of fire: 450-550 rds/min
Muzzle velocity: 883 m/s (2,900 ft/s)
Max effective range:
anti-surface: 6,700 m (7,400 yd)
anti-air: 1,380 m (4,500 ft)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

DR-3000S ESM receiver
The DR-3000S (ARBR-17) ESM suite is a high-performance radar detection, analysis and threat warning system, covering conventional radar threat frequencies (that is, C- to J-bands). The system analyses the measured radar parameters and uses these characteristics to determine other parameters such as the radar's type and identity. There are two antenna assemblies, both on the mainmast. One is an omnidirectional array providing initial detection and threat frequency, and carrying out primary analysis, while below this are two eight-port directional antennas to provide more accurate bearing and frequency information. The antenna assemblies contain preamplifiers for improved performance.

Manufacturer/Contractor
Thomson-CSF, France.

DECOYS

DAGAIE CS Mk 2 countermeasures system
There are two DAGAIE CS Mk 2 launchers mounted on the upper deck immediately below the foremast. These can be loaded with either IR or chaff rockets, and the firing sequence runs automatically, once triggered by a missile alarm from a variety of sources, such as radar, ESM systems, or optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, windspeed and direction, ship heading and speed data.

The launching of radar and IR decoys is so arranged that advanced mixed-guidance missile systems cannot discriminate between them and thus collocation of both decoys is achieved. The installation is a double mounting and comprises: (a) two trainable mountings carrying 10 replaceable containers (suitcases), each of which is loaded with either 3-5 and 8-14 μm IR or I/J-band chaff projectiles.

A wide range of ammunition is provided by Etienne Lacroix Défense providing seduction, distraction and seduction/dissimulation modes. The electromagnetic decoys are normally based upon aluminised glass fibre chaff with rapid bloom time and they cover the I and J frequency bands. The infra-red decoys cover both the 3-5 and the 8-14 μm bands.

Specifications
Traverse: 330° at 21°/s
Average reaction time: Within 4 s
REM rocket dimensions: 850 × 127 mm (33.5 × 5 in)
Rocket weight: 13 kg (28.66 lb)
Container dimensions: 900 × 130 mm (35.4 × 5.1 in)
Container weight: 20 kg (44.1 lb)
LIR/LEM container dimensions: 780 × 630 × 134 mm (30 × 24.8 × 5.3 in)
Container weight: 54 kg (119 lb)

Manufacturer/Contractor
CSEE Défense, Paris, France.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Thomson-CSF TAVITAC 2000
TAVITAC 2000 (TAVITAC = *Traitement Automatique et VIsualisation TACtique*) is a tactical picture compilation system which uses data from ship sensors and integrates data from offboard sensors through a Link 11 datalink system. It also designates targets to weapon systems. In the 'La Fayette' class TAVITAC 2000 controls:

- Thomson-CSF Sea Tiger Mk 2 2D radar
- Thomson-CSF ARBR 17 ESM suite
- Two Racal-Decca Type 1226 navigation and helicopter control radars
- Syracuse-2 Satcom systems
- Exocet MM 40 missiles
- 100 mm gun with radar fire-control unit
- Sea Crotale CN2
- Two 20 mm automatic cannon
- Two CSEE Dagaie Mk 2 decoy launchers

The TAVITAC 2000 system has a distributed architecture using the Thomson-CSF MLX-32 computers which are built around a Motorola 68030 microprocessor. The system uses Ada software language, the UNIX System V operating system and features a duplicated VMEbus 5 Mbyte/s Ethernet-standard local area network. A ruggedised disk storage system offers a database management capability for map displays, ship resources and management. The system includes the Vista raster scan software-driven display consoles which incorporate the Motorola 68020 microprocessor. The consoles, with high-resolution colour displays and a powerful radar scan converter, allow the radar video data to be superimposed upon the graphic picture. The displays use a 48.26 cm (19 in) colour 1,024 × 1,280 pixel screen, which is increased to 2,000 × 2,000 pixels at the graphic controller.

The Vista console is capable of processing up to 800 tracks and displaying 300 of them together with 30 circles, 30 ellipses, 500 vectors and 2,000 shoreline vectors. Options include a second 19 in television monitor. The MMI facilities include two programmable keyboards and a rollerball, with four associated buttons. Features which may be added include a second radar scan converter for window displays of further raw radar video and further MMI facilities.

Up to 15 display consoles and network interface units can be run from two computers. In the 'La Fayette' class there are two MLX-32 computers, one of which provides redundancy, and another two to interface with sensor and weapon systems as well as Link 11. There are six Vista consoles and a Precilec E8000 tactical table linked by an Ethernet dual-redundancy local area network.

Manufacturer/Contractor
Thomson-CSF, Division Systèmes Défense et Controle, Bagneux, France.

RADARS

Datalinks: Link 11
Satcom: Syracuse 2

Combat support system

The OPSMER combat support system will be installed.

WEAPONS CONTROL

CTM (DIBC-1A PIRANA) gun fire-control system

CTM (*Conduit de Tir Modulaire*) is the fire-control system for the 100 mm gun, after the targets have been designated by the combat information centre using inputs from the ship's search radar. The PIRANA system (PIRANA = *Pointeur Infra-Rouge pour l'Artillerie Navale*) consists of an IR tracker fitted to the Thomson-CSF Castor IIc director, which includes a TV camera and the DRBC-33 radar. The CTM system features a single operator console and two Cimsa Sintra 15MO5E computers, this being an extended (Etendu) version of the 15MO5. The software is in the national LTR language. The CTM interfaces with the TAVITAC 2000 computers for firing designation and engagement monitoring.

Manufacturers/Contractors

DCN International, Paris, France (CTM).
SAT, Paris Cedex 13, France (PIRANA).

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 31.5 × 15.4 m (103 × 50 ft) 33.2 × 16.2 m (109 × 50.5 ft)

HELICOPTERS

One Eurocopter AS 365F Dauphin 2 ASW and light liaison

Specifications

Dimensions:
rotor diameter: 13.29 m (43.6 ft)
fuselage length: 11.41 m (37.43 ft)
height to rotor head: 4.0 m (13.12 ft)
Weights:
empty: 2,262 kg (4,987 lb)
max take-off: 4,250 kg (9,370 lb)
Performance:
max speed (never exceed): 160 kts (296 km/h)
cruising speed (sea level): 148 kts (274 km/h)
rate of climb (sea level): 420 m (1,380 ft)/min
hovering ceiling (in ground effect): 2,600 m (8,530 ft)
Engines: two Turbomeca Ariel 1M1 turboshafts; take-off – 558 kW (749 shp), continuous – 487 kW (653 shp)
Accommodation: Two-man crew; 10 passengers

PROPULSION

Specifications

System: Combined diesel and diesel (CODAD)
Main machinery: 4 SEMT-Pielstick 12PA 6V 280STC diesels; 15.52 MW (21,107 hp(m)) sustained;
Shafts: 2
Propellers: cp
Bow thruster: 1 bow thruster

FURTHER INFORMATION

PROGRAMME

The Saudi Navy's first major warships were the four F 2000S ('Madina' class) frigates, which were built in France and delivered between 1985 and 1986. While that order was still in hand the Saudi Navy was searching for a new class of ships and the order was eventually won by the French F 3000S against strong international competition, particularly from Canada's St John Shipbuilding. The contract, known as Sawari II, is for two modified versions of the La Fayette, which will be delivered in 1999 and 2002, respectively.

DESIGN

The design of the Saudi Arabian ships is generally similar to that of the French prototype. The Saudi ships will, however, be 3 m (9.8 ft) longer and 0.8 m (2.62 ft) broader in the beam, and have an 820 t greater full load displacement. According to drawings so far released, the superstructure will be more like that of the Taiwanese ships, particularly the raised section behind the bridge and the arrangement and design of the macks.

The La Fayette flight deck is already large by frigate standards (31.5 × 15.4 m (103 × 50 ft)), but that of the Saudi ships will be even larger at 33.2 m (109 ft) long and 16.2 m (53 ft) wide. This will enable large helicopters to be handled, although the Saudi Navy has no known plans to purchase anything larger than the SA 365 Dauphins currently in the inventory.

Laid down Nov 1994
Launched May 1996
Commissioned Oct 1998

Taiwanese frigate Si Ning *(1203) fitting out at Lorient. These ships will provide a substantial boost to the combat capability of the RoCN which for many years has relied on Second World War-vintage, ex-US Navy destroyers* (Jane's/H M Steele)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Hsiung Feng II short/medium-range anti-ship missile

There are eight launcher-container tubes for Hsiung Feng II anti-ship missiles. They are located in the same place as the La Fayette's Exocet launchers, and like them they point directly over the side, with an efflux deflection plate in the centre of the ship. Hsiung Feng II is a short-range anti-ship missile, derived from the Israeli Gabriel, powered by a turbojet cruise engine, with rocket boosters for take-off. The fire-control system is similar to that used in Gabriel with a radar tracker (usually HR 76), a display control and processing unit, a vertical reference unit and an optical sight which is usually the Kollmorgen Mk 35 or Model 985. The launcher-containers are also identical to those used in Gabriel and are generally similar to the Harpoon's Mk 141.

The launcher operation is likely to follow that of most conventional medium-range anti-ship missiles with the target acquired by long-range surface search radars with over-the-horizon targeting facilities through a Ta Chen datalink. The launcher and target locations are inserted into the inertial guidance system, the missile is launched and adopts a low-level cruising altitude. The target is acquired by both the radar and the IR sensors and the returns are compared with an onboard library. If significant deviations in one sensor's returns occur then the guidance system assumes it is being jammed and gives priority to the other as the missile enters the sea-skimming terminal phase.

Specifications

Hsiung Feng II
Length: 3.9 m (12.8 ft)
Diameter: 34 cm (13.4 in)
Wing span: 1.35 m (4.4 ft)
Weight: 540 kg (1,190 lb)
Speed: Mach 0.85
Range: 32 n miles (60 km)
Guidance: Semi-active radar, manual or IR homing
Warhead: 150 kg (330 lb) HE
Engine: Microturbo TRI-60 single spool turbojet

Launch of Hsiung Feng II anti-ship missile. Each Kang Ding frigate will carry eight

SURFACE-TO-AIR MISSILES (SAM)

RIM-72C Sea Chaparral

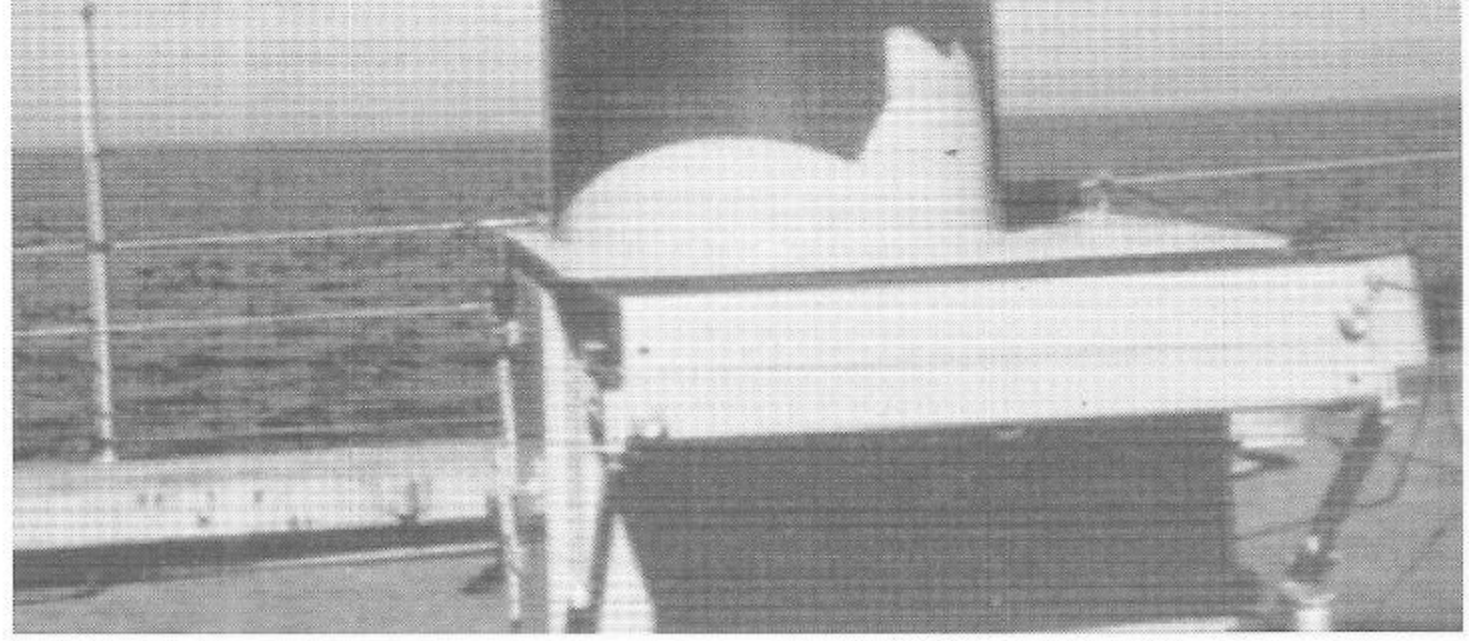
One Sea Chaparral quad launcher is sited immediately before the bridge screen in the location earmarked in the French ships for Aster 15. The Chaparral system was originally developed for the US Army and consists of a manned Mk 54 mounting with two rails on each side, each of which carries a single Sidewinder SAM. In addition to the four missiles on the mounting there are 16 reloads in the below-decks magazine. The rails elevate from −9 to +90°. The Sidewinder missile has an all-aspect IR seeker, a blast fragmentation warhead, and is powered by a single-stage, solid propellant rocket motor.

The operator sits in an air conditioned cab with controls for activating the system, selecting the missile and initiating the launch sequence. Early warning of the target is provided by the ship's radar and the CIC directs the operator to which direction he should turn the mounting. He acquires the target optically, tracks it and selects and activates a missile for the engagement. When the missile's IR detector has acquired the target an audio tone sounds and the operator launches the missile. Proportional navigation guidance commands are generated from seeker tracking rates and used to control the missile's flight path.

Sea Chaparral is only in service with the RoCN.

Specifications

Length: 2.91 m (9.5 ft)
Diameter: 12.7 cm (5 in)
Wing span: 63 cm (25 in)
Weight: 86.2 kg (190 lb)
Speed: Mach 1.2
Range: 4.75 n miles (9 km)
Guidance: Optical aiming, infra-red homing
Warhead: Picatinny Arsenal M-250 12.6 kg (27.7 lb) HE blast-fragmentation
Motor: Hercules/Atlantic Research Corporation M-121 single-stage, solid propellant rocket motor.



Sea Chaparral launcher. The RoCN continues to be the only user of this system which combines Sidewinder missiles with a launcher/operator unit

Manufacturer/Contractor
Loral, Aeronutronic.

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited at the forward end of the flight deck, in the open.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)

Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 76 mm (3 in)/62 Compact

There is a single OTOBREDA 76 mm (3 in)/62 calibre Compact mounting in 'A' position.

Specifications

Elevation: −15 to +85°
Training speed: 70°/s
Elevation speed: 40°/s
Weight (unloaded): 12 t
Muzzle velocity: 900 m/s (2,952 ft/s)
Rate of fire: 85 rds/min
Range: 8.5 n miles (15.75 km)
Weight of shell: 6 kg (13.2 lb)

Hughes Mk 15 CIWS Phalanx

There is one Hughes Mk 15 Phalanx close in weapons system (CIWS) sited at the after end of the hangar roof. The mount consists of a 20 mm M61A1 Vulcan, six-barrel, Gatling-principle gun with a cylindrical magazine and feeding mechanism suspended beneath. Firing usually begins at 1 n miles (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 3,000 rds/min (Block 0, Block 1 Baseline 0), 4,500 rds/min (Block 1 Baseline 1)
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor

Hughes Missile Systems, Tucson, Arizona, USA (System).

Bofors 40 mm/70

There are two single Bofors 40 mm in enclosed mountings on small platform decks at the after end of the hangar. These appear to be the same mounts as in the 'Cheng Kung' class frigates.

Specifications

Traverse: 360° (nominal) at 90°/s
Elevation: −3 to +85° at 60°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Max range:
anti-surface: 6.5 n miles (12 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Chang Feng IV (AN/SLQ-32(V)5) ESM/ ECM suite

An order was placed with the Hughes Company to deliver eight AN/SLQ-32(V)5 systems to the US Navy and one to Taiwan, an order which was eventually taken over and completed by Raytheon. AN/SLQ-35(V)5 is now produced in Taiwan as the Chang Feng IV system.

The ESM component gives radar warning on B- to J-bands, while the additional 'Sidekick' ECM element provides active onboard countermeasures, employing a high-gain, multibeam antenna system and with full ECM techniques repertoire for both ship defence and counter-targeting roles. Sidekick can counter simultaneous threats from any azimuth angle.

Manufacturer/Contractor

Raytheon Company, Electromagnetic Systems Division, Goleta, California, USA.

DECOYS

DAGAIE CS Mk 2 countermeasures system

There are two DAGAIE CS Mk 2 launchers mounted on the upper deck immediately below the foremast. These can be loaded with either IR or chaff rockets, and the firing sequence runs automatically, once triggered by a missile alarm from a variety of sources, such as radar, ESM systems, or optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, windspeed and direction, ship heading and speed data.

The launching of radar and IR decoys is so arranged that advanced mixed-guidance missile systems cannot discriminate between them and thus collocation of both decoys is achieved. The installation is a double mounting and comprises: (a) two trainable mountings carrying 10 replaceable containers (suitcases), each of which is loaded with either 3-5 and 8-14 μm IR or I/J-band chaff projectiles.

A wide range of ammunition is provided by Etienne Lacroix Défense providing seduction, distraction and seduction/ dissimulation modes. The electromagnetic decoys are normally based upon aluminised glass fibre chaff with rapid bloom time and they cover the I and J frequency bands. The infra-red decoys cover both the 3-5 and the 8-14 μm bands.

Specifications

Traverse: 330° at 21°/s
Average reaction time: Within 4 s
REM rocket dimensions: 850 × 127 mm (33.5 × 5 in)
Rocket weight: 13 kg (28.66 lb)
Container dimensions: 900 × 130 mm (35.4 × 5.1 in)
Container weight: 20 kg (44.1 lb)
LIR/LEM container dimensions: 780 × 630 × 134 mm (30 × 24.8 × 5.3 in)
Container weight: 54 kg (119 lb)

Manufacturer/Contractor

CSEE Défense, Paris, France.

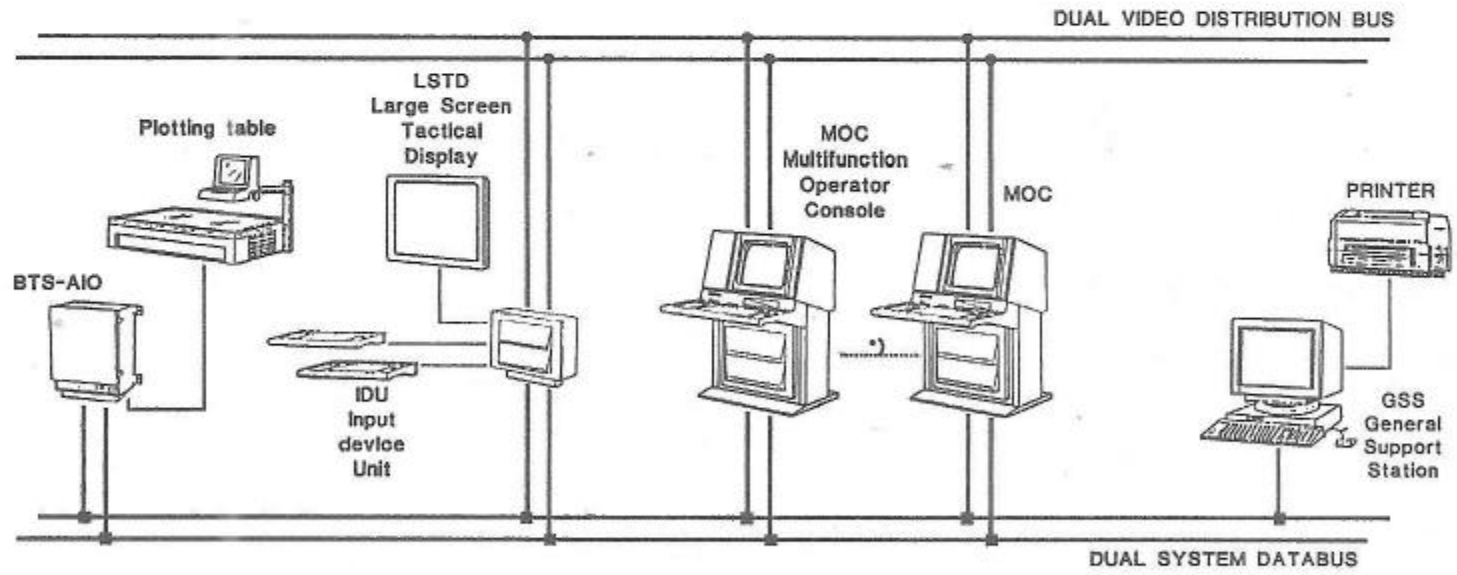
COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

TACTICOS combat management system

TACTICOS (TACTical Information and COmmand System) results from merging the best elements of Signaal's STACOS and Thomson's TAVITAC 2000. TACTICOS comprises command and control, command support and fire-control facilities on behalf of anti-air warfare, surface warfare, anti-submarine warfare, electronic warfare as well as naval gunfire support. It allows the command team to assess and monitor the tactical situation, to plan and co-ordinate naval operations and to control the sensor and weapon systems. Tasks include:

- Short- and long-term planning of maritime operations
- Control of online surveillance sensors, datalinks and communication equipment
- Presentation of raw or digitised sensor information
- Compilation and presentation of the tactical situation in the air, surface and subsurface environments, including the EW situation
- Decision support for the command team
- Automatic threat evaluation and threat ranking
- Automatic target designation to weapon systems and tracking/illumination sensors
- Assistance in operations, including navigation and the direction of aircraft and other assets under control
- Scenario and simulation facilities for wargaming, planning and training

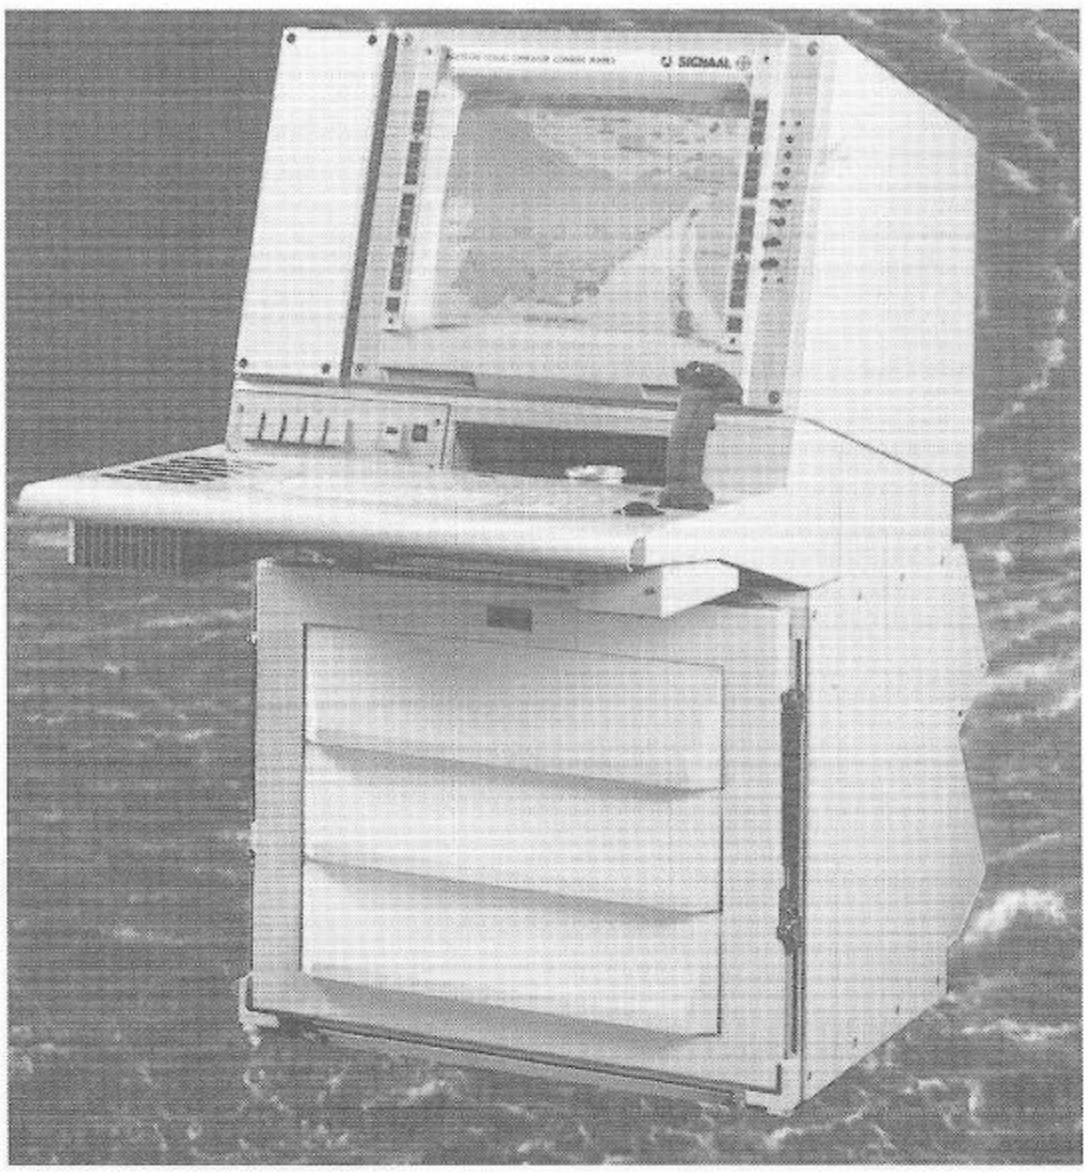


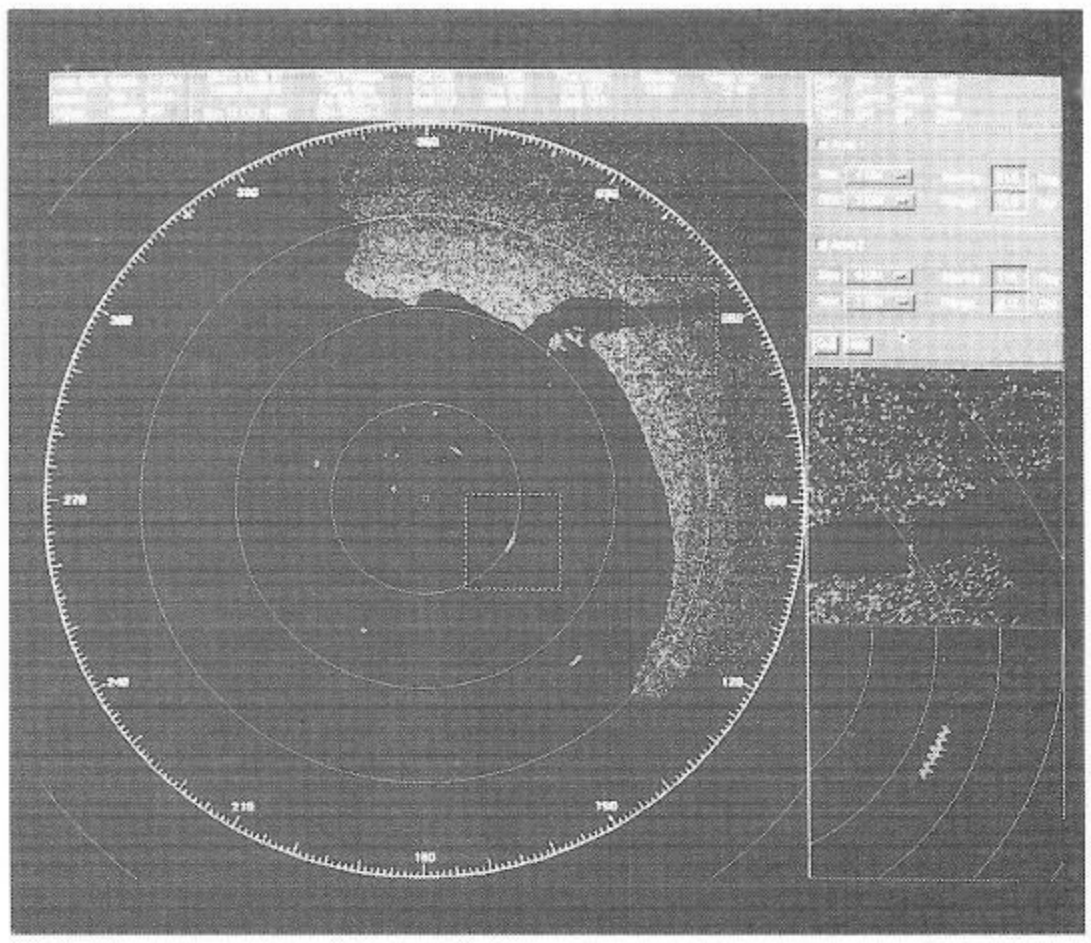
The TACTICOS system

TACTICOS employs a distributed computer architecture, applying a multinode, multiprocessor concept in a battle damage-resistant configuration. The nodes are hosted in the Multifunction Operator Consoles (MOCs) and Bus Terminal Servers (BTSs) and contain two to seven state-of-the-art SPARC processor boards. The package is known as SigMA3-S (Signaal's Modular Architecture, release 3 with SPLICE). The software is written in the Ada language and includes the SPLICE distributed database and data communication software that operates alongside a real-time version of UNIX. The hardware is linked through a dual Ethernet (IEEE 802.3) standard local area network, which may be extended to a quadruple network or which can be replaced by a redundant FDDI network. A redundant video distribution bus collects the radar, TV and/ or IR videos and distributes these to the various operator consoles, where a selection can be made from the available videos for presentation on the console.

Some subsystems can be linked directly to the local area network and video bus, and those that cannot do so use the BTS to interface with the local area network and the video bus. The BTS contains spare interface card positions that will allow NTDS, MIL-STD-1553B, RS-432 or any other subsystem interface, to link into TACTICOS.

Other hardware includes an online plotting table for automatic and manual plotting on various types of charts and a General Support Station (GSS). The latter is a standard commercial workstation with a 16 in colour raster scan display and a laser printer and is used for system monitoring, database support and training.





At the heart of the TACTICOS system to be used by the RoCN is the Multifunction Operator Console (MOC) (above left). A typical presentation (above right) shows filled map data in the background, a TV picture and a series of dialogue windows (Signaal)

Manufacturers/Contractors

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

Thomson-CSF, Division Systèmes Défense et Controle, Bagneux, France.

WEAPONS CONTROL

CSEE Najir Mk 2 electro-optic director

Najir (designated DMAc by the French Navy) is an autonomous, deck-mounted director for use in air defence operations to complement the radar fire-control system. It has similar functions to Panda/Naja but the manned element supplements the Ericsson Nd:YAG laser rangefinder with an SAT Murène thermal imager operating in the 8-11 µm range. The latest production Najir features Radamec television cameras and consideration is being given to an eye-safe laser rangefinder. The manned element has, in addition to three sensors, a servo cabinet, a ballistic unit based upon two Motorola 68000 microprocessors and a power supply box.

Specifications

Najir
Height: 1.35 m (4.4 ft)
Width: 1.5 m {4.9 ft)
Weight: 560 kg (1,235 lb)
Max velocity
traverse: 90°/s
elevation: 60°/s

Manufacturer/Contractor

CSEE Défense, Paris, France

RADARS

Type	Jupiter (DRBV 26D) (Note 1)	Triton G (DRBV-51)	Castor IIC (DRBC-33) (two)
Manufacturer/ contractor	Thomson-CSF, France	Thomson-CSF, France	Thomson-CSF, France

Scan rate	7.5/15 rpm	40 rpm	—
Typical range		Air: 2 m² target 16 n miles (30 km) distance, 6,000 m altitude Surface: 10 m² target at 24.25 n miles (45 km)	8 n miles (15 km) for 1 m² target

Note: (1) Uses Signaal LW-08 antenna

SONARS

BAe/Thomson Sintra ATAS (V)2 active towed array

ATAS comprises a high-power, low-frequency transmitter, operating in three frequencies around the 3 kHz band, which can be deployed at up to 900 m (2,953 ft) behind the towing platform, together with an in-line receiver array towed a further 300 m (984 ft) behind the transmitter, all of which may be towed at depths suited to prevailing oceanographic conditions. The port/starboard ambiguity normally associated with a towed array is automatically and instantaneously resolved within the system without the need for ship manoeuvre. ATAS can be operated at depths of 235 m (771 ft). The transmitter has a high-power acoustic sound source consisting of a vertical stave of 10 in low-frequency flextensional transducers. Transmissions in CW or FM are omnidirectional in the horizontal plane with a vertical beamwidth of 25°. The receiver array is a 30 m (98 ft) long flexible tube housing a line of hydrophones and associated electronics to condition and digitise hydrophone signals. The receiver gives full azimuth cover and in the broadside direction a bearing resolution of up to 0.5°. The receiver uses 96 preformed beams with bearing stabilisation. The processing equipment uses current technology to provide high processing capability within a single compact unit.

Manufacturers/Contractors

BAeSEMA Marine Division, Bristol, UK.

Thomson Sintra Activités Sous-Marines, Sophia Antipolis Cedex, France.

TSM 2633 (Spherion) hull-mounted sonar

TSM 2633 is the hull-mounted version of the Spherion VDS and is a long-range active sonar for ASW surface combatants. It comprises a spherical hull-mounted array with an electronic processing system that allows for real-time computation in transmission and reception modes; three-dimensional stabilisation to compensate for pitch, roll and yaw in the parent vessel; and a beam-tilting capability to counter adverse sound velocity profiles and strong reverberation.

Specifications

Acoustic array: Spherical with 160 individual transducers
Frequency: 7 kHz (approx)
Transmitter: Omnidirectional and sectoral transmissions in CW and FM modes, various modes including TRDT
Receiver: 36 preformed beams stabilised in azimuth and elevation; advanced processing with replica correlator in FM and spectrum analysis (FFT) in CW
Video processing: Data processing in FM and CW modes: automatic detection and tracking; simultaneous multitrack extraction (up to 64); target analysis (apparent length, Doppler measurement).
Display: High-resolution, flicker-free colour TV monitors
Total weight: 4,000 kg (8,818 lb)

Manufacturer/Contractor

Thomson Sintra Activités Sous-Marines, Sophia Antipolis Cedex, France.

System: Combined diesel and diesel (CODAD)

Main machinery: 4 SEMT-Pielstick 12 PA6 V 280 STC diesels; 17.00 MW (23,228 hp(m))

Shafts: 2

FURTHER INFORMATION

PROGRAMME

The sale of up to 16 of the 'La Fayette' class was authorised by the French Government in August 1991. These ships are generally similar to the French prototypes, but with a number of differences arising in part from different requirements, but also because of the limitations placed on weapons supplied to Taiwan. The role of the ships is also different, with the 'Kang Ding' class having a major ASW function, for which it is fitted with sonar and ASW torpedo tubes, and carrying an ASW helicopter.

The contract for the first six was signed with Thomson-CSF in early 1992, with the ships being constructed in France, but with some weapon assembly by the China Shipbuilding Corporation at Kaohsiung in Taiwan. The first of class arrived in Taiwan in March 1996 and the last is due to arrive in July 1998. A second batch of 10 is due to be built by the China Shipbuilding Corporation, although recent reports suggest that 1,500 tonne corvettes are being considered as a cheaper alternative.

NAMES

The five names so far announced are those of cities in mainland China, all provincial capitals:

Kang Ding (1202), Hsikiang province
Si Ning (1203), Qinghai province
Kun Ming (1205), Yunnan province
Di Hua (1206), Sinkiang province
Wu Chang (1207), Hupeh province

It should be noted that the number 4 or numbers whose digits add up to 4 are never allocated by the RoCN as they are deemed to be unlucky.

DESIGN

While these are basically the same design as the French 'La Fayette' class there are considerable external differences, and there may be even more differences internally.

The macks are quite different, those on the Taiwanese ship being lower and more substantial, with the forward mack carrying the main search radar (DRBV 26D) array.

In terms of armament, the Taiwanese ships have an OTOBREDA 76 mm gun instead of the French 100 mm and its only air defence weapon is the short-range Sea Chaparral, while the indigenous Hsiung Feng II anti-ship missile replaces the Exocet carried in the French ships. The Taiwanese ship also mounts a Mk 15 CIWS, giving it a capability lacking in the French ships.

The superstructure immediately behind the bridge is higher in the Taiwanese ship and midships there are four square apertures immediately abaft the opening for the ship's boats. It appears, however, that the Hsiung Feng missiles are fired across the ship and these apertures (which are immediately below the missile launch tubes) may well be exhaust channels for the rocket motors. The after end of the superstructure is also different, with a large recess on either side of the hangar. Each recess has two levels, with the lower one destined to take the Bofors 40 mm mount; what is to be mounted in the upper level is not yet clear.

Aft, the Taiwanese ships do not have the RAST helicopter flight deck handling gear. Nor is there a stern hatch to launch commandos and presumably the internal space is used for other purposes, one of which will be housing the ATAS towed sonar array.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 38 medium-range anti-ship missile

These ships mount two Aerospatiale MM 38 Exocets immediately abaft the mast in two individual ITS *(Installation de Tir Standard)* launcher-containers, within which they are suspended from a launch rail in the ceiling. These launcher-containers point outwards and are inclined at an angle of 12° to the horizontal. Targets are acquired by the ship's DRBV-21A radar and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence. This involves turning on the thermal battery, releasing the mechanical safety locks, igniting the booster, and, finally, breaking the umbilical cord; the total process takes some 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change of course during its flight.

The attack consists of three phases: cruise, approach and terminal. A salvo may be fired in 12-20 seconds. An additional two missiles can be carried, if necessary.

Specifications

MM 38
Length: 5.21 m (17.1 ft)
Diameter: 35 cm (13.78 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 2-22.5 n miles (4-42 km)
Guidance: Inertial and active radar
Sustainer motor: SNPE Eole alloy-cased CDB; weight 151 kg (333 lb); max burn time 93 s
Booster: 100 kg (220 lb), SNPE Epervier boost motor, burn time of 2.4 s
Warhead: Luchaire 165 kg (364 lb) fragmentation warhead
Fuzes: Delayed impact fuze and autopilot-controlled proximity fuze

Manufacturer/Contractor

Aerospatiale Tactical Missiles, Chatillon Cedex, France.

GUNS

100 mm/55 Modèle 1968 CADAM

There is one single 100 mm/55 Modèle 1968-II CADAM dual-purpose mounting located on the foredeck. This is normally operated in the fully automatic remote mode with an unmanned turret, although there is a fallback manual mode, which requires two men in the turret. The turrets have been taken from an old ship and upgraded to CADAM (CADence AMéliorée) standard with improved recoil and feed systems, raising the firing rate from 60 rds/min to 78 rds/min.

Specifications

Calibre: 100 mm
Length of barrel: 55 calibres
Muzzle velocity: 870 m/s (2,854 ft/s)
Traverse: 360° at 40°/s
Elevation: −15 to +80° at 25°/s
Crew: 2 (optional) and 2 loaders
Range:
anti-surface: 9.15 n miles (17 km)
anti-air: 8,000 m (26,000 ft)
Rate of fire: 78 rds/min
Ammunition: 13.5 kg (29.8 lb) (multipurpose projectile); 9.7 kg (21.4 lb) (charge)

Manufacturers/Contractors

Direction des Constructions Navales (DCN) (prime).
Mécanique Creusot-Loire, Marine Products (mountings).
DCN Ruelle (gun).
CSEE Défense (servo equipment).

Giat 20 mm F2 Type A M 693 multipurpose cannon

There are two manually operated 20 mm cannon mounted in the two after corners of the hangar roof. It is intended that these will be replaced by SIMBAD in due course.

Specifications

Calibre: 20 mm
Length of barrel: 90 calibres
Rate of fire: 720 rds/min
Muzzle velocity: 1,050-1,250 m/s (3,445-4,100 ft/s)
Traverse: 325°
Elevation: −15 to +80°
Weight of shell: 0.25 kg (0.55 lb)
Crew: 2
Range: 3.5-5.5 n miles (6.75-10 km)

Manufacturer/Contractor

Giat, France.

Germinal *(F 735) with a French Army Super Puma helicopter embarked. Note the two 20 mm guns on the hangar roof and the DRBN 34A helicopter control radar on the quarterdeck*

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Thomson-CSF ARBR-17

The Thomson-CSF ARBR-17 ESM suite is a high-performance radar detection, analysis and threat warning system, covering conventional radar threat frequencies (such as, C- to J-bands). The system analyses the measured radar parameters and uses these characteristics to determine other parameters such as the radar's type and identity. There are two antenna assemblies, the first being an omnidirectional system installed on the ship's mainmast which provides initial detection and threat frequency, and carries out primary analysis. Below this are two eight-port directional antennas which provide more accurate bearing and frequency information. The antenna assemblies contain preamplifiers for improved performance.

Manufacturer/Contractor

Thomson-CSF, Sophia Antipolis, France.

DECOYS

DAGAIE countermeasures system

There are two DAGAIE launchers located either side of the mast. These can be loaded with either IR or chaff rockets. The firing sequence runs automatically, once triggered by a missile alarm from a variety of sources, such as radar, ESM systems, or optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, windspeed and direction, ship heading and speed data.

The launching of radar and IR decoys is so arranged that advanced mixed-guidance missile systems cannot discriminate them and thus collocation of both decoys is achieved. The installation is a double mounting and comprises: (a) two trainable mountings carrying 10 replaceable containers (suitcases), each of which is loaded with either 3-5 and 8-14 µm IR or I/J-band chaff projectiles.

A wide range of ammunition is provided by Etienne Lacroix Défense providing seduction, distraction and seduction/dissimulation modes. The electromagnetic decoys are normally based upon aluminised glass fibre chaff with rapid bloom time and they cover the I and J frequency bands. The infra-red decoys cover both the 3-5 and the 8-14 µm bands.

Specifications

Traverse: 330° at 21°/s
Average reaction time: Within 4 s
REM rocket dimensions: 850 × 127 mm (33.5 × 5 in)
Rocket weight: 13 kg (28.66 lb)
Container dimensions: 900 × 130 mm (35.4 × 5.1 in)
Container weight: 20 kg (44.1 lb)
LIR/LEM container dimensions: 780 × 630 × 134 mm (30 × 24.8 × 5.3 in)
Container weight: 54 kg (119 lb)

Manufacturer/Contractor

CSEE Défense, Paris, France.

COMMAND AND CONTROL SYSTEMS

COMMUNICATIONS AND DATALINKS

Syracuse 2 Satcom.

WEAPONS CONTROL

NAJIR (DMAc) electro-optic director

Najir (French Navy designation: DMAc) entered service in July 1988 and is an autonomous deck-mounted electro-optic director, which is used in this class in air defence operations. Najir has similar functions to the earlier Panda/Naja but the Ericsson Nd:YAG laser rangefinder is supplemented by an SAR Muréne thermal imager operating in the 8-11 µm range. The latest production Najir also features Radamec television cameras.

Specifications

Height: 1.35 m (4.43 ft)
Width: 1.5 m (4.9 ft)
Weight: 560 kg (1,235 lb)
Elevation: −20 to +70°
Max velocity
traverse: 90°/s
elevation: 60°/s

Manufacturer/Contractor

CSEE Défense, Paris, France.

RADARS

DRBV 21A (Mars) air and surface surveillance radar

DRBV 21A is a D-band radar intended for ocean-capable patrol vessels and operates with a simplified transmitter assembled with the receiver in a single electronics cabinet. The antenna weighs approximately 600 kg (1,323 lb), has a gain of 26 dB and rotates at 12 rpm. Instrumented ranges are 52 n miles (110 km) for the air channel and 43 n miles (80 km) for the optional surface channel. The radar cabinet is fitted for extraction/tracking unit for automated surveillance. The transmitter is solid state with frequency agility,

The operations centre aboard Germinal *(F 735) is spartan by warship standards, but is tailored to the surveillance frigate's needs* (French Navy)

burst-to-burst with Doppler processing, or pulse-to-pulse.

Manufacturer/Contractor
Thomson-CSF, Systèmes Navals de Combat, Bagneux, France.

Decca 1226
There are two Racal-Decca 1226 radars. One is used for navigation, the other for helicopter control. In the French Navy their designation is DRBN 34A.

Specifications
Role: Surface search
Band: I
Beam: 1.2°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1 µs
Scan rate: 28 rpm

Manufacturer/Contractor
Racal-Decca.

SONAR

No sonar is fitted in these ships.

AVIATION

AVIATION FACILITIES

Specifications
Flight deck: 23 × 14 m (76 × 46 ft)

HELICOPTER

The ships normally deploy with a Panther, although Alouette IIIs are sometimes also used. The hangar and flight deck are, however, large enough to accommodate an AS 332F Super Puma, when required to do so. They are capable of operating helicopters up to Sea State 5.

Eurocopter AS 365MA Panther
One Eurocopter AS 365MA Panther light liaison, search-and-rescue helicopter

Specifications
Rotor diameter: 13.29 m (43.6 ft)
Fuselage length: 11.41 m (37.43 ft)
Height to rotor head: 4.0 m (13.12 ft)
Weights
empty: 2,262 kg (4,987 lb)
take-off: 4,250 kg (9,370 lb)
Performance
max speed (never exceed): 160 kts (296 km/h)
cruising speed (sea level): 148 kts (274 km/h)
rate of climb (sea level): 420 m (1,380 ft)/min
hovering ceiling (in ground effect): 2,600 m (8,530 ft)
Engines: 2 Turbomeca Ariel 1M1 turboshafts; take-off — 558 kW (749 shp), continuous — 487 kW (653 shp).
Accommodation: 2-man crew; cabin can hold 10 passengers.

Pilot's view of the very large flight deck aboard Floreal *(F 730)* (Chantiers de l'Atlantique)

PROPULSION

Specifications
System: Combined diesel and diesel (CODAD)
Main machinery: 4 SEMT-Pielstick 6 PA6 L 280 diesels; 6.5 MW (8,820 hp(m)) sustained

Shafts: 2
Propellers: cp
Bow thruster: 250 kW (340 hp(m))
Ship's services: 3—590 kw diesel generator sets

FURTHER INFORMATION

PROGRAMME

These are unique ships, which were built to operate in the offshore zone in low-intensity operations. They are officially described as *'Frégates de Surveillance'* or ocean-capable patrol vessel.

The first two were ordered on 20 January 1989, followed by the second pair on 9 January 1990 and the third pair in January 1991. All have been built at Chantiers de l'Atlantique at St Nazaire, with the weapons systems being fitted by DCAN Lorient.

NAMES

The ships are named after six of the months of the new calendar introduced during the French Revolution.

DESIGN

The ships have been designed for patrol duties in distant waters. The hull, accommodation and most facilities are built to merchant passenger marine standards, and all four engines, for example, are grouped together in one large engine room to reduce watchkeeping and maintenance requirements. Damage control, however, together with magazines and helicopter facilities are to full Service standards.

The ships are fitted with two screws and a bow thruster, making them extremely manoeuvrable, an essential requirement in overseas areas, where normal harbour facilities will not always be available. They have stabilisers and are air conditioned throughout. The range proved, during sea trials, to be even better than planned.

Aviation facilities are excellent for the size of ship. The hull is wider that usual for its length to enable a large flight deck to be fitted and a new stack design has been developed to improve the airflow over the flight deck. Thus, although the helicopter normally embarked will be a Dauphin or Alouette, 9 to 10 tonne helicopters (such as, Puma/Cougar) can also be operated, which will be of particular importance when operations involving troop landings are being undertaken.

Medical facilities are good, with a small hospital and, included in the design, is a freight bunker aft, which will take about 100 tonnes of cargo.

MODERNISATION

It is planned to replace the manually operated 20 mm guns with two Matra Simbad twin launchers in due course.

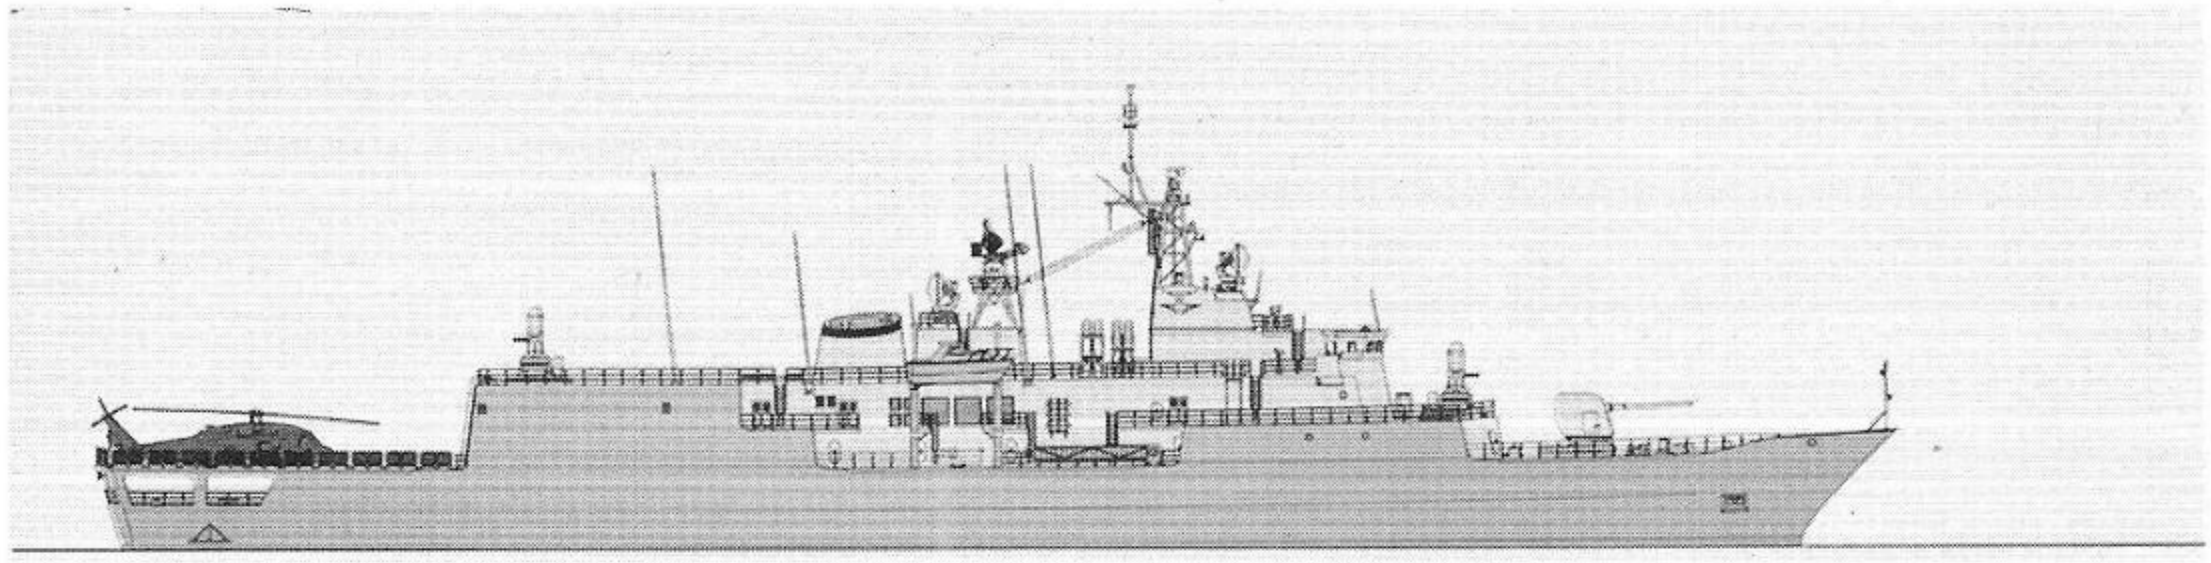
DEPLOYMENT

Normal deployment of the ships is:
Floréal — South Indian Ocean
Ventose — Antilles
Germinal — tender to training ship Jeanne d'Arc
Prairial, Vendemiaire — Tahiti
Nivose — Nournea

Prairial *(F 731)*

MEKO

OVERVIEW



Typical of the MEKO ships built to date is the MEKO 200 PN, built for the Portuguese Navy (Blohm + Voss)

The MEKO* series of destroyers and large frigates designed by Blohm + Voss has proved to be very successful, with 30 ships so far ordered. The MEKO design was produced to meet a number of requirements, but the essential elements are that it is based on the Functional Unit System or FES. This enables customers to place orders for weapons, sensors, command and control equipment and other electronics to meet their individual requirements, whilst taking full advantage of a common hull and avoiding a large proportion of the usual development costs involved in a new class of ship.

*MEKO = *Merhzwecks Kombination* (Multirole Combination)

Hulls

The hulls are to a common overall design, although the length can vary: the two MEKO 360s are both 119 m (390 ft) long (waterline), while of the six MEKO 200s, five are 109 m (357.6 ft) long but one (the Turkish MEKO 200 Track I) is only 102 m (334.6 ft) long. Hulls and superstructures are all constructed of high-tensile steel, there is no aluminium, and fin stabilisers are standard.

The hull design incorporates the results of considerable analysis and trialling, combining good seakeeping, range and speed, with reduced radar, infra-red and optical signatures. Radar signature reduction measures include slanting the hull shape above the waterline and sloping the external superstructure. The hangar door and the bridge screen are also sloped, while possible corner reflectors have been identified and eliminated and a low-median point for the radar cross-section (RCS) has been achieved.

Measures to reduce the infra-red signature include insulating radiating elements such as the CIC, together with careful design and routeing of ventilation ducts and their exits to the atmosphere. Attention has also been paid to the stacks, especially with regard to their position relative to antennas. Current work is being carried out on cooling the ship's structure using a seawater spraying system, and on inhibiting soot particles in the exhaust plume to see whether either can be used to reduce the IR signature yet further.

Reduction of the optical signature is mainly achieved by minimising the topside.

Functional units

Weapons and electronic systems are installed in the form of Functional Units, known as FES from the initials of their German designation, which are mounted either in a container, a pallet or a framework. Allied to this, there are standardised installation and removal routes throughout the ship, which ease construction, and make it much easier to remove units for repair/overhaul, or to replace them with new equipment during refits.

One of several advantages of this system is that construction of the hull and of the weapons systems are decoupled from each other, so that they can be built concurrently, with a major saving in overall construction time. In addition to this, the functional units can be built by subcontractors at sites remote from the shipyard and fully tested ashore, prior to installation in the ship.

Some functional units such as guns are hard mounted to the ship platform, using standard mechanical interfaces. The unit is placed in position, levelled using hydraulic jacks, bedded down using a quick-setting epoxy resin and then bolted down using bolts of a standard size positioned at standard intervals. For units requiring shock absorption, the shockmounts are installed at the interface between the platform and the functional unit, thus enabling all equipment within the unit to be hard mounted, which is not only more efficient, but also saves in complexity and the expense of shockmounting every individual item of equipment. The most time-consuming function in these procedures is the setting of the resin during installation and undoing the bolts in removing a unit.

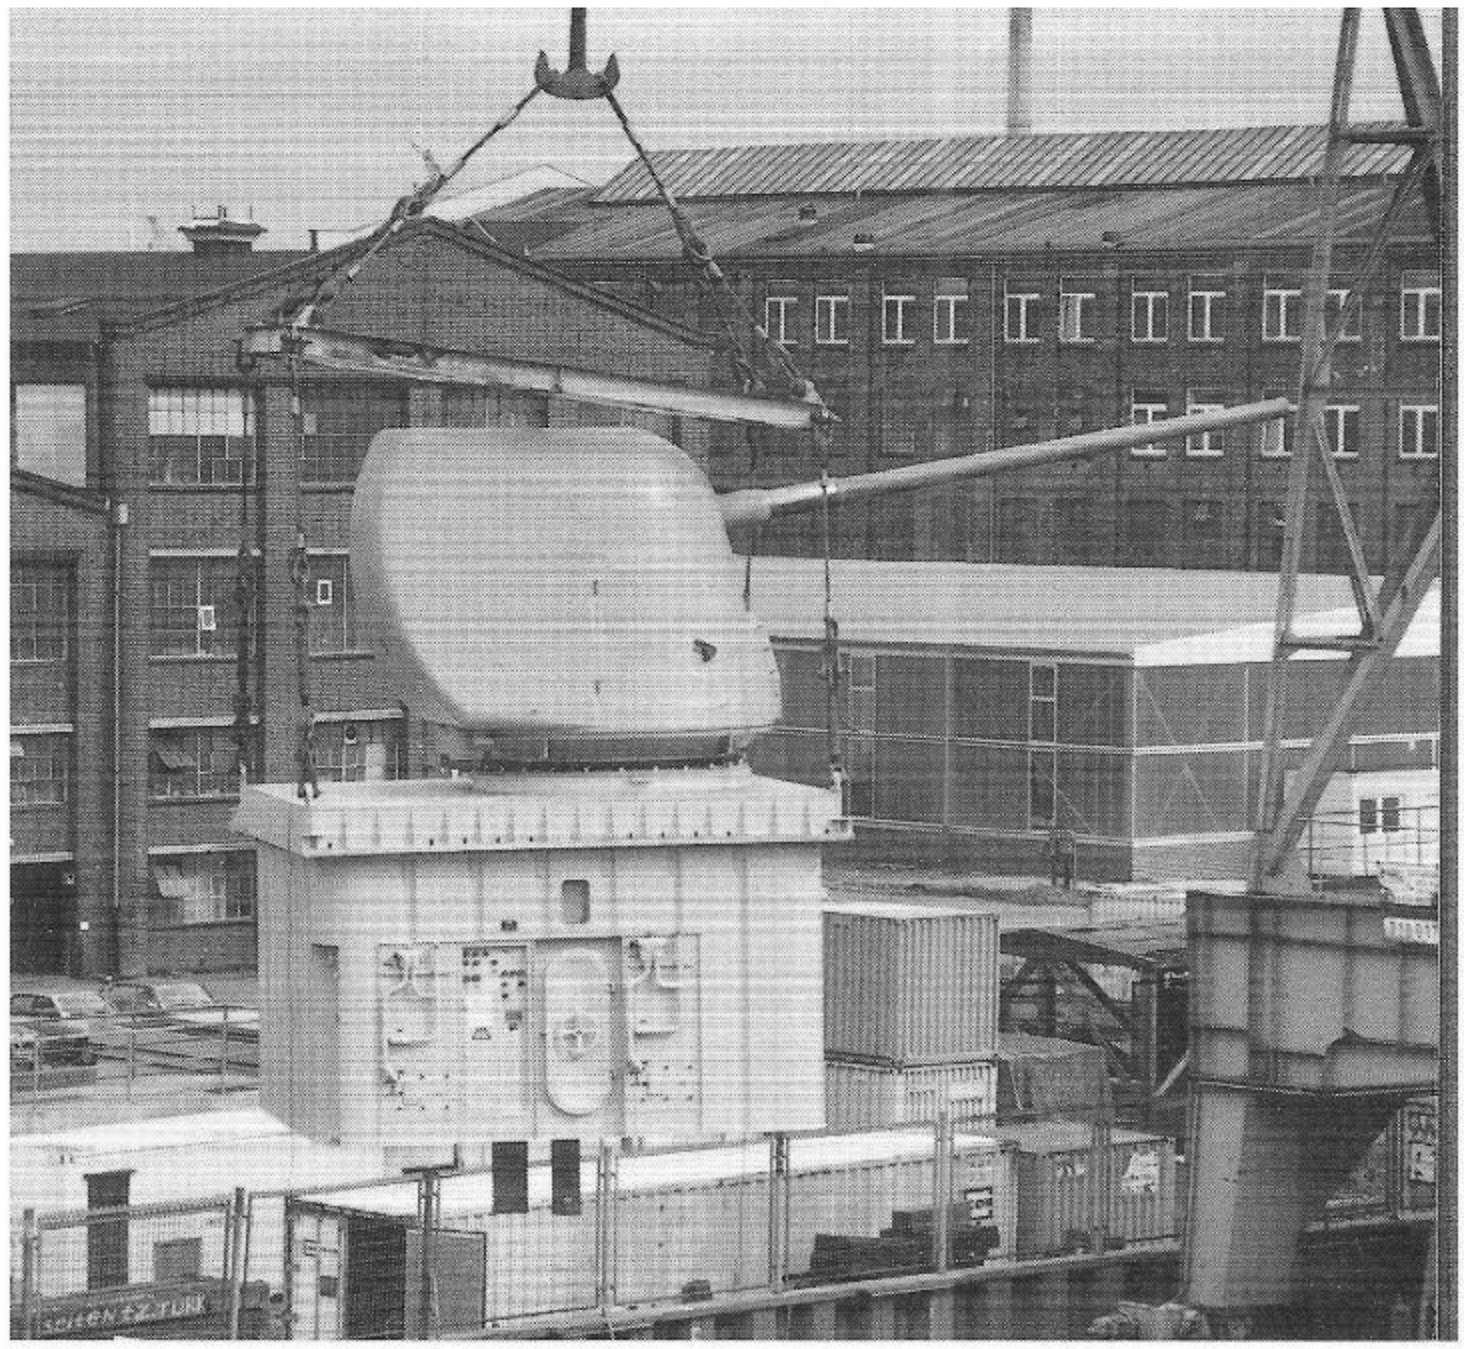
The interfaces between Functional Units and ship's services have also been standardised. Every functional unit has its own air conditioning unit and a switchboard/connecting panel, and there are standard connectors in standard locations for data, electric power, ventilation, cooling water, and so on.

Weapon Functional Units come in four standard sizes:

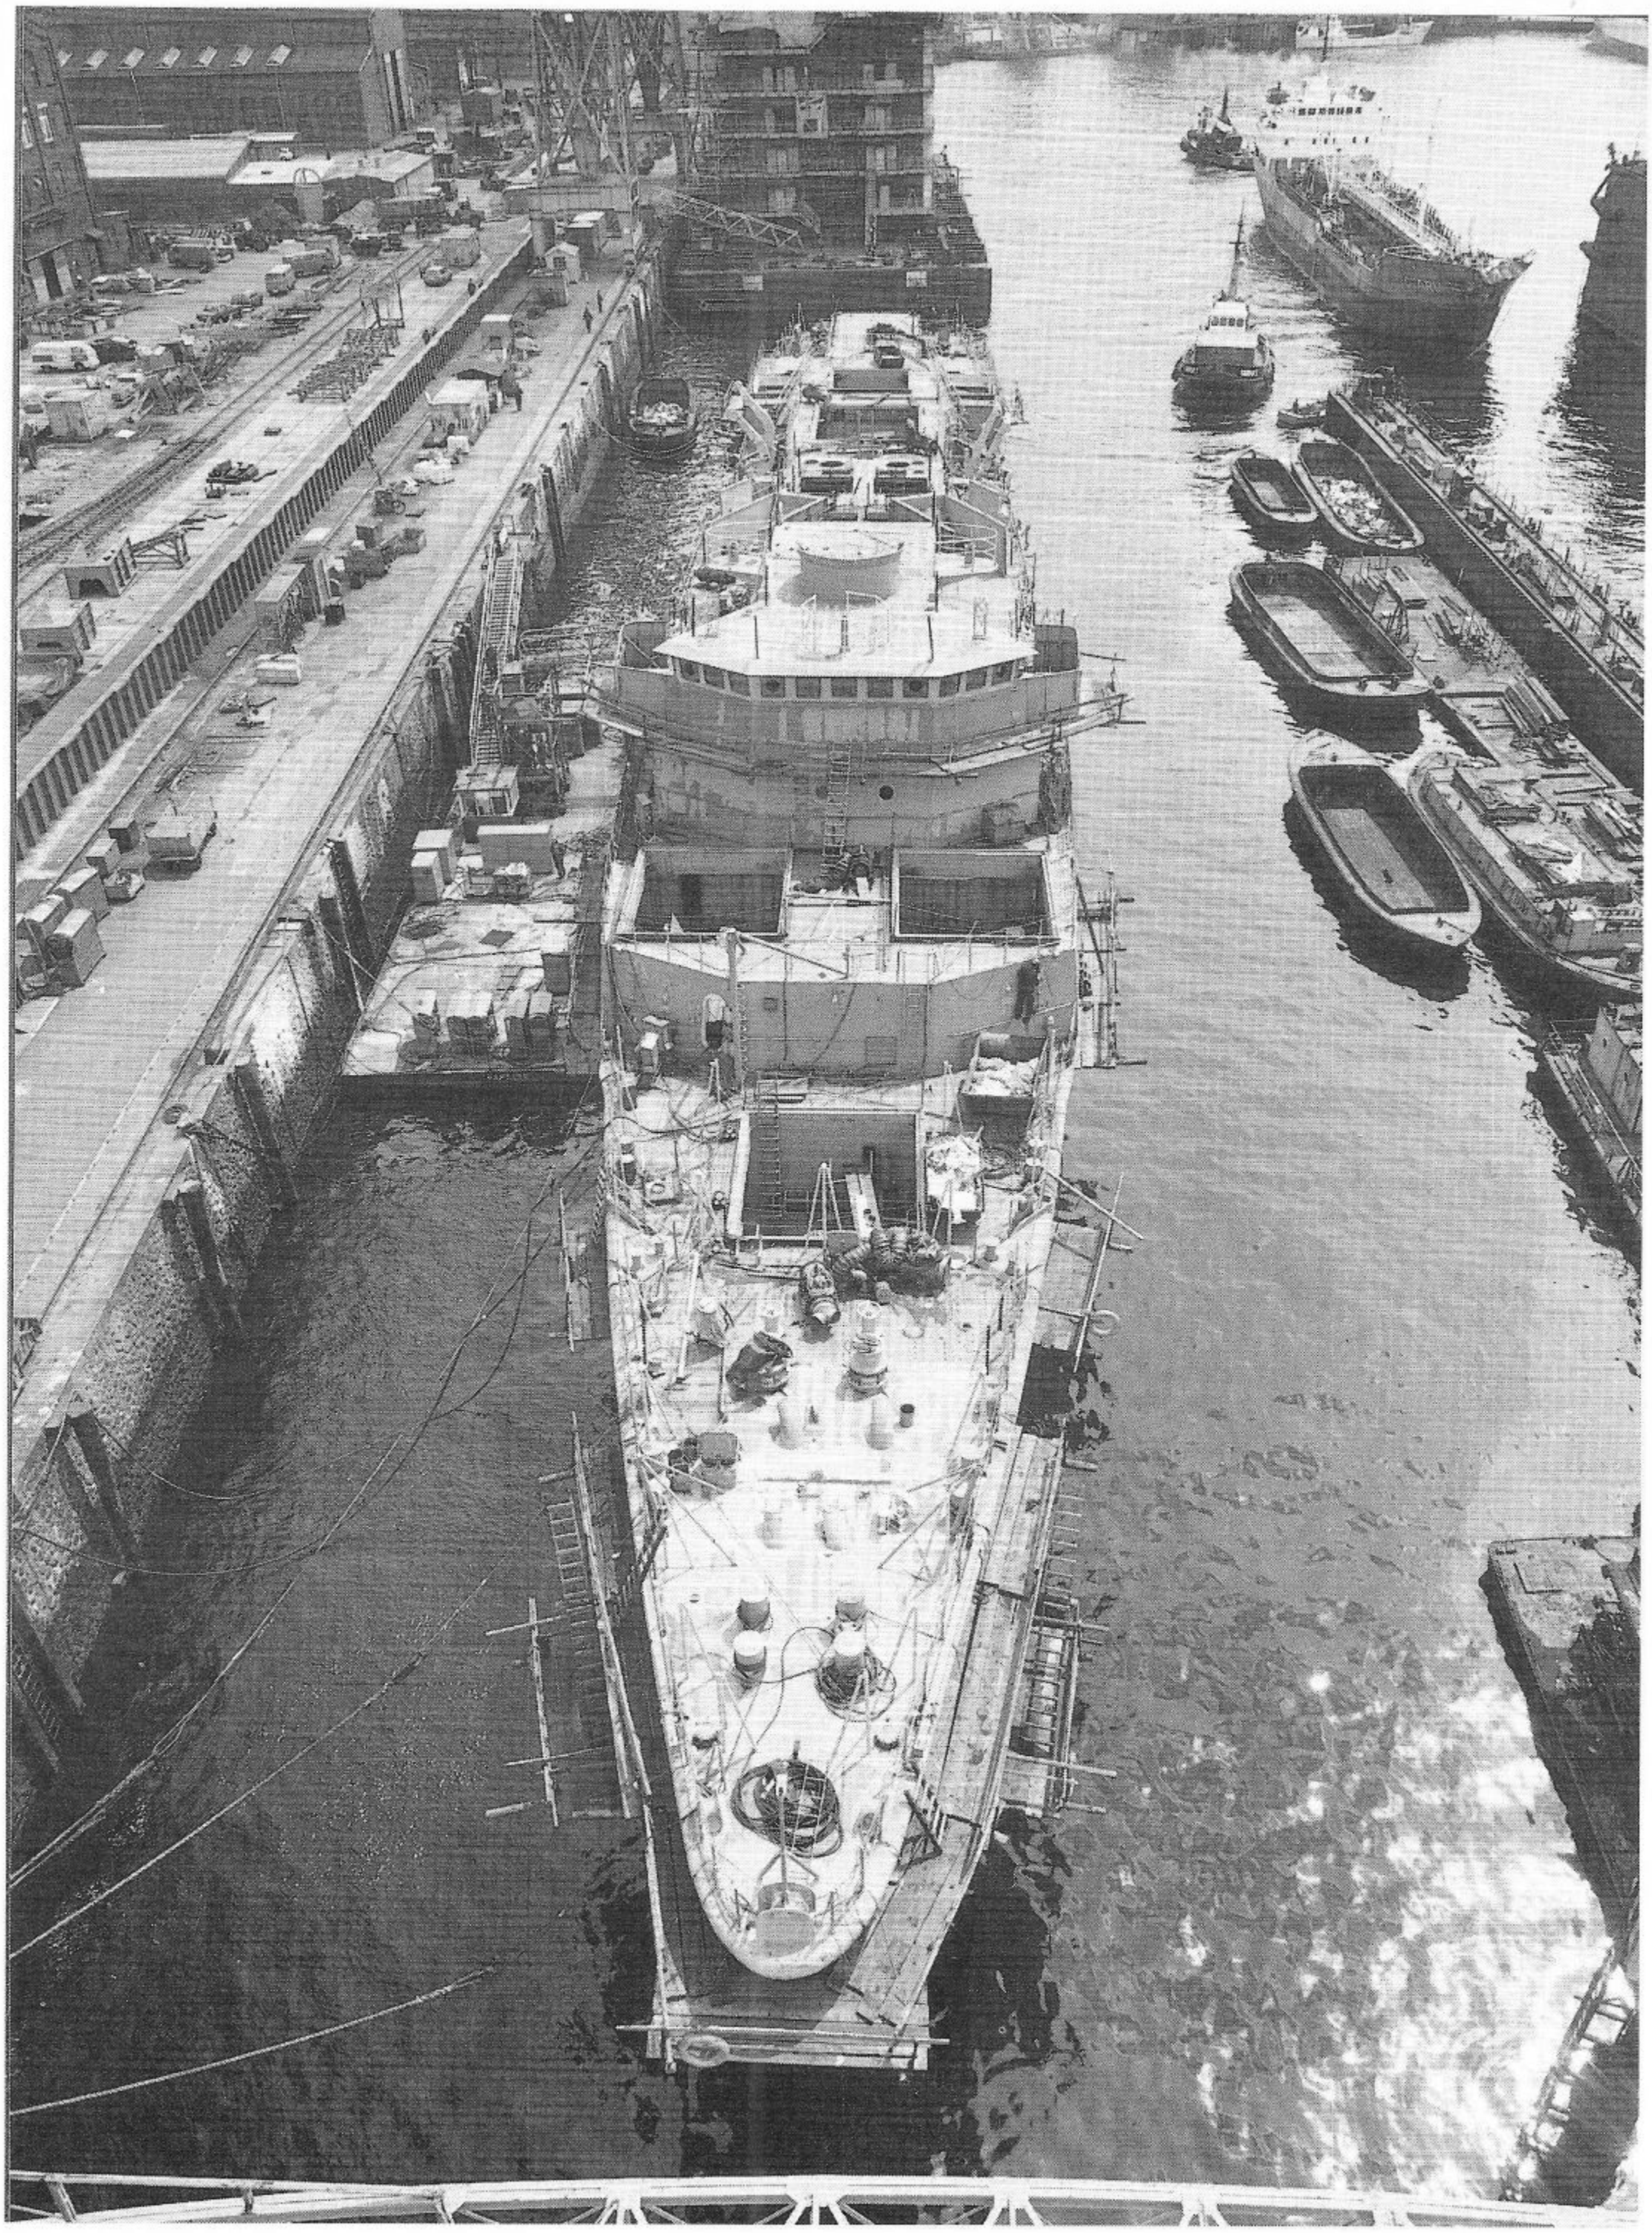
Type	Length	Breadth	Sample Equipment
AAA	4.10 m (13.45 ft)	3.50 m (11.5 ft)	RAM missile launcher
AA	4.70 m (15.42 ft)	4.10 m (13.45 ft)	OTOBREDA 76 mm Compact gun
A	6.50 m (21.32 ft)	5.30 m (17.4 ft)	GMVLS Mk 41 with 16 launcher tubes
B	9.30 m (30.5 ft)	6.50 m (21.32 ft)	

The Electronic Functional Units conform to ISO container standards for height and breadth, but vary in length between 3.0 and 4.5 m (9.84 and 14.76 ft). Maximum height of 2.15 m (7.05 ft) is determined by deck height.

There are already numerous examples of navies operating equipment pools in other types of ship, with a small number of high-value items such as Mk 15 Phalanx CIWS being transferred between operational ships, so that the item does not sit unused in a ship during refits. The MEKO system considerably facilitates such intership transfers, with the removal of a major module taking no more than three hours.



A Weapons Functional Unit containing a 127 mm (5 in) gun. Such WFUs come in four standard sizes (Blohm + Voss)



A MEKO 360 H1 frigate outfitting. The two large holes immediately before the bridge will be filled by WFUs containing OTOBREDA 40 mm/70 guns, while the hole in the foredeck will accommodate a 127 mm (5 in) gun (Blohm + Voss)

The mast module incorporates sensors according to customer's requirements, but it has a standard footprint, standard foundation, and standard connections.

Data highway

B+W has developed its own data highway with its own software clock. All modules have their own MICE (Multi-Interface Computer Equipment) system and are connected to the DAIL (DAta Information Link) highway using the Ethernet IEEE 802.3 protocol. Distributed processing within each module greatly reduces the transmission load on the highway, since only processed data needs to be passed. The network is fully redundant with two buses following physically separate routes around the ship. Bus A normally handles command and control data (for example, targeting and status) while Bus B normally handles navigation and 'own ship' data, but both have sufficient capacity to take the entire load, if necessary. There is also a separate databus within the command and control system, with the various consoles and other equipment in the CIC having their own

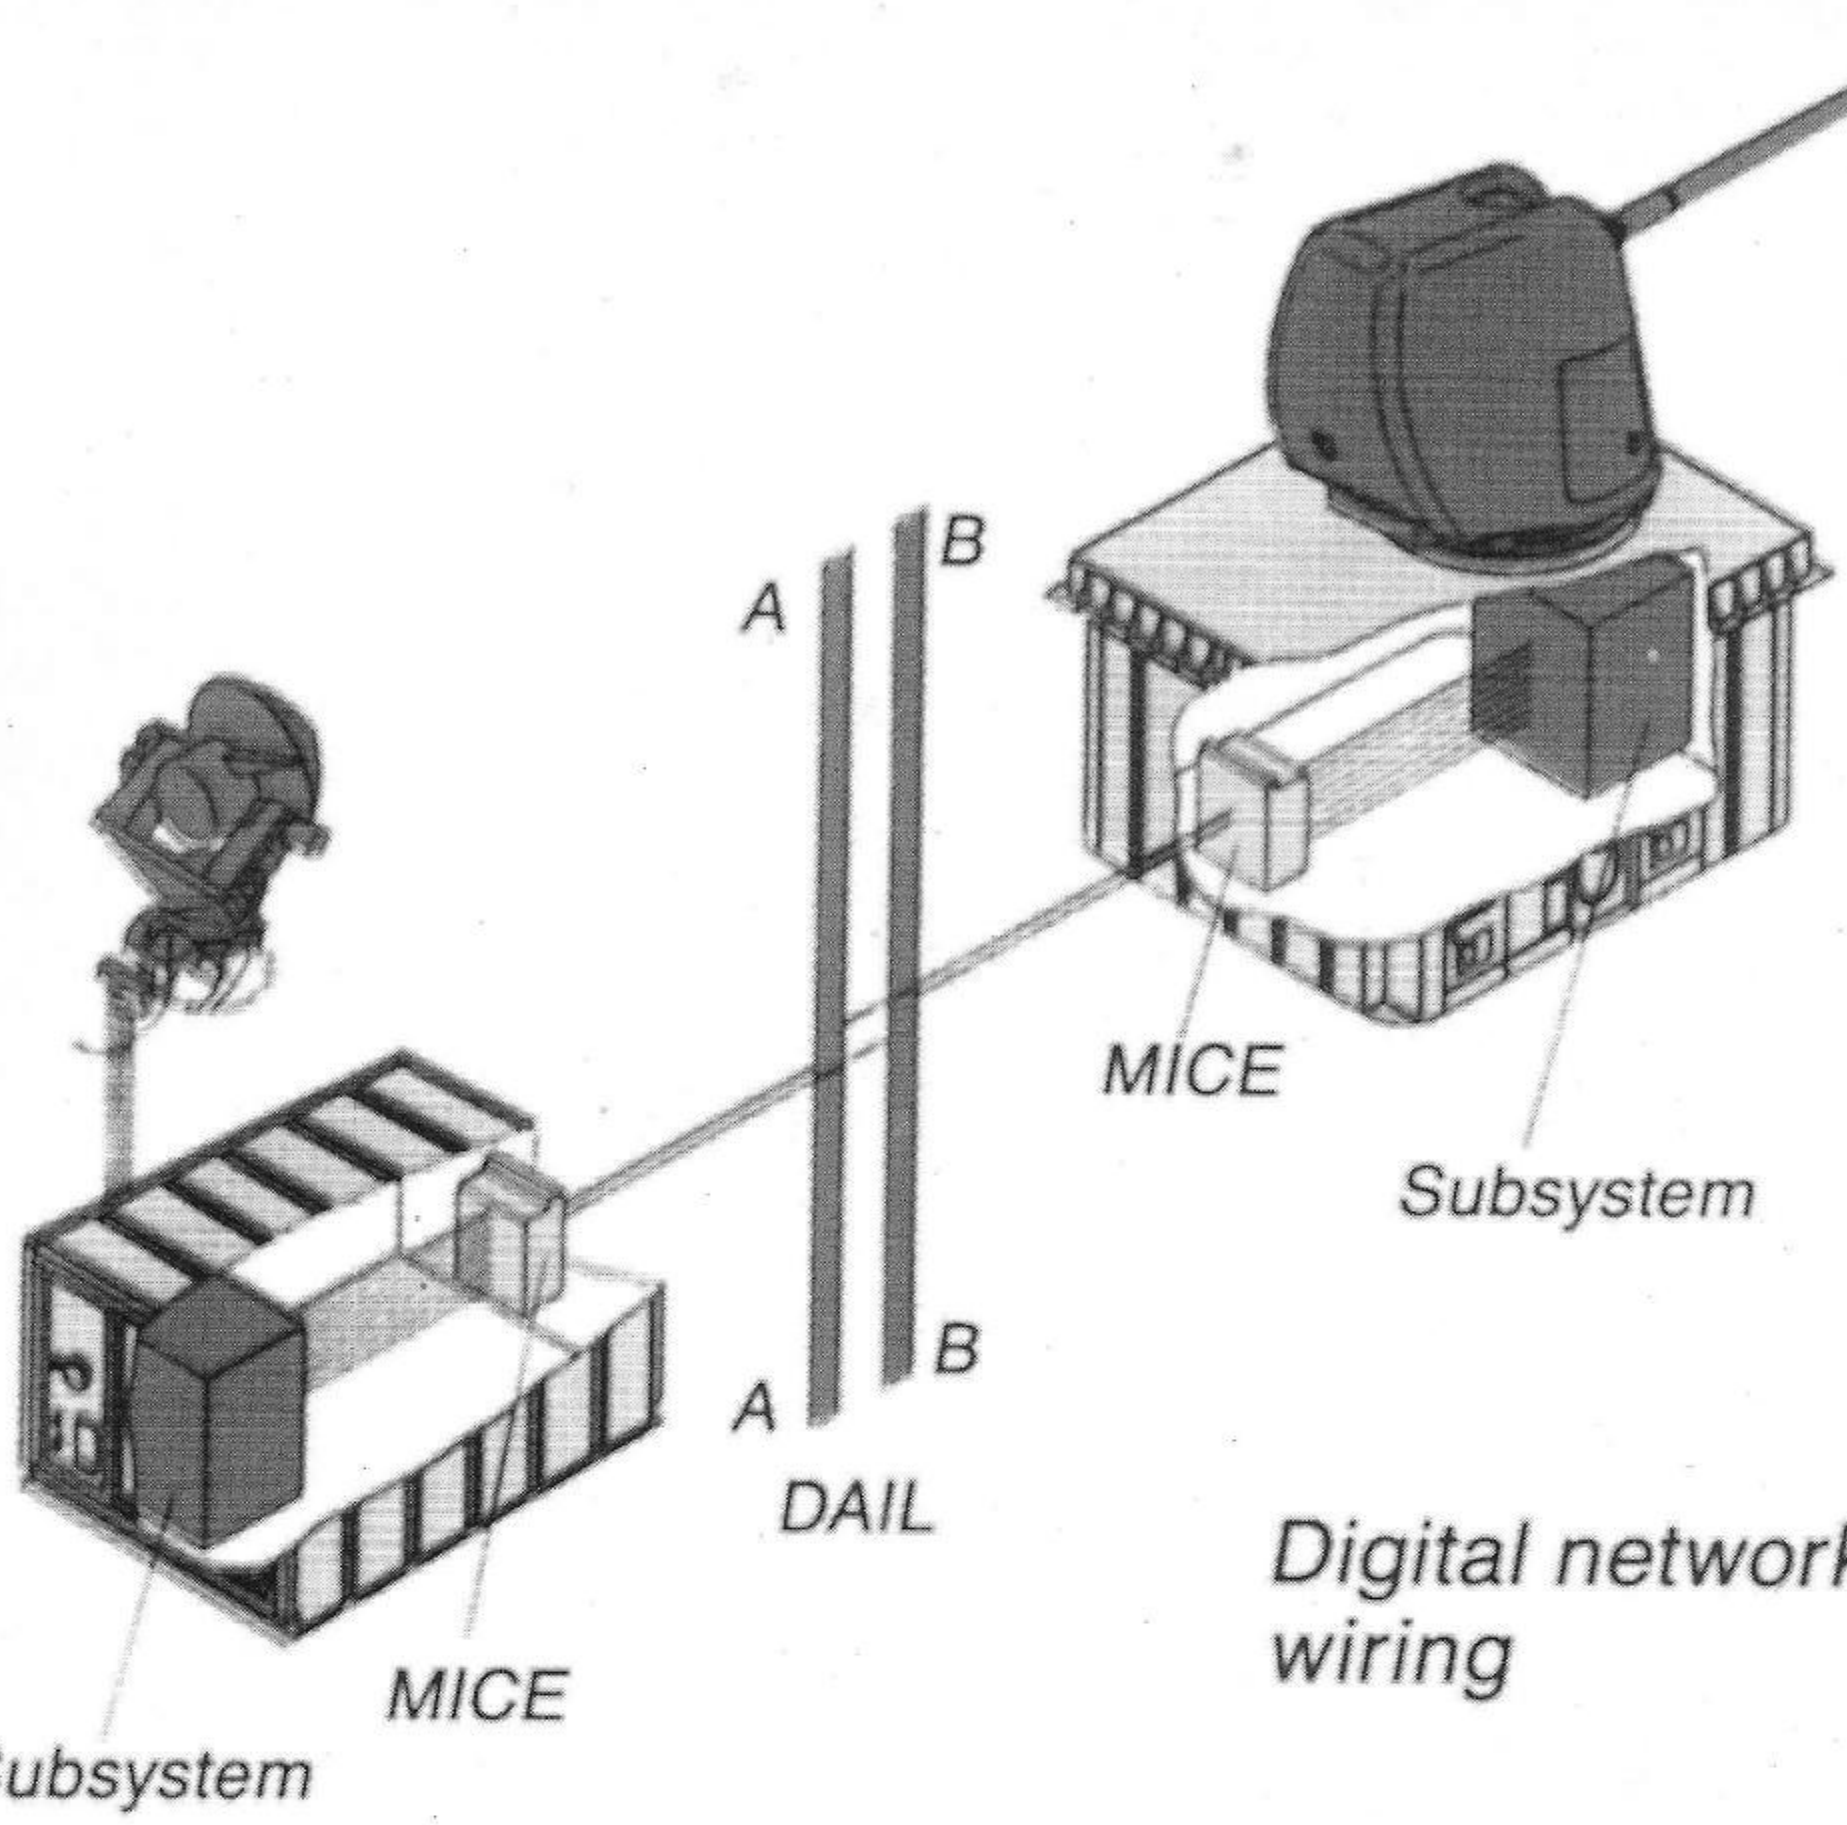
Notes

1. Two ships for New Zealand are being built in Australia and are virtually identical with the ships for the Australian Navy
2. This ship is no longer serviceable and is included here for purposes of comparison.
3. Length is length overall; beam is maximum width; draught is depth of hull at full load, excluding sonar and propellers
4. Manufacturers
   - [A] = Thomson/Signaal
   - [B] = Plessey
   - [C] = Raytheon
   - [D] = Celsius Tech
   - [E] = STN Atlas
   - [F] = Racal-Decca
   - [G] = Kelvin Hughes
   - [H] = Thomson-Marconi
   - [J] = Computing Devices of Canada
5. Space has been left for VDS to be fitted in due course.



Digital network wiring

All modules have their own MICE (Multi-Interface Computer Equipment) and are connected to the fully redundant DAta Information Link (DAIL)

closed data network, which interfaces with the ship-wide DAIL through two or more MICE, which serve as gateways.

Ship's services

One of the components of MEKO Mod 3 technology is compartmental independence, with each watertight compartment being independent of other compartments. One of the major benefits of this approach is that compartments are individually sealed and vertically integrated for environmental control and monitoring, firefighting, power distribution and NBC protection. The only exceptions to this are the fore and after ends, consisting of two compartments each, which are combined.

Electrical power is generated by three diesel generators which are located on the 4th deck level below the waterline and widely separated from each other. These feed power to two Main Switchboards , one each in the forward and after damage control centres. Power is fed from the switchboards via cables running along the ship centreline and well below the waterline to the Load Centres, of which there is one in every compartment, and which are responsible for distributing power to the main and subsystems within the compartment. Each Load Centre includes changeover facilities, a main distribution group, a weapons group, a 24 V group and chargers.

These ship's services are monitored by NAUTOS (Naval Automation System), which also controls and monitors all propulsion and auxiliary machines and valves.

Warhead	165 kg (363 lb) HE frag	155 kg (342 lb) HE frag
Fuze delay	impact/proximity	impact/proximity
Guidance	Inertial and active radar	Inertial and active radar

SURFACE-TO-AIR MISSILES (SAM)

The Albatros Mk 2 Mod 9 system comprises three elements:

Riva-Calzoni launcher
Aspide missile
WM 25 fire-control system

Riva-Calzoni Albatros launcher

The single, eight-cell Albatros launcher is located atop the deckhouse at the forward end of the hangar. Produced by Riva-Calzoni, it has eight launch cells, four on each side of the mounting, each with a frangible front and rear cover. Each cell contains a loading guide to which the launching rail of the missile is electrically and mechanically connected. Sixteen reload missiles are stored horizontally in a hydraulically operated store and reload system in the deckhouse forward of the launcher; they are in four rows of four missiles each, their location corresponding to that of the launcher cells, and each storage cell has an autonomous missile travel device.

Pilot's view of an Argentine MEKO 360H2. Either side of the hangar are OTOBREDA 'Fast Forties', and on the hangar roof are (from front to rear of picture) a Signaal LIROD electro-optic director, Alenia octuple Albatros launcher, Signaal STIR and Signaal DA 08 air/surface search radar (Blohm + Voss)

Specifications
Albatros launcher
Height: 2.98 m (9.8 ft)
Width: 3.82 m (12.5 ft)
Length: 3.82 m (12.5 ft)
Weight (loaded): 8.5 t
Traverse: 360° at 45°/s
Elevation: −5 to +80° at 25°/s

Alenia Aspide missile
The system uses the Selenia (now Alenia) Aspide SAM, a missile developed by Selenia from the US Sparrow. Targets are detected by the ship's primary search radar and then allocated to the Signaal WM25 fire-control system. The target is acquired by the fire-control system radar and the CW transmitter group injects signals into the fire-control system tracker as the launcher slews in the target's direction. The missile control system selects the missile or missiles which the power supply units then prepare for launch. Total system reaction time is 8 seconds. When the decision is made to engage the target with missiles the reversible pre-launch commands are issued. The firing command itself can be issued automatically or manually, the operator also having the options of a single shot or salvo mode. In the latter, two missiles are launched sequentially against the same target, the maximum firing rate of the system being one missile every 2.5 seconds. Upon launch the missile is gathered into the tracker-illuminator's beam through a direct signal to the rear receiver and homes on the reflected energy from the target. Up to three missiles at once may be controlled by the tracker, according to the manufacturer who also claims the system can engage horizontal targets at up to 15 km, vertical ones at 5 km and lateral ones at 8 km. A short reaction time gives the system the ability to destroy anti-ship missiles even when detection is late.

Specifications
Aspide missile
Length: 3.7 m (12 ft)
Diameter: 20.3 cm (8 in)
Wing span: 80 cm (31 in)
Weight: 220 kg (485 lb)
Speed: Mach 2.5
Range: 7 n miles (13 km)
Altitude: 15-5,000 m (49-16,405 ft)
Warhead: 33 kg (72.7 lb)
Guidance: Semi-active radar

Manufacturer/Contractor
Alenia-Elsag Sistemi Navali, Rome, Italy (system/missile).
Riva-Calzoni, Bologna, Italy (launcher).

TORPEDOES

B515 (ILAS-3) anti-submarine torpedo launching system
There are two B515 (also known as ILAS-3) triple mounts on the main deck below the stack. The tubes are manually loaded and trained but remotely operated from the combat information centre, although emergency local operation is possible.

Specifications
Length: 3.4 m (11 ft)
Height: 1.2 m (4.0 ft)
Width: 1.285 m (4.2 ft)
Weight: 1,050 kg (2,315 lb) (unloaded)

Manufacturer/Contractor
Whitehead, Division of Gilardini SpA, Salviano, Italy.

A 244/S
A244/S lightweight air/surface-launched anti-submarine weapon. There are 18 reloads. The seeker in this weapon is the Alenia CIACIO-S which is capable of active, passive or mixed modes for closing on to its target and can discriminate between decoys and real targets in the presence of heavy reverberations, using specially emitted pulses and signal processing. It also discriminates between target noise and reverberations, as well as having a series preset of programmable search patterns and tactical manoeuvres (including re-attack procedures). The seeker has a large search volume covered by multiple preformed beams following a number of self-adaptive search patterns and is reported capable of target detection at −5 dB in good acoustic conditions. The computerised homing system also provides for presettable combinations of signal processing, spatial filtering and tactical torpedo manoeuvring. The software may be reprogrammed by the customer to meet new tactical conditions. Upon launching, the A244/S initially steers a straight course and, if the target is not detected, it then begins a search pattern which may be either a spiral between preselected depths or a helix pattern.

Specifications
Length: 2.7 m (8.85 ft)
Diameter: 324 mm (12.75 in)
Weight: 215 kg (474 lb) (warshot version)
Warhead: 34 kg (75 lb) shaped charge HBX-3 HE
Propulsion: Electric; silver-zinc batteries
Range: 3.5 n miles (6 km)
Speed: 30 kts
Guidance: Active/passive sonar, self-adaptive programmed patterns

Manufacturer/Contractor
Whitehead, Division of Gilardini SpA, Salviano, Italy.

GUNS

OTOBREDA 127 mm/54 Compatto
There is one OTOBREDA 127 mm/54 Compatto mounting in 'A' position. This weapon is designed to provide naval gunfire support, to engage surface targets and to engage air targets, including anti-ship missiles and fixed-wing aircraft which do not have standoff weapons. The turret is unmanned and is enclosed by a glass fibre shield. Much of the turret and the lower part of the mounting are made of aluminium alloy. The below-deck element of the mounting consists of three drums each containing 22 rounds, which are stocked automatically from two chain-driven lower hoists which lead to the magazines and are loaded manually. The gun captain uses his control to select which drums are to be replenished and with what ammunition. The weapon is compatible with all US 5 in L/54 ammunition.

Specifications
Gun
Calibre: 127 mm (5 in)
Length of barrel: 54 calibres
Muzzle velocity: 808 m/s (2,625 ft/s)

Almirante Brown *(D 10). On the bridge roof are (right) Signaal ZW 06 surface search radar and the LIROD electro-optic fire director. The forward tower is topped by a Signaal WM25 'egg' with below it the DF arrays of the Sphinx ESM system surrounding the neck of the tower like a collar. Protruding from the tower are the jammers of the Scimitar system* (Blohm + Voss)

Argentine Navy's Almirante Brown *(D 10)* (Argentine Navy)

Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 13,600 m (45,000 ft)
Rate of fire: 45 rds/min
Weight of shell: 32 kg (70 lb)

Mounting
Compatto
Training: 330° at 40°/s
Elevation: −15 to +85° at 30°/s
Crew: 5

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

OTOBREDA 40 mm L/70 Compact (Type 70) twin mounting

There are four twin 40 mm turrets: two either side of the hangar and two in 'B' position on the foredeck.

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −13 to +85° at 60°/s
Rate of fire: 600 rds/min/mount
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC COUNTERMEASURES

CSEE DAGAIE Mk 2 countermeasures system

There are two CSEE DAGAIE Mk 2 ten-barrelled, trainable launchers, which can be loaded with either IR or chaff rockets. The firing sequence runs automatically, once triggered by a missile alarm from a variety of sources, such as radar, ESM systems, or optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, windspeed and direction, ship heading and speed data.

The launching of radar and IR decoys is so arranged that advanced mixed guidance missile systems cannot discriminate between them and thus collocation of both decoys is achieved. The installation is a double mounting and comprises two trainable mountings carrying 10 replaceable containers (suitcases), each of which is loaded with either IR or I/J-band chaff projectiles.

A wide range of ammunition is provided by Etienne Lacroix Défense providing seduction, distraction and seduction/dissimulation modes. The electromagnetic decoys are normally based upon aluminised glass fibre chaff with rapid bloom time and they cover the I and J frequency bands. The infra-red decoys cover both the 3-5 and the 8-14 µm bands.

Specifications
Traverse: 330° at 21°/s
Average reaction time: Within 4 s
REM rocket dimensions: 850 × 127 mm (33.5 × 5 in)
Rocket weight: 13 kg (28.66 lb)
Container dimensions: 900 × 130 mm (35.4 × 5.1 in)
Container weight: 20 kg (44.1 lb)
LIR/LEM container dimensions: 780 × 630 × 134 mm (30 × 24.8 × 5.3 in)

Manufacturer/Contractor
CSEE Défense, Paris, France.

OTOBREDA SCLAR rocket launchers

Two 20-tube, 105 mm (4 in) OTOBREDA SCLAR, multipurpose, rocket launchers. The control unit is linked to the ship's radar and a control panel in the ECM compartment to provide the necessary operating signals, with the data needed to stabilise the two launchers against pitch and roll being provided by the ship's gyrocompass. The system provides defence against radar and IR homing missiles, confuses enemy radars, and provides illumination for visual fire control at night. Provision is made to load different types of rockets in various arrangements (long-range chaff, medium-range chaff, illuminating) to permit mixed salvos. Automatic selection of the rockets to be fired is possible from the remote fire-control unit and the time fuzes and launch sequence may be similarly controlled. The rockets all have double-base propellant motors with folding fins and electronic fuzes while their speed to burnout is 260-645 m/s (853-2,146 ft/s).

Specifications
Launcher weight: 1.15 t (empty); 1.75 t (with 20 rockets)
Trunnion height: 1.17 m (3.8 ft)
Traverse: 300° at 60°/s
Elevation: −5 to +60° at 30°/s
Rate of fire: 1 rd/s

Chaff distraction rocket
Type: SNIA 105 LR-C
Length: 1.85 m (6.0 ft)
Diameter: 105 mm (4 in)
Max range: 12 km
Weight: 27 kg (59.5 lb)
Payload: 10.2 kg (22.5 lb)

Chaff seduction rocket
Type: SNIA 105 MR-C
Length: 1.83 m (6.0 ft)
Diameter: 105 mm (4 in)
Max range: 4.7 km
Weight: 29 kg (64 lb) (SNIA 105 MR)
Payload: 17.4 kg (38 lb)

Infra-red seduction
Type: SNIA 105 MR-IR

Illumination
Type: SNIA 105 LR-I
Payload: 10.2 kg (22.5 lb)
Range: 4 km

Manufacturers/Contractors
Breda Meccanica Bresciana SpA (launcher).
SNIA BPD (rockets).

DECOYS

Graseby G1738 towed torpedo decoy equipment

The Graseby G1738 is a solid-state, export version of the Grasey 182 torpedo decoy, which is designed to decoy both active and passive homing torpedoes, using signals electronically generated within the ship and fed, via the towing cable, to electroacoustic transducers within the towed body. The equipment produces two independently controllable output signals which are radiated simultaneously from the towed decoy. An amplitude modulated noise signal simulates the ship's propeller noise and causes passive homing torpedoes to be seduced away from the ship towards the towed decoy. The second signal is a swept CW

signal, which simulates sonar echoes, in order to confuse or jam the guidance system of active homing torpedoes, thus causing them to miss the ship. The frequency bands covered by both types of output are switchable to meet tactical scenarios and to enable concurrent operation of other sonar and communication equipments.

Specifications

Towed decoy:
diameter: 533 mm (21 in)
length: 2,005 mm (79 in)
weight: 74 kg (163 lb)
Towing cable:
length: 411 m (1,348 ft)
diameter: 14.48 mm (0.6 in))
weight: 269 kg (593 lb)

Manufacturers/Contractors

Graseby Marine (Graseby Dynamics Ltd), Watford, UK.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Thorn EMI Scimitar ECM system

Scimitar is a descendant of a system developed by MEL; others are Signaal's Reprogrammable Advanced Multimode Shipborne ECM System (RAMSES) and the Canadian SLQ-503. Scimitar is a modular naval electronic countermeasures system designed to provide protection against radar threats. It is an integrated responsive jammer capable of long-range jamming of search radars and the deception of missiles once launched. In its normal mode of operation, Scimitar is controlled by the Mentor 2 system, so that a dedicated ECM operator is not therefore required. In the back-up mode, Scimitar can be manually controlled (target designation and jamming) from the remote-control panel located near the EW operator.

Scimitar operates in I/J-band and is capable of high pulse and CW Effective Radiated Power (ERP). Multimode jamming operation is possible with multitarget handling capability. There are two antennas in small 'egg-shaped' radomes on each side of the ship, at the end of the yard-arms. The two Scimitar antennas are vertically separated with the receive antenna uppermost. On receiving orders from Mentor the Scimitar receiver trains towards the designated threat, searches for it and then locks onto it, whereupon the system automatically triggers a programmed response. With two separate systems, two targets can be handled simultaneously, but, in addition to this, jamming sequences for the next targets can be set up, so that as soon as one target has been dealt with the next can be tackled.

Manufacturer/Contractor

Thorn EMI, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Thomson-CSF/Signaal SEWACO command and fire-control system

The Argentine ships are fitted with a Signaal SEWACO action data automation system, which is an automatic threat evaluation, weapon assignment and sensor allocation system, and which can also be used as a planning aid through inputs of intelligence data and decision support facilities. The software package, designated STACOS, is written in RTL-2

Manufacturer/Contractor

Signaal, Hengelo, Netherlands

COMMUNICATIONS AND DATALINKS

Datalinks
Link 10
Link 11.
Satcoms can be fitted.

WEAPONS CONTROL

Signaal LIROD 8 electro-optic director

LIROD (Lightweight Radar Optronic Director) is a lightweight fire-control system based upon a K-band tracking radar and a TV camera. It is used in these ships to control the two twin 40 mm mounts, while tracking one air and one surface target. The system reaction time from detection to the beginning of the engagement is about 4.5 seconds. It is based upon a 0.6 m (1.97 ft) diameter parabolic antenna with monopulse cluster. It has a very narrow pencil beam and is resistant to clutter through the application of pulse Doppler tracking combined with FFT techniques. There are also sophisticated ECCM facilities. The radar can track fighter-size targets up to 18 km away and is capable of tracking targets with a maximum speed of 1000 m/s (3,280 ft/s). In addition to the radar there is a militarised TV camera with CCIR standard video format, which can detect fighter-size targets at about 5.44 n miles (10 km) and large surface ships at about 10.9 n miles (20 km).

Heroina *(D 12) and* Espora *(F 41) (then F-10), two variations on the MEKO theme* (H & L van Ginderen Collection)

Specifications
Director
Traverse: 360° at 120°/s
Elevation: −25 to +150° at 80°/s
Radar: K-band
Field of view
TV camera: 3-30° (2-20°)
IR camera: 3°

Laser rangefinder
Pulse length: 20 ns
Max repetition frequency: 10 Hz
Beam divergency: 1.2-1.5 mrad

Laser tracker
Max repetition frequency: 25 Hz
Beam divergency: 1.5 and 6 mrad

Manufacturer/Contractor
Hollandse Signaalapparatan BV, Hengelo, Netherlands.

SONARS

STN Atlas 80 (DSQS 21BZ) hull-mounted sonar
The DSQS-21BZ sonar was originally designed by (the then) KAE for the German Navy's Type 122 frigate, the ASO 80 series being the subsequent export models. Computer-aided detection techniques are used for classification and tracking and the information is presented on colour CRT displays to permit Doppler coding and the discrimination of data on the integrated displays. The transducer array is 1 m (3.28 ft) in diameter and consists of 32 staves.

Manufacturer/Contractor
STN Atlas Elektronik GmbH, Bremen, Germany.

Performance
max speed (never exceed): 113 kts (210 km/h)
max cruising speed: 100 kts (185 km/h)
service ceiling: 3,200 m (10,500 ft)
range (max fuel): 267 n miles (495 km)
Engines: 1—694 kW (870 shp) Turbomeca Artouste IIIB turboshaft derated to 425 kW (570 shp)
Accommodation: 7 (pilot plus 6)
Weapons: In the ASW role the Alouette III would carry two lightweight torpedoes

PROPULSION

Specifications
System: combined gas turbine or gas turbine (COGOG)
Main machinery: 2 Rolls-Royce Olympus TM3B gas turbines; 37.4 MW (50,000 hp) sustained; 2 Rolls-Royce Tyne RM1C gas turbines, 7.4 MW (9,900 hp(m))
Shafts: 2
Propellers: 2, cp
Auxiliary generators: 4—775 kVA diesel-generator sets

FURTHER INFORMATION

PROGRAMME

Six of these ships were originally ordered by the Argentine Navy in 1978, but the order was later reduced to four when the six Meko 140 frigates were ordered in 1979. The first of the four ships was commissioned in 1983, too late for the Falklands (Malvinas) War.

HELICOPTERS

These ships were intended to operate two Westland Lynx helicopters, but the order was embargoed by the British Government in the aftermath of the 1982 war. The Argentine Navy then sought to order Agosta-Bell AB212ASW from Italy, but failed to obtain funding and the order lapsed. As a result, the Alouette IIIs already operated by the navy are used, but they are inadequate for the ASW mission.

DEPLOYMENT

Almirante Brown (D 10) took part in allied Gulf operations in late 1990, together with one of the navy's MEKO 140 frigates.

ENGINES

One of the major problems facing the Argentine Navy with these ships is the lack of spares for the Rolls-Royce gas turbines. There were unconfirmed reports at the time of the Gulf War that *Almirante Brown*'s engines were given a covert refit while the ship was en route to the Gulf, and there have also been reports that at least some spares have been obtained on the international markets.

GENERAL SPECIFICATIONS

Country of origin: Germany
Operator: Australia/New Zealand
Type: MEKO 200 ANZAC

Class: ANZAC*

Building: 9
Active: 1

Displacement:
standard: 3,195 t
full load: 3,600 t

Dimensions
Length: 118.0 m (387.1 ft) (oa); 109 m (357.6) (wl)
Beam: 14.80 m (48.6 ft)
Draught: 4.40 m (14.44 ft)

Speed: >27 kts
Range: 6,000 n miles at 18 kts

Complement: 163 (22 officers; 41 POs; 100 ratings)

***Note:**
The name 'ANZAC' is the abbreviated title of the 'Australian and New Zealand Army Corps' which was formed during the First World War. It suffered great losses during the Gallipoli campaign in 1915 which had a major impact on the small (then) colonial territories from which it was raised. Ever since, the term 'ANZAC' has had a deep emotional significance in both Australia and New Zealand.

SHIPS

Australia

ANZAC (150)
Builder Transfield Shipbuilding, Williamstown, Australia
Laid down 5 Nov 1993
Launched 16 Sep 1994
Commissioned Mar 1996

Laid down	Jul 1996
Launched	Jul 1997
Commissioned	Nov 1998

First of class, Anzac *(150). Eight of these MEKO 200 design ships are being built for Australia and two (with a possible third) for New Zealand* (Jane's/H M Steele)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Both Australian and New Zealand ships are fitted for but not with (FFBNW) Harpoon anti-ship missiles.

SURFACE-TO-AIR MISSILES (SAM)

GMVLS Mk 41 Mod 5 Vertical Launch System

The Australian frigates are equipped with one eight-cell version of the Guided Missile Vertical Launch System (GMVLS) Mk 41, which was developed specifically for the Sea Sparrow missile. The system is currently known as the 'Mk 41 Vertical Launching System — Vertical Launch RIM-7 Sea Sparrow Missile' (VLS-VL/RIM-7). The launcher uses the same structural and electronic components as the other versions of the system but the module is 6.86 m (22.5 ft) high and an eight-cell unit weighs 24.36 t. The Sea Sparrows are housed in Mk 22 canisters which are 5.79 m (19.0 ft) deep and weigh 1,503 kg (3,314 lb) (complete with missile) and which actually revert to the original design of canister before it was modified for the Tomahawk missile.

Raytheon Sea Sparrow VL/RIM-7P point-defence missile system

Eight RIM-7P Sea Sparrow missiles are carried and the system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg (85.1 lb) blast/fragmentation warhead and a dual-purpose proximity-impact fuze.

Specifications

VL/RIM-7P
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 231.5 kg (510 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturers/Contractors

Raytheon Company, Equipment Division (prime system contractor).

Raytheon Company, Missile Systems Division (prime missile contractor).

Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

Launch of Anzac *(150) on 16 September 1994. Note the broad, curving bow and the straight stem without any bow sonar* (Transfield)

TUBES

Six 324 mm US Mk 32 Mod 5 (two triple) torpedo tubes will be fitted in each ship after acceptance by the navy. The tubes will be located on the main deck immediately below the RIB.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

GUNS

Mk 45 Mod 2 single 127 mm (5 in) L/54 gun mounting
One single United Defense Mk 19 Mod 2 127 mm/54 calibre gun in a Mk 45 Mod 2 mounting is mounted forward. The weapon fires semi-fixed ammunition with point detonating, proximity (variable time or infra-red), mechanical time and electronically set fuzes. The theoretical rate of fire is 20 rds/min and a gun crew of six is required, all below decks, of which four are ammunition handlers. The Mod 2 incorporates a number of improvements, including the ability to change the type of ammunition under remote control and electronic fuze setting.

Specifications
Calibre: 127 mm (5 in)
Length of barrel: 54 calibres
Muzzle velocity: 807.72 m/s (new barrel), 762 m/s (mid-life)
Crew: 6 (1 mount captain, 1 panel operator, 4 ammunition handlers)
Traverse: 340° at 30°/s
Elevation: −15 to +65° at 20°/s
Range:
anti-ship: 12.39 n miles (23 km)
anti-air: 15,000 m (49,000 ft)
Rate of fire: 16-20 rds/min
Ammunition weight: 31.75 kg (70 lb) (projectile)

Manufacturer/Contractor
United Defense, Armament Systems Division, Minneapolis, Minnesota, USA.

Hughes Mk 15 CIWS Phalanx
Both Australian and New Zealand ships are fitted for but not with Mk 15 CIWS.

M2HB 12.7 mm (0.50 in) machine guns
Two M2HB 12.7 mm machine guns are carried and can be mounted on flexible mounts.

Specifications
Calibre: 12.7 mm (0.50 in)
Rate of fire: 450-550 rds/min
Muzzle velocity: 883 m/s (2,900 ft/s)
Max effective range:
anti-surface: 6,700 m (7,400 yd)
anti-air: 1,380 m (4,500 ft)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal-Thorn EMI Sceptre A ESM system
The Sceptre A system was developed specially for the ANZAC frigate and is reported to be virtually identical to the British Navy's Outfit UAT. The limited information available suggests that the system is intended to measure all radar parameters with a 'significantly increased sensitivity' over current systems and will provide threat lethality classification with a high signal sorting capability. It consists of three major components; an eight-element antenna array, a receiver/processor and an operator's console, and is integrated with the ship's command system. The receiver is a channelised type developed originally by the Philips Research Laboratory. Processing is undertaken by a system based on transputers which are configured in a neural network type of architecture. An integrated receiver system is employed and software control is used across the entire system.

Manufacturer/Contractor
Racal-Thorn EMI Electronics Ltd, Sensors Group, Crawley, UK.

Telegon 10 radio communications direction-finder
The Telegon 10, type PGS 1720, DF equipment is a communications direction-finder covering the frequency range 10 kHz to 1,000 MHz. It uses the Watson-Watt method and is able to obtain a bearing on signals with a duration as low as 1 ms, which is of particular value when targeting burst signals and frequency hoppers.

Specifications
Frequency range: 10 kHz to 1,000 MHz
Frequency resolution: 10 Hz
Equipment error: <1°
Operational modes: A1A, A2A, A3E, F2A, F3E, J3E

Manufacturer/Contractor
Daimler-Benz Aerospace, Sensor Systems Division, Ulm, Germany.

DECOYS

G & D Aircraft GD 36 Mod 1 chaff launchers
Australian ships only. These ships use four Australian-designed GD 36 Mod 1 launchers for standard Mk 36 SRBOC rounds.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Mk 36 SRBOC
New Zealand ships only. The New Zealand ships mount two Loral Hycor Mk 36 SRBOC launchers.

Ammunition. Both Australian and New Zealand ships use the standard SRBOC rounds.

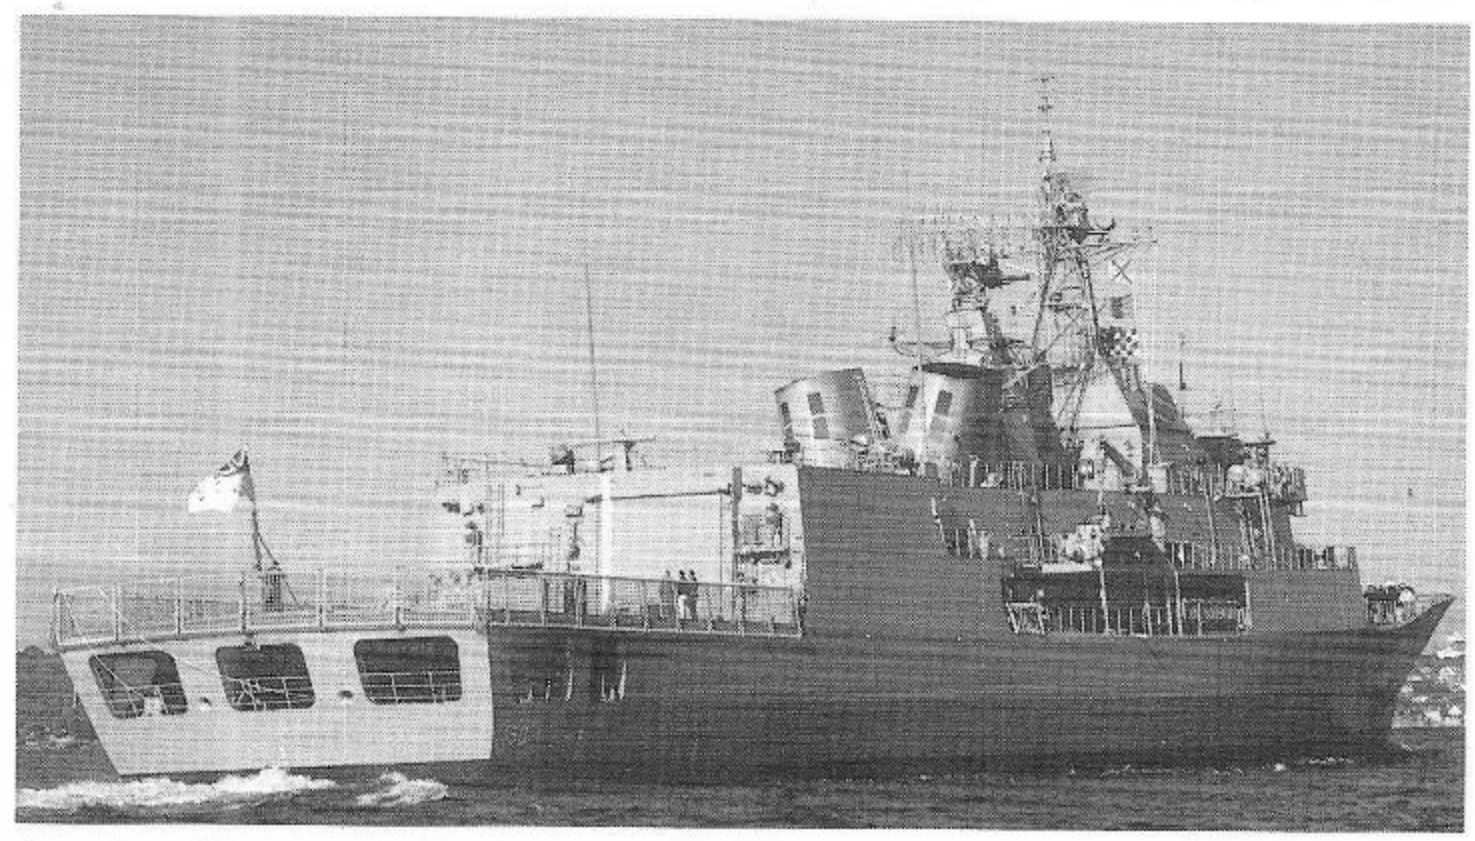
Specifications
Rounds (Mk 36 SRBOC)
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

AWADI Nulka expendable rocket-launched hovering decoy system
Both Australian and New Zealand ships carry four Nulka launchers. This is an expendable, active decoy, providing all-weather self-protection for naval vessels against anti-ship missiles and is designed for use either as part of a multilayer defence system or for stand-alone ship protection. The Winnin rocket is held in a hermetically sealed canister which acts both as storage container and launch tube. Control of the decoy's hovering flight is achieved by a thrust-control mechanism, which acts on the motor's efflux, and a spin-control unit mounted on top of the decoy. The combination of thrust- and flight-control enables successful launches to be made in severe sea states and high winds. Once launched, the decoy operates autonomously and follows its stored flight demands, moving away from the ship at its programmed height and speed to present an alternative and more attractive target to incoming missiles.

Manufacturers/Contractors
AWA Defence Industries (AWADI) Pty Ltd (System).
Sippican, USA (Payload).

Aerojet AN/SLQ-25A Nixie noisemaker
One AN/SLQ-25A Nixie electroacoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed through the transom. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm long (3.10 ft), 15.24 cm (6 in) in diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body at a time is deployed.

Manufacturer/Contractor
Aerojet ElectroSystems, Sacramento, California, USA.



Stern view of Anzac *(150). Flight deck and hangar will be used by a Sikorsky S-70B(RAN). The ship is equipped with a Canadian Indal RAST system to control the helicopter on the flight deck and to move it to and from the hangar* (Jane's/H M Steele).

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

CelsiusTech 9LV 453 Mk 3 command and weapon control system

CelsiusTech's 9LV 453 Mk 3 command system has a fully distributed architecture based upon a 32-bit computer using Motorola 68020 and 68040 microprocessors and Ada-language software, screen Multi Function Consoles and Ethernet IEEE 802.3 standard local area networks. The functions of the C2 system are:

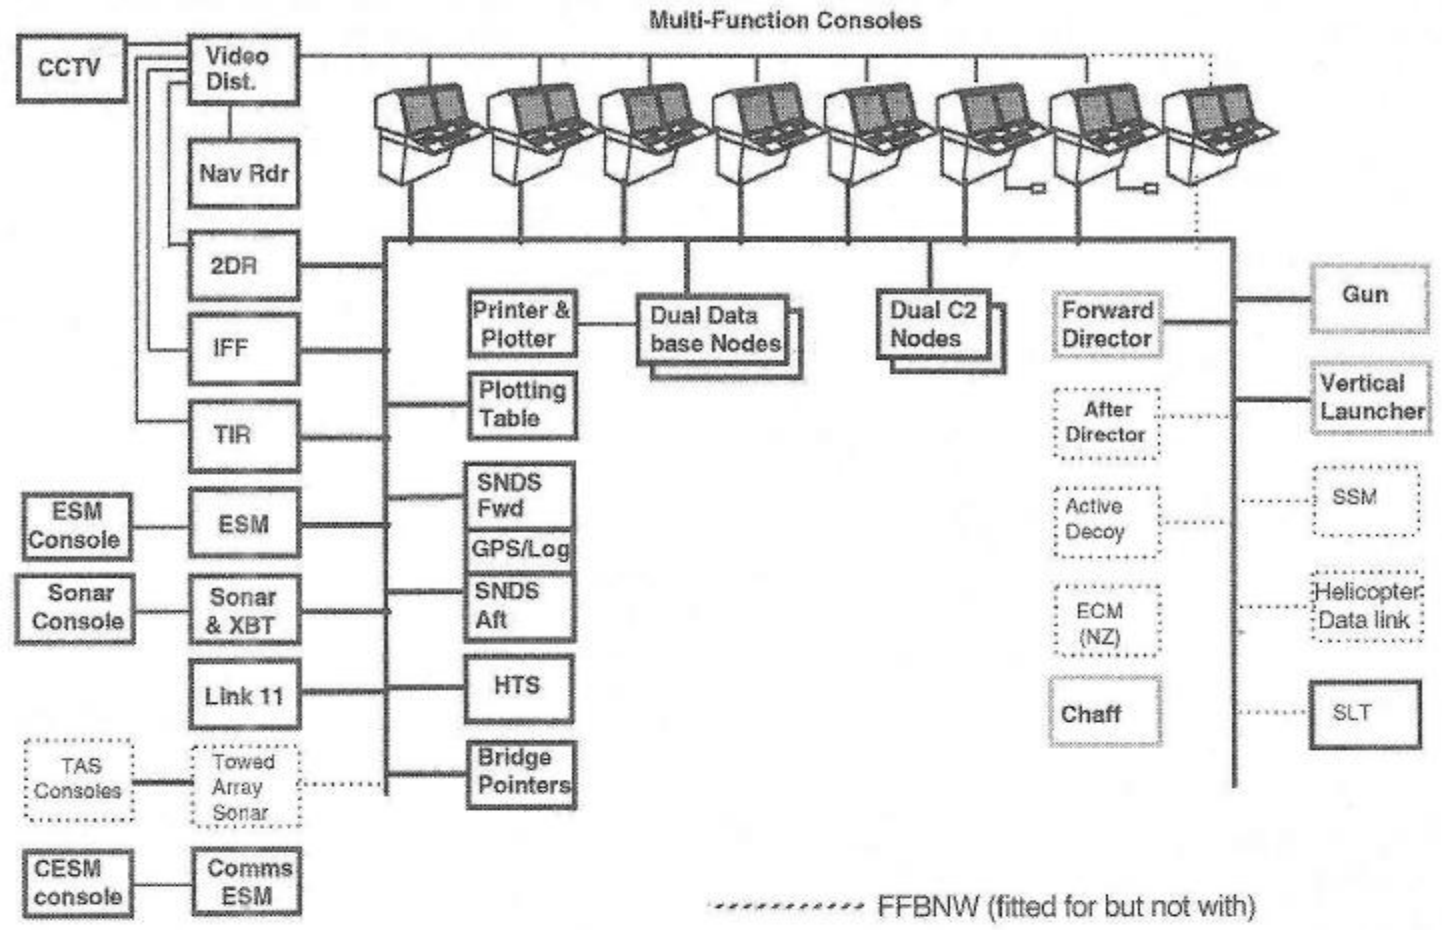
- **Surveillance.** Receive data from and control all sensors (Raytheon SPS-49(v)8, CelsiusTech Target Indication Radar, Cossor AIMS Mk XII IFF, MEL Sceptre ESM, Thomson Spherion B Sonar)
- **Command and Control.** Tactical picture compilation, data fusion, threat evaluation, weapon assignment, tactical planning, Link 11
- **Engagement.** Control the radar/electro-optic director, UDS Mk 41 Vertical Launch system and Sea Sparrow Missiles. Control of FMC 5/54 Mk 45 gun.
- **Support.** Navigation, tactical and technical recording and onboard training. On-line C2 and combat system diagnostics.

Surveillance is centrally managed by the system and track data (consisting of position, identity, type, name and so on) is correlated from each of the most accurate sensors to produce an unambiguous, coloured tactical display. Link 11 is fully integrated as is a helicopter telebriefing system (New Zealand ships only). Ship manoeuvre, navigation planning and automatic surveillance are all managed by the C2 system.

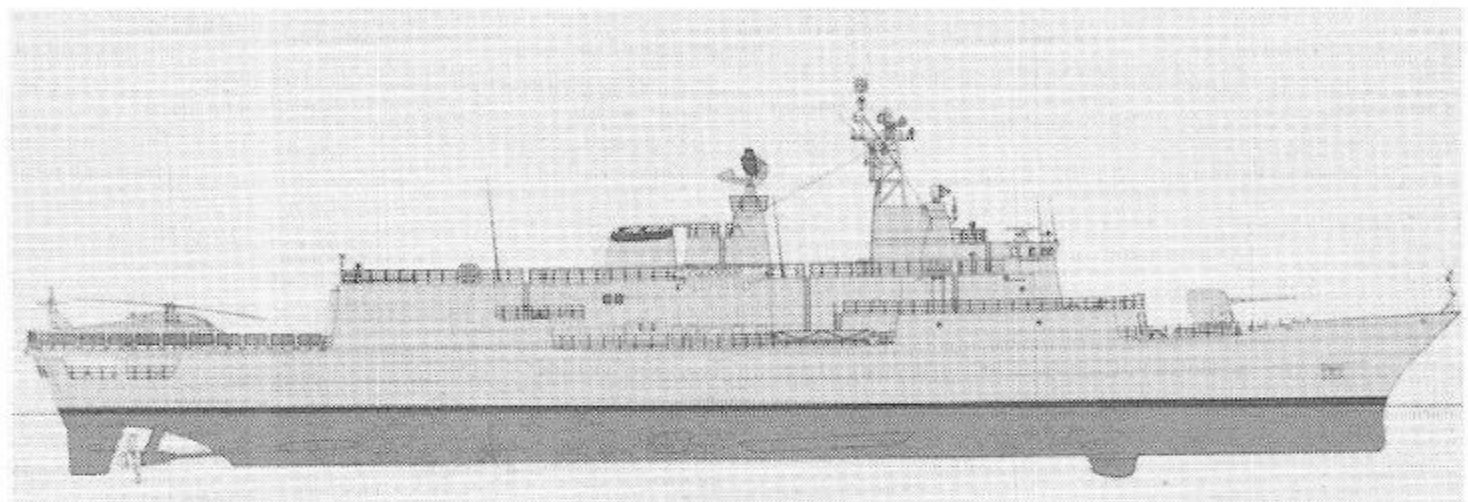
Memory consists of 4 MByte RAM and 256 k of EPROM. The hardware is used to create nodes which may be workstations, processing or interface nodes with a network interface, one or more processing units, power supply, local PROM, and appropriate interfaces. Memory management is by means of the Motorola 68851 while the floating-point processor is the Motorola 68881. All software programs run independently but communicate through an Inter-Program Communication 2000 (IPC2000) mechanism. The basic system has about 500,000 lines of code but this is usually more than doubled to meet added requirements.

The dual-redundant local area network interfaces with all sensors, weapon systems and workstations and the system is supported by two processor units (one redundant) which provide command, communications and control as well as a database. The system is capable of acting as a data handling system compiling the tactical situation, conducting threat evaluation and target designation, as well as providing navigation and offboard sensor data (the latter via a datalink) while recording and providing a simulation capability.

The Mk 3 system retains the horizontal tactical situation compilation display used in the Mk 1/2 system although with improved electronics and its own secondary database. However, the prime MMI consists of workstations, either the CelsiusTech SCL 85 or Terma Standard Consoles.



CelsiusTech 9LV 453 Mk 3



The 'ANZAC' class incorporates four Weapon Modules, eight Electronic Modules, four Pallet Modules, two Mast Modules and nine Ventilation Modules (Blohn & Voss)

The launch of Te Kaha *(F77), the first MEKO 200 ANZAC for New Zealand, at the Transfield yard in July 1995* (Transfield)

Manufacturer/Contractor
CelsiusTech AB, Sweden.

CEROS 200 Fire Control Director

The CEROS 200 Fire Control Director is a high accuracy, lightweight, combined radar and electro-optical director. It uses a small (1 m diameter) Cassegrain antenna and a very wideband TWT radar operating in the J band to achieve high-quality radar tracking for air and surface gunfire control. The antenna also provides an I band feed for the Continuous Wave Illuminator for NATO Sea Sparrow missiles. Three tracking modes provide a range of options to counter all combinations of environmental and manmade (ECM) clutter.

A daylight TV, an Infra-Red imager and a Laser range-finder ensure reliable electro-optical tracking under all but the most extreme conditions. The radar data can be used in conjunction with data from three electro-optical sensors to provide even better track quality; especially against very low-level targets. Together with the radar they provide many combinations of active and passive range and angle tracking of targets, giving the operator a choice of modes which are best suited to the tactical conditions.

The integrated fire-control system provides a variety of weapons functions such as pre-action calibration and fall of shot spotting corrections for surface gunnery and shore bombardment. Weapon safety is strictly maintained and IFF interrogation prior to engagement is also supported.

The CelsiusTech director's details are shown below:

- **Radar.** Spread spectrum Ku band transmitter with monopulse receiver. 1.5 kW peak power, Cassegrain antenna with 1.5° beamwidth. Pulse Doppler, MTI and frequency agile modes.
- **TV.** 2.3-23° field of view, 10-30,000 cd/m² luminance.
- **IR Thermal Imager.** 8-12 µm with option for 3-5 µm
- **Laser.** Nd-YAG type (1.06 or 1.54 µm wavelength). Peak power 4 MW (1.06) or 1.5 MW (1.54)

RADARS

	SPS-49(V)8 ANZ	9600 ARPA
Manufacturer	Raytheon	STN Atlas
Role	2D air search	Navigation
Band	C/D (0.5-2 GHz)	I
Beam	3.4° × 9°	1.5°/ 0.95° × >20°
Peak Power	360 kW	25 kW
Gain	28.5 dB	
Pulsewidth	125 µs/2 µs	
PRF	280/800/1,000 pps	
Scan rate	6/12 rpm	23 rpm
Typical range	250 n miles (475 km)	

CelsiusTech 9LV 453 TIR (Target Indication Radar)

The ship's high-definition target indication radar is based on the Ericsson Sea Giraffe but is fitted with a CelsiusTech antenna system. It is a G band radar using TWT technology with good MTI and a very high data rate (60 Hz) suitable for fire-control systems. There are separate air and surface channels with automatic detection (air only) and tracking. The lightweight air porous antenna has very low sidelobes and high gain. The Threat Evaluation and Weapon Assignment function uses the high data rate to continually replan engagements to cater for manoeuvring and pop-up targets.

SONARS

Spherion B (TSM-2633) hull-mounted sonar

Spherion B is a hull-mounted, long-range active sonar for ASW surface combatants. It comprises a spherical hull-mounted array with an electronic processing system that allows for real-time computation in transmission and reception modes; three-dimensional stabilisation to compensate for pitch, roll and yaw in the parent vessel; and a beam-tilting capability to counter adverse sound velocity profiles and strong reverberation. The transmitter is omnidirectional, with sectoral transmissions in CW and FM modes, various modes including TRDT. The receiver has 36 preformed beams stabilised in azimuth and elevation, and advanced processing with replica correlator in FM and spectrum analysis (FFT) in CW.

Specifications
Acoustic array: Spherical with 160 individual transducers
Frequency: 7 kHz (approx)

Manufacturer/Contractor
Thomson Sintra Activités Sous-Marines, Sophia Antipolis Cedex, Paris.

Towed arrays

Provision is made in both Australian and New Zealand ships for a towed array to be fitted in due course. In the Australian ships this is likely to be the Australian-developed Kariwara, but the RNZN has yet to select a system for its ships.

COMMUNICATIONS AND DATALINKS

Data-link

Link 11
Communications: SHF Satcom (believed to be receive only)
Interrogator: Cossor Electronics IFF Mk XII

Vesta-VC helicopter transponder/datalink system

Vesta consists of a helicopter-mounted transponder which transmits a VHF signal when the aircraft is illuminated by the ship's search radar. This reply is picked up by the Vesta shipborne component to produce and tag a clear echo on the ship's radar screen.

The helicopter is equipped with two spherical antennas for reception of the ship's search radar signals. The transponder generates a VHF reply containing a number of code pulses for identification purposes. On board the ship there are two simple rod antennas to receive the transponder signals, which are then routed via the receiver (and extractor unit) to the ship's radar display. The Vesta system is controlled by either a control unit and a radar indicator, or a data handling system.

The Vesta system can indicate unambiguously any number of Vesta-equipped helicopters on the ship's radar display. A limited number of helicopters can be identified by means of preselected codes.

Specifications
Transmission frequency: VHF
Radar reception frequency: 1-10 GHz
Transmission power: 10 W
Pulse length: 2 µs
PRF (helicopter part): 20 kHz without code
Sensitivity (ship part): −78 dBm
Range: 0-124 n miles (230 km)
Number of codes: 5 (optionally 64)
Number of co-operating radar systems: 4

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

Navigation system

Sperry Mk 49 SINS.

AVIATION

AVIATION FACILITIES

Specifications
Flight deck: 24.42 × 14.8 m (80 × 48 ft)
Hangar: 1, single hangar
Landing aid: The Canadian Indal RAST system is fitted

Sikorsky S-70B-2(RAN) Seahawk

Specifications
Dimensions:
main rotor diameter: 16.36 m (53.66 ft)
tail rotor diameter: 3.35 m (11.00 ft)
length overall: 15.26 m (50.0 ft)
height (top of rotor head): 3.79 m (12.43 ft)
Weights:
empty: 6,191 kg (13,648 lb)
mission gross weight: 9,182 kg (20,244 lb)
Performance:
max at 1,525 m (5,000 ft): 126 kts (234 km/h)
vertical rate of climb: 213 m (700 ft)/min
Power plant: 2 General Electric T700-GE-401C turboshafts rated at 1,417 kW (1,900 shp); transmission rating 2,535 kW (3,400 shp)
Accommodation: 3 (Pilot and airborne tactical officer/back-up pilot in cockpit, sensor operator in specially equipped station in cabin)
Communications: Collins AN/ARC-159(V)2 UHF, Collins AN/ARC-174(V)2 HF, Hazeltine AN/APX-76A(V) and Bendix/King AN/APX-100(V)1 IFF transponders, TSEC/KG-45(E-1) communications security set, TSEC/KY-75 voice security set, Telephonics OK-374/ASC communications system control group
Radar: Thomson Thorn SuperSearcher
Mission: Sikorsky sonobuoy launcher, Edmac AN/ARR-84; CAE AN/ASQ-504(V) internal MAD; Raymond MU-670/ASQ magnetic tape memory unit, Astronautics IO-2177/ASQ altitude indicator, Fairchild AN/ASQ-164 control indicator set, Fairchild AN/ASQ-165 armament control indicator set, Computing Devices UYS-503 and CV-3252/A converter display, Control Data AN/AYK-14 (XN-1A) digital computer, Raytheon AN/ALQ-142 ESM, Rockwell Collins DHS-901 datalink and telemetry. AN/AAQ-16 FLIR was fitted in Gulf War.
Self-defence: AN/ALE-47 chaff/flare dispensers and AN/AAR-47 missile detectors during Gulf War
Armament: 2 Mk 46 torpedoes

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 1 General Electric LM2500-30 gas turbine; 22.5 MW (30,172 hp) sustained; 2 MTU 12V 11634 TB83 diesels; 6.5 MW (8,840 hp(m)) sustained
Shafts: 2
Propellers: cp
Auxiliary power: 4 MTU 8V 396 TE54 diesel generator sets; 1,160 kW each

FURTHER INFORMATION

PROGRAMME

After many years of buying British warships, the Australian Navy switched in the 1960s to US ships, purchasing, first, three 'Charles F Adams' class destroyers between 1962 and 1967 ('Perth' class), followed by six 'Oliver Hazard Perry' class frigates between 1977 and 1993 ('Adelaide' class). When, therefore, there was a competition in the late 1980s for a new class of frigate it came as a considerable surprise that the winner was Blohm + Voss with a variant of the MEKO 200 design. The RNZN also found itself needing to find replacements for its ageing British-built 'Leander' class frigates and joined with the RAN in a joint programme.

The contract was signed with the (then) Australian Marine Engineering Consolidated (Amecon), now Transfield Shipbuilding, Melbourne, Victoria, on 10 November 1989 to build eight Blohm + Voss-designed MEKO 200 ANZ frigates for Australia and two for New Zealand, which has an option for two more.

Construction of the first ship started on 27 March 1992, with modules being constructed at Newcastle and Whangarei, and then shipped to Melbourne for assembly. Ships one and three are for the Australian Navy, while the second and fourth are for New Zealand. The remaining six ships of the current order are for Australia; known as 'Batch 2' they will be fitted with Evolved Sea Sparrow.

The total contract runs for 15 years and is the largest defence contract ever signed in Australia. The fixed-price contract was worth $3.8 billion in 1988 dollars.

DESIGN

The design is known as MEKO 200 ANZAC and is based on the Portuguese variant MEKO 200PN. Perhaps the most unusual feature is the propulsion system, which is unlike that of any other MEKO variant, with two MTU diesels but only one LM 2500 gas turbine, giving a lower maximum speed of 27 knots (compared to 30+ for the others), but a very considerable increase in range.

It was originally planned to install a 76 mm gun, but the army insisted on 127 mm for increased terminal effects in the shore bombardment role.

One of the more surprising aspects of the ships is the number of weapons and sensors which they are 'fitted for but not with' (FFBNW). This category includes eight Harpoon SSMs, two Phalanx CIWS, a second Sea Sparrow launcher, the after fire-control radar and a towed-array sonar.

Various sensible economies are being achieved by transferring equipment from older ships. Thus, for the Australian ship, fin stabilisers and Mk 32 torpedo tubes are being transferred from the 'River' class frigates.

THE FUTURE

It is reported that the Australian Navy is conducting a reassessment of the ships' 'war-fighting' capabilities, and it could well be that this will concentrate on the current absence of a long-range anti-ship missile, which may be alleviated by the possible purchase of long-range anti-ship missiles for the shipboard helicopter. Another area of concern must be the lack of a close in weapons system. The outcome of such a study could be incorporated into a possible stretched version of this class, which is being considered as a replacement for the 'Perth' class DDGs.

The New Zealand Navy is very keen to convert its options for two further hulls into an actual order. To this end, stringent economies are being applied elsewhere in the navy programme in an endeavour to create the necessary financial 'head-room'.

WEAPONS SYSTEMS

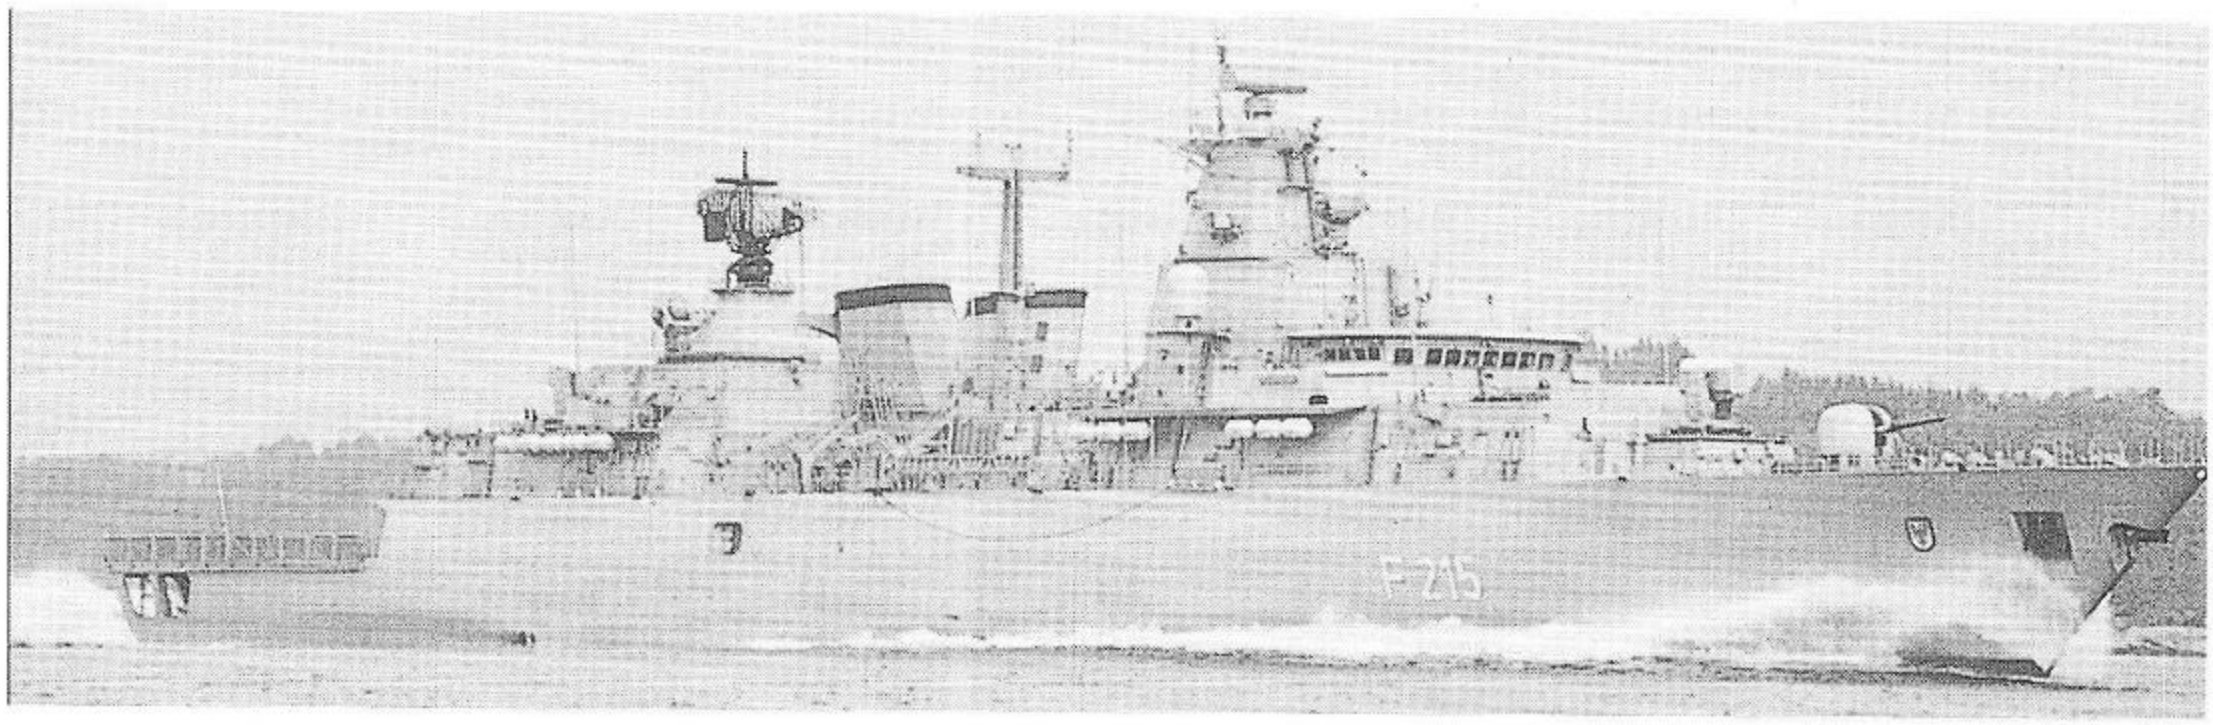
SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 38 medium-range anti-ship missile

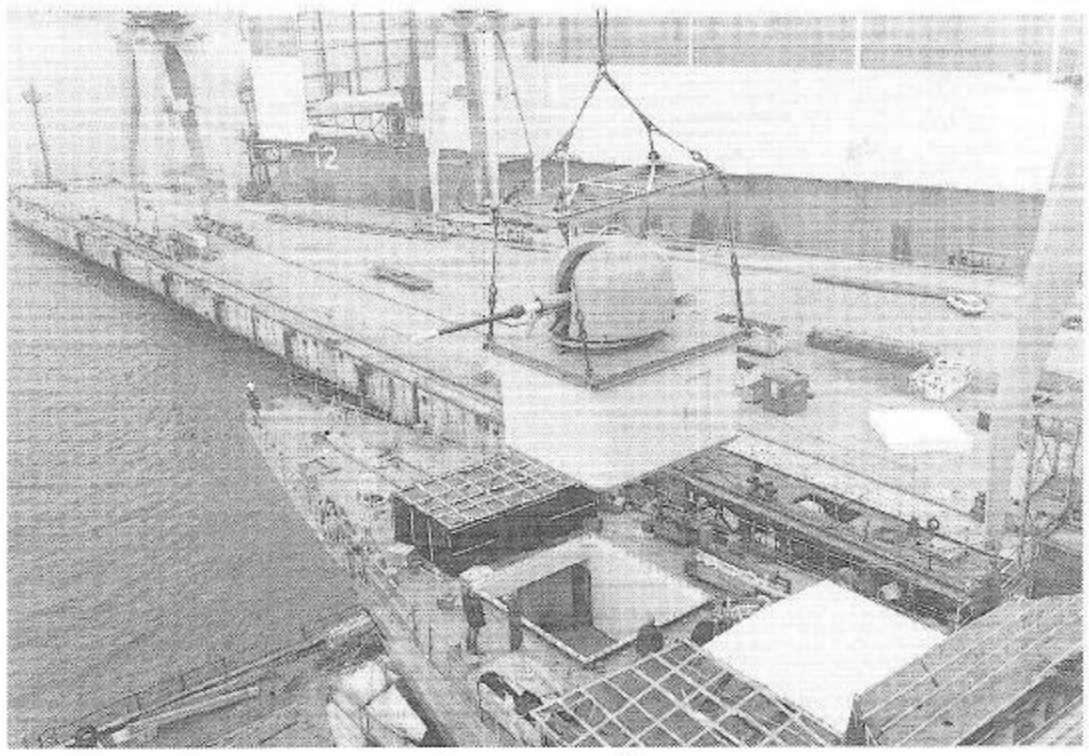
Four Aerospatiale MM 38 Exocets are mounted between the foremast and the stacks in two pairs of individual ITS *(Installation de Tir Standard)* launcher-containers, which point across the ship and are inclined at an angle of 12° to the horizontal. Targets are acquired by the ship's search radar and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence. This involves turning on the thermal battery, releasing the mechanical safety locks, igniting the booster, and, finally, breaking the umbilical cord; the total process takes some 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change of course during its flight. A salvo may be fired in 12-20 seconds.

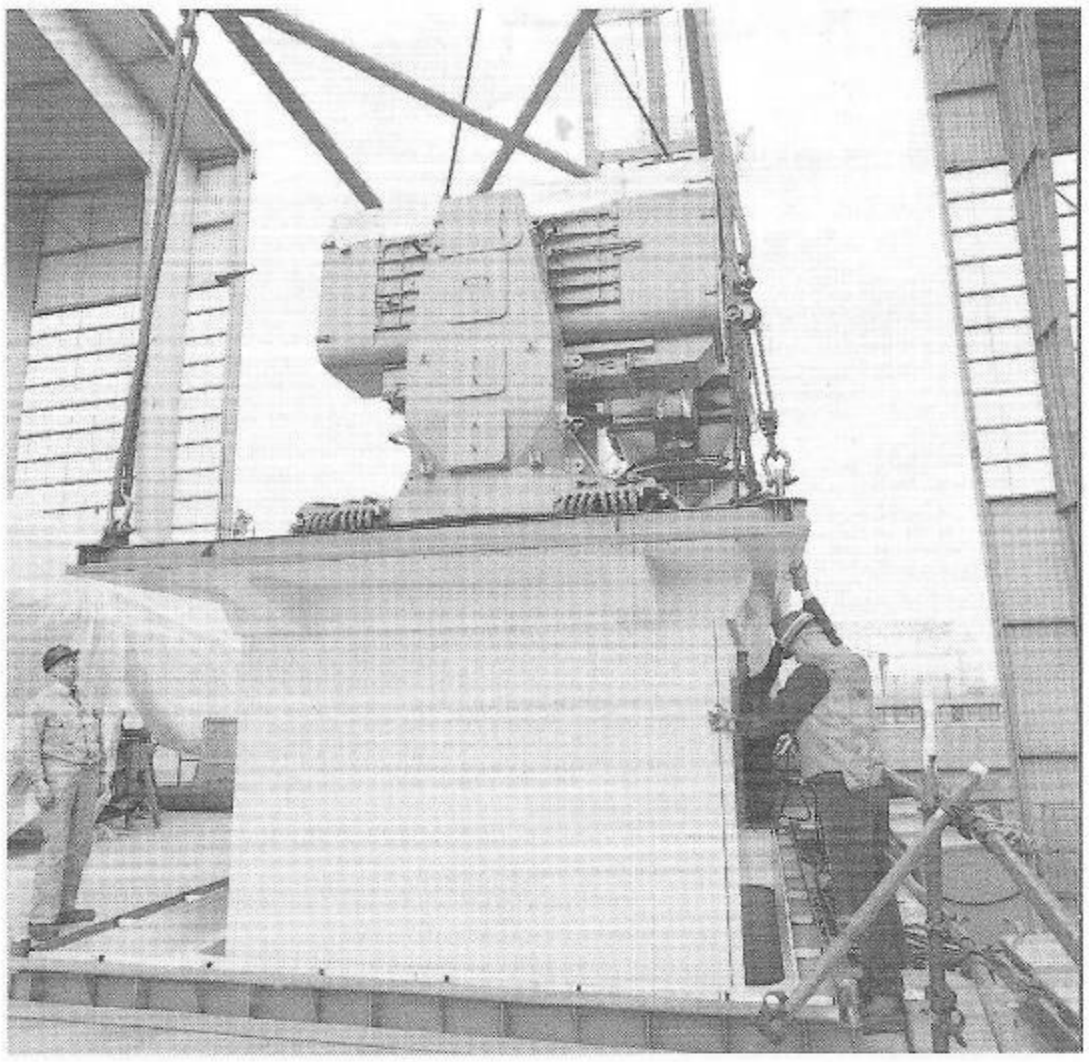
The attack consists of three phases:

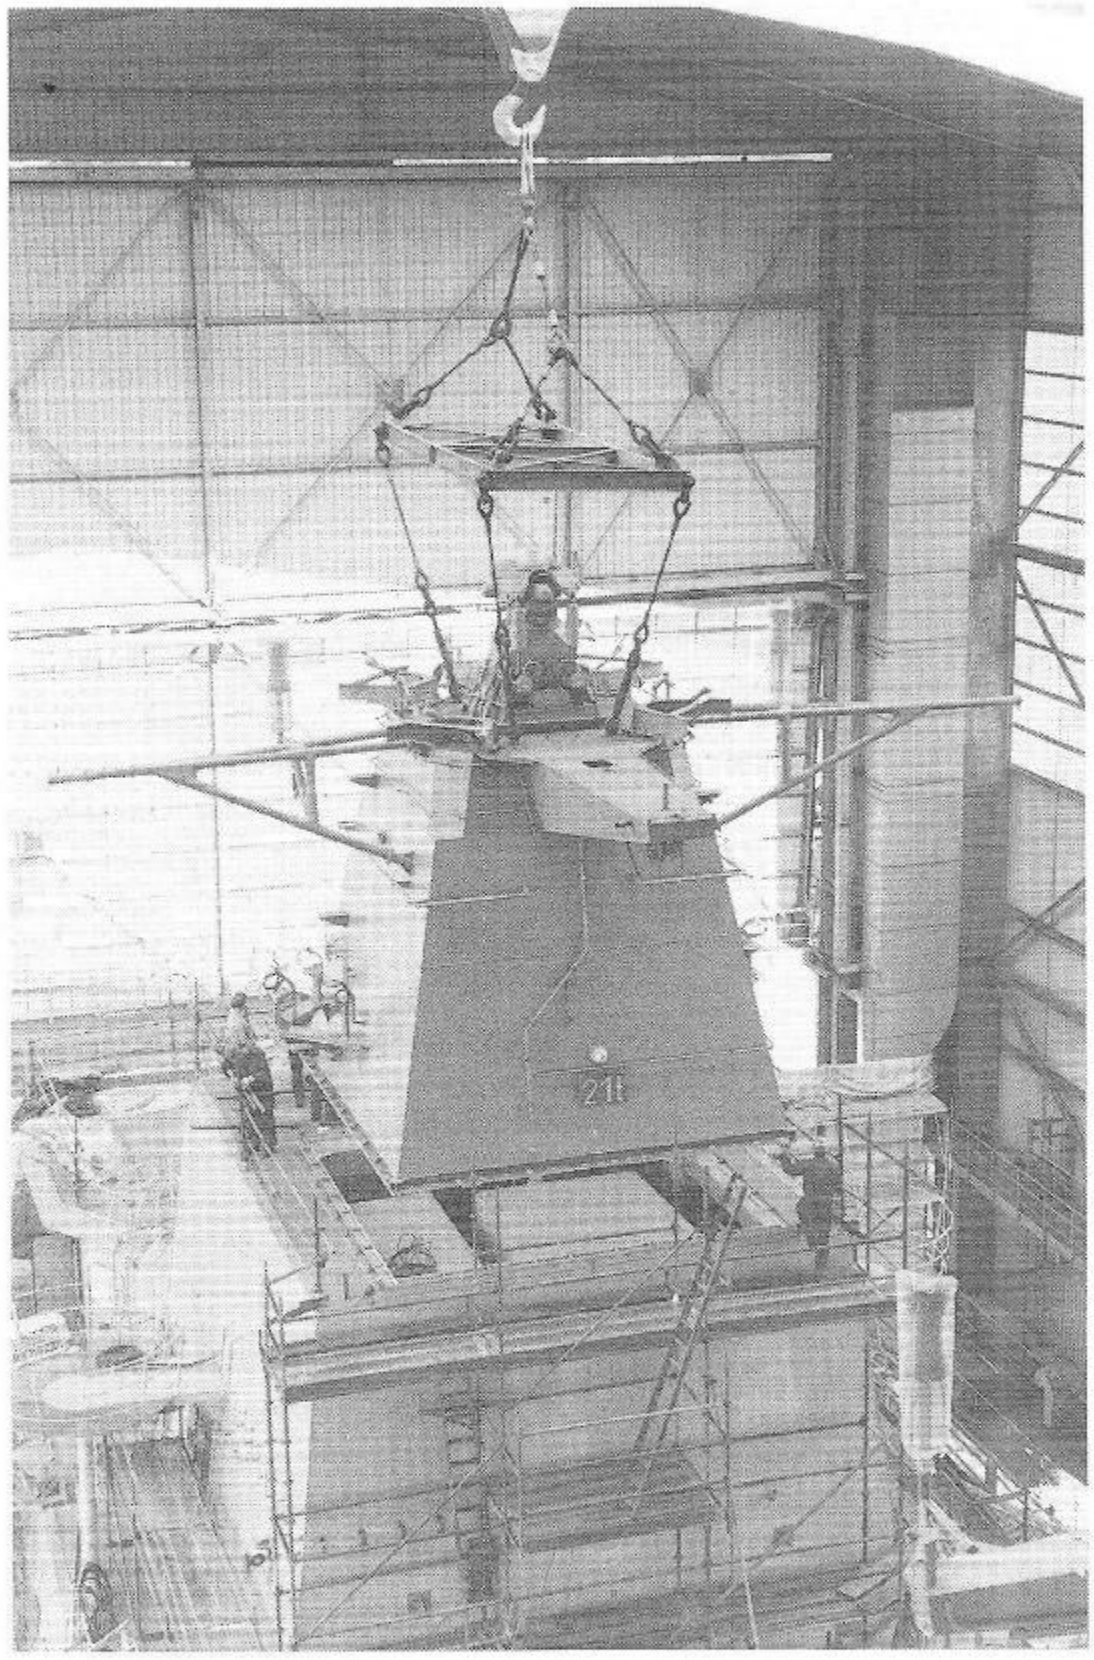
Cruise phase. As soon as the missile clears the container powered by the sustainer motor, it flies towards the general location of the target at a height of about 100 m (328 ft), which is low enough to reduce the chance of detection but adequate for target acquisition. This leg, which can be as long as 22 km, ends when the

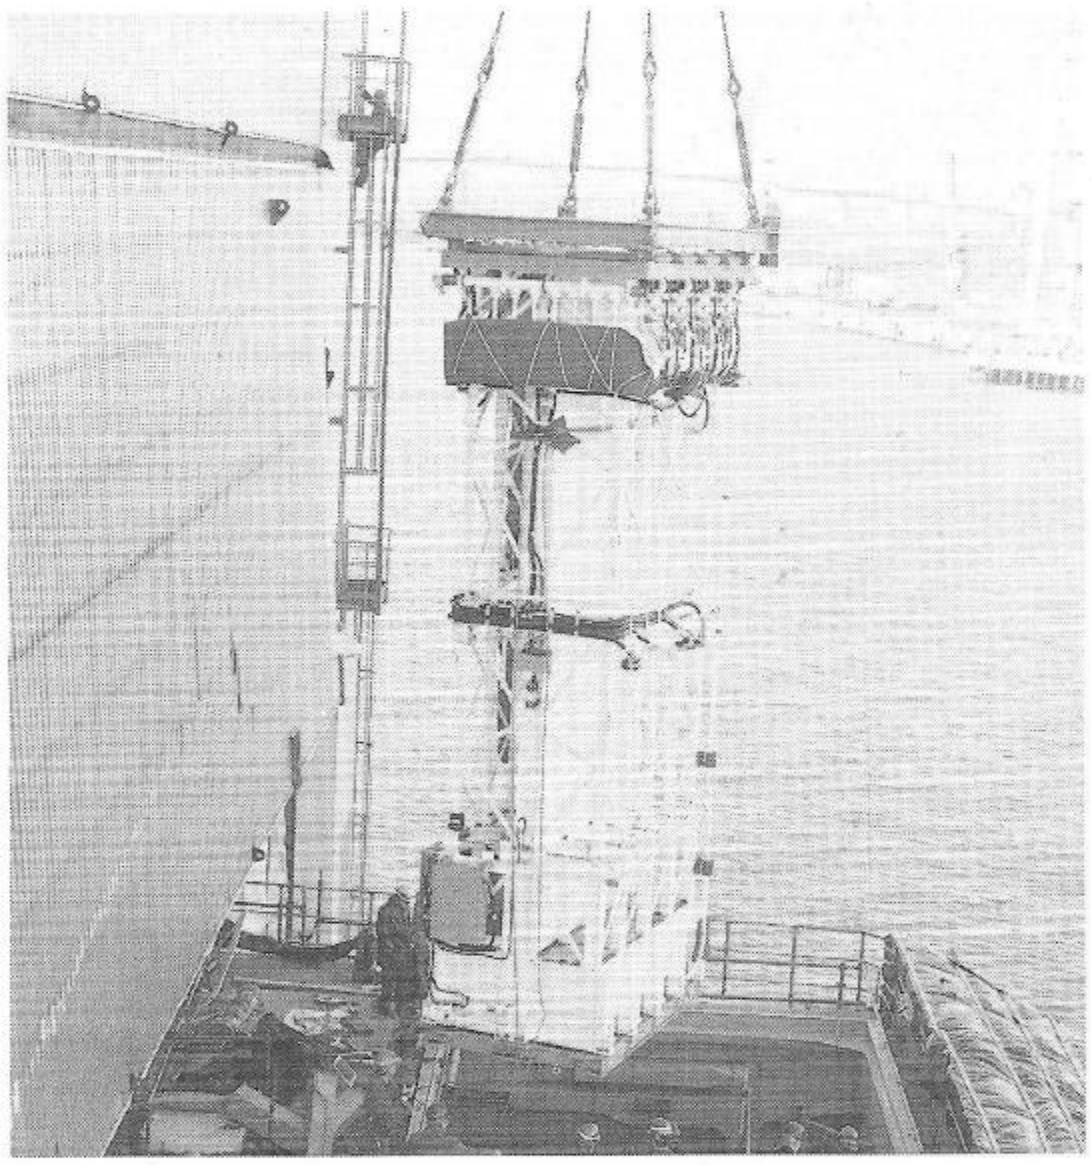


Brandenburg *(F 215), nameship of the class. Four have been built for the Federal German Navy and the design is also being used as the basis for the Type 124 air defence ships* (FGS Brandenburg)









The Brandenburg is not a MEKO design as such, but it uses the modular system developed by Blohm + Voss for the MEKO ships. This series of pictures shows various items being installed, including, clockwise, from top left: the 76 mm gun module (1); the RAM launcher module (2); the eight cell NATO SeaSparrow ULS module (3); and the mast module (4)

seeker acquires the target. This seeker is a Dassault Electronique ADAC (Auto Directeur Anti-Clutter) active monopulse radar, working in the I band (8-10 GHz), which has a typical range of 13 n miles (24 km) against a target such as an FAC.

Approach phase. On detecting the target the missile descends to 9-15 m (29.5-49.2 ft).

Terminal phase. During this final phase the missile descends to 8 m (26.2 ft) (2-5 m (6.5-16.4 ft) in a calm sea) for a sea-skimming run in to the target.

The MM 38s for these four frigates were taken from the Type 101A 'Hamburg' class, which they replaced. The launch frames are easily adaptable and could take Harpoon or the new supersonic Franco-German ANNG *(anti-navire, nouvelle génération)* anti-ship missile, currently under development.

Specifications

MM 38

Length: 5.21 m (17.1 ft)
Diameter: 35 cm (13.8 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 2-22.5 n miles (4-42 km)
Guidance: Inertial and active radar
Sustainer motor: SNPE Eole alloy-cased CDB; weight 151 kg (333 lb); max burn time 93 s
Booster: 100 kg (220 lb) SNPE Epervier boost motor, weight 100 kg (220 lb), burn time of 2.4 s
Warhead: Luchaire 165 kg (363.7 lb) fragmentation warhead
Fuzes: Delayed impact fuze and autopilot-controlled proximity fuze

Manufacturer/Contractor

Aerospatiale Tactical Missiles, Chatillon Cedex, France.

SURFACE-TO-AIR MISSILES (SAM)

GMVLS Mk 41 Mod 3 Vertical Launch System

The 'Brandenburg' class frigates are equipped with a Guided-Missile Vertical Launch System (GMVLS) Mk 41 Mod 3 with 16 launch tubes. The launcher module is 6.86 m (22.5 ft) high and contains sixteen Mk 22 canisters which are 5.79 m (19 ft) deep and weigh 1,503 kg (3,313 lb) (complete with missile). The current installation consists of two sub-modules of eight tubes each, but there is ample space, both above and below decks, for another two eight-cell launchers.

Raytheon Sea Sparrow point-defence missile system

Sixteen RIM-7P Sea Sparrow missiles are carried and the system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg (85.1 lb) blast/fragmentation warhead and a dual-purpose proximity impact fuze.

Specifications

RIM-7P

Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 231.5 kg (510 lb)

There are two large torpedo rooms at the 01 deck level, either side of the main internal passageway. The tubes are fixed and angled outwards, their muzzles pointing through a rectangular aperture in the ship's side (directly below the LW-08 radar antenna in the picture)

Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturers/Contractors

Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

RIM-116A RAM close in system

There are two 21-cell Mk 49 launchers for the Rolling-Airframe Missile (RAM): one on the foredeck, the other aft on the roof of the twin hangars. RAM is a lightweight, close in, quick-reaction, anti-missile defence system, the RIM-116 missile being based on the Sidewinder air-to-air missile, but with significant modifications, enabling it to be used as a fire-and-forget system. There is an infra-red, terminal guidance seeker in the nose (taken from the Stinger man-portable surface-to-air missile), behind which is a new dual-mode passive radio frequency seeker for mid-course guidance. Most of the rear of the missile is based upon Sidewinder components. Missiles are stored in sealed launcher containers, which are manually loaded into the 21-cell Mk 49 RAM Standard Launchers.

Radar and electro-optical sensors provide details of target location, distance and speed, while the ship's ESM system inputs data on the target's radar frequency, as well as correlating radar data on location. On launch, the missile is spun-up by a rifling band as it is driven down the launch tube, and then as it leaves the launcher the four tail fins deploy which maintain the spin. Aerodynamic control is provided by the two canard surfaces, which also deploy after launch. The autopilot and control system maintain the initial line of sight course towards the target and then the RF seeker is activated and once this acquires the target it takes control of the guidance system and makes the appropriate course alterations. The IR seeker is also activated and when a sufficient signal-to-noise ratio is achieved this takes over guidance control for the terminal phase. The missile is capable of manoeuvres up to 20 *g* in any direction. The system can only be fired automatically at the moment, but manual control will become possible with Block 2 missiles.

Specifications

Mk 49 RAM Standard launcher
Traverse: 360°
Elevation: −25 to +80°
Turning circle: 3.27 m (10.73 ft)

RIM-116 missile
Length: 2.79 m (9.1 ft)
Diameter: 12.7 cm (5 in)
Wing span: 43.4 cm (17.1 in)
Weight: 73.6 kg (162 lb)
Speed: Mach 2
Range: 5.17 n miles (9.6 km)
Warhead: 9.09 kg fragmentation blast WDU-17B
Motor: Hercules/Aerojet Mk 36 solid propellant rocket

Manufacturer/Contractor

RAM Systems GmbH, D-85521 Riemerling, Germany.

TUBES

Four 324 mm US Mk 32 Mod 9 (two twin) torpedo tubes are mounted within the superstructure, immediately below the RAS station.

The spacious torpedo compartments are sited either side of the main corridor on the main deck level and house a number of reloads and reloading gear. The tubes launch the torpedoes through permanently open apertures in the ship's side at a forward angle of 45° to the ship's centreline.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 324 mm torpedoes

Specifications

Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 232 kg (511.5 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Monopropellant
Speed: 45 kts
Range: 4.5 n miles (8.33 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 76 mm (3 in)/62 Mk 75 Compact

There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck, which is mounted in a MEKO-type module on the foredeck for use in either air defence or anti-surface roles. If the weapon is designated to the air-defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission. In the anti-surface role, the 76 mm gun can be controlled either from the CIC or by a new target designation sight, two of which are installed, one on each bridge wing. This sight is based on that used in the Type 122, but has been improved, as a result of the FGN's experiences in the Adriatic, by the addition of a firing button, enabling the 76 mm gun to be fired from the bridge under full visual control.

Specifications

Calibre: 76.2 mm (3.0 in)
Barrel length: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.

Rheinmetall Rh-202 20 mm cannon

One of the lessons of Gulf deployments is the need for a light, short-range gun. Therefore, the Type 123 ships mount two Rheinmetall Rh-202 20 mm cannon, which were taken from decommissioned Klasse 520 landing craft. These are mounted in the bridge wings, abaft the target designation sights.

Manufactuer/Contractor

Rheinmetall, Germany.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

DASA FL 1800S Stage II

The FL 1800S Stage II ESM/ECM suite is based on the earlier FL-1800S, but with considerable improvements in the areas of signal processing, analysis, MMIC and ECM. A new channelised receiver with nine sub-bands provides extremely accurate frequency measurement and CW resistance. Two fully integrated superheterodyne receivers have been incorporated for special analysis of pulses and for later upgrade to fit in a 'fingerprinting' system. Expanded capacity threat libraries are provided, which include onboard reprogrammable modules for use in out-of-area missions. The system handles several threats simultaneously, regardless of frequency or direction of arrival.

The ECM system consists of a tracking processor for tracking ECM emitters and to control the timing of both synchronous and asynchronous ECM, modulators for generating ECM modes (ECM-RF), and multibeam array ECM antennas for simultaneous generation of countermeasures, even against multiple threats. A different collection of ECM modes is used to counter each threat, with a look-through mode employed to verify the effectiveness of jamming, and to update the ESM situation in general. The effective radiated power of the jamming is such that it is sufficient to cover the ship's radar cross-section.

Specifications

Frequency range: 2-18 GHz
Azimuth coverage: 360°
Elevation coverage: −10 to +60°
Polarisation: 45° linear for receiving channel; circular for DF
DF accuracy: 5° typical RMS

Manufacturer/Contractor

Daimler-Benz Aerospace AG, Sensor Systems Division, Ulm, Germany.

DECOYS

OTOBREDA 105 mm Rocket Launcher (SCLAR)

The SCLAR 105 mm rocket launcher system provides defence against radar and IR homing missiles, confuses enemy radars, and provides illumination for visual fire control at night. Different types of rockets can be loaded in various arrangements (long-range chaff, medium-range chaff, illuminating) to permit mixed salvos. The remote fire-control unit is used to select the number and types of rockets to be loaded and to set the fuzes and carry out the launch sequence. There are two 20-tube launchers trained and elevated by remote control. The control unit is linked to the ship's radar and a control panel in the ECM compartment to provide the necessary operating signals. The data needed to stabilise the two launchers against pitch and roll is provided by the ship's gyrocompass.

There are four types of rocket, all of which have double-base propellant motors, folding fins and electronic fuzes.

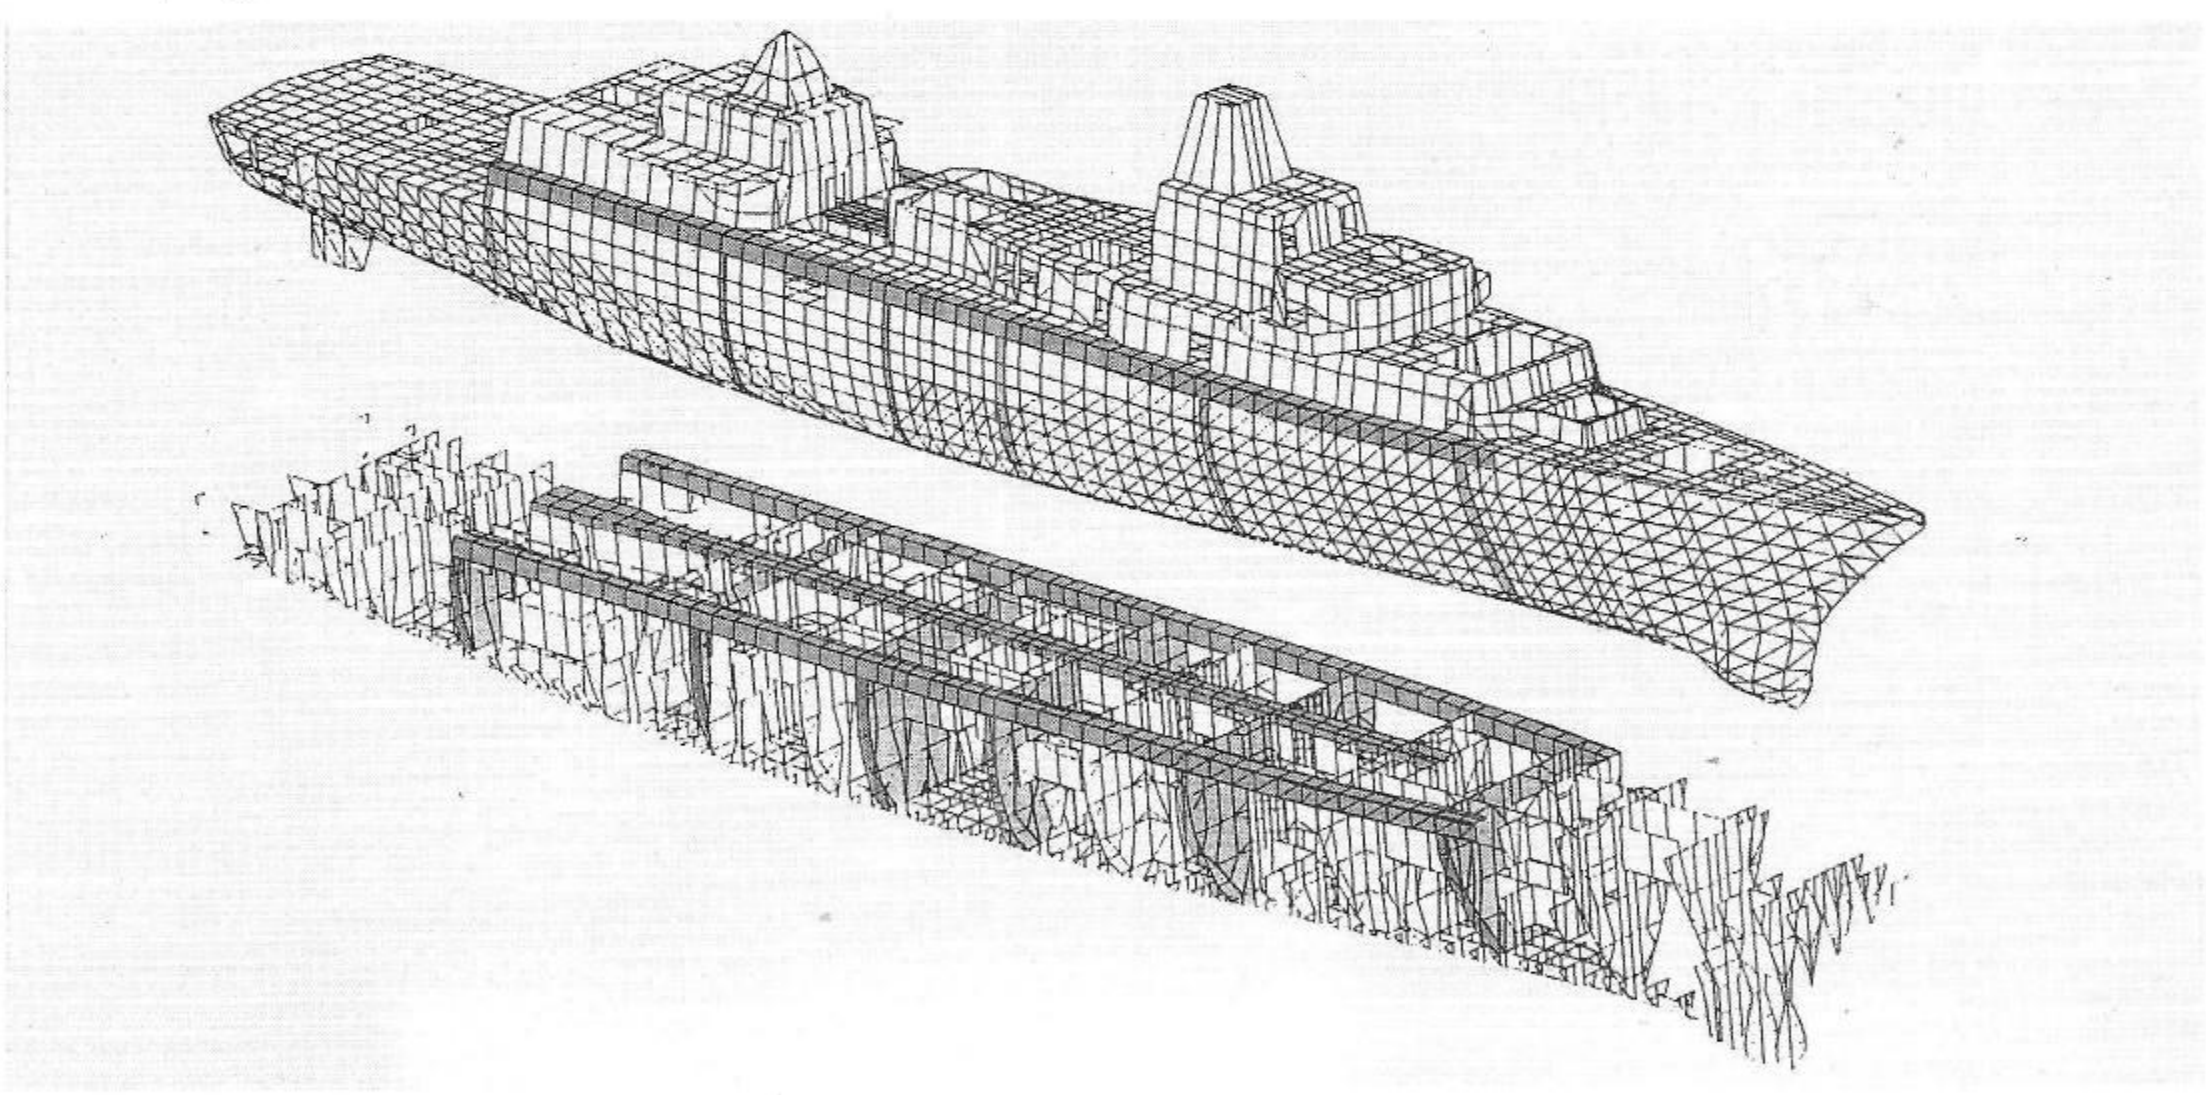
Specifications

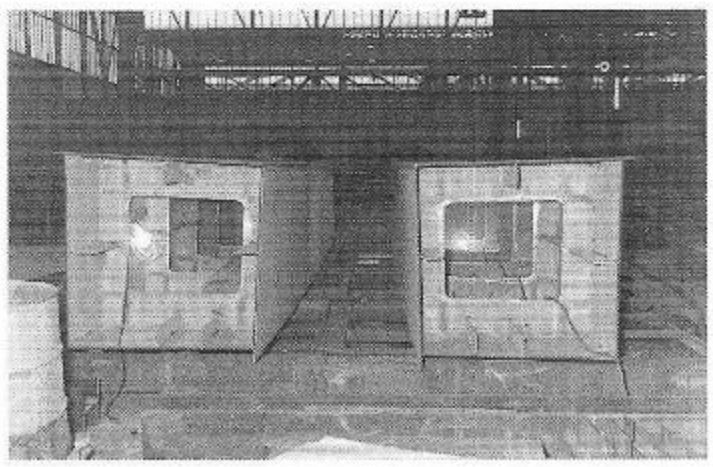
Launcher
Traverse: 300° at 60°/s
Elevation: −5 to +60° at 30°/s
Number of tubes: 20
Diameter: 105 mm
Rate of fire: 1 rd/s (approx)

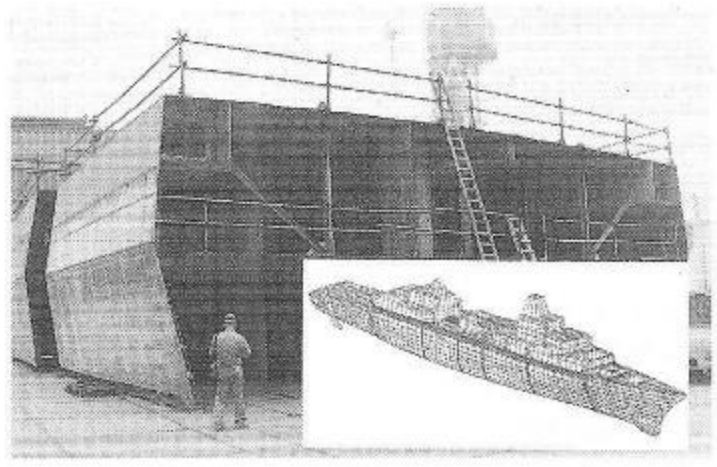
These rockets are:

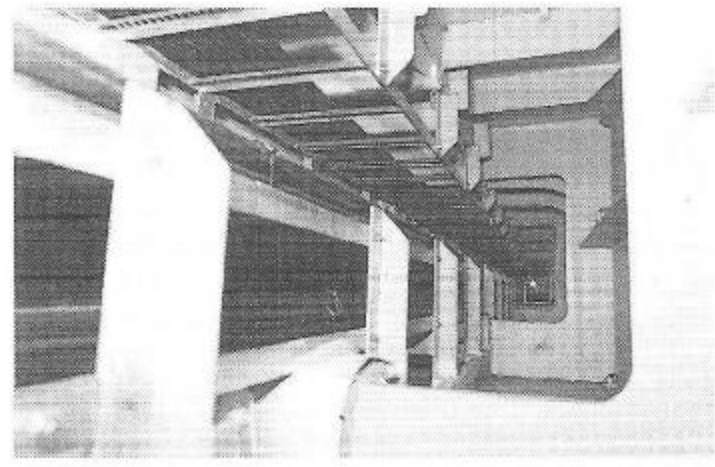
Rockets

Rocket	Role	Range	Length	Weight of complete round	Payload
SNIA 105 LR-C	Chaff distraction	12,000 m (13,120 yd)	1.85 m (6.07 ft)	27 kg (60 lb)	10.2 kg (22.5 lb)
SNIA 105 MR-C	Chaff seduction	4,700 m (5,140 yd)	1.83 m (6.0 ft)	29 kg (64 lb)	17.4 kg (38.4 lb)
SNIA 105 MR-IR	Infra-red seduction	5,000 m (5,470 yd)	1.83 m (6.0 ft)	29 kg (64 lb)	10.2 kg (22.5 lb)
SNIA LR-I	Illuminating	4,000 m (4,370 yd)	1.85 m (6.07 ft)	27 kg (60 lb)	10.2 kg (22.5 lb)









All three girders are constructed from 16 mm thick steel plate, the two outer girders being 1.2 m square (above left), while the central girder has slightly different dimensions (1.5 × 0.6 m) to give adequate headroom in the central passageway running below it at the 02 deck level (top, lower graphic). There are also six double-skinned bulkheads, which both support the longitudinal girders after damage and also provide subdivisions within the ship (top, top graphic). Individually, these girders have a high intrinsic buckling strength and will not themselves be degraded by blast or fragment damage. Taken together, however, they give immense strength to the entire structure, providing a very stiff backbone, with a high ultimate bending moment. The outer girders are also used as highly survivable carriers of certain of the ship's services, such as power distribution cabling (above, right) (All pictures and diagrams: Blohm & Voss)

Frigate Bayern *(F 217) at St Petersburg in July 1996. Although classified as frigates, these four ships are as large as pre-war light cruisers and they are very spacious* (H & L van Ginderen Collection)

Manufacturers/Contractors

OTOBREDA, Rome, Italy (launcher).
SNIA BPD (rockets).

AN/SLQ-25 Nixie noisemaker

One AN/SLQ-25 Nixie (Phase 1), a solid-state, modular design electroacoustic countermeasures decoy system is mounted on the port side of the quarterdeck. It protects the ship from acoustic homing torpedoes and consists of a remote-control unit; a countermeasures transmitter which generates and amplifies the signals; a power-operated double-drum winch for streaming/recovering the towed bodies; and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them, while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located on the quarterdeck, with the towed bodies deployed through the transom. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm long (3.10 ft), 15.24 cm (6 in) in diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body at a time is deployed.

Manufacturer/Contractor

Aerojet ElectroSystems, Sacramento, California, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

SATIR F 123 tactical data handling system

SATIR *(System zur Auswertung Taktischer Informationen auf Raketenzerstoerren)* is a command and weapon control system *(Führungs und Waffeneinsatzsystem* (FüWes)) with the hardware and software integrated by the Bundesamt für Wehrtechnik und Beschaffung (BWB) and the Kommando Marine Führungssystems (KdoMFüSys) and then interfaced with sensor and weapon systems. The original SATIR system was fitted in the three 'Lütjens' class destroyers and entered service in March 1969, but there have since been two development programmes, the first for the F 122 frigates (SATIR Z103B) and subsequently the SATIR F 123 system for 'Brandenburg' class frigates.

SATIR F 123 is a mainframe architecture system using BWB software in the CMS-2Y language running on a 32-bit Unisys AN/UYK-43 computer, which has a 2.56 M memory and an operating speed of between 3 and 4.9 Mips. The system acquires data from a variety of sensors, and processes and displays them to ensure effective engagement of airborne, surface and subsurface targets. The CIC is one deck below the bridge, with four banks of consoles grouped by function, with ASW and helicopter management to port, information management and link control forward, weapon control to starboard, and command and control to the rear overlooking the other three groups. Normal CIC occupancy is approximately 20, increasing to 30 at action stations. All visual information is colour.

A modular software structure was adopted and four packages were produced for operations, maintenance, support and administration. All operational software is run on the UYK-43 computer but basic software is run on twelve Atlas Elektronik BM 802-52 consoles designated by the German Navy Querschnittskonsole Marine or QKM (Cross-section Naval Consoles). In the event of the computer failing these consoles can continue to provide a minimum level of functionality. The commanding officer does not have his own console but uses that of either the tactical action officer or the executive officer. Radar video data is transmitted both directly to the display consoles and, via the video extractor, to the central computer and there is partial integration of the IFF system.

Manufacturers/Contractors

BWB, D-56057 Koblenz, Germany (prime).
Unisys, Great Neck, New York, USA (subcontractor 1).
STN Atlas, Bremen, Germany (subcontractor 2).

SONAR

STN Atlas DSQS 23BZ (AS 96)

The F 123 frigates are fitted with the DSQS-23BZ hull-mounted, low-frequency sonar, which has the STN Atlas company designation ASO 96. DSQS-23BZ is designed for computer-aided detection, localisation and classification over the entire 360° azimuth and is of a modular design enabling it to provide underwater telephone; automatic target tracking; classification; ray trace; intercept; torpedo warning; vertical stabilisation; simulation; interface to 'own ship's' fire-control system; underwater survey display and torpedo command functions, together with, if one is fitted, interface to a towed array sonar. The hull-mounted transducer is 2.5 m (8.2 ft) in diameter and 1 m (3.28 ft) high. The system is designed to transfer data on up to 10 targets automatically into the SATIR system. No decision on fitting a towed array has been made, although the relevant space and facilities are incorporated in the ships as built.

Manufacturer/Contractor

STN Atlas Elektronik GmbH, Bremen, Germany.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 25.4 × 16.7 m (83 × 55 ft)

Hangar: There is a large, laterally split hangar, which accommodates 2 helicopters

HELICOPTERS

The current type is the Westland Mk 88 Lynx ASW helicopter. Under current plans this will be replaced by the Eurocopter NH-90s sometime after 2000.

Specifications

Dimensions

main rotor diameter: 12.80 m (42.00 ft)

tail rotor diameter: 2.21 m (7.25 ft)

length overall (rotors turning): 15.165 m (49.75 ft)

Weights

empty: 2,740 kg (6,040 lb)

empty, equipped (ASW): 3,343 kg (7,370 lb)

Performance:

cruising speed: 125 kts (232 km/h)

speed for max endurance: 70 kts (130 km/h)

max rate of climb: 661 m (2,170 ft)/min

time on station (ASW) 50 n miles (93 km) radius: 2 h

max range: 320 n miles (593 km)

max endurance: 2 h 50 min

Power plant: 2 Rolls-Royce Gem 42-1 with max contingency rating of 835 kW (1,120 shp)

Crew: 2 (pilot and co-pilot/observer)

Radar: Ferranti Sea Spray Mk 1 lightweight search and tracking radar

Mission: Bendix AN/AQS-18 dipping sonar

Navigation: Racal RNS 252 GPS-aided INS; Doppler 91

ASW armament: 2 Mk 46 homing torpedoes; depth charges; possibly DM 4A1 torpedoes and/or anti-ship missiles in future

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)

Main machinery: 2 General Electric GE-7LM2500 9A-ML gas turbines; 38 MW (51,600 shp) sustained; 2 MTU 20V 956 TB92 diesels; 8.14 MW (11,400 bhp) sustained

Shafts: 2

Propellers: cp

Auxiliary power: 4—750kW MWM TBD-602-V16K diesel generators

FURTHER INFORMATION

PROGRAMME

The order for four Type 123s was placed on 28 June 1989, with one being built by each of the four major German shipyards The design, selected in October 1989, was by Blohm + Voss. The class was originally known as the 'Deutschland' class.

DESIGN

German analysis of the Falklands (Malvinas) war concluded that while every effort must be made to detect and destroy incoming missiles, some hits, particularly in a mass attack, are inevitable; therefore, ships must be very strong, with emphasis on survivability after a missile hit.

One of the principle means of achieving this is the use of three large, continuous box girders at the strength-deck level, stretching from the forward end of the superstructure to the after end of the hangar. Laterally, the ship's hull and superstructure are divided by bulkheads into 12 separate and independent compartments, each of which is fitted with its own ventilation module containing all the necessary electrical equipment and its own NBC filter station. Main ventilation ducts are situated near the centreline of each compartment and are made of steel, while the ducting is networked so that each air unit can supply fresh air to either of the two adjacent modules. The ducting is also designed to clear the smoke out of a compartment after a fire has been extinguished.

Type 123 is not a MEKO design, not least because it displaces some 1,000 t more than the largest MEKO, but it employs the MEKO modular principle, with 14 modules, each easily removable and shockmounted, containing outfits such as communications, sonar equipment and weapons.

The design is spacious, with sufficient volume, electrical power and 270 t available for growth during the ships' planned 30-year lives. Such growth could include a further 16 vertical launch tubes, a towed sonar array, a heavier gun or increased data processing capacity.

DAMAGE CONTROL

There is a single damage control (DC) headquarters (DCHQ), with a reserve DCHQ and four DC section bases, one in each of the four DC zones. DC systems essential for survival are remotely controlled from DCHQ, but should DCHQ be lost, these systems can be

controlled from the reserve DCHQ or, in the last resort, from the section bases. There are numerous near-vertical staircases, giving excellent mobility to the DC teams without breaching the integrity of the module. The sea-water firefighting system is also arranged on a compartment basis with twelve firefighting pumps, ten electrically driven and two diesel driven, all with their own rising pipes, one per compartment. Other survivability features include widespread provision of breathing apparatus, drain-down pipes to dispose of water used in fighting fires (a lesson from the *Stark* incident in the Gulf) and the use throughout the ship of special heat-resistant paint.

Each compartment has its own electrical power distribution panel and, to enhance survivability, all main power supply cable runs are contained in the port and starboard box girders. Outside such well-protected areas, cabling of all types is mounted clear of the walls to protect against heat and, in addition, all sheathing uses fire- and fume-proof materials.

STEALTH

Superstructure and hull are carefully angled, which, in combination with certain classified measures, is claimed to reduce radar cross-section (RCS) by about 90 per cent compared to the Type 122. Infra-red suppression is being worked on, especially 'glint' from the ship's sides, which is due to reflection, rather than from internal heat sources and is a problem by no means unique to the Type 123.

Type 123 also accommodates a CTG (commander task group) and a staff of ten. They have been allocated a large room on the starboard side, separate from the bridge and ship CIC, with a DASA message handling system and a central control console to ensure that they can operate independently of the CIC.

NAMES

These four frigates were originally to have been known as the 'Deutschland' class. This was changed to the names of four *Länder* (states). These are a careful balance of two former Federal Republic Länder — *Schleswig-Holstein* (F 216) and *Bayern* (F 217) and two from the erstwhile Demokratik (sic) Republik — *Brandenburg* (F 215) and *Mecklenburg-Vorpommern* (F 218).

Brandenburg *(F 215). Note the large flight deck, twin hangars, RAM launcher on the hangar roof, Signaal STIR fire director and LW-08 air search radar*

Launched	Oct 1995
Commissioned	Dec 1997

Greek frigate Hydra *(F 452). This heavily armed ship carries a single 127 mm (5 in) gun, two Mk 15 CIWS, eight Harpoon anti-ship missiles, and 16 vertical launch tubes for Sea Sparrow SAM inset in the forward end of the hangar roof. ASW systems include a Sikorsky S-70B-6 and two triple 324 mm torpedo tubes* (R Neth Navy)

WEAPONS SYTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas UGM-84B Harpoon

Eight Harpoon anti-ship missile canisters are mounted amidships; there are two groups of four launchers each, with one group pointing to either beam. The missiles are the Block 1C version with additional options, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

GMVLS Mk 48 Mod 2A missile launching system
The two Guided Missile Vertical Launch Systems (GMVLS) Mk 48 Mod 2A are mounted at the forward end of the hangar, with one set of eight launch tubes on either side of the ship. Each system consists of two sets, each of four pairs of Mk 164 vertical launcher groups, a Mk 220 missile launch controller and a Mk 63 shipboard mounting interface-electrical (SMI-E). The Mk 164 launcher group consists of pairs of aluminium honeycomb launcher canisters, each 3.97 m (13.0 ft) long, attached to an aluminium framework, with each container having its own vertical efflux system with the exhaust gases vented up pipes running alongside the containers. The Greek Mod 2 system is mounted inside the superstructure in four lines of four canisters with vertical efflux pipes in pairs between canisters. There is one Mk 220 launch-controller for every 16 missiles and one bulkhead-mounted Mk 62 SMI-E for every four missiles.

The Greek version has no provision for underway replenishment, the only version to have this facility being fitted in Japanese Maritime Self-Defense Force ships.

Manufacturers/Contractors
Raytheon Company, Equipment Division (prime).
NEA-Lindberg, Denmark (SMI-E).
EBCO, Canada (SMI-M).
Bronswerk, Belgium (Mk 20 canister).
MBLE, Netherlands (Mk 220 missile launch-controller).

Raytheon Sea Sparrow point-defence missile system
The SAM is the RIM-7M Sea Sparrow missile. The system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg (85.1 lb) blast/fragmentation warhead and a dual-purpose proximity impact fuze.

Specifications
RIM-7M
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 226.8 kg (500 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturers/Contractors
Raytheon Company, Equipment Division (prime system contractor).
Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited in the waist immediately below the main mast.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

Mk 45 Mod 2A single 127 mm (5 in) L/54 gun mounting
One United Defense single 127 mm (5 in) Mk 45 Mod 2A gun is mounted forward, firing semi-fixed ammunition with point detonating, proximity (variable time or infra-red), mechanical time and electronically set fuzes. The theoretical rate of fire is 20 rds/min and a gun crew of six is required, all below decks, of which four are ammunition handlers. The Mod 2 incorporates a number of improvements over previous versions.

Specifications
Calibre: 127 mm (5 in)
Length of barrel: 54 calibres
Muzzle velocity: 807.72 m/s (new barrel), 762 m/s (mid-life)
Crew: 6 (1 mount captain, 1 panel operator, 4 ammunition handlers)
Traverse: 340° at 30°/s
Elevation: −15 to +65° at 20°/s
Range:
anti-ship: 12.39 n miles (23 km)
anti-air: 15,000 m (49,000 ft)
Rate of fire: 16-20 rds/min
Ammunition weight: 31.75 kg (projectile)

Manufacturer/Contractor
United Defense, Armament Systems Division, Minneapolis, Minnesota, USA.

Hughes Mk 15 CIWS Phalanx
There are two Hughes Mk 15 CIWS Phalanx close in weapons systems (CIWS). One is situated immediately before the bridge, the other at the after end of the hangar roof on the port side. The mount consists of a 20 mm M61A1, six-barrel, Gatling-principle gun with a cylindrical magazine and feeding mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 3,000 rds/min
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor
Hughes Missile Systems, Tucson, Arizona, USA (system).

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

TELEGON 10 radio communications direction-finder
The Telegon 10, type PGS 1720, DF equipment is a communications direction-finder covering the frequency range 10 kHz to 1,000 MHz. It uses the Watson-Watt method and is able to obtain a bearing on signals with a duration as low as 1 ms, which is of particular value when targeting burst signals and frequency hoppers.

Specifications
Frequency range: 10 kHz to 1,000 MHz
Frequency resolution: 10 Hz
Equipment error: <1°
Operational modes: A1A, A2A, A3E, F2A, F3E, J3E

Manufacturer/Contractor
Daimler-Benz Aerospace, Sensor Systems Division, Ulm, Germany.

Hydra (F 452). Built on the MEKO principle, the ship includes four weapon modules, ten electronic modules, ten pallet modules, two mast modules and nine ventilation modules. (Blohm + Voss)

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

APECS II/AR-700 ECM/ESM suite

APECS II is an advanced modular ESM/ECM suite covering frequencies from 0.5 to 18 GHz, which is designed to counter most known radar threats. The Argo 700 is the IFM receiver part of the system, providing surveillance and radar warning over 2-18 GHz band. APECS II can be operated fully automatically, semi-automatically (that is, with manual intervention) or manually. The ECM part of the system jams threat emitters, with high-speed switching enabling up to 16 threats to be jammed simultaneously. The antenna array consists of a mast-mounted ESM antenna assembly with two DF arrays, one omnidirectional unit and two monopulse units; system processing equipment; operator's console and two ECM transmitters (port and starboard) with their antenna systems located inside the transmitter units.

Specifications

ESM role (AR-700)
Frequency coverage: 0.5-18 GHz
High sensitivity: Up to −67 dBm
Detection range: 200 n miles ships; 50 n miles aircraft
DF accuracy: 4° RMS; 2° RMS fine DF
Automatic tracking: 500 active signals in dense signal environment
Signal identification speed: <1s

ECM role
Azimuth coverage: 360° using a 60-beam jammer (one beam per 6° azimuth sector)
Radiated power: 180 kW nominal mid-band
Frequency coverage: 7.5-18 GHz

Manufacturer/Contractor

ARGOSystems Inc, Sunnyvale, California., USA

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher

There are four Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units, two mounted on either side of the forward Phalanx CIWS.

Specifications

Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)

Rounds
Diameter: 130 mm (5.1 in)
Length, weight:
Mk 182: 1,209 mm; 22.7 kg
Super Chaffstar: 1,209 mm; 20.9 kg
Super Gemini: 451 mm; 5.5 kg
Super Hiram III: 1,220 mm; 13.6 kg
Super Hiram IV: 467 mm; 3.8 kg
Super Loroc: 734 mm; 13.2 kg

Manufacturers/Contractors

Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

AN/SLQ-25 Nixie noisemaker

One AN/SLQ-25 Nixie solid-state, electroacoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter to generate and amplify the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed over the transom. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. The winch streams and recovers the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed body, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, is 95 cm long (3.10 ft), 15.24 cm (6 in) in diameter and weighs 18 kg (40 lb). It receives amplifier outputs, converts them into acoustic signals and projects them.

Manufacturer/Contractor

Aerojet ElectroSystems, Sacramento, California, USA.

COMMAND AND CONTROL SYSTEMS

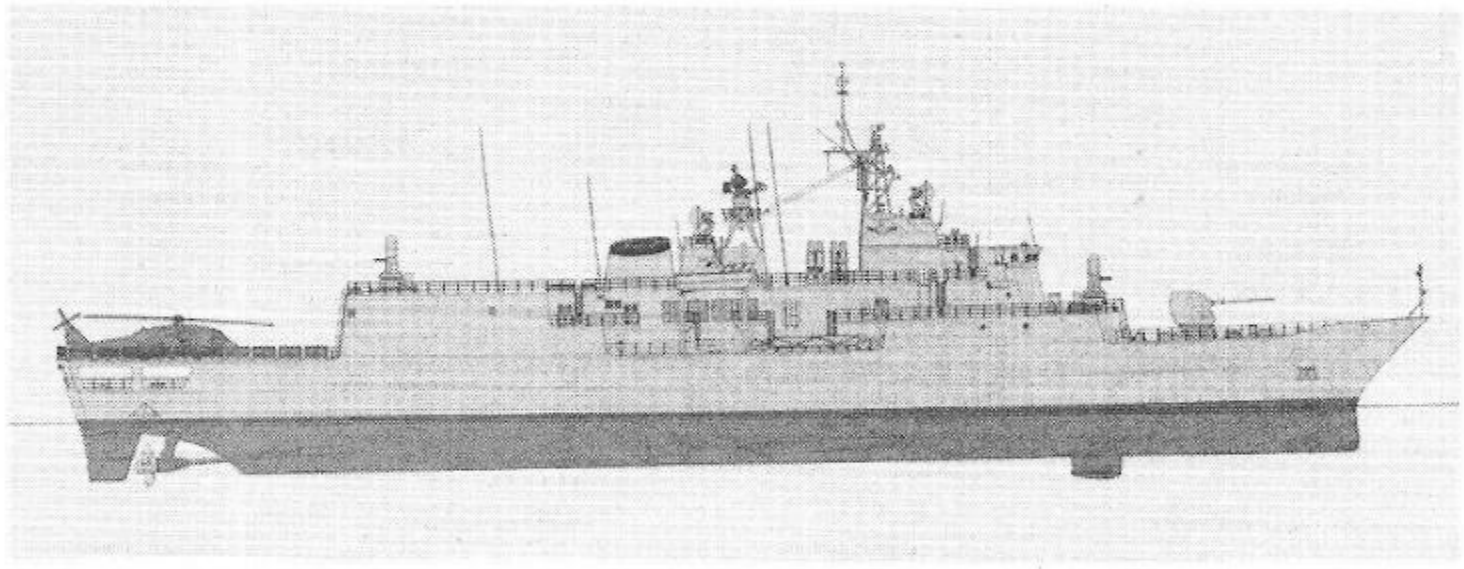
COMBAT DATA SYSTEMS

Signaal STACOS Mod III command and weapon control system

The Greek MEKO frigates are fitted with the Signaal STACOS (Signaal TActical COmmand System) Mod III system. STACOS Mod III presents raw and/or processed sensor data from search and fire-control radars together with IFF, sonar, electronic warfare and electro-optic systems to create a picture of the tactical situation, with data from offboard systems being added via Link 11. The data may also be used to designate targets to weapon systems and to assist in operations with auxiliary functions such as ASW helicopter direction and tactical navigation. STACOS Mod III uses Signaal SMR-4 computers and software is written in RTL-2 with Assembler used for high-speed data processing. All export packages are produced by Signaal at its own software development facility.

Hardware includes sensor data distribution units, primary and secondary video extractors, plot history generators for automatic initiation and tracking of targets, a display system and a Defence Equipment Systems Ltd (DES) electronic plotting table. STACOS Mod III uses the SIGHT family of workstations including the Multifunctional Operator Consoles (MOC), which feature high-resolution colour, and have complete local intelligence to support the distributed processing architecture with their integrated SigMA nodes. The latest Silicon Graphics graphics engine is specifically tailored and redesigned for the MOC. In addition the MOC has autonomous MMI including dedicated and programmable keyboards, screen boundary keys, a joystick, rollerball and hand wheels. Optional features include light pens and touch-input devices. To facilitate the man-machine interface, sets of operational system tasks are defined as 'system functions' each of which can be independently assessed from any workstation (MOC). There is a data communication network including high-speed buses and/or direct connections and/or intelligent communications handling packages; COMPASS for federated and SPLICE for the fully distributed systems. Through duplication of critical elements the system possesses both fail-safe and 'soft degradation' capabilities. There is an Ethernet standard LAN linking all the subsystems. This has a capacity of 40 Mbits/s with a coaxial bus for raw video data.

For fire-control purposes the system operates with the STIR (Separate Tracking and Illumination Radar), a dual-frequency (I/K-band) system capable of automatically acquiring and tracking targets. It can also provide simultaneous J-band CW illumination for guiding semi-active homing missiles. The radar tracker has a cassegrain antenna, usually of 1.8 m (5.9 ft) diameter, which has a maximum speed of 170°/s in azimuth and 115°/s in elevation. There is usually one fire-control radar console per tracker. Each tracker may also be fitted with a television camera as a back-up system for use in conditions of high ECCM activity.



Meko 200HN (Blohm + Voss)

RADARS

Set	MW 08	DA 08	STIR (two)	2690 BT ARPA

WEAPONS CONTROL

Spar AN/SAR-8

The AN/SAR-8 is an infra-red search and target designator (IRSTD), which uses passive means to detect and track both airborne and surface targets.

Manufacturer/Contractor
Spar Aerospace, Mississauga, Ontario, Canada.

Vesta-VC helicopter datalink system

The Vesta-VC (VC = voice channel) is a supplementary facility to the Vesta helicopter-mounted transponder system in which a VHF signal is automatically transmitted when the aircraft is illuminated by the parent ship's search radar. This reply is picked up by the Vesta shipborne component to produce and tag a clear echo on the ship's radar screen.

The helicopter is equipped with two spherical antennas for reception of the ship's search radar signals. The transponder generates a VHF reply containing a number of code pulses for identification purposes. On board the ship there are two simple rod antennas to receive the transponder signals, which are then routed via the receiver (and extractor unit) to the ship's radar display. The Vesta system is controlled by either a control unit and a radar indicator, or a data handling system.

The Vesta system can indicate unambiguously any number of Vesta-equipped helicopters on the ship's radar display. A limited number of helicopters can be identified by means of preselected codes.

VESTA-VC provides an additional facility which extends the ship's radar horizon by enabling the pilot to transmit information (target range, bearing and speed) from the helicopter's radar back to the parent ship over an existing voice channel. All necessary information is contained in a pulse train lasting about 0.9 seconds and containing 50 words of 32 bits. The system works with any radio and any radar, using interfaces produced by Signaal. The effect of this system is to extend the parent ship's radar horizon.

Specifications
VESTA
Transmission frequency: VHF
Radar reception frequency: 1-10 GHz
Transmission power: 10 W
Pulse length: 2 µs
PRF (helicopter part): 20 kHz without code
Sensitivity (ship part): −78 dBm
Range: 0-124 n miles (230 km)
Number of codes: 5 (optionally 64)
Number of co-operating radar systems: 4

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

AN/SWG-1A Harpoon Launch Control System (LCS)

SWG-1A is the Harpoon Launch Control System, which activates the missile, selects the flight pattern and sets seeker search modes (with small-, medium- or large-acquisition windows), as well as providing target range and bearing data. Alternatively, the missile can simply be launched along the bearing of the target, with the seeker activated early to scan a 90° sector; if, after a set time, no target has been acquired the missile commences a preset search pattern. SWG-1A takes account of other ships in the general target area and generates indirect flight plans for the missile, including waypoints to optimise angles of approach which will achieve the highest possibility of success while minimising the chances of the missile being destroyed by hostile fire. It can also be used to compute flight plans in a multiple attack so that several missiles, from either the same or different ships, arrive on target simultaneously, thus swamping the defences.

The Combat Information Centre (CIC) aboard Hydra *(F 452). The system is Signaal STACOS Mod 1. The workstations are Multifunction Operator Consoles (MOC) from the SIGHT range* (Signaal)

SONAR

Raytheon AN/SQS-56 hull-mounted sonar

The AN/SQS-56 hull-mounted sonar, which was originally developed for the US Navy's 'Oliver Hazard Perry' (FFG 7) class frigates, has been provided by the US Navy to various foreign navies, including that of Turkey, via the FMS programme. (Note that sets exported via the FMS are designated AN/SQS-56; those exported as a commercial sale from Raytheon are designated DE 1160.) Digital implementation allows packaging of the complete multifunction active and passive sonar in five medium-size electronics cabinets and one operator's console. System control uses a built-in mini-computer

and an advanced display system. The sonar is an active/passive, preformed beam, digital sonar providing panoramic echo ranging and panoramic (DIMUS) passive surveillance. All signal processing, except transducer-received signal amplification and linear transducer transmit drive, is accomplished in digital hardware, most of which is implemented using US Navy SEMP (Standard Electronic Module Programme) components in compact water-cooled cabinets small enough to allow installation through standard-size hatches.

The basic system includes the transducer array, transducer junction box, five electronics cabinets (array interface, transmitter(s), receiver and controller), operator console, sonar dome and control unit. Options in production include a loudspeaker/intercom, a water-cooling unit, a remote display and a performance prediction subsystem.

A single operator can search, track, classify and designate multiple targets from the active system while simultaneously maintaining anti-torpedo surveillance on the passive display.

Computer-assisted system control permits the operator to concentrate on the sonar data being displayed rather than on the system control. Operating frequencies are 5.6, 7.5 and 8.4 kHz.

Manufacturer/Contractor

Raytheon Company, Submarine Signal Division, Portsmouth, Rhode Island.

Hydra *(F 452). The Greek ships are the only MEKO frigates with two Mk 15 CIWS: one is in 'B' position (with the radome in the bridge sightline), the other on the port side of the hangar roof* (Blohm + Voss)

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 24.2 × 14.8 m (79.5 × 48.6 ft)
Hangar: 1
Helicopter: 1 Sikorsky S-70B-6 Seahawk. This is a hybrid SH-60B/F for the Greek Navy for operation from the new MEKO 200 frigates. Five (plus three options) were ordered on 17 August 1992 and the first two were delivered in the fourth quarter of 1994.

Sikorsky S-70B-6 Seahawk

Specifications

Dimensions:
main rotor diameter: 16.36 m (53.66 ft)
tail rotor diameter: 3.35 m (11.00 ft)
Length, fuselage: 15.26 m (50.0 ft)
Height to top of rotor head: 3.79 m (12.43 ft)
Weights:
empty: 6,191 kg (13,648 lb)
mission gross weight: 9,182 kg (20,244 lb)
Performance:
dash speed: 126 kts (234 km/h)
vertical rate of climb: 213 m (700 ft)/min
Power plant: 2 General Electric T700-GE-401C turboshafts rated at 1,417 kW (1,900 shp) Transmission rating 2,535 kW (3,400 shp)

Accommodation: 3 (pilot, airborne tactical officer, sensor operator)
Radar: Search radar AN/APS-143(V)3
Mission: AN/AQS-18(V)-3 dipping sonar, Texas Instruments AN/ASQ-81(V)2 towed MAD, Raymond MU-670/ASQ magnetic tape memory unit, Astronautics IO-2177/ASQ altitude indicator, Fairchild AN/ASQ-164 control indicator set, Fairchild AN/ASQ-165 armament control indicator set, IBM AN/UYS-1(V)2 Proteus acoustic processor and CV-3252/A converter display, Control Data AN/AYK-14 (XN-1A) digital computer, Raytheon AN/ALQ-142 ESM, Sierra Research AN/ARQ-44 datalink and telemetry; AN/ALR-66(V)-2 ESM.
Armament: 2 Mk 46 torpedoes or NFT Penguin ASMs.

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 General Electric LM-2500 gas turbines; 44.76 MW (60,000 hp sustained; 2 MTU 20V 956 TB82 diesels; 7.66 MW (10,420 hp(m)) sustained
Shafts: 2
Propellers: 2 Escher-Wyss, cp
Auxiliary power: 4 — 775 kVA diesel generator sets

FURTHER INFORMATION

PROGRAMME

The decision to buy four MEKO 200 Mod 3HN was announced on 18 April 1988, in a somewhat complicated deal involving both HQNATO and seven individual members of the Alliance. There was a German Government 'offset' involving tanks and aircraft, while the electronics and some of the weapon systems were secured through US FMS credits. The first ship was ordered on 10 February 1989 and was built by Blohm + Voss, Hamburg, while the remainder was ordered on 10 May 1989 for construction at Hellenic Shipyards, Skaramanga, with German technical assistance. The programme was delayed by financial problems at Hellenic Shipyards in 1992 and some of the prefabrication of the first Greek-built ship, *Spetsai,* was done in Hamburg.

DESIGN

The design follows that of the Portuguese 'Vasco da Gama' class, but with a single hangar and a prominent bulwark around the bows. The Greek ships are the only MEKO 200s to have two Phalanx CIWS mountings, the forward mount being in the 'B' position immediately forward of the bridge, which results in the top of the radome coming above the window level of the bridge.

GENERAL SPECIFICATIONS

Country of origin: Germany
Operator: Turkey
Type: MEKO 200 TN Track I

Class: YAVUZ

Built: 4
Active: 4

Displacement:
standard: 2,500 t
full load: 2,784 t

Dimensions
Length: 110.5 m (362.5 ft) (oa); 102.0 m (334.6 ft) (wl)
Beam: 14.80 m (48.56 ft)

Design draught: 4.10 m (13.45 ft)

Speed: 27 kts
Range: 4,100 n miles at 18 kts

Complement: 180 (24 officers)

SHIPS

YAVUZ (F 240)
Builder Blohm + Voss, Hamburg, Germany
Laid down 30 May 1985
Launched 7 Nov 1985
Commissioned 17 Jul 1987

TURGUTREIS (F 241)
Builder Howaldtswerke, Kiel, Germany
Laid down 20 May 1985
Launched 30 May 1986
Commissioned 4 Feb 1988

FATIH (F 242)
Builder Golcuk, Izmit, Turkey
Laid down 1 Jan 1986
Launched 24 Apr 1987
Commissioned 28 Aug 1988

YILDIRIM (F 243)
Builder Golcuk, Izmit, Turkey
Laid down 24 Apr 1987
Launched 22 Jul 1988
Commissioned 17 Nov 1989

Yildirim *(F 243), last of the Turkish Navy's four 'Track 1' ships. The ship's AB-212ASW helicopter is on the flight deck* (Selim San)

Yavuz *(F 240). This Turkish ship is armed with eight Harpoon anti-ship missiles (abaft the mast), one eight cell Mk 29 launcher for Sea Sparrow missiles and three Oerlikon-Contraves Sea Zenith CIWS (two either side of the hangar and one before the bridge). There is a 127 mm (5 in) gun on the foredeck and two triple Mk 32 torpedo tubes in the waist* (Blohm + Voss)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas UGM-84B Harpoon

Eight Harpoon anti-ship missile canisters are mounted amidships; there are two groups of four launchers each, with one group pointing to either beam. The missiles are the Block 1C version with additional options, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications

Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

GMLS Mk 29 Mod 1 missile handling and launching system

There is one Guided Missile Launching System (GMLS) Mk 29 Mod 1, with the launcher atop the hangar roof. The system consists of a launcher, a launcher-control, power supply unit, launcher loader, and a maintenance/interconnecting cabinet. The launcher itself consists of eight watertight cells in two box mountings on either side of the pedestal, each cell having a heater and two frangible covers (front and rear). The reloading system consists of two loading installations on the port and starboard sides and a control panel. Each installation consists of two rows of missiles, each supported by two blocks, in a frame carried by four air springs to reduce the chances of shock or vibration damage. The installation also has a loading arm suspended from a vertical and horizontal transport unit in the ceiling and a hydraulically operated hatch in the front. When the launch cell or cells require reloading they are turned to a fore-and-aft position and inclined at an angle of 5° to bring them into line with the loading system.

Specifications

Operators: 1
Associated fire-control system: Mk 91
Training limits: 360°
Elevation limits: −5 to +85°
Firing rate: 3 missiles/min

Manufacturer/Contractor

Raytheon Company, Equipment Division.

Raytheon Sea Sparrow point-defence missile system

The SAM used is the RIM-7 NATO Sea Sparrow system. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg (85.1 lb) blast/fragmentation warhead and a dual-purpose proximity impact fuze.

Specifications

RIM-7M
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 226.8 kg (500 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturers/Contractors

Raytheon Company, Equipment Division (prime system contractor)
Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited in the waist immediately below the main mast.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

Mk 45 Mod 1 single 127 mm (5 in) L/54 gun mounting

One United Defense single 127 mm (5 in) Mk 45 Mod 1 gun is mounted forward, firing semi-fixed ammunition with point detonating, proximity (variable time or infrared), mechanical time and electronically set fuzes. The theoretical rate of fire is 20 rds/min and a gun crew of six is required, all below decks, of which four are ammunition handlers.

Specifications
Calibre: 127 mm (5 in)
Length of barrel: 54 calibres
Muzzle velocity: 807.72 m/s (2,650 ft/s) (new barrel), 762 m/s (2,500 ft/s) (mid-life)
Crew: 6 (1 mount captain, 1 panel operator, 4 ammunition handlers)
Traverse: 340° at 30°/s
Elevation: −15 to +65° at 20°/s
Range:
anti-ship: 12.39 n miles (23 km)
anti-air: 15,000 m (49,000 ft)
Rate of fire: 16-20 rds/min
Ammunition weight: 31.75 kg (70.0 lb) (projectile)

Manufacturer/Contractor
United Defense, Armament Systems Division, Minneapolis, Minnesota, USA

Oerlikon Contraves GM25 Sea Zenith 25 mm mounting

The 'Yavuz' class was the first in the world to be fitted with the Oerlikon-Contraves Sea Zenith system, which was selected in preference to Phalanx. There are three mountings: one forward in 'B' position and two aft, on platform decks either side of the hangar. Sea Zenith is a four-barrelled 25 mm KBB gun mounting, which has been given its name because of its ability to bear on targets 'at the zenith' by virtue of a slewing two-axis mounting which is inclined at 35° to the horizontal. It is designed to destroy anti-ship missiles using special AMDS ammunition with a forged tungsten core designed to ensure that a single hit will be sufficient to destroy the target by exploding its warhead. It also has a capability against aircraft using more conventional ammunition.

The four 25 mm barrels have a combined rate of fire of 3,400 rds/min, each being independently fed from four 300-round ammunition drums. The ready-use supply of 1,660 rounds is sufficient for 18 normal engagements of missile targets. Reloading can be achieved during the firing cycle.

Specifications
Calibre: 25 mm
Length of barrel: 65 calibres
Traverse: 340° at 2.5 rad/s
Elevation: −10 to +122° at 2.5 rad/s
Mounting weight: 4,400 kg (9,702 lb) (with ammunition)
Muzzle velocity: 1,355 m/s (4,445 ft/s)
Crew: 0
Range: 1.07 n miles (2 km)
Ammunition: 625 g (TP-T); 615 g (APP-T, APDS-T); 625 g (HEI)

Manufacturer/Contractor
Oerlikon Contraves, Switzerland.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Signaal RAPIDS

RAPIDS (RAdar Passive IDentification System) is an automatic system for analysing and tracking radar signals, covering the frequencies between 2 and 18 GHz in four bands. There is a large radar and platform library, and it exchanges information with RAMSES.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

Signaal RAMSES

RAMSES (ReprogrAmmable Multimode Shipborne ECM System) is a noise and deception jammer covering the I and J bands, which is triggered by the RAPIDS system (see above).

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

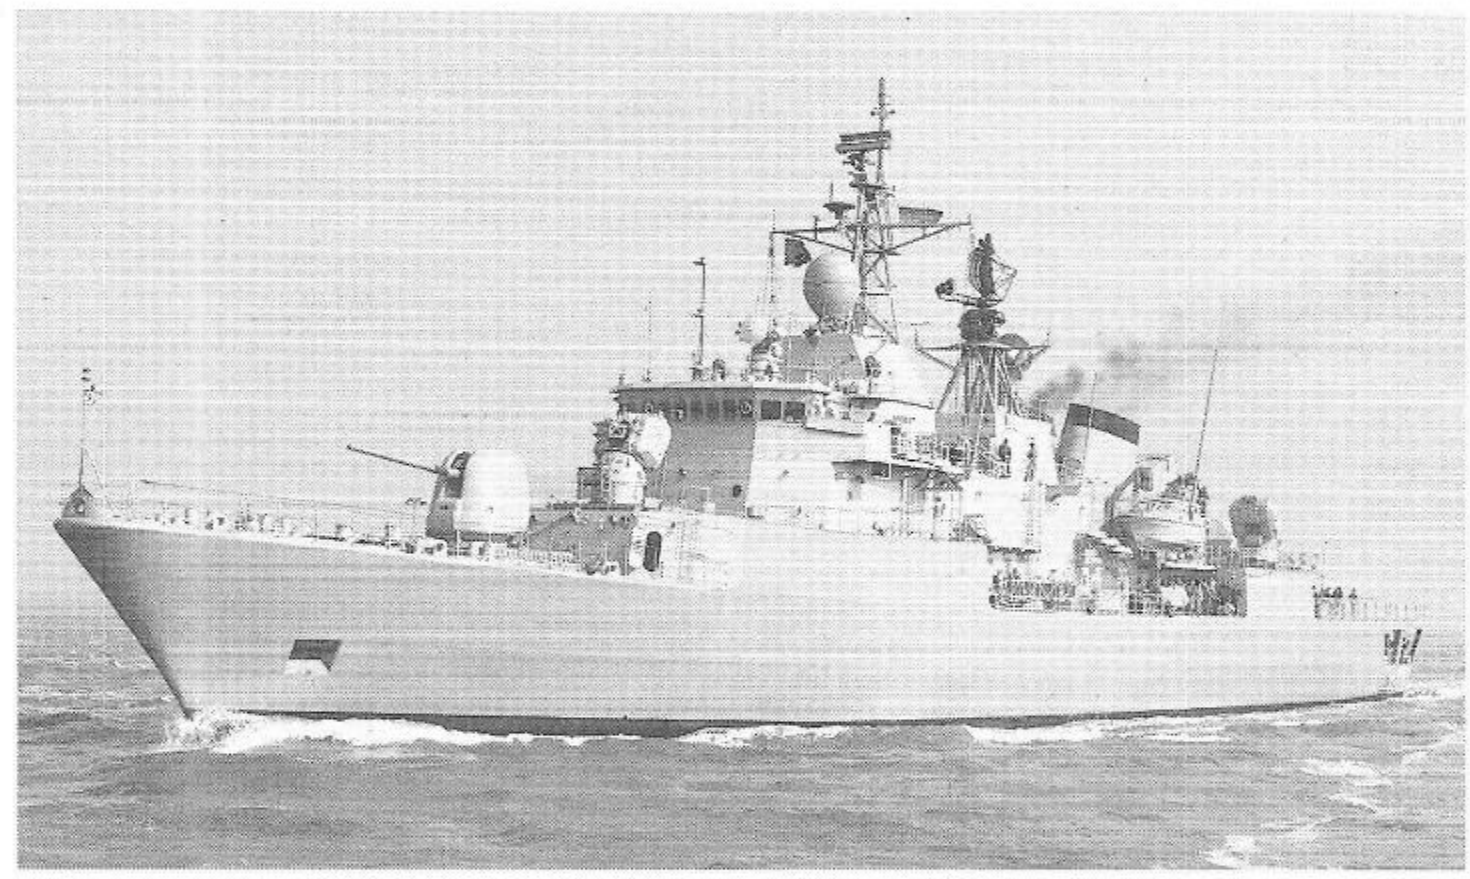
DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher

There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units. They are mounted on either side of the hangar, immediately below the Mk 29 launcher.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)

Rounds
Diameter: 130 mm (5.1 in)



Length, weight:
Mk 182: 1,209 mm; 22.7 kg
Super Chaffstar: 1,209 mm; 20.9 kg
Super Gemini: 451 mm; 5.5 kg
Super Hiram III: 1,220 mm; 13.6 kg
Super Hiram IV: 467 mm; 3.8 kg
Super Loroc: 734 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA

AN/SLQ-25 Nixie noisemaker

One AN/SLQ-25 Nixie solid-state, electroacoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter to generate and amplify the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed over the transom. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. The winch streams and recovers the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed body, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, is 95 cm (3.10 ft) long, 15.24 cm (6 in) in diameter and weighs 18 kg (40 lb). It receives amplifier outputs, converts them into acoustic signals and projects them.

Manufacturer/Contractor
Aerojet ElectroSystems, Sacramento, California, USA.

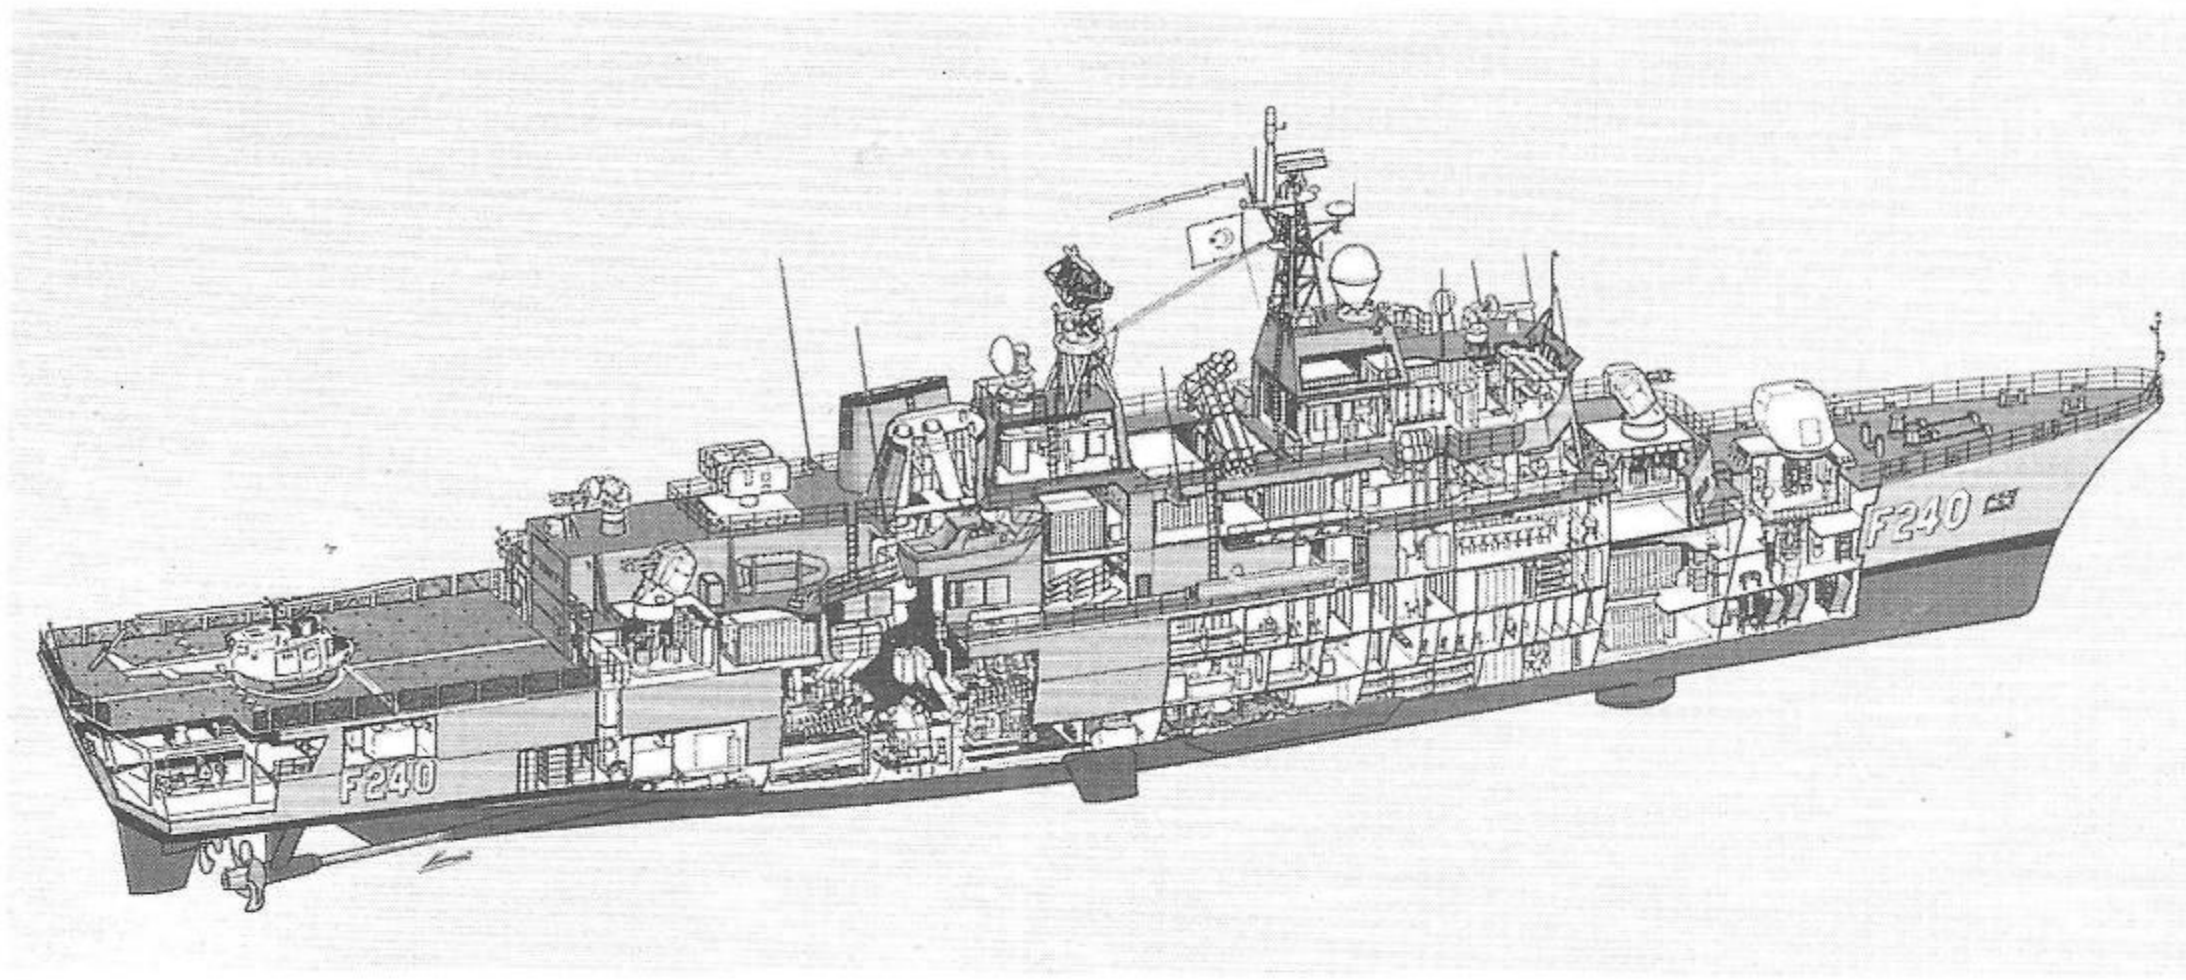
COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

STACOS Mod I

STACOS (Signaal TActical COmmand System) Mod I entered service in July 1987 with the Turkish frigate *Yavuz*. It is designed to present raw and/or processed sensor data from search and fire-control radars together with IFF, sonar, electronic warfare and electro-optic systems to create a picture of the tactical situation, using data from both on- and offboard sensors through a Link 11. The data may also be used to designate targets to weapon systems and to assist in operations with auxiliary functions such as ASW helicopter direction and tactical navigation.

The system features a mainframe architecture using three Signaal SMR-4 mainframe computers, programmed in the RTL-2 language, and using Assembler language for high-speed data processing. STACOS



Cutaway of Yavuz *(F 240)* (Blohm & Voss)

Mod I uses CIDIS (Combat Information Display System) which features software-driven Vertical Display Consoles (VDC) and Horizontal Display Consoles (HDC). (Note: Unlike later systems, STACOS Mod 1 does not use an Ethernet LAN.)

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

WEAPONS CONTROL

AN/SWG-1A Harpoon Launch Control System (LCS)

SWG-1A is the Harpoon Launch Control System, which activates the missile, selects the flight pattern and sets seeker search modes (with small-, medium- or large-acquisition windows), as well as providing target range and bearing data. Alternatively, the missile can simply be launched along the bearing of the target, with the seeker activated early to scan a 90° sector; if, after a set time, no target has been acquired the missile commences a preset search pattern. SWG-1A takes account of other ships in the general target area and generates indirect flight plans for the missile, including waypoints to optimise angles of approach which will achieve the highest possibility of success while minimising the chances of the missile being destroyed by hostile fire. It can also be used to compute flight plans in a multiple attack so that several missiles, from either the same or different ships, arrive on target simultaneously, thus swamping the defences.

COMMUNICATIONS AND DATALINKS

Datalink
Link 11

Tacan
URN 25

IFF
Mk XII

Vesta helicopter transponder/datalink system

Vesta consists of a helicopter-mounted transponder which transmits a VHF signal when the aircraft is illuminated by the ship's search radar. This reply is picked up by the Vesta shipborne component to produce and tag a clear echo on the ship's radar screen.

The helicopter is equipped with two spherical antennas for reception of the ship's search radar signals. The transponder generates a VHF reply containing a number of code pulses for identification purposes. On board the ship there are two simple rod antennas to receive the transponder signals, which are then routed via the receiver (and extractor unit) to the ship's radar display. The Vesta system is controlled by either a control unit and a radar indicator, or a data handling system.

The Vesta system can indicate unambiguously any number of Vesta-equipped helicopters on the ship's radar display. A limited number of helicopters can be identified by means of preselected codes.

Specifications

Transmission frequency: VHF
Radar reception frequency: 1-10 GHz
Transmission power: 10 W
Pulse length: 2 µs
PRF (helicopter part): 20 kHz without code
Sensitivity (ship part): −78 dBm
Range: 0-124 n miles (230 km)
Number of codes: 5 (optionally 64)
Number of co-operating radar systems: 4

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

AN/WSC-3(V)7

WSC-3 is the US Navy's standard UHF satellite terminal, but the (V)7 used in the Turkish ships is employed only as a terrestrial line of sight radio terminal.

SONAR

Raytheon AN/SQS-56 hull-mounted sonar

The AN/SQS-56 hull-mounted sonar, which was originally developed for the US Navy's 'Oliver Hazard Perry' (FFG 7) class frigates, has been provided by the US Navy to various foreign navies, including that of Turkey, via the FMS programme. (Note that sets exported via the FMS are designated AN/SQS-56; those exported as a commercial sale from Raytheon are designated DE 1160). Digital implementation allows packaging of the complete multifunction active and passive sonar in five medium-size electronics cabinets and one operator's console. System control uses a built-in mini-computer and an advanced display system. The sonar is an active/passive, preformed beam, digital sonar providing panoramic echo ranging and panoramic (DIMUS) passive surveillance. All signal processing, except transducer-received signal amplification and linear transducer transmit drive, is accomplished in digital hardware, most of which is implemented using US Navy SEMP (Standard Electronic Module Programme) components in compact water-cooled cabinets small enough to allow installation through standard size hatches.

The basic system includes the transducer array, transducer junction box, five electronics cabinets (array interface, transmitter(s), receiver and controller), operator console, sonar dome and control unit. Options in production include a loudspeaker/intercom, a water-cooling unit, a remote display and a performance prediction subsystem.

A single operator can search, track, classify and designate multiple targets from the active system while simultaneously maintaining anti-torpedo surveillance on the passive display.

Computer-assisted system control permits the operator to concentrate on the sonar data being displayed rather than on the system control. Operating frequencies are 5.6, 7.5 and 8.4 kHz.

Manufacturer/Contractor

Raytheon Company, Submarine Signal Division, Portsmouth, Rhode Island.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 21.5 × 14.8 m (70 × 49 ft)
Hangar: Hangar accommodates one helicopter
Helicopter: AB-212ASW

Agusta-Bell AB 212ASW

One Agusta-Bell AB 212ASW anti-submarine helicopter is normally embarked.

Specifications

Main rotor diameter: 14.63 m (48.0 ft)
Length overall (both rotors turning): 22.15 m (57.08 ft)
Fuselage length: 12.92 m (42.39 ft)
Height to rotor head: 3.91 m (12.82 ft)
Rotor disc area: 168.1 m² (1,809 sq ft)
Max take-off weight: 5,070 kg (11,177 lb)
Max speed (never exceed): 130 kts (240 km/h)
Typical cruising speed: 100 kts (185 km/h)
Hovering ceiling (out of ground effect): 396 m (1,300 ft)
Range with max standard fuel: 332 n miles (615 km)
Engine: 1 Pratt & Whitney Canada PT6T-6 Turbo Twin Pac rated at 1,398 kW (1,875 shp)
Role equipment: Sea Skua ASMs

PROPULSION

Specifications

System: Combined diesel and diesel (CODAD)
Main machinery: 4 MTU 20V 1163 TB93 diesels; 24.5 MW (33,300 hp(m)) sustained
Shafts: 2
Propellers: 2 KaMeWa, cp
Ship's services: 3 MTU/Siemens; 775 kVA at 1,800 rpm
Emergency generator: 1 KHD/Siemens; 250 kVA at 1,800 rpm

FURTHER INFORMATION

PROGRAMME

The Turkish Navy originally undertook negotiations in 1980 with the US Navy, with a view to building four 'Oliver Hazard Perry' (FFG 7) class frigates in Turkey, but the project was eventually abandoned on the grounds that it was 'too large'. The Turkish Navy then received bids from several yards to fill the gap and eventually the MEKO 200 design was accepted in January 1982, with the contract being signed on 29 December 1982.

The organisation required to realise this project was complicated, but worked very well. Prime contractorship for the project was exercised by a consortium of three German companies: Blohm + Voss (B+V); Howaldts Deutsche Werft (HDW); and Thyssen Rheinstahl Technik (TRT). This consortium had overall control of the entire project, was responsible for all financial aspects, and was the system integrator with particular concern for the US weapons and electronic systems supplied through the FMS programme. Three yards were involved in the construction of the four ships: Blohm + Voss built *Yavuz*; Howaldtswerke *Turgutreis*; and Golcük built the third and fourth ships. Finally, three navies were involved: the Turkish Navy as the customer and user; the Federal German Navy for operational training of the crews and the US Navy for training in US systems. Despite the complexity of these arrangements, the time taken from signing the contract to the commissioning of the fourth ship was just six years and four months.

A further class of four MEKO 200s is under construction, but is sufficiently different to warrant a separate entry — see 'Barbaros' class (MEKO 200 TN Track II).

DESIGN

The Turkish Track 1 ship design is generally similar to other MEKO 200s, but with several important differences. The hulls are 17 m (55.8 ft) shorter at the waterline and the design displacement of 2,800 t is 400 t less than the others. Further, the propulsion system is unique in the class, since while all others use a CODAG arrangement, the Turkish ships have four diesels in a CODAD arrangement.

Despite these differences, the weapons systems and electronic fit of the Turkish ships is fully up to the standards of the other ships. Indeed, following a detailed appraisal by the Turkish naval staff of the Falklands (Malvinas) war, these ships have the heaviest close in air defence system with a Mk 29 SAM system with 24 Aspide missiles and three Oerlikon-Contraves Sea Zenith 25 mm gun systems, one forward and two aft.

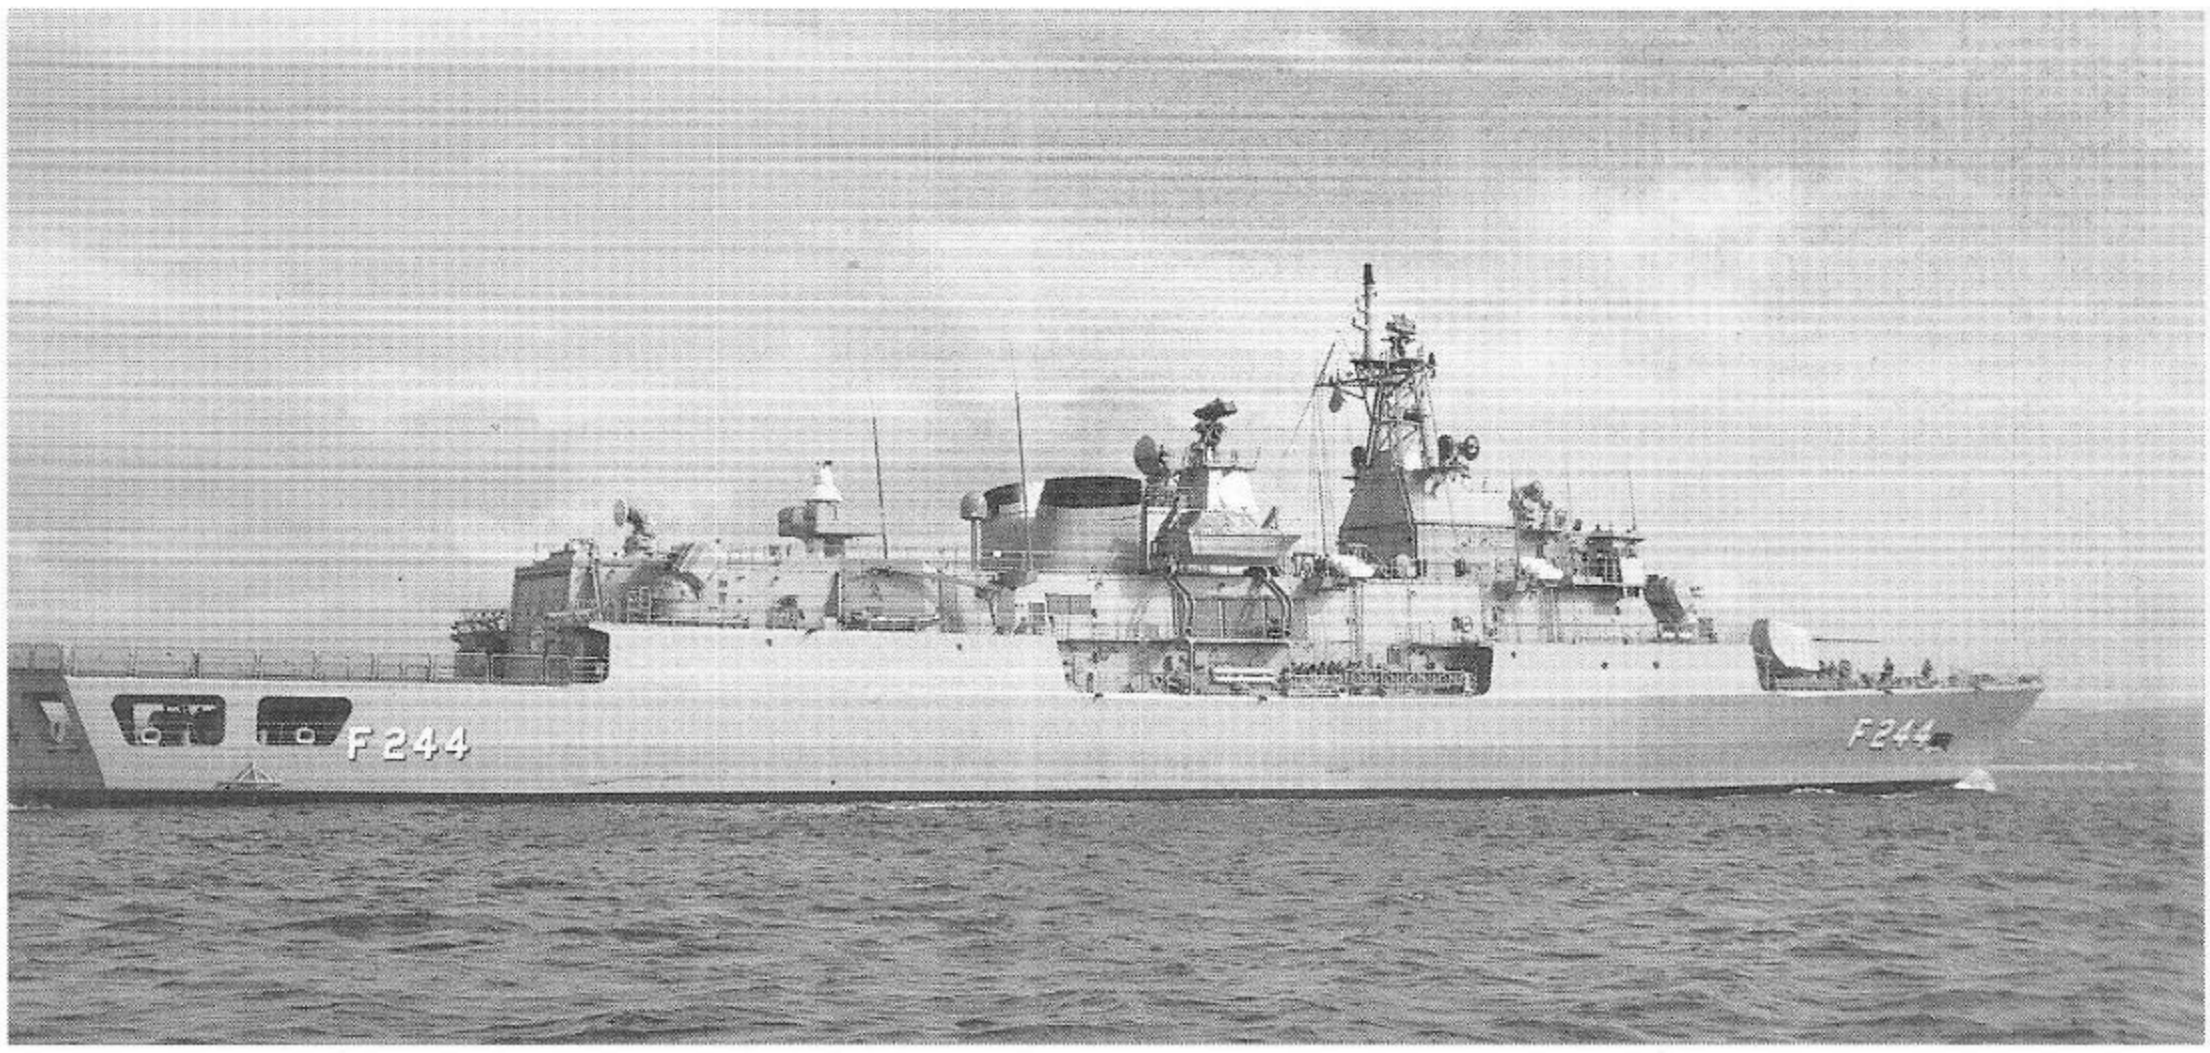
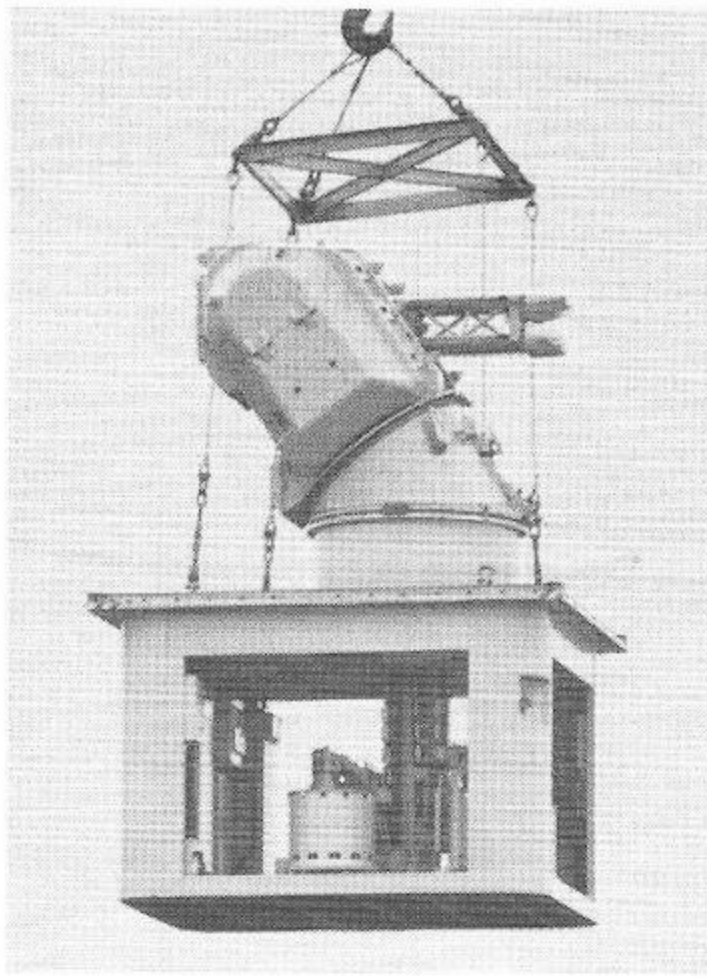
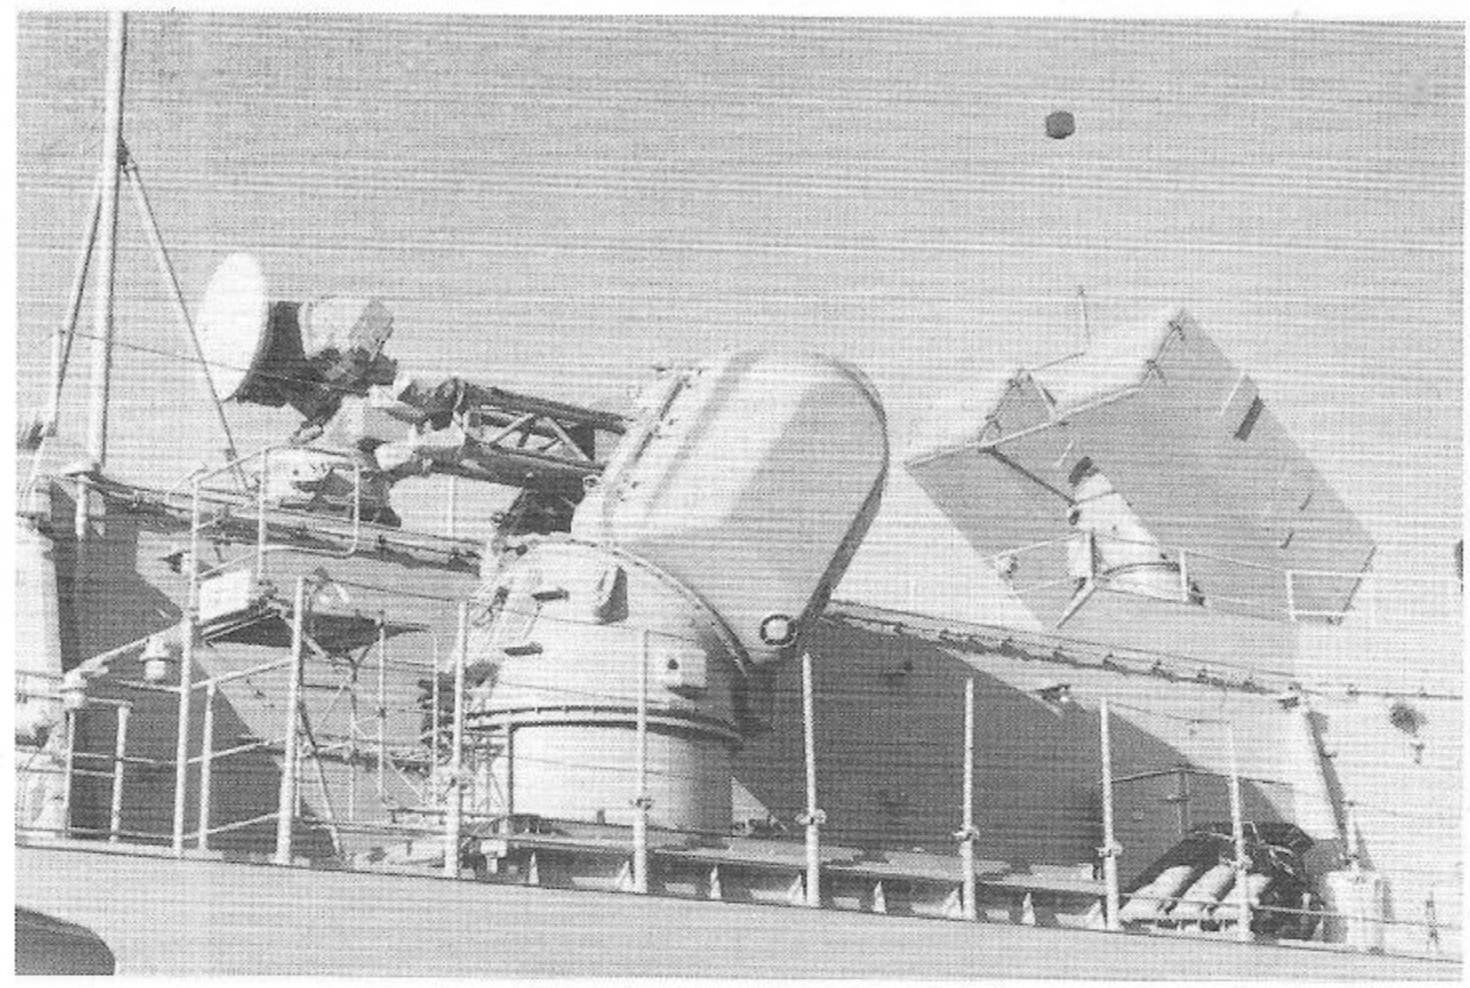
Commissioned 2000



First of the Track II ships, Barbaros *(F 244). These ships are longer than Track I and have CODOG, as opposed to CODAD propulsion. Armament includes a 127 mm gun, three 25 mm Sea Zenith CIWS and an eight-cell Sea Sparrow launcher* (Jane's/H M Steele)





The Turkish Navy is the main user of the Oerlikon-Contraves Sea Guard CIWS. The main element is the Sea Zenith gun mount which has a unique canted, two-axis system enabling the weapon to have a true 0 to 90° capability

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas UGM-84B Harpoon

Eight Harpoon anti-ship missile canisters are mounted amidships; there are two groups of four launchers each, with one group pointing to either beam. The missiles are the Block 1C version with additional options, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications

Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

GMLS Mk 29 Mod 1 missile handling and launching system

F 244 and F 245 each have one Guided Missile Launching System (GMLS) Mk 29 Mod 1, with the launcher atop the hangar roof. The system consists of a launcher, a launcher-control, power supply unit, launcher loader, and a maintenance/interconnecting cabinet. The launcher itself consists of eight watertight cells in two box mountings on either side of the pedestal, each cell having a heater and two frangible covers (front and rear). The reloading system consists of two loading installations on the port and starboard sides and a control panel. Each installation consists of two rows of missiles, each supported by two blocks, in a frame carried by four air springs to reduce the chances of shock or vibration damage. The installation also has a loading arm suspended from a vertical and horizontal transport unit in the ceiling and a hydraulically operated hatch in the front. When the launch cell or cells require reloading they are turned to a fore-and-aft position and inclined at an angle of 5° to bring them into line with the loading system.

Specifications

Operators: 1
Associated fire-control system: Mk 91
Training limits: 360°
Elevation limits: −5 to +85°
Firing rate: 3 missiles/min

Manufacturer/Contractor

Raytheon Company, Equipment Division.

Guided Missile Vertical Launch System (GMVLS) Mk 41

F 246 and F 247 are being built with the GMVLS Mk 41 system, which will subsequently be retrofitted to F 244 and F 245. GMVLS Mk 41 was developed specifically for launching the Sea Sparrow missile. The new launcher uses the same structural and electronic components as the other versions of the system but the module is 6.86 m (22.5 ft) high and an eight-cell unit weighs 24.36 t. The Sea Sparrows are housed in Mk 22 canisters which are 5.79 m (19.0 ft) deep and weigh 1,503 kg (3,314 lb) (complete with missile) and which actually reverts to the original design of canister before it was modified for the Tomahawk missile.

Raytheon Sea Sparrow point-defence missile system

The SAM used is the RIM-7 NATO Sea Sparrow system. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg (85.1 lb) blast/fragmentation warhead and a dual-purpose proximity impact fuze.

Specifications

RIM-7M
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 226.8 kg (500 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturers/Contractors

Raytheon Company, Equipment Division. (prime system contractor).
Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited in the waist immediately below the main mast.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications

Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

Mk 45 Mod 2 single 127 mm (5 in) L/54 gun mounting

One United Defense single 127 mm (5 in) Mk 45 Mod 2 gun is mounted forward, firing semi-fixed ammunition with point detonating, proximity (variable time or infrared), mechanical time and electronically set fuzes. The theoretical rate of fire is 20 rds/min and a gun crew of six is required, all below decks, of which four are ammunition handlers. The Mod 2 incorporates a number of improvements over previous versions.

Specifications
Calibre: 127 mm (5 in)
Length of barrel: 54 calibres
Muzzle velocity: 807.72 m/s (new barrel), 762 m/s (mid-life)
Crew: 6 (1 mount captain, 1 panel operator, 4 ammunition handlers)
Traverse: 340° at 30°/s
Elevation: −15 to +65° at 20°/s
Range:
anti-ship: 12.39 n miles (23 km)
anti-air: 15,000 m (49,000 ft)
Rate of fire: 16-20 rds/min
Ammunition weight: 31.75 kg (70.0 lb) (projectile)

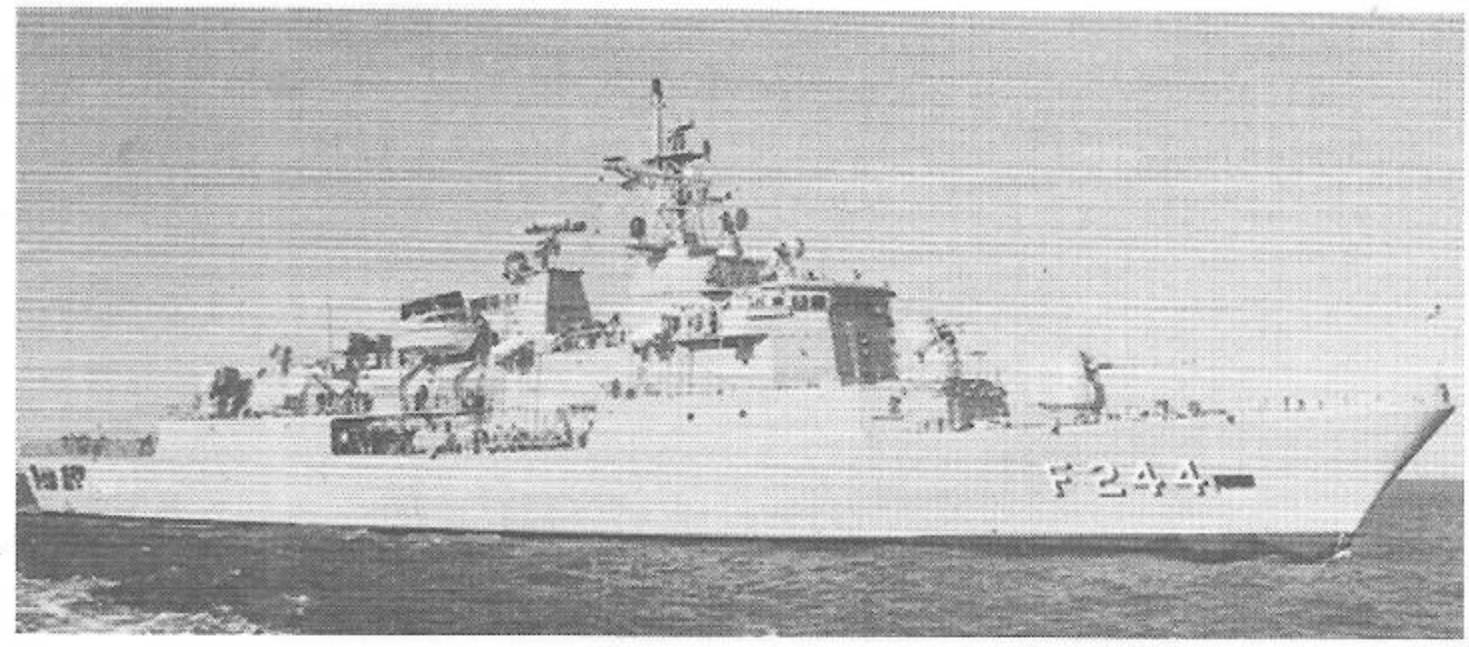
Manufacturer/Contractor
United Defense, Armament Systems Division, Minneapolis, Minnesota, USA.

Oerlikon Contraves GM25 Sea Zenith 25 mm mounting
These four ships are being fitted with the same Oerlikon-Contraves Sea Zenith system as in the Track I ships, which was selected in preference to Phalanx. There are three mountings: one forward in 'B' position and two aft, on platform decks either side of the hangar. Sea Zenith is a four-barrelled 25 mm KBB gun mounting, which has been given its name because of its ability to bear on targets 'at the zenith' by virtue of a slewing two-axis mounting which is inclined at 35° to the horizontal. It is designed to destroy anti-ship missiles using special AMDS ammunition with a forged tungsten core designed to ensure that a single hit will be sufficient to destroy the target by exploding its warhead. It also has a capability against aircraft using more conventional ammunition.

The four 25 mm barrels have a combined rate of fire of 3,400 rds/min, each being independently fed from four 300-round ammunition drums. The ready-use supply of 1,660 rounds is sufficient for 18 normal engagements of missile targets. Reloading can be achieved during the firing cycle.

Specifications
Calibre: 25 mm
Length of barrel: 65 calibres
Traverse: 340° at 2.5 rad/s
Elevation: −10 to +122° at 2.5 rad/s
Mounting weight: 4,400 kg (9,702 lb) (with ammunition)
Muzzle velocity: 1,355 m/s
Crew: 0
Range: 1.07 n miles (2 km)
Ammunition: 625 g (TP-T); 615 g (APP-T, APDS-T); 625 g (HEI)

Manufacturer/Contractor
Oerlikon Contraves.



The twin propeller CODOG propulsion system has two lineshafts, each with one MTU diesel (4335 kW), one General Electric LM-2500 gas turbine (23,700 kW), a reduction gearbox and a KaMeWa controllable pitch propeller. The main propulsion system is split between two adjacent watertight compartments (Blohm + Voss)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Cutlass B1 ESM system
Cutlass B1 is designed for operation in very dense signal environments, receiving signals in the 1 to 18 GHz frequency range, measuring their parameters, comparing these with those in the radar library which contains the parameters of 2,000 radars, and displaying the information — all within one second. The EW operator is presented with a tabular display for threat identity and threat evaluation, and a tactical display giving a pictorial representation of the RF environment. Selected digital outputs can be sent to other local systems, and hard copy printout of the intercepted radar is also available. The tabular display can indicate 150 intercepts, in the order of priority. Cutlass is wide open in both bearing and frequency: that is, it does not employ sweep techniques, giving a very high intercept probability (nearly 100 per cent). Cutlass B1 uses the Cutlass processor and an Instantaneous Frequency Measurement (IFM) receiver. It has a 32-element array antenna to provide bearing measurement by phase analysis techniques. This antenna also provides RF for the IFM. In both systems the processor is provided with fast and accurate information on incoming pulses.

Specifications
Frequency coverage: 2-18 GHz
Accuracy: 2° RMS in bearing
Coverage: 360° azimuth; +40 to −10° elevation
Pulse density capability: 500,000/s
Radar store capability: 2,000 modes

Manufacturer/Contractor
Racal Radar Defence Systems Ltd, Chessington, Surrey, UK.

ELECTRONIC COUNTERMEASURES (ECM)

Scorpion noise and deception jamming system
Scorpion jammers are designed to jam salvos of incoming sea-skimming missiles over a wide angle and a wide frequency range. Scorpion operates over a frequency range of 7.5 to 18 GHz and offers a range of countermeasures to confuse long-range search radars, target acquisition radars and missile radars operating

Barbaros *(F 244). These ships have a very extensive electronics fit* (Blohm + Voss)

in both their search and lock on modes. The ESM library contains a customer-defined ECM response code for each known threat. Threats are prioritised and segregated from the general signals environment by integral PRI tracking circuitry. Received pulse trains are de-interleaved to establish time-of-arrival data for use in the Scorpion's pulse-prediction circuits. The data is then fed through a techniques generator to a fast tuning voltage-controlled oscillator, whose output is fed to a high-power amplifier for transmission. Scorpion can generate ten types of jamming modulation, including continuous and burst noise, cover pulse noise, synchronised railing and false target generation. Overall, the system can handle up to eight threats simultaneously with each target being treated to a time domain managed mix of the ten jamming modulations. The jammer is stabilised in all three axes and houses a twin antenna array, providing a wide beam multiple target output and a narrowbeam capability for high ERP operations.

Ship's sonar is the Raytheon AN/SQS-56, an active/passive hull-mounted system with the hull-mounted transducer protected by a steel dome (right) and pallet-mounted operators' positions (Blohm + Voss)

Manufacturer/Contractor
Racal Radar Defence Systems Ltd, Chessington, Surrey, UK.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher
There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units. They are mounted on either side of the hangar, immediately below the Mk 29 launcher.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)

Rounds
Diameter: 130 mm (5.1 in)
Length, weight:
Mk 182: 1,209 mm; 22.7 kg
Super Chaffstar: 1,209 mm; 20.9 kg
Super Gemini: 451 mm; 5.5 kg
Super Hiram III: 1,220 mm; 13.6 kg
Super Hiram IV: 467 mm; 3.8 kg
Super Loroc: 734 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

AN/SLQ-25 Nixie noisemaker
One AN/SLQ-25 Nixie solid-state, electroacoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter to generate and amplify the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed over the transom. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. The winch streams and recovers the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed body, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, is 95 cm (3.10 ft) long, 15.24 cm (6 in) in diameter and weighs 18 kg (40 lb). It receives amplifier outputs, converts them into acoustic signals and projects them.

Manufacturer/Contractor
Aerojet ElectroSystems, Sacramento, California, USA.

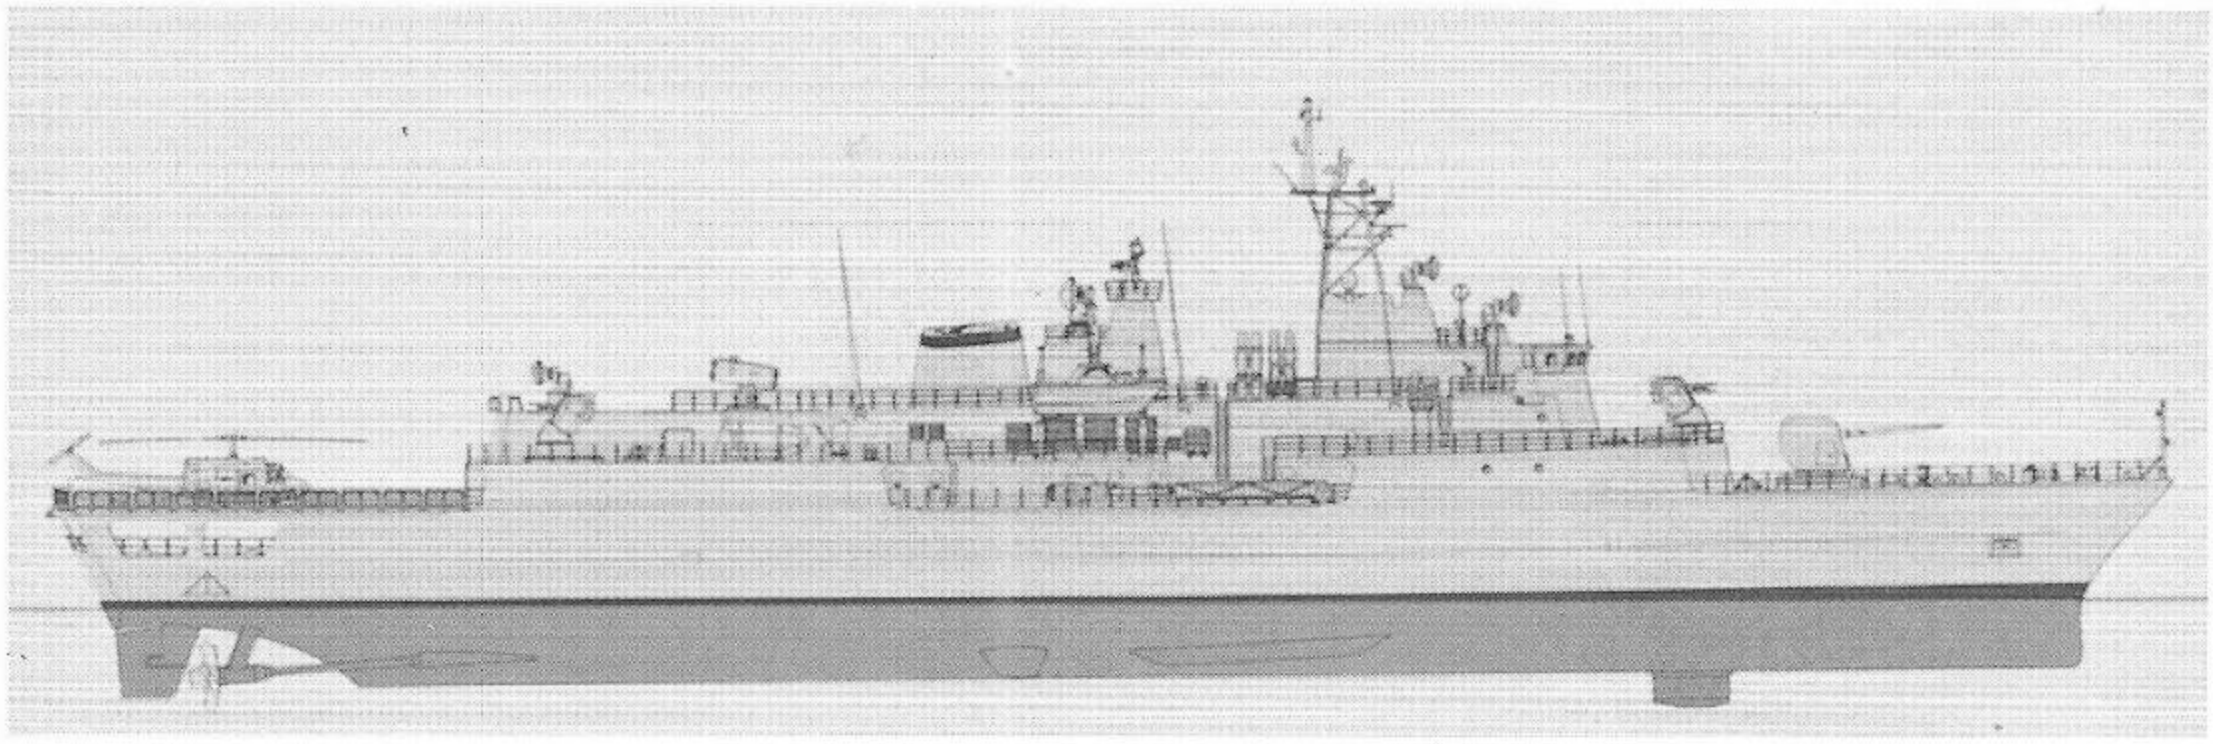
COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEM

Signaal SEWACO FD command and fire-control system
SEWACO FD (FD = Fully Distributed) is an automatic threat evaluation, weapon assignment and sensor allocation system, which can also be used as a planning aid through inputs of intelligence data and decision support facilities. SEWACO FD has been developed from the SEWACO system, with distributed processing power replacing the centralised computer complexes. The processing power is formed by SIGMA (SIGnaal Modular Architecture) nodes, one of which is built into every MOC (Multifunction Operator Console) and Bus Terminal Server (BTS). These SIGMA nodes consist of a number of SUN-1S type processor boards each with 16 Mbyte RAM and capable of 12.5 Mips.

The software package, (designated TACTICOS) is written in Ada but includes SPLICE (Subscription Paradigm for the Logical Interconnection of Concurrent Engines) distributed database and data communication modules, which operate alongside UNIX. The hardware is linked through a dual Ethernet (IEEE 802.3) standard LAN (local area network), with subsystems either linked directly to the LAN through a digital data interface bustap, or through a BTS interface. These BTS also have spare processing power which they bring into use automatically to compensate for failures in standard processor nodes.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.



Meko 200 TN Track II frigate (Blohm & Voss)

COMMUNICATIONS AND DATALINKS

AN/WSC-3(V)7

WSC-3 is the US Navy's standard UHF satellite terminal, but the (V)7 used in the Turkish ships is employed only as a terrestrial line of sight radio terminal.

WEAPONS CONTROL

AN/SWG-1A Harpoon Launch Control System (LCS)

SWG-1A is the Harpoon Launch Control System, which activates the missile, selects the flight pattern and sets seeker search modes (with small-, medium- or large-acquisition windows), as well as providing target range and bearing data. Alternatively, the missile can simply be launched along the bearing of the target, with the seeker activated early to scan a 90° sector; if, after a set time, no target has been acquired the missile commences a preset search pattern. SWG-1A takes account of other ships in the general target area and generates indirect flight plans for the missile, including waypoints to optimise angles of approach which will achieve the highest possibility of success while minimising the chances of the missile being destroyed by hostile fire. It can also be used to compute flight plans in a multiple attack so that several missiles, from either the same or different ships, arrive on target simultaneously, thus swamping the defences.

Seaguard Weapon control system

Seaguard is the weapon control system for the 25 mm CIWS and is based upon four modules (Common Support Module; Search Radar Module (SRM); Tracking (and illumination) Module (TM); and the 25 mm Gun Module (GM 25)) which are all linked by a Seaguard databus. The Common Support Module interfaces all system elements and has a mainframe architecture based upon the Cora II MV computer, while the Search Radar Module is based upon the Dolphin version of the Siemens Plessey AWS-6 radar, a dual-beam radar which detects both sea-skimmers and high-altitude cruise/dive attack missiles. In the Turkish Track II ships the Tracking (and illumination) Module (designated TMX/Ka-CW) operates in I/J-band for continuous illumination of targets, the electronic sensor being supplemented by two Siemens/Albis electro-optic directors. The TMX/Ka-CW is based upon a Contraves Italiana I/J-band, fully coherent, pulse Doppler monopulse radar and is capable of tracking targets at distances from 37.75 n miles (70 km) to 300 m and in addition to automatic target tracking of both air and surface targets it features a track-on-jam capability.

SONAR

Raytheon AN/SQS-56 hull-mounted sonar

The AN/SQS-56 hull-mounted sonar, which was originally developed for the US Navy's 'Oliver Hazard Perry' class frigates, has been provided by the US Navy to various foreign navies, including that of Turkey, via the FMS programme. (Note that sets exported via the FMS are designated AN/SQS-56; those exported as a commercial sale from Raytheon are designated DE 1160). Digital implementation allows packaging of the complete multifunction active and passive sonar in five medium-size electronics cabinets and one operator's console. System control uses a built-in mini-computer and an advanced display system. The sonar is an active/passive, preformed beam, digital sonar providing panoramic echo ranging and panoramic (DIMUS) passive surveillance. All signal processing, except transducer-received signal amplification and linear transducer transmit drive, is accomplished in digital hardware, most of which is implemented using US Navy SEMP (Standard Electronic Module Programme) components in compact water-cooled cabinets small enough to allow installation through standard size hatches.

The basic system includes the transducer array, transducer junction box, five electronics cabinets (array interface, transmitter(s), receiver and controller), operator console, sonar dome and control unit. Options in production include a loudspeaker/intercom, a water-cooling unit, a remote display and a performance prediction subsystem.

A single operator can search, track, classify and designate multiple targets from the active system while simultaneously maintaining anti-torpedo surveillance on the passive display.

Computer-assisted system control permits the operator to concentrate on the sonar data being displayed rather than on the system control. Operating frequencies are 5.6, 7.5 and 8.4 kHz.

Manufacturer/Contractor

Raytheon Company, Submarine Signal Division, Portsmouth, Rhode Island.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 23.16 × 14.8 m (76 × 49 ft)
Hangar: Hangar accommodates 1 helicopter

Agusta-Bell AB 212ASW

One Agusta-Bell AB 212ASW anti-submarine helicopter is normally embarked.

Specifications

Main rotor diameter: 14.63 m (48.0 ft)
Length overall (both rotors turning): 22.15 m (57.08 ft)
Fuselage length: 12.92 m (42.39 ft)
Height to rotor head: 3.91 m (12.82 ft)
Rotor disc area: 168.1 m² (1,809 sq ft)
Max take-off weight: 5,070 kg (11,177 lb)
Max speed (never exceed): 130 kts (240 km/h)
Typical cruising speed: 100 kts (185 km/h)
Hovering ceiling (out of ground effect): 396 m (1,300 ft)
Range with max standard fuel: 332 n miles (615 km)
Engine: 1 Pratt & Whitney Canada PT6T-6 Turbo Twin Pac rated at 1,398 kW (1,875 shp)
Role equipment: 2 Mk 46 or 244/S lightweight torpedoes, or 2 Sea Skua ASMs

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 1 General Electric LM-2500-30 gas turbine; 44.76 MW (60,000 hp) sustained; 2 MTU 16V 1163 TB83 diesels; 8.67 MW (11,780 hp(m)) sustained;
Shafts: 2
Propellers: 2 KaMeWa, cp
Ship's services: 4 MTU/Siemens diesel generators; 775 KVA at 1,800 rpm.

FURTHER INFORMATION

PROGRAMME

First contacts between the Turkish Navy and Blohm + Voss on the possibility of a second order started in May 1987. This led to a contract being signed on 19 January 1990 for what became known as the MEKO 200 TN (Turkish Navy) Track II. The first ship *(Barbaros)* was laid down at the Blohm + Voss yard in November 1992 and completed on 16 March 1995, with the first Turkish ship being laid down in September 1993 and completed in March 1996.

A total of four has been ordered to date. *Barbaros* (F 244) started running first of class sea trials in October 1994.

DESIGN

The MEKO 200 TN Track II ships are longer than the Track I ships but, in fact, this simply makes them the same length as the MEKO 200s built for Australia, Greece, New Zealand and Portugal. Unlike Track I, however, the Track II ships are being built to the latest MEKO Mod 3 standards, which includes the combat system databus (MICE/DAIL) in addition to the ship system databus and compartmental divisions (see 'Overview').

The CODAD propulsion system has also been changed to CODOG to improve the top speed. More up-to-date electronic systems are also being fitted, but it does, however, retain the Sea Zenith CIWS. Eight Harpoon launchers are fitted, as is the Sea Sparrow SAM system. The first pair have GMLS Mk 29 eight-cell launchers, but the second pair have GMVLS Mk 41 vertical launchers and these will be retrofitted to the first two in due course. A full command system is installed and, for the first time in a Turkish warship, there is an NBCD citadel. The complement is increased to 200.

DEPLOYMENT

F 244 and F 245 will normally be employed as Flagships.

WEAPONS SYSTEMS

SURFACE-TO SURFACE MISSILES (SSM)

McDonnell Douglas UGM-84B Harpoon

Eight Harpoon anti-ship missile canisters are mounted amidships; there are two groups of four launchers each, with one group pointing to either beam. The missiles are the Block 1C version with additional options, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications

Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile)
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

GMLS Mk 29 Mod 1 missile handling and launching system

There is one Guided Missile Launching System (GMLS) Mk 29 Mod 1, with the launcher atop the hangar roof. The system consists of a launcher, a launcher-control, power supply unit, launcher loader, and a maintenance/interconnecting cabinet. The launcher itself consists of eight watertight cells in two box mountings on either side of the pedestal, each cell having a heater and two frangible covers (front and rear). The reloading system consists of two loading installations on the port and starboard sides and a control panel. Each installation consists of two rows of missiles, each supported by two blocks, in a frame carried by four air springs to reduce the chances of shock or vibration damage. The installation also has a loading arm suspended from a vertical and horizontal transport unit in the ceiling and a hydraulically operated hatch in the front. When the launch cell or cells require reloading they are turned to a fore-and-aft position and inclined at an angle of 5° to bring them into line with the loading system. Space and weight have both been allocated for vertical launch Sea Sparrow.

Specifications

Operators: 1
Associated fire-control system: Mk 91
Training limits: 360°
Elevation limits: −5 to +85°
Firing rate: 3 missiles/min

Manufacturer/Contractor

Raytheon Company, Equipment Division.

Raytheon Sea Sparrow point-defence missile system

The SAM is the RIM-7M Sea Sparrow missile. The system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg (85.1 lb) blast/fragmentation warhead and a dual-purpose proximity impact fuze.

Specifications

RIM-7M
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 226.8 kg (500 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturers/Contractors

Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited in the waist immediately below the main mast.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

Vasco da Gama *(F330). These ships are the only MEKOs to be armed with the Creusot-Loire 100 mm Modèle 68 CADAM. The aperture in 'B' position is capped, but is reserved for VLS Sea Sparrow in due course* (Blohm + Voss)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications

Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

100 mm/55 Modèle 1968 CADAM

There is one single 100 mm/55 Modèle 1968-II CADAM dual-purpose mounting located on the foredeck. This is normally operated in the fully automatic remote mode with an unmanned turret, although there is a fall-back manual mode, which requires two men in the turret. The turrets have been taken from an old ship and upgraded to CADAM (CADence AMéliorée) standard with improved recoil and feed systems, raising the firing rate from 60 rds/min to 78 rds/min.

Specifications

Calibre: 100 mm
Length of barrel: 55 calibres
Muzzle velocity: 870 m/s (2,854 ft/s)
Traverse: 360° at 40°/s
Elevation: −15 to +80° at 25°/s
Mounting weight: 21 t
Crew: 2 (optional) and 2 loaders
Range:
anti-surface: 9.15 n miles (17 km)
anti-air: 8,000 m (26,000 ft)
Rate of fire: 78 rds/min
Ammunition: 13.5 kg (29.8 lb) (multipurpose projectile); 9.7 kg (21.4 lb) (charge)

Manufacturers/Contractors

Direction des Constructions Navales (DCN) (prime).
Mécanique Creusot-Loire, Marine Products (mountings).
DCN Ruelle (gun).
CSEE Défense (servo equipment).

Hughes Mk 15 CIWS Phalanx

A single Hughes Mk 15 CIWS Phalanx close in weapons system (CIWS) is mounted on the port side of the hangar roof to provide the innermost layer of defence against anti-ship missiles. The 20 mm M61A1, six-barrel, Gatling-principle gun has a cylindrical magazine with the feed mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 3,000 rds/min
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor

Hughes Missile Systems, Tucson, Arizona, USA (system).

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

APECS II/AR-700 ECM/ESM suite

APECS II is an advanced modular ESM/ECM suite covering frequencies from 0.5 to 18 GHz, which is designed to counter most known radar threats. The Argo 700 is the IFM receiver part of the system, providing surveillance and radar warning over 2-18 GHz band. APECS II can be operated fully automatically, semi-automatically (that is, with manual intervention) or manually. The ECM part of the system jams threat emitters, with high-speed switching enabling up to 16 threats to be jammed simultaneously. The antenna array consists of a mast-mounted ESM antenna assembly with two DF arrays, one omnidirectional unit and two monopulse units; system processing equipment; operator's console and two ECM transmitters (port and starboard) with their antenna systems located inside the transmitter units.

Specifications

ESM role (AR-700)
Frequency coverage: 0.5-18 GHz
High sensitivity: Up to −67 dBm
Detection range: 200 n miles ships; 50 n miles aircraft
DF accuracy: 4° RMS; 2° RMS fine DF
Automatic tracking: 500 active signals in dense signal environment
Signal identification speed: <1s

ECM role
Azimuth coverage: 360° using a 60-beam jammer (one beam per 6° azimuth sector)
Radiated power: 180 kW nominal mid-band
Frequency coverage: 7.5-18 GHz

Manufacturer/Contractor

ARGOSystems Inc, Sunnyvale, California.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher

There are two Mk 36 SRBOC (Super Rapid Bloom Off-board Countermeasures) units. They are mounted on either side of the hangar, immediately below the Mk 29 launcher.

Specifications

Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)

Rounds
Diameter: 130 mm (5.1 in)
Length, weight:
Mk 182: 1,209 mm; 22.7 kg
Super Chaffstar: 1,209 mm; 20.9 kg
Super Gemini: 451 mm; 5.5 kg
Super Hiram III: 1,220 mm; 13.6 kg
Super Hiram IV: 467 mm; 3.8 kg
Super Loroc: 734 mm; 13.2 kg

Manufacturers/Contractors

Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA

AN/SLQ-25 Nixie noisemaker

One AN/SLQ-25 Nixie solid-state, electroacoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter to generate and amplify the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed over the transom. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. The winch streams and recovers the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed body, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, is 95 cm long (3.10 ft), 15.24 cm (6 in) in diameter and weighs 18 kg (40 lb). It receives amplifier outputs, converts them into acoustic signals and projects them.

Manufacturer/Contractor

Aerojet ElectroSystems, Sacramento, California, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Thomson-CSF/Signaal SEWACO command and fire-control system

The Portuguese ships are fitted with a Signaal SEWACO action data automation system, which is an automatic threat evaluation, weapon assignment and sensor allocation system, and which can also be used as a planning aid through inputs of intelligence data and decision support facilities. The software package, designated STACOS, is written in RTL-2.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

Link 11
Link 14
Satcom (rotated between ships, as required)

WEAPONS CONTROL

AN/SWG-1A Harpoon Launch Control System (LCS)

SWG-1A is the Harpoon Launch Control System, which activates the missile, selects the flight pattern and sets seeker search modes (with small-, medium- or large-acquisition windows), as well as providing target range and bearing data. Alternatively, the missile can simply be launched along the bearing of the target, with the seeker activated early to scan a 90° sector; if, after a set time, no target has been acquired the missile commences a preset search pattern. SWG-1A takes account of other ships in the general target area and generates indirect flight plans for the missile, including waypoints to optimise angles of approach which will achieve the highest possibility of success while minimising the chances of the missile being destroyed by hostile fire. It can also be used to compute flight plans in a multiple attack so that several missiles, from either the same or different ships, arrive on target simultaneously, thus swamping the defences.

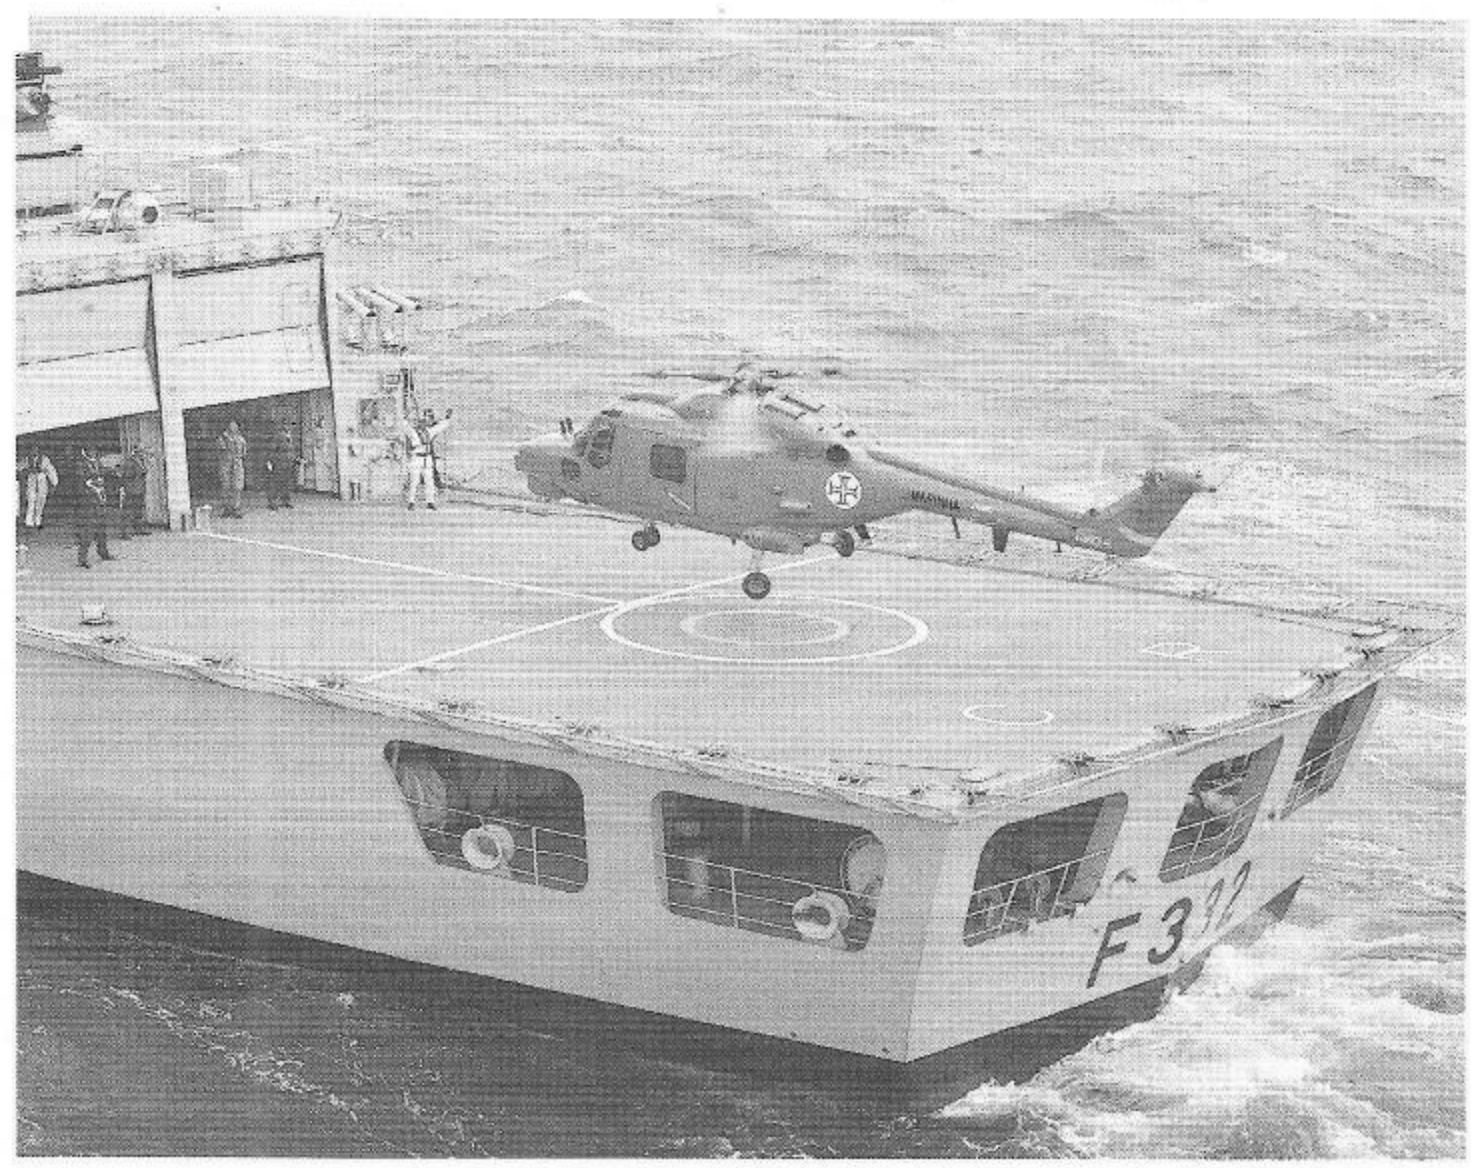
Vesta-VC helicopter datalink system

The Vesta-VC (VC = voice channel) is a supplementary facility to the Vesta helicopter-mounted transponder system in which a VHF signal is automatically transmitted when the aircraft is illuminated by the parent ship's search radar. This reply is picked up by the Vesta shipborne component to produce and tag a clear echo on the ship's radar screen.

The helicopter is equipped with two spherical antennas for reception of the ship's search radar signals. The transponder generates a VHF reply containing a number of code pulses for identification purposes. On board the ship there are two simple rod antennas to receive the transponder signals, which are then routed via the receiver (and extractor unit) to the ship's radar display. The Vesta system is controlled by either a control unit and a radar indicator, or a data handling system.

The Vesta system can indicate unambiguously any number of Vesta-equipped helicopters on the ship's radar display. A limited number of helicopters can be identified by means of preselected codes.

VESTA-VC provides an additional facility which extends the ship's radar horizon by enabling the pilot to transmit information (target range, bearing and speed) from the helicopter's radar back to the parent ship over an existing voice channel. All necessary information is contained in a pulse train lasting about 0.9 seconds and



Portuguese Navy Westland Super Lynx Mk 95 lands aboard the frigate Corte Real *(F 332). The ship normally carries two such helicopters* (Westland)

containing 50 words of 32 bits. The system works with any radio and any radar, using interfaces produced by Signaal. The effect of this system is to extend the parent ship's radar horizon.

Specifications
Vesta
Transmission frequency: VHF
Radar reception frequency: 1-10 GHz
Transmission power: 10 W
Pulse length: 2 µs
PRF (helicopter part): 20 kHz without code
Sensitivity (ship part): −78 dBm
Range: 0-124 n miles (230 km)
Number of codes: 5 (optionally 64)
Number of co-operating radar systems: 4

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

SONAR

AN/SQS-510 sonar
The Computing Devices of Canada (CDC) AN/SQS-510(V) is installed in these ships. AN/SQS-510 (V) is a development of the Canadian Westinghouse AN/SQS-505 sonar, combined with the AN/SQR-501 towed array. The hull-mounted element is a 7 kHz medium-size search and attack sonar, which can be used in direct communication with a digital computer, either for the transfer of range and bearing information, or it can give assistance to the operator in detection and tracking. It is a deep water, omnidirectional, surveillance system, but is also able to operate in a directional mode that can maintain search ability while tracking defined targets. Three selectable frequencies are available so that several ships can survey an area in close proximity without cross-talk. The 'wet end' is AN/SQR-501 (also known as the Canadian Towed Sonar Array (CANTASS), which is itself a combination of a US Navy AN/SQR-19 array and a Computing Devices of Canada signal processor.

Specifications
AN/SQS-501
Coverage: 360° (azimuth)
Range: 183-3,000 m (200-3,200 yd)
Doppler range: ±40 kts (7.2 kHz)
Doppler frequencies: 6.4, 7.2 and 8.0 kHz
Source levels: From 224.233 dB/µPa/m (transmission mode dependent)
Initial detection: 12 ping history of returns
Bearing accuracy: 1° RMS
Range accuracy: ±1% range reading
Transmission modes: Omni, TRDT, DT, ASPECT
Power level: High and low (10 dB reduction)

Manufacturers/Contractors
Computing Devices, Ottawa, Canada (prime and software).
Westinghouse Canada Inc, Burlington, Ontario, 0 Canada (sonars).

PROPULSION

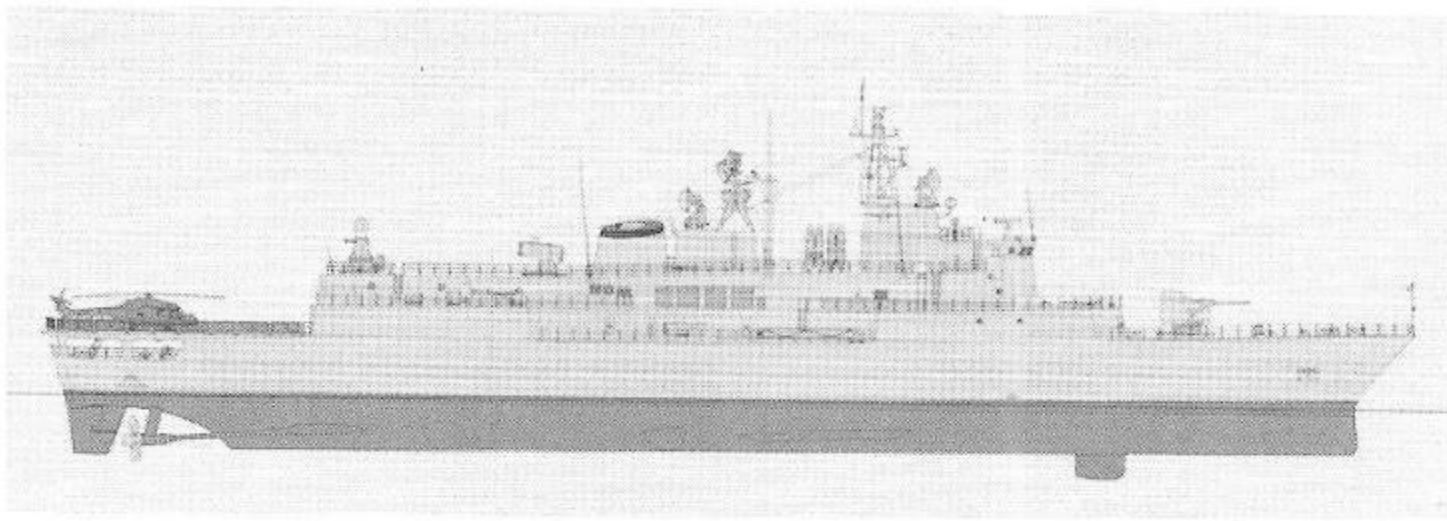
Specifications
System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 General Electric GE LM 2500-30 gas turbines; 39.5 MW (53,000 hp) sustained; 2 MTU 12V 1163 TB83 diesels; 6.5 MW (8,840 hp(m))
Shafts: 2
Propellers: 2, cp
Auxiliary generators: 4 — 775 kVA diesel-generator sets

FURTHER INFORMATION

PROGRAMME

The contract for all three was signed on 25 July 1986. The lead ship was built by Blohm + Voss and the other two by Howaldtswerke, with all three being commissioned in 1991.

Portugal met 40 per cent of the programme costs, with the balance coming from seven NATO partners: Canada, France, Germany, Luxembourg, Netherlands, Norway, and USA.



MEKO 200 PN. Sonar dome is for the Computing Devices (Canada) SQS-510 (V) active search and attack system

DESIGN

The MEKO 200PN was the first to incorporate the MEKO Mod 3 concepts such as compartmentalisation (see MEKO Introduction). As usual, the MEKO 200PN is designed to the normal MEKO standards, but with variations as required by the Portuguese customer. Such variations include facilities for two helicopters and a twin hangar, and a French 100 mm gun. There is only one Mk 15 CIWS Phalanx, which is located at the after port corner of the hangar roof.

The ships are designed primarily for the ASW mission, with the two Sea Lynx helicopters giving them a particularly strong capability.

These ships are fitted with stabilisers and have full RAS facilities. Space has been left for a sonar towed array and for VLS Sea Sparrow.

*See 'Further Information'

An 'Espora' class ship at sea. Four are in service with the Argentine Navy, where they have proved a success, but no further international sales have been achieved. This ship is one of the first two to be built, as it lacks the telescopic hangar (Blohm + Voss)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 38 medium-range anti-ship missile

As built, all ships were armed with four MM 38 Exocet SSMs, which are located on the afterdeck, ahead of the twin 40 mm turret. It is, however, intended to convert all ships to take eight MM 40 Exocets, which will be in the same position. *Espora* was the trials ships for such an installation, and the other three are due to follow.

Specifications

MM 38
Length: 5.21 m (17.1 ft)
Diameter: 35 cm (13.78 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 2-22.5 n miles (4-42 km)
Guidance: Inertial and active radar
Sustainer motor: SNPE Eole alloy-cased CDB; weight 151 kg (333 lb); max burn time 93 s
Booster: SNPE Epervier boost motor; burn time of 2.4 s
Warhead: Luchaire 165 kg (364 lb) fragmentation warhead
Fuzes: Delayed impact fuze and autopilot-controlled proximity fuze

Manufacturer/Contractor

Aerospatiale Tactical Missiles, Chatillon Cedex, France.

TORPEDOES

B515/ILAS-3 anti-submarine torpedo launching system

There are two triple 324 mm torpedo launchers at the forward end of the flight deck. These are the B515 system (also known as ILAS-3), which consists of three 324 mm diameter torpedo tubes. The tubes are manually loaded and trained but remotely operated from the combat information centre, although emergency local operation is possible.

Specifications

Length: 3.4 m (11.15 ft)
Height: 1.2 m (3.94 ft)
Width: 1.285 m (4.22 ft)
Weight: 1,050 kg (2,315 lb) (unloaded)

Manufacturer/Contractor

Whitehead SpA, Division of Gilardini SpA.

A244/S lightweight anti-submarine weapon

The torpedo used by the 'Espora' class is the Whitehead A244/S. The A244/S uses the Alenia CIACIO-S which is capable of active, passive or mixed modes for closing on to its target and can discriminate between decoys and real targets in the presence of heavy reverberations by specially emitted pulses and signal processing. It also discriminates between target noise and reverberations, as well as having a series preset of programmable search patterns and tactical manoeuvres (including re-attack procedures). The seeker has a large search volume covered by multiple preformed beams following a number of self-adaptive search patterns and is reported capable of target detection at −5 dB in good acoustic conditions. The computerised homing system also provides for presettable combinations of signal processing, spatial filtering and tactical torpedo manoeuvring. The software may be reprogrammed by the customer to meet new tactical conditions. Upon launching the A244/S initially steers a straight course and, if the target is not detected, it then begins a search pattern which may be either a spiral between preselected depths or a helix pattern.

Specifications

Length: 2.7 m (8.86 ft)
Diameter: 324 mm (12.75 in)

Espora *(F-41) with an Aerospatiale SA 319B Alouette III on the flight deck*

Weight: 215 kg (474 lb) (warshot version)
Warhead: 34 kg (75 lb) shaped charge HBX-3 HE
Propulsion: Electric; silver/zinc batteries
Range: 3.5 n miles (6 km)
Speed: 30 kts
Guidance: Active/passive sonar, self-adaptive programmed patterns

Manufacturer/Contractor
Whitehead SpA, Salviano, Italy.

GUNS

OTOBREDA 76 mm (3 in)/62 Compact
There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck for use in either air defence or anti-surface roles.

Specifications
Calibre: 76.2 mm (3.0 in)
Barrel length: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

OTOBREDA 40 mm L/70 Compact
There are two twin OTOBREDA 40 mm L/70 mountings. One is in 'B' position forward, the other in 'Y' position aft.

Specifications
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,025 m/s (3,362 ft/s) (PFHE), 1,350 m/s (4,430 ft/s) (APFSDS)
Traverse: 360°
Elevation: −13 to +85°
Traverse speed: 90°/s
Elevation speed: 60°/s
Range:
surface/surface: 6.75 n miles (12.5 km)
surface/air: 8,700 m (28,500 ft)
Rate of fire: 900 rds/min
Ammunition: 2.4 kg (5.3 lb) (PFHE), 2.5 kg (5.5 lb) (APFSDS)

Manufacturer/Contractor
OTOBREDA, I-25128 Brescia, Italy.

M2HB 12.7 mm machine guns

There are two mounts for M2HB 12.7 mm machine guns.

Specifications
Calibre: 12.7 mm (0.50 in)
Rate of fire: 450-550 rds/min
Muzzle velocity: 883 m/s (2,900 ft/s)
Max effective range:
against surface targets: 6,700 m (7,400 yd)
against airborne targets: 1,380 m (4,500 ft)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Elettronica INS-3 EW suite
The ships are equipped with the Elettronica INS-3 EW suite, comprising the RQN-3B radar warning set (covering frequencies 1-18 GHz) and the TQN-2X jammer.

DECOYS

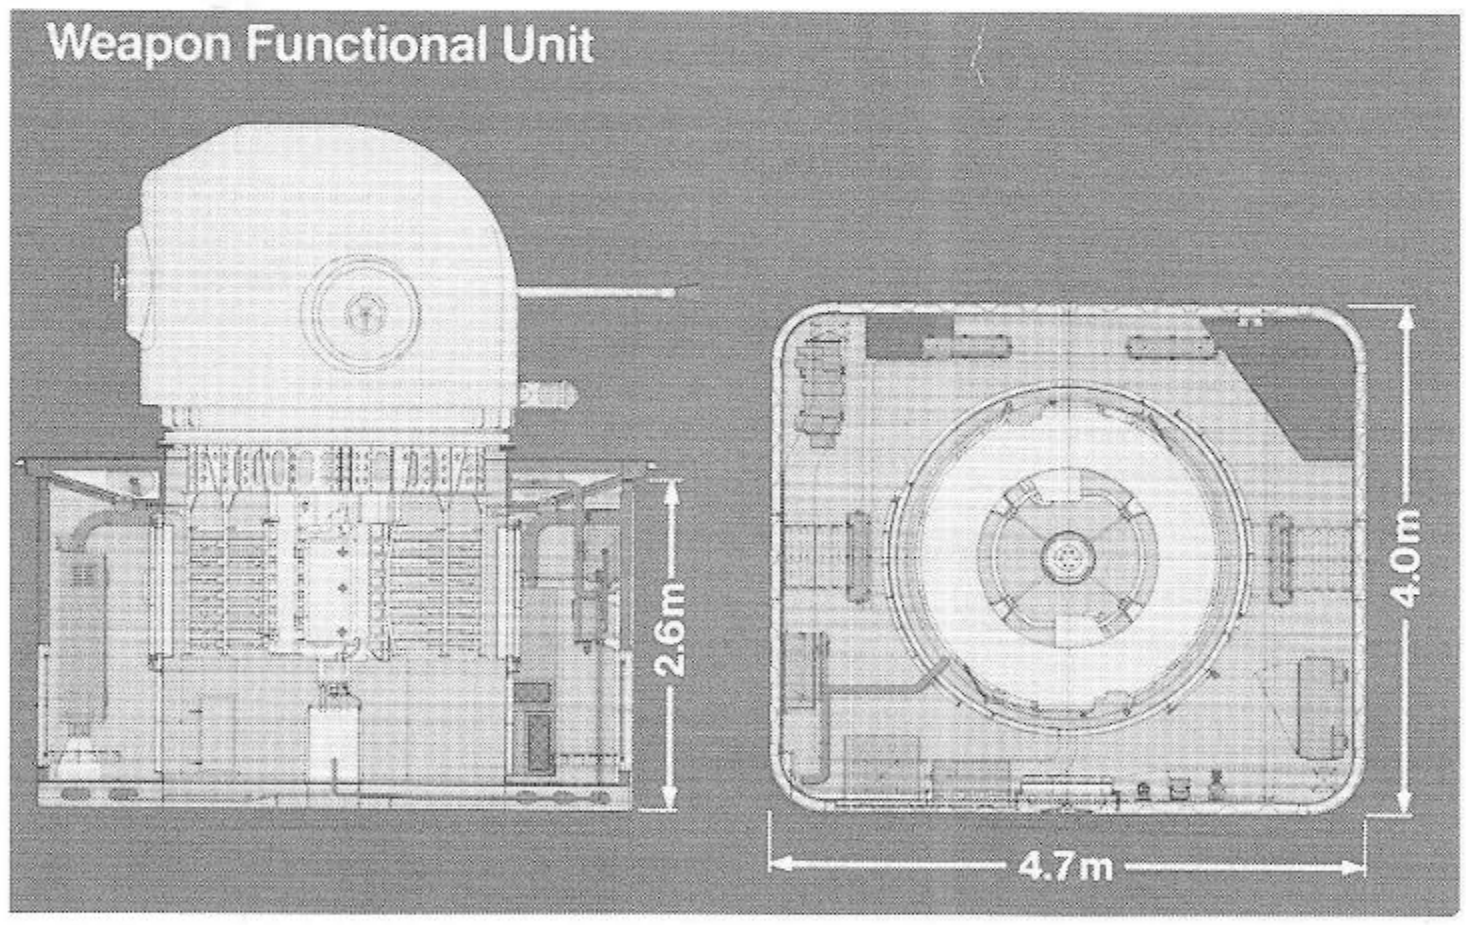
DAGAIE countermeasures system
There are two DAGAIE launchers, which can be loaded with either IR or chaff rockets, the firing sequence running automatically, once triggered by a missile alarm from a variety of sources, such as radar, ESM systems, or optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, windspeed and direction, ship heading and speed data.

The launching of radar and IR decoys is so arranged that advanced mixed-guidance missile systems cannot discriminate them and thus collocation of both decoys is achieved. The installation is a double mounting and comprises: (a) two trainable mountings carrying 10 replaceable containers (suitcases), each of which is loaded with either 3-5 and 8-14 µm IR or I/J-band chaff projectiles.

A wide range of ammunition is provided by Etienne Lacroix Défense providing seduction, distraction and seduction/dissimulation modes. The electromagnetic decoys are normally based upon aluminised fibreglass chaff with rapid bloom time and they cover the I and J frequency bands. The infra-red decoys cover both the 3-5 and the 8-14 µm bands.

Specifications
Traverse: 330° at 21°/s
Average reaction time: Within 4 s
REM rocket dimensions: 850 × 127 mm (33.5 × 5 in)
Rocket weight: 13 kg (28.66 lb)
Container dimensions: 900 × 130 mm (35.4 × 5.1 in)
Container weight: 20 kg (44.1 lb)
LIR/LEM container dimensions: 780 × 630 × 134 mm (30 × 24.8 × 5.3 in)
Container weight: 54 kg (119 lb)

Manufacturer/Contractor
CSEE Défense, Paris, France.



The OTOBREDA Fast Forty 40 mm/70 twin module as used in the 'Espora' class. This is a typical modular installation as used throughout the MEKO system (Blohm + Voss)

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Signaal EASY-AR
EASY was derived from Signaal's DAISY (DAISY = Digital Action Information SYstem), which is used by the RNIN and is designed for corvette-sized ships, with the EASY-AR system being specifically tailored to suit the Argentine ships' requirements. The EASY C^2 system is designed to present raw and/or processed sensor data from search and fire-control radars together with IFF, sonar, electronic warfare and electro-optic systems to create a picture of the tactical situation. The data may also be used to designate targets to weapon systems and to assist in operations with auxiliary functions such as ASW helicopter direction and tactical navigation.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

COMMUNICATIONS AND DATALINKS

Integrated communications system: A comprehensive communications system is fitted, integrated by Hagenuk.

IFF: Mk 10

WEAPONS CONTROL

Signaal WM-28
The WM-28 is the fire-control system for the guns and is housed in the egg-shaped radome above the bridge. The radar operates in the I and J bands and has a range of some 25 n miles (46 km). It can track one air and one surface target and control the fire of two guns simultaneously.

Signaal LIROD 8 electro-optic director
One LIROD (Lightweight Radar Optronic Director) is mounted on the after end of the hangar roof. LIROD is a lightweight fire-control system based upon a K-band tracking radar and a TV camera, and is designed for simultaneous control of two dual-purpose guns while tracking one air and one surface target. The system reaction time from detection to the beginning of the engagement is about 4.5 seconds. It is based upon a 0.6 m (1.97 ft) diameter parabolic antenna with monopulse cluster. It has a very narrow pencil beam and is resistant to clutter through the application of pulse Doppler tracking combined with FFT techniques. There are also sophisticated ECCM facilities. The radar can track fighter-size targets up to 9.8 n miles (18 km) away and is capable of tracking targets with a maximum speed of 1,000 m/s (3,280 ft/s). In addition to the radar there is a militarised TV camera with CCIR standard video format, which can detect fighter-size targets at about

5.44 n miles (10 km) and large surface ships at about 10.9 n miles (20 km).

Specifications

Director
Traverse: 360° at 120°/s
Elevation: −25 to +150° at 80°/s
Radar: K-band
TV camera, field-of-view: 3-30° (2-20°)
IR camera. field-of-view: 3°

Laser rangefinder
Pulse length: 20 ns
Max repetition frequency: 10 Hz
Beam divergency: 1.2-1.5 mrad

Laser tracker
Max repetition frequency: 25 Hz
Beam divergency: 1.5 and 6 mrad

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

SONAR

STN Atlas ASO-4

The 'Espora' class is fitted with an STN Atlas ASO-4 hull-mounted, active search and attack, medium-frequency sonar.

Manufacturer/Contractor

STN Atlas Elektronik GMBH, Bremen, Germany.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 10.6 × 7.3 m (35 × 24 ft). It is reported that in at least two of the class the flight deck has been enlarged to enable them to operate Kaman SH-2F Seasprite or AS 550 helicopters
Hangar: As built, the first three ships had a flight deck but no hangar. A telescopic hangar was then successfully installed in *Parker* and the following ships and is to be retrofitted to the first three

HELICOPTERS

SA 319B Alouette III.

Specifications

Dimensions:
main rotor diameter: 11.02 m (36.15 ft)
length overall (rotor turning): 12.84 m (42.15 ft)
fuselage length: 10.17 m (33.7 ft)
height to rotor head: 3.00 m (9.84 ft)
Weights
empty: 1,143 kg (2,520 lb)
max take-off: 2,200 kg (4,850 lb)
Performance
max speed (never exceed): 113 kts (210 km/h)
max cruising speed: 100 kts (185 km/h)
service ceiling: 3,200 m (10,500 ft)
range with max standard fuel: 267 n miles (495 km)
Engines: 1—694 kW (870 shp) Turbomeca Artouste IIIB turboshaft derated to 425 kW (570 shp)
Accommodation: 7 (pilot plus six)
Weapons: In the ASW role the SA 319B can carry two lightweight torpedoes

PROPULSION

Specifications

System: Diesel
Main machinery: 2 SEMT-Pielstick 16 PC2-5V400 diesels; 19,360 kW sustained
Shafts: 2
Propellers: Fixed pitch
Auxiliary engines: 4 MTU/Siemens diesel-generator sets

'Espora' class MEKO 140 frigate (Blohm + Voss)

FURTHER INFORMATION

PROGRAMME

The larger MEKO designs have been remarkably successful, achieving numerous sales in an extremely competitive global market. It is, therefore, somewhat surprising that the MEKO 140 corvette has not done as well, achieving only six sales, all to Argentina. This contract was signed with Blohm + Voss on 1 August 1979 with all to be constructed at the AFNE yard at Rio Santiago in Argentina. The first ship was completed in 1985, followed by the second in 1986 and the third in 1987. There was then a considerable delay before the fourth was completed in April 1990 and work on the last pair then stopped due to lack of funds. Work restarted in July 1994, with the intention of finishing the ships in late 1995, but construction was then suspended again in early 1995. There have been repeated rumours of possible sales abroad, with Venezuela being mentioned as a potential customer, but nothing firm has been announced.

In late 1996 a new proposal emerged in which a Malaysian company would buy the two hulls 'as is', transport them to Malaysia and then finish them as patrol ships. They would then be sold to the Royal Malaysian Navy to meet part of its OPV requirement. It is not known whether this plan has official backing in Malaysia.

DESIGN

The design of the 'Espora' class was developed by Blohm + Voss as the corvette-sized hull in its MEKO series. The design uses the company's modular principles, with three weapons modules, six electronic modules and five pallet modules. Armament is relatively heavy for the size of hull, with one 76 mm gun and two twin 40 mm cannon, while ASW systems include a light helicopter and two triple torpedo tubes.

Parker was fitted with a telescopic hangar during construction, which was also included in *Robinson* and *Gomez Roca* (although neither of the latter two has been completed) and it is planned that similar hangars will be retrofitted in the first three. In addition, at least two of the class have flight deck extensions for SH-2F or AS 550 helicopters in due course.

All ships are fitted with roll dampers.

SURVIVABILITY AND DAMAGE CONTROL

The hull and superstructure are constructed of steel, and are shaped to give a low radar signature. The hull is divided into more than ten watertight compartments and three damage control zones, each with its own dedicated high-capacity salvage pump and fire pump. There are four auxiliary diesel-generator sets, of which one is in a separate compartment to ensure survivability.

DEPLOYMENT

The four ships in service are heavily used in economic zone patrol and fishery protection duties. However, *Spiro* (43) accompanied *Almirante Brown* (D 10) to the Gulf in 1990 and was later relieved by *Rosales* (42), forming a unique 'all-MEKO' national task group.

Gomati *(F 21) at sea in 1996. These ships are an interesting mixture of British hull; Dutch, Italian and Russian electronics; Russian weapons; and British helicopters. The hangar is very large – sufficient to accommodate two Sea Kings* (1996)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

SS-N-2D (Rubezh P-22) ('Styx') medium-range anti-ship missile

The 'Godavari' class is armed with four SS-N-2D 'Styx' missiles with two twin forward-facing launch bins either side of a narrow deckhouse on the foredeck. There are no reloads. The SS-N-2D was introduced into Soviet service in 1967 and is essentially an SS-N-2A with an added infra-red seeker. This relatively large anti-ship missile is powered by a liquid-fuelled rocket motor, with a solid fuel booster attached.

Once the target is detected the ship must close with the aim of being within the optimum engagement distance, some 15-20 n miles (28-37 km). Once ready to launch, the ship must face the target, maintain a speed of 15 knots or less, and hold its course for 20-30 seconds before launching the first salvo of two missiles. These may be followed, a minute later, by the second pair. Upon launch, the missile climbs at an angle of 45° to one of five preset altitudes (100, 150, 200, 250 or 350 m), where the onboard radar searches for a target and the receiver is switched on for very short periods to receive signals from a designated range, the range gate being 1 km on either side of the target. The radar locks on only after eight returns have been received, at distances of 3.5-12 n miles (6.5-22 km), whereupon the seeker guidance system switches off the autopilot. A throw-off gyroscope takes the missile on target a few seconds before impact as it becomes too close for radar-generated homing signals. Russian Navy tacticians calculate that seven to eight missiles are required to destroy a cruiser-size target and four for a destroyer, making salvo firing a major feature of any tactical engagement scenario with SS-N-2D missiles to ensure destruction of the target.

Specifications

SS-N-2D
Length: 6.55 m (21.5 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.9 ft)
Speed: Mach 0.9
Weight (without booster): 2,600 kg (5,733 lb)
Warhead: 454 kg (1,001 lb) hollow-charge
Fuzes: Impact, proximity
Range: 3-54 n miles (5.5-100 km)
Guidance: Autopilot with active radar (supplemented in some with IR)

MS-2 seeker
Frequency: I-band (8-12 GHz) (four presets)
PRF: 300-500 pps (adjustable)
Altitude control: Barometric pressure device

Manufacturer/Contractor

Raduga, Moscow, Russia.

SURFACE-TO-AIR MISSILES (SAM)

SA-N-4 'Gecko' (OSA-M) point defence system

There is one SA-N-4 launcher just forward of the bridge, with 20 missiles in a below-deck magazine. This system is known to NATO as SA-N-4 (reporting name = Gecko) but is known in Russia as the Osa-M system, while the missile itself is designated 9M33.

SA-N-4 has a distinctive loading and launching system in which the twin-rail launcher normally lies beneath a hinged flat cover plate, emerges to launch its missiles, and then must retract in order to reload. This is likely to result in a low rate of fire which must be slowed even further by the need to close the magazine cover before firing. Underneath the launcher are four revolving drums each with five missiles while the electromechanical and hydraulic machinery is below that. On launch, the booster burns for 2 seconds allowing the radar to gather the missile at a range of 0.75 n miles (1.5 km), following which the sustainer burns for 15 seconds.

The 9M33 missile has a slender cylindrical body with clipped delta-shaped aerodynamic surfaces. Small control fins are near the nose and there are larger fins at the tail all in 'X' configuration and in line. Midway along the body, on the underside, are two small fins while along most of each side runs a rib which may also contain electrical cables. At the rear of the missiles, on either side, are two beacon transponders.

SA-N-4 is controlled by the Pop Group system. There is a frequency-agile, monopulse radar with a parabolic rotating search antenna operating in H-band (6-8 GHz) and with a typical acquisition range of 16 n miles (30 km). There are two J-band (10-20 GHz) antennas, one of them for a pulse Doppler target-tracking element with a range of 10.75 n miles (20 km) and the smaller parabolic antenna being used to track the missile. Above the prime antennas is a smaller, circular one which emits an I-band (8-10 GHz) uplink capture beam which gathers the missile shortly after launch. The director also has a small, rectangular command uplink emitter. If the Osa-M follows the Romb, the engagement sequence is likely to see the target acquired by the 'Pop Group' air search radar. The data is then displayed on a panoramic display in the operator's console where it is designated either automatically or manually. The missile or missiles (Romb usually fires two missiles) are launched and while one 'Pop Group' antenna automatically illuminates the target, the second tracks the missile and transmits command signals.

Specifications

Range: 8 n miles (15 km)
Altitude: 9.1-3,048 m (130-10,000 ft)
Speed: Mach 2.5
Warhead: 50 kg (110.25 lb)

TORPEDOES

B515 (ILAS-3) anti-submarine torpedo launching system

There are two B515 (also known as ILAS-3) triple mounts on the main deck below the stack. The tubes are manually loaded and trained but remotely operated from the combat information centre, although emergency local operation is possible.

Specifications

Length: 3.4 m (11.15 ft)
Height: 1.2 m (3.93 ft)
Width: 1.285 m (4,216 ft)
Weight: 1,050 kg (2,315 lb) (unloaded)

Manufacturer/Contractor

Whitehead SpA, Salviano, Italy.

Whitehead A 244/S or NST-58

A244/S lightweight air-/surface-launched anti-submarine weapon. Most Indian Navy warships now use the Whitehead A244/S torpedo, which is also produced in India as the NST-58. The seeker in this weapon is the Alenia CIACIO-S which is capable of active, passive or mixed modes for closing on to its target and can discriminate between decoys and real targets in the presence of heavy reverberations, using specially emitted pulses and signal processing. It also discriminates between target noise and reverberations, as well as having a series preset of programmable search patterns and tactical manoeuvres (including re-attack procedures). The seeker has a large search volume covered by multiple preformed beams following a number of self-adaptive search patterns and is reported capable of target detection at −5 dB in good acoustic conditions. The computerised homing system also provides for presettable combinations of signal processing, spatial filtering and tactical torpedo manoeuvring. The software may be reprogrammed by the customer to meet new tactical conditions. Upon launching, the A244/S initially steers a straight course and, if the target is not detected, it then begins a search pattern which may be either a spiral between preselected depths or a helix pattern.

Specifications

Length: 2.7 m (8.85 ft)
Diameter: 324 mm (12.76 in)
Weight: 215 kg (474 lb) (warshot version)
Warhead: 34 kg (75 lb) shaped charge HBX-3 HE
Propulsion: Electric; silver/zinc batteries
Range: 3.5 n miles (6 km)
Speed: 30 kts
Guidance: Active/passive sonar, self-adaptive programmed patterns

Manufacturer/Contractor

Whitehead SpA, Salviano, Italy.

GUNS

57 mm twin L/75 (ZIF-72/AK 725)

There is one twin 57 mm L/75 mounting in 'A' position. This Russian weapon has been designed for prolonged air defence engagements, but can also be used against seaborne and land targets. The 4.57 m (15 ft) long barrels are water-cooled and the mounting consists of the elevating mass with two automatic weapons and the cradle, the rotating structure for the elevating mass with gun drives, firing system and other elements, all on a slip ring with two arrays of ball-bearings. Below decks are the ammunition handling system and the magazine. The turret is made of aluminium alloy.

The 550-round linked belt is initially threaded into the feeder mechanism by hand and is advanced by the cocking mechanism; thereafter, the hydraulic mechanism takes over. The feeder system is capable of operating in bursts or in a sustained form with automatic interruption when only 50 rounds remain in the belt. Each round weighs 6.61 kg (14.57 lb) and the feeder mechanism has 15 rounds per barrel within the turret.

There are two operators in the fire-control station, which is associated with the 'Muff Cob' fire-control system.

'Muff Cob' has its antenna in a 1 m (3.28 ft) wide, weather-proof mounting suspended from a trunnion-yoke carried on a traversing mounting. The radar is supplemented by an electro-optic sensor. The height of the mounting is about 3 m (9.8 ft) and the H-band radar can probably tilt from −10 to +50° as with the gun mounting. It is likely that control of the mounting is conducted from the compartment which houses the radar display system. Remote laying is controlled through a servo follower drive which ensures smooth slew rate changes at all speeds. Manual operation of the mounting is confined to maintenance and repair functions.

Specifications

Length of barrel: 75 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Traverse: ±200°
Elevation: −10 to +85°
Range:
anti-surface: 3.25 n miles (6 km)
anti-air: 6,000 m (19,686 ft)
Rate of fire: 120 rds/min/barrel
Projectile weight: 6.61 kg (14.57 lb)
Power requirements: 220 or 380 V, three phase

30 mm L/65 AK-230 twin mounting

F 20-F 22 only. The four twin AK-230 turrets are located either side of the two masts, giving a 'four-square' defence. The AK-230 is a remotely operated, twin barrel, automatic anti-aircraft gun designed to engage air targets at heights of up to 4,000 m (13,124 ft). It is also capable of engaging surface targets at ranges up to 2.2 n miles (4 km). The electrically powered mounting is 1.46 m (4.8 ft) high, 3.11 m (10.2 ft) long and 2.1 m (6.9 ft) wide, and consists of two 64.2 calibre, water-cooled, NN30 guns, each with a liner and a rotating breech with four chambers. The elevating mechanism is on the carriage together with a compressed air tank and associated equipment for the loading system. Russian ammunition for this weapon consists of two rounds; BR-83 and OF-83D (see Specifications).

Propellant gas ducted from the breech ejects the empty cartridge case and the rotating breech moves the next chamber into line with the gun. With every round fired, coolant is injected into the barrels, the liners and the front of the revolving breech. During intensive firing, nitrogen gas is blown into the breech opening to prevent the accumulation of explosive gases. Recoil forces are used to move empty cartridges and belt links, together with misfired rounds, into a storage space between the base ring and the magazine.

The fire-control radar is the I/J-band Rys (NATO = Drum Tilt), whose maximum acquisition range is approximately 22 n miles (40 km), with each radar director controlling two gun mountings.

Specifications
NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,445 ft/s)
Range:
anti-surface: 2.2 n miles (4 km)
AA: 4,000 m (13,124 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Mounting weight: 1,857-1,905 kg (4,095-4,200 lb)
Crew: 2 (off mount)

Ammunition
BR-83:
type: armour-piercing tracer
weight (complete round): 1.47 kg (3.24 lb)
weight (projectile): 0.35 kg (0.77 lb)

OF-83D:
type: high explosive
weight (complete round): 1.40 kg (3.08 lb)
projectile: 0.27 kg (0.59 lb)
explosive: 30 g (A-XI-2)

30 mm/65 AK-630 close in weapons system
F 23-F 25 only. The second batch of ships have four 30 mm Gatling-type AK-630s in the same positions as the AK-230s of the earlier ships. These have five roles, engaging anti-ship missiles, aircraft, small surface vessels, drifting mines and unprotected targets ashore. The AO-18 weapon is a water-cooled, six-barrelled, Gatling-principle weapon with fixed breech block and revolving barrels. The weapon is believed to operate in a similar manner to the Phalanx, firing bursts of up to 400 rounds, but unlike the US weapon AK-630 features a separate radar director, although it is believed that the installation aboard the carriers slaves the AK-630s to the CADS-1 system.

Specifications
Calibre: 30 mm
Length of barrel: 65 calibres
Number of barrels: 6
Muzzle velocity: 890 m/s (2,920 ft/s)
Cooling: Water
Traverse: 360° at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range: 4,000 m (13,214 ft) (radar fire control), 5,000 m (16,405 ft) (electro-optic fire control)
Rate of fire: 4,000-5,000 rds/min
Magazine: 2,000 rounds
Weight of complete round: 1.224 kg (2.7 lb)
Ammunition types:
UOF-84 HE-I weight: 384 g
UOR-84 HE-T weight: 388 g
Fuze: MG-32 point impact (both rounds)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

INS-3 ESM/ECM system
INS-3 (INS = Integrated Naval System) is an Elettronica ESM/ECM system. The main components are the Bharat Ajanta ESM, a 1-18 GHz radar warning system, with a 1,500 emitter library, which was developed from the Elettronica RQN-3. The ECM system is the Elettronica TQN-2 jammer. INS-3 is used to trigger jamming and the SuperBarricade countermeasures system. The array characteristic of the INS-3 is mounted at the head of the short extension on the foremast.

Manufacturers/Contractors
1. Bharat Electronics, Bangalore, India.
2. Elettronica SpA, Rome, Italy.

Gomati *(F 21)* (H & L van Ginderen Collection)

DECOYS

ML Aviation Barricade countermeasures system
SuperBarricade launchers are being fitted in these ships. SuperBarricade is an improved version of the widely used Barricade system and provides ships with means of deploying chaff and infra-red (IR) decoys to counter missile attacks, using a layered defence against the various types of anti-ship missile. The system uses a 102 mm rocket and a redesigned launcher with four sets of triple-cell launchers. The system has a similar control unit to Barricade Mk III and the same tactical computer. The ammunition lockers each contain 24 rockets. There are four decoy modes:

- confusion, in which long-range (Stockade) rockets are fired to confuse enemy search radar and make target selection difficult
- distraction, in which medium-range chaff and/or infrared rockets are fired in a pattern of six around the ship to present alternative targets to missiles during their search phase, affording defence against multiple missiles coming from different directions
- dump is used where a missile has locked on to the ship. The ship uses a jammer to remove the missile's range gate and then fires a single rocket to produce a chaff cloud on which the gate may be 'dumped' thus allowing the jammer to be redeployed.
- centroid is a close-range, final defence mode, used against single missiles. If the incoming missile is locked on to the ship, a pattern of short-range chaff and/or IR rockets is fired to create a large alternative target close to the ship, which manoeuvres away, leaving the missile to home on to the decoy.

Manufacturer/Contractor
ML Wallop Defence Systems, Andover, Hampshire, UK.

Graseby G738 towed torpedo decoy equipment
The G738 is the export version of the British Type 182 towed torpedo decoy, which is designed to decoy both active and passive homing torpedoes, using signals electronically generated within the ship and fed, via the towing cable, to electroacoustic transducers within the towed body. The G738 produces two independently controllable output signals which are radiated simultaneously from the towed decoy. An amplitude modulated noise signal simulates the ship's propeller noise and causes passive-homing torpedoes to be seduced away from the ship towards the towed decoy. The second signal is a swept CW signal, which simulates sonar echoes, in order to confuse or jam the guidance system of active homing torpedoes, thus causing them to miss the ship. The frequency bands covered by both types of output are switchable to meet tactical scenarios and to enable concurrent operation of other sonar and communication equipments.

Specifications
Towed decoy:
diameter: 533 mm (21 in)
length: 2,005 mm (6.58 ft)
weight: 74 kg (163 lb)
Towing cable:
length: 411 m (1,348 ft)
diameter: 14.48 mm (0.57 in)
weight: 269 kg (593 lb)

Manufacturers/Contractors
Graseby Marine (Graseby Dynamics Ltd), Watford, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

SADOC 2/IPN 10
SADOC 2/IPN 10 (SADOC = *Systema Direzione della Operazioni di Combattimento)* is a mainframe architecture system designed to acquire, process and present data acquired by sensors but can also be used for a number of other functions, including threat evaluation and weapons control, ECM management, aircraft control, conducting ASW operations, as well as datalink and databank management.

Data are received from onboard and offboard sensors via datalinks. The system has two or three Central Processing Units (CPU) mini-computers (Alenia 32-bit CDG-3032 with a 128 k memory), one of which usually acts as the immediate back-up in the event of system failure. Within the consoles are Alenia 16-bit NDC-160 processors, with 64 k memories. Both possess mass memory modules for handling programmes and large amounts of data and an interface with a 10 Mbit/s serial databus.

There are two TAVITAC operating systems; the disk operating system and a time-sharing executive.

The SADOC 2/IPN 10 system was designed in Italy by Selenia (now Alenia Elsag) and was produced in India under licence by Bharat Electronics Ltd (BEL).

Manufacturers/Contractors
Alenia Elsag Sistemi Navali, Rome, Italy (design).
Bharat Electronics, Bangalore, India (licence production).

Satcom: Inmarsat

WEAPONS CONTROL

MR-103 gunfire control system

MR-103 is the Russian-supplied weapon control system for the 57 mm guns. The director is located on the deckhouse which separates the two pairs of SS-N-2D launchers and includes the Muff Cob director (see below).

MR-310 missile fire control system

The SS-N-4D missile system is controlled by a Russian-supplied fire-control system designated MR-310 by the Indian Navy. The director associated with this system is Pop Group, which is sited on the bridge roof.

RADARS

Set	LW-08	ZW-06 (two)*
Company	HSA	Signaal
Role	Air search	Navigation/helo control
Band	D	I
Beam	2.2 × csc² to 40°	0.9 × 19°
Peak power	150 kW	60 kW
Gain	30 dB	32 dB
Pulsewidth	35/69 µs	0.06/0.6 µs
PRF	1,000/500 pps	4,000/2,000 pps
Scan rate	7.5/15 rpm	24 rpm
Typical ranges	145 n miles (260 km) for 2m² target at 26,000 m (85,000 ft)	14 n miles (26 km)

Note: * May be Russian Don Kay (I-band) in some.

Head Net C

Head Net C is the air/surface search radar and consists of two antennas back to back with one canted at 30° which enables it to act as a height-finder. The radar operates in the E band and has a maximum effective range of approximately 70 n miles (128 km).

Pop Group

Pop Group is the weapon control system for the SA-N-4 missile system, with the director sited on the bridge roof. The director includes an acquisition radar with a long, curved antenna on top of the cab, and two target trackers. The latter two are of different size, but presumably the smaller one performs a similar function to the larger, but at higher frequencies, which would enable them to direct two different missiles against the same target. The system operates in the F/H/I band.

Muff Cob

Muff Cob is the director for the 57 mm fire-control system and is the large cylindrical radome atop the deckhouse on the foredeck. The F/G-band radar radome is supported by a trunnion yoke in a traversing mounting and is thus capable of both elevation and traverse. There is a device to the left of the radome (from the front), with a remotely controlled cover, which may be a TV camera. The F/G band radar is named Muff Cob by NATO and Bars (Wildcat) by the Russian Navy.

Drum Tilt

F 20 to F 22 only. There are two Drum Tilt, H/I band radars for the twin 30 mm guns in the first three ships. The cylindrical radar is permanently tilted upwards at 30° and approximate ranges are reported to be: acquisition — 40,000 m (131,240 ft); tracking 23,000 m (75,463 ft). Russian name is Rys.

Seaguard tracking module

F 23 to F 25 only. The second batch of ships has the Seaguard tracker in place of the Drum Tilt used in the first three ships. The tracking module (TMX) is a general purpose tracking module for accurate long-range tracking of air and surface targets for engagement by guns. The TMX uses a combination of I/J-band radar, FLIR, TV, and laser rangefinder sensors. The I/J-band radar is a fully coherent pulse Doppler system using pulse compression and a TWT transmitter. Real-time FFT Doppler processing is used in both acquisition and tracking modes. The radar incorporates random frequency agility over the entire band, MTI, variable pulse compression ratio, CFAR, frequency coded transmission, staggered PRF, and track-on-jam. When equipped with electro-optical sensors the combined system processing techniques provide redundancy, and make the TMX impervious to ECM and multipath effects. Optional second radar receiver and CW injection are available for ship-to-air missile guidance purposes.

Specifications

Frequency: 8.6-9.5 GHz
Antenna: Cassegrain 1.31 m (4.3 ft) diameter
Transmitter: TWT
Peak power: 4 kW
Pulse length: 0.53-4 µs
Tracking range: 300 m to 70 km
E-O sensors: FLIR spectral bandwidth 8-12 µs, Centroid FTT tracking principle; Laser spectral wavelength 1.06 µs with a 25 Hz data rate
Tracker: Unique three-axis, high-dynamic (3 rad/s; 15 rad/s²); hemispherical tracking (elevation: −35 to +120°)

Manufacturer/Contractor

Oerlikon-Contraves AG, Zurich, Switzerland.

SONARS

Graseby G 750

Godavari (F 20) only. The Graseby G 750 search and attack sonar was developed from the British Type 184M and provides accurate fire-control data from two independent automatic tracking systems, whilst simultaneously maintaining all-round surveillance, independent Doppler search, and classification and continuous torpedo warning. Three separate processing and display systems are incorporated for all-round search and tracking; Doppler, and passive search. In the standard G 750 system, an improved version of the Type 184M cylindrical 32-stave transducer is used to form a large number of beams. Range and bearing measurement is by in-beam scanning, obviating the need for separate expanded displays. Target range and bearing are measured by either: using a manually positioned marker technique, in which the circular markers are placed over the target echo, it being the marker position that is measured; or by echo gating, where the echo range and bearing are measured directly. This form of tracking is normally on acquisition of a possible target and is available either with or without computer assistance.

Operational capabilities of the equipment include active detection of submarines throughout 360° and the ability to track two targets simultaneously. Similar detection coverage and tracking capabilities are available in respect of torpedo targets, with suitable outputs to torpedo warning and avoidance systems. There is also an active search capability over a 45° arc with facilities for determining target Doppler. Four 11° beams forming a 45° 'searchlight' are providing a 360° search facility capable of measuring target Doppler up to ±40 knots. Targets can be tracked to a maximum range of 20 km.

Manufacturer/Contractor

Graseby Marine (Graseby Dynamics Ltd) Watford, UK.

Bharat APSOH

Gomati (F 21) *Ganga* (F 22) only. APSOH is an Indian-designed and -developed sonar, produced by Bharat Electronics, which was trialled in *Himgiri* (F 34).

Manufacturer/Contractor

Bharat Electronics, Bangalore, India.

Fathoms Oceanic VDS

Not in *Godavari.* The second (*Gomati* F 21) and subsequent ships are reported to have a VDS produced by Fathoms Oceanics.

Type 162M

Type 162M sonar detects and classifies both mid-water and seabed targets, displaying port and starboard recordings simultaneously on a single straight-line recorder, which has a maximum range scale of 1,200 yd. Operation is simplified by entirely automatic gain control. The three transducers are all similar and employ 49.8 kHz barium titanate elements. Their beam pattern is fan-shaped, about 3° wide and 40° vertical angle; the side-looking elements have their axes 25° below the horizontal. A loudspeaker and a socket for headphones enable signals to be monitored aurally if required. The three range scales are 0 to 300, 0 to 600 and 0 to 1,200 yd, and accuracy is better than two per cent assuming a sound velocity of 4,920 ft/s.

Manufacturer/Contractor

AB Precision (Poole) Limited, Poole, Dorset, UK.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 24.3 × 14.5 m (80 × 48 ft)
Landing aids: French helicopter handling equipment is fitted
Helicopters: The 'Godavari' class has been designed to operate two Sea King-size helicopters, although ships are frequently seen with one Sea King, one Chetak or one Helix.

Westland Sea King Mk 48 B/C ASW helicopter

Specifications

Dimensions:
main rotor diameter: 18.90 m (62.0 ft)
length overall, both rotors turning: 22.15 m (72.66 ft)
fuselage length: 17.02 m (55.83 ft)
height to rotor head: 4.74 m (15.5 ft)
Weights:
max take-off: 9,752 kg (21,500 lb)
internal cargo capacity: 2,720 kg (6,000 lb)
max speed (never exceed): 144 kts (267 km/h)
typical cruising speed: 120 kts (222 km/h)
service ceiling: 3,720 m (12,200 ft)
range with max standard fuel: 630 n miles (1,166 km)
Engines: 2 — 1,092 kW (1,465 shp) Rolls-Royce Gnome H.1400-IT turboshafts
Role equipment: 6 underwing pylons, torpedo bay, 32 sonobuoy ports, 2 depth-charge racks, search radar, FLIR, MAD
Accommodation: 4 (pilot, co-pilot, two sonar operators)
Sensors: Low-frequency 360° AQS-18/AQS-13F sonar; Doppler radar; SMA/APS-707 radar (chin radome)
Weapons: 2 or 4 homing torpedoes, or 4 depth charges or 2 Sea Eagle anti-ship missiles

PROPULSION

Specifications
System: Steam turbines
Main machinery: 2 Babcock & Wilcox boilers; 38.7 kg/cm² (550 psi); 450°C (850°F); 2 Bhopal turbines; 22.4 MW (30,000 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The Indian Navy has long set itself the goal of self-sufficiency in naval matters, which includes the design and construction of its own warships. Thus, having produced six 'Leander' class frigates to virtually the same design as the UK original, the Indian Navy next carried out a modification so fundamental that it is, in virtually all respects, a new class of ship. The first batch of three ships was laid down between 1978 and 1981, and entered service between 1982 and 1988. They have a unique combination of Russian, Western and Indian weapon systems which has inevitably led to some equipment compatibility problems.

A second batch of three has now been ordered from Garden Reach Shipyard in Calcutta, of which the first is due to be commissioned in mid-1997. This second batch is officially designated Project 16A, indicating that there are significant changes in the design. The first ship of this batch was scheduled to start sea trials in 1996, but was delayed by Russian equipment supply problems.

DESIGN

The Godavari hull is somewhat larger than that of the Nilgiri (see Table 1), creating extra volume which is used to accommodate a considerably more powerful weapons fit, of which the most significant is a second Sea King-size helicopter.

The Indian designers rejected the Russian practice of placing the anti-ship launchers alongside the bridge and placed them instead on the foredeck, although the width required is so great that the outer launchers are mounted on sponsons.

It is noteworthy that these ships retained a steam-turbine propulsion system at a time when most new ship designs in other navies were changing to gas turbines.

The second batch of three are larger still, with an increase in length of approximately 4 m (13 ft) and width of 1.5 m (4.9 ft), resulting in a displacement growth of some 1,150 tonnes (full load). This will create yet more internal volume and should also improve stability. The second batch also has some noticeable modifications in the bow area, particularly around the SSM launchers, which may indicate that the elderly SS-N-2 Styx has been replaced by a more modern missile such as SS-N-25. It is also reported that an OTOBREDA 76 mm/62 may be fitted.

These ships have a crew of 313, a large number in comparison with other navies' ships of a similar size, such as the British Type 23 — 169; American 'Perry' (FFG 7) class — and the French La Fayette — 139. Shortage of manpower is not, however, a significant problem for the Indian Navy.

TABLE 1: 'NILGIRI' AND 'GODAVARI' CLASSES: COMPARISON OF DISPLACEMENT AND DIMENSIONS

	Nilgiri	Godavari	
		F 20 - F22	F 23 - F 25
Displacement			
standard	2,682 t	3,600 t	4,500 t
full load	2,962 t	3,850 t	5,000 t
Length	113.4 m (372 ft)	126.5 m (414.9 ft)	130.5 m (428.0 ft)
Beam	13.1 m (43 ft)	14.5 m (47.6 ft)	16.0 m (52.5 ft)
Draught	5.5 m (18 ft)	4.5 m (14.8 ft)	n/k

MODERNISATION

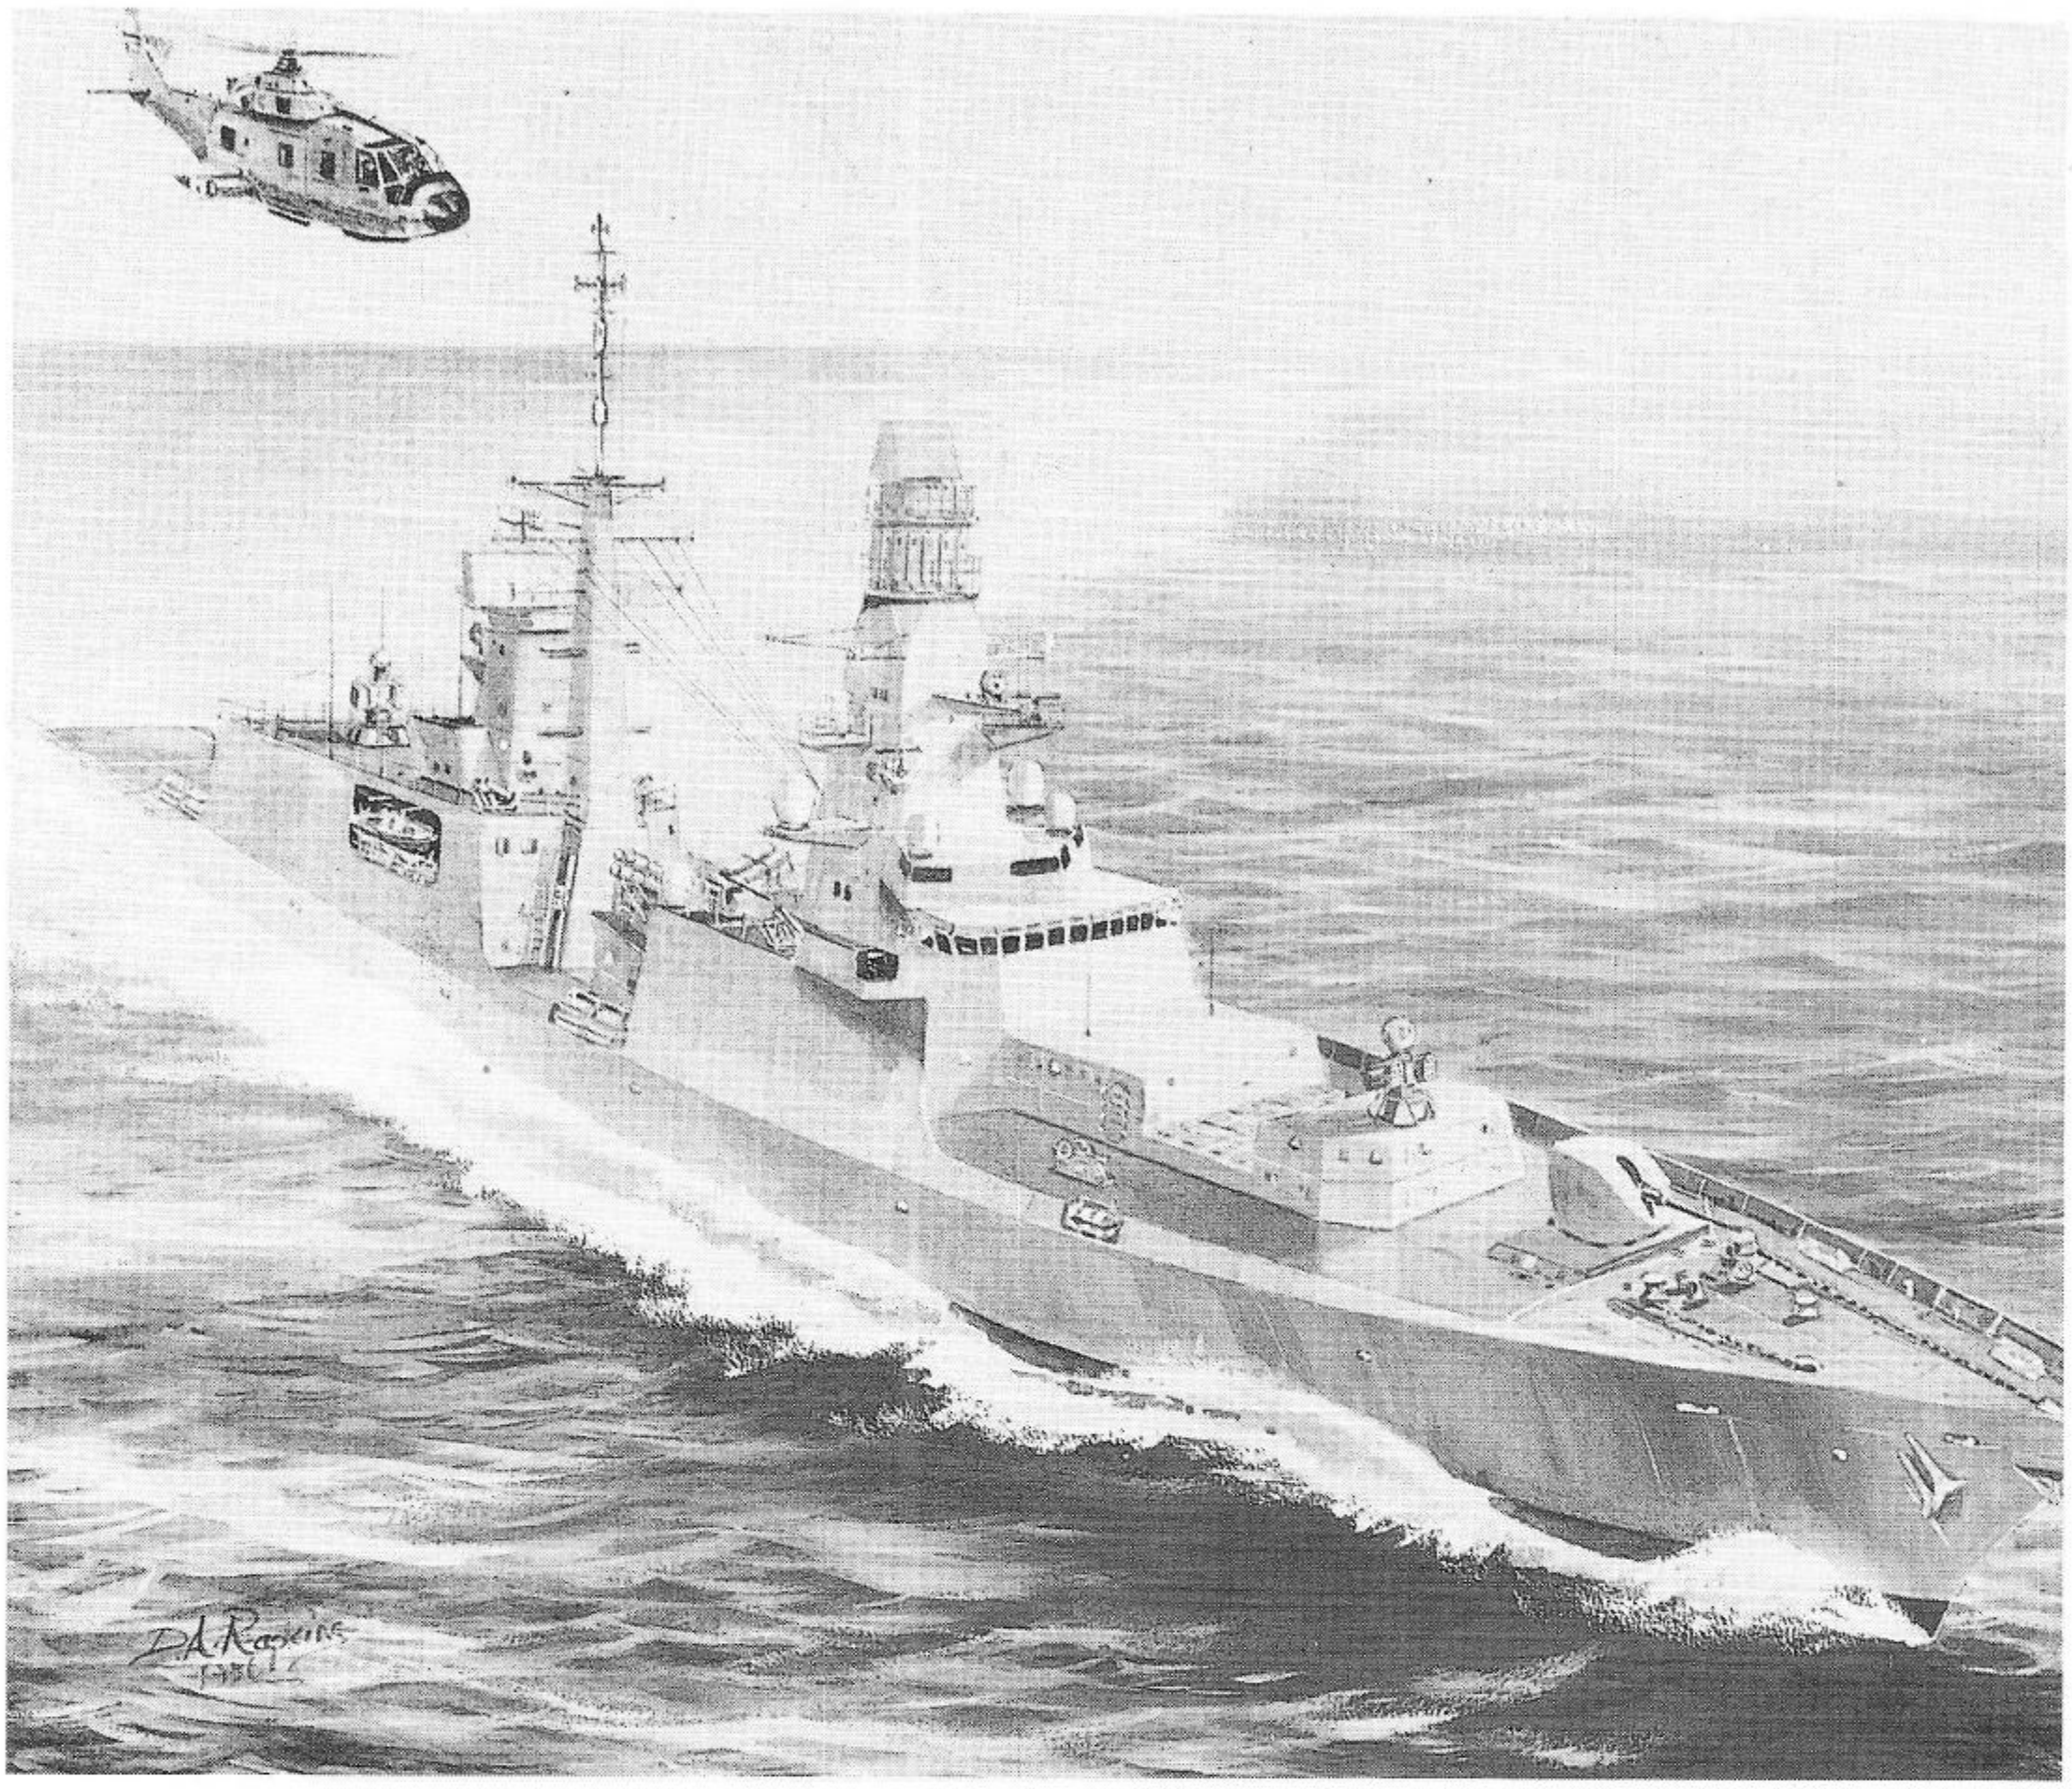
A variety of modernisation programmes is under consideration for the first three ships, including:

Fitting the Indian-developed Trishul surface-to-air missile. Trishul is a rapid reaction missile primarily intended for use against incoming sea-skimming missiles.
Replacing AK 230 guns by AK 630 Gatlings.

Godavari *(F 20). The Sea King helicopter takes up a great deal of room on the flight deck. At the foremast head is the Russian Head Net C radar, with, above it, the Italian Elettronica ESM array, and at the mainmast head is the Dutch Signaal LW 08.*

HORIZON

(Common New-Generation Frigate (CNGF))



An artist's impression of a possible configuration of the UK Royal Navy version of the CNGF

GENERAL SPECIFICATIONS

Operators: France/Italy/UK

Class: HORIZON

Active: 0
Building: 0
Proposed: Italy—4; France—6; UK—12

Displacement:
full load: 6,300 t

Dimensions
Length: 148.8 m (488.2 ft)(oa); 140 m (459.3 ft)(wl)
Beam: 19.9 m (65.3 ft)(max); 17.6 m (57.7 ft)(wl)
Draught: 5.4 m (17.7 ft)

Speed: 30 kts
Range: 7,000 n miles at 18 kts

Complement: 235

Note
These figures are based on Joint Indicative Design #2 and the final design may well differ in detail.

SHIPS

Horizon #1	
Builder	France or Italy
Laid down	Apr 1999
Launched	Jul 2001
In service	Jun 2004
Horizon #2	
Builder	France or Italy
Laid down	Oct 1999
Launched	Apr 2002
In service	Mar 2005
Horizon #3	
Builder	Yarrow, Clydebank, UK
Laid down	Nov 2000
Launched	Feb 2003
In service	Mar 2006

Note
These are speculative dates, based on the programme at August 1996. Note that Horizon #1 will be built in either France or Italy, and that Horizon #2 will be built in whichever of those two does not build Horizon #1. The builders will be: France — DCN Lorient; Italy — Fincantieri, Riva Trigoso. Horizon #3 will be built in the UK.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

There will be eight surface-to-surface missiles with a range of 80-160 n miles (150-300 km).These are 'non-developmental items' and it is reported that the competing systems are:

Aerospatiale — ANNG *(Anti-Navir Nouvelle Génération)*
Alenia-OTOSystemi — Ulisee/Teseo Mk 3
Saab Dynamics — RBS 15 Mk 3
McDonnell Douglas — Harpoon 2000

SURFACE-TO-AIR MISSILES (SAM)

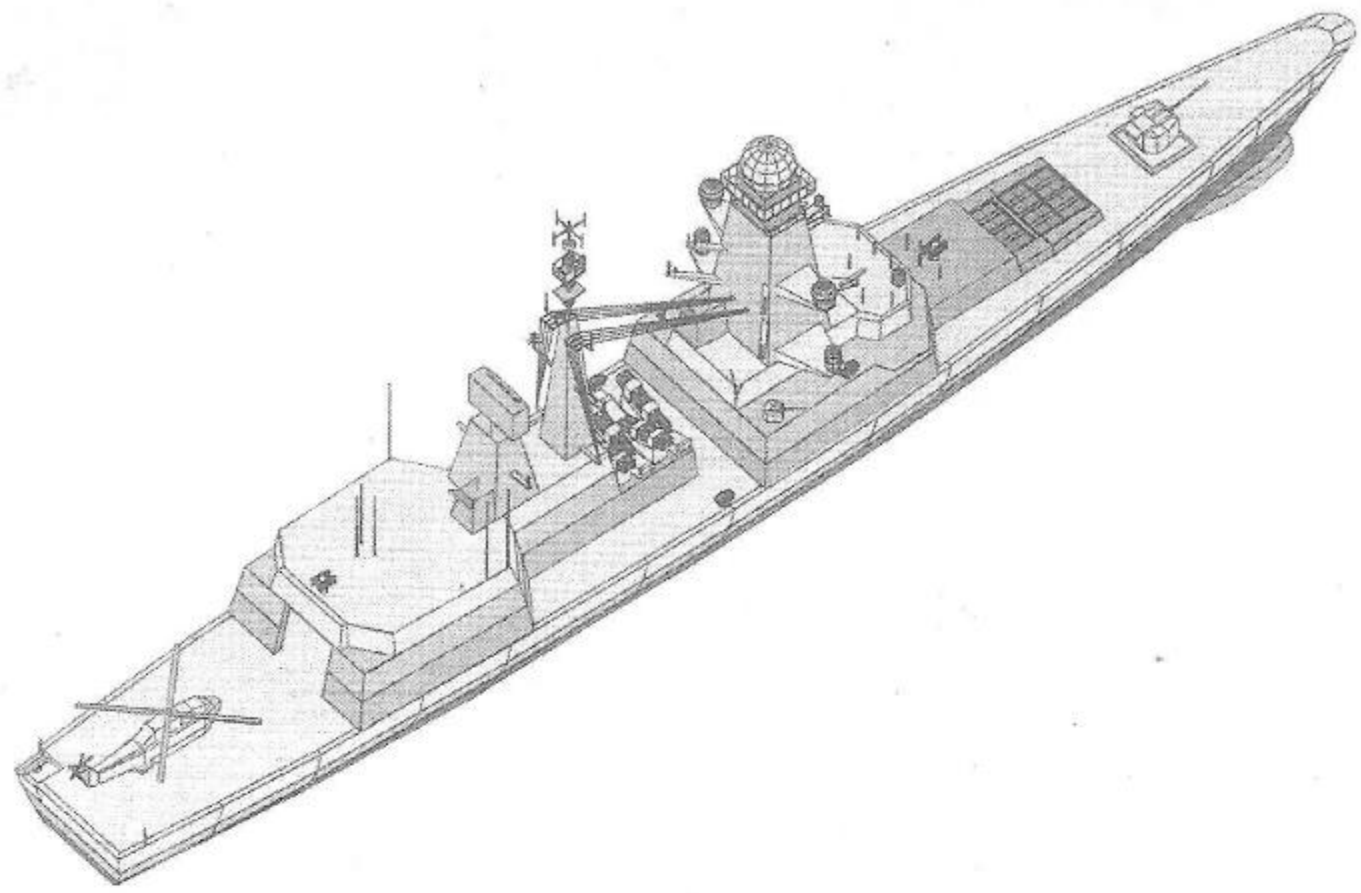
PAAMS VLS

The main anti-air system will be PAAMS (principal air defence missile system). This will comprise a 48-cell vertical launch system mounted in the foredeck, missiles, command and control equipment, a three-dimensional multifunction radar (MFR) and a three-dimensional long-range radar (LRR). The missiles will be two variants of the Aster missile: sixteen Aster 15 and thirty-two Aster 30 weapons.

ILMS

There will be two ILMS (inner layer missile system). The competition for this short-range system has been deliberately left open to either missile or gun solutions and it is reported that potential systems include:

- BAe Dynamics — Naval ASRAAM
- Matra — Sadral
- OTOBREDA — 25 mm Myriad
- Royal Ordnance — 35/1000 Millenium cannon
- Shorts Missile Systems — Seastreak
- VSEL Armaments (with Hughes) — RAM



A computer-generated model of one possible version of the Horizon frigate (DCNI)

TORPEDOES

There will be two twin torpedo launchers, the only current known criterion being that the chosen system must be capable of launching either the Mu 90 (France and Italy) or Sting Ray (UK) torpedoes.

GUNS

127 mm

There will be one 127 mm gun in 'A' position. Current competitors in this field are reported to be:

- OTOBREDA (with VSEL) — 127 mm Alleggerito
- Royal Ordnance (with United Defense) — 127 mm (5 in) Ultra Lightweight

Small Calibre Gun System (SCGS)

There will be two 30 mm cannon, probably on the forward superstructure.

ELECTRONIC WARFARE SYSTEMS

Electronic Warfare (EW)

The Electronic Warfare System (EWS) will be a comprehensive soft-kill package, comprising radar-band ESM and a combination of onboard jammers and offboard decoys, all co-ordinated by decision support software, which will presumably include softkill/hardkill scheduling. There is reported to be general agreement on the requirement except for one area, where Italy is a proponent of 'cross eye' jamming using solid-state onboard systems, while both France and UK prefer using off-board decoys for angular seduction.

Communications band ESM will be the subject of separate national programmes.

DECOYS

There will be four chaff and IR flare launchers and an anti-torpedo defence system.

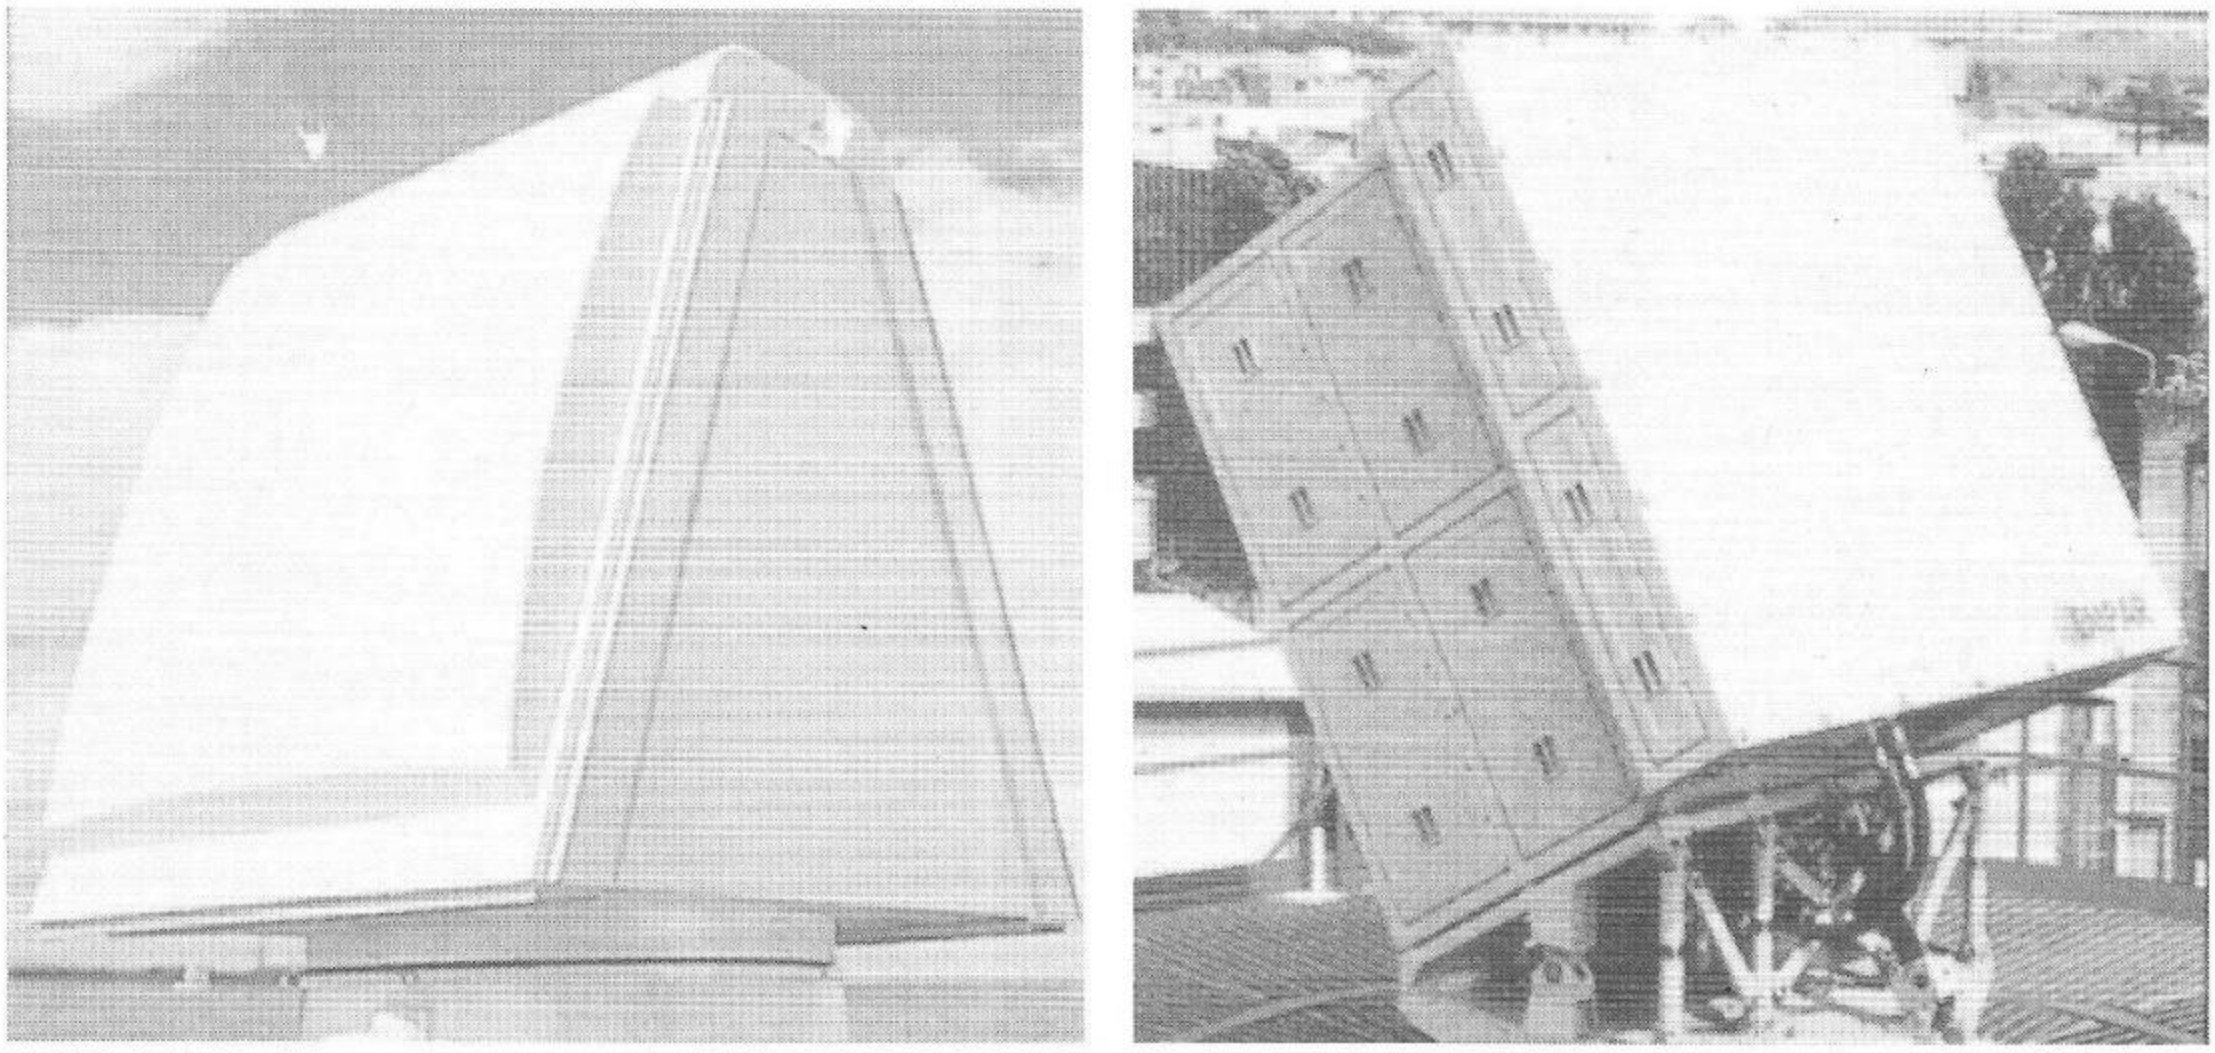
COMMAND AND CONTROL SYSTEMS

COMBAT MANAGEMENT SYSTEM

The Combat Management System (CMS) will combine the functions of real-time command and weapon control; longer-term command support; and own-platform operational information.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 16
Satcom: To be installed.



One of the major areas of difference is that France and Italy have opted for the Empar radar (right) while the UK wants the Siemens-Plessey Sampson (left)

RADARS

There will be three sets:
- Air/surface search
- Surveillance/fire control
- Surface search: I band

SONAR

There will be one bow-mounted sonar set.

AVIATION

HELICOPTERS

It has already been decided that helicopters will be approved national variants:
- France — NH 90
- Italy — EH-101
- UK — Merlin

PROPULSION

Four machinery options are currently under consideration:

System 1: combined diesel, electric and gas turbine (CODLAG), based on the Rolls-Royce Spey SM1C gas turbine, with unspecified diesels and two electric motors.

System 2: combined diesel, electric or gas turbine (CODLOG), in which the gas-turbine component would be the Westinghouse/Roll-Royce WR-21 intercooled/ recuperated (ICR) engine, with unspecified diesels and two electric motors.

System 3: combined diesel or gas turbine (CODOG), based on the General Electric LM-2500 gas turbine.

System 4: combined diesel or gas turbine (CODOG), based on the WR-21 (ICR) engine

All
Shafts: 2

FURTHER INFORMATION

OVERVIEW

This three-nation project involving France, Italy and the UK for a new air defence ship has its origins in the collapse of the eight nation NATO Frigate for the 1990s (NFR90). The Joint Project Office (JPO) was established in London, UK in 1993 and the initial Memorandum of Understanding (MoU) for joint development was signed on 11 July 1994. The aim is to produce an air defence frigate which will enable the three countries to replace current classes:

One of the most fundamental features in the project is that the principle weapons system (PAAMS) is being managed by a separate structure from that of Horizon. What is now the PAAMS trinational project originated in the bi-national Franco-Italian *Famille de Systèmes Anti-aériens Futurs* (FSAF) and there were protracted discussions and much negotiating before the UK was able to join. This caused some 18 months delay, which had a knock-on effect on the Horizon project. This has, however, been overcome and certain parts of the project have been altered to suit the UK's wishes, while the UK has had to pay some FFr 1.5billion ($290 million) to compensate France and Italy for work already done. The UK will also bear most of the extra costs arising from the integration of the Sampson radar.

PROGRAMME

The programme started with an MoU (Memorandum of Understanding) signed on 11 July 1994, which laid down the framework for managing the project and the long-term procurement strategy. This is being followed by a number of supplementary documents, which commit the funds to each stage of the project:

Preliminary supplement. This covered the first segment of definition studies and was assigned at the same time as the MoU (11 July 1994).

Supplement 1. This covers the main part of design definition and was signed on 23 March 1996 (18 months behind schedule)

Supplement 2. This covers the design, build, trials and acceptance of the three first of class ships, of which one is to be built in each of the participating countries. This is scheduled to be signed in mid-1998.

Supplement 3. This will cover the first full production batch, currently estimated to amount to between four and eight ships. It is estimated that this will be signed some two years after Supplement 2.

Supplements 4 onwards. Each further procurement batch will then be funded by further supplements.

DESIGN

The operational requirement is for an area air defence ship, which is capable of defending a task group against early 21st century air threats. It is also required to include command facilities and accommodation. Secondary capabilities include anti-surface warfare, naval gunfire support and anti-submarine warfare.

Initial design studies were carried out on a national basis by DCN Ingenierie (France); Marisat/Fincantieri (Italy); and BMT Defence Services (UK). These were integrated by a trinational working group, operating in conjunction with the JPO, to prepare a Joint Indicative Design (JID). JID1 was presented to the three partner countries in July 1993, which led to JID1(revised). Further revision resulted in JID2, which was completed in early 1995 by the IJVC, and which is intended to provide a common reference design for feasibility and costs purposes, and to provide the IJVC with background feasibility studies to support design definition in critical areas.

MANAGEMENT ORGANISATION

The management and implementation of the project is the responsibility of three principle organisations:

Steering Committee (SC). The SC is a high-level, tri-national, intergovernmental body established under the authority of the three National Armament Directors (NAD).

Joint Project Office (JPO). The JPO manages the Horizon project on behalf of the three governments and is responsible for defining the technical specification, reviewing work progress against specification and ensuring that the warship meets performance requirements within the agreed timescale and budget. As the Warship Procurement Authority, the JPO assumes an overall co-ordinating role between the warship, PAAMS and (during Phase 1) the FDI equipment consortia. The JPO is located in London and reports to the Steering Committee.

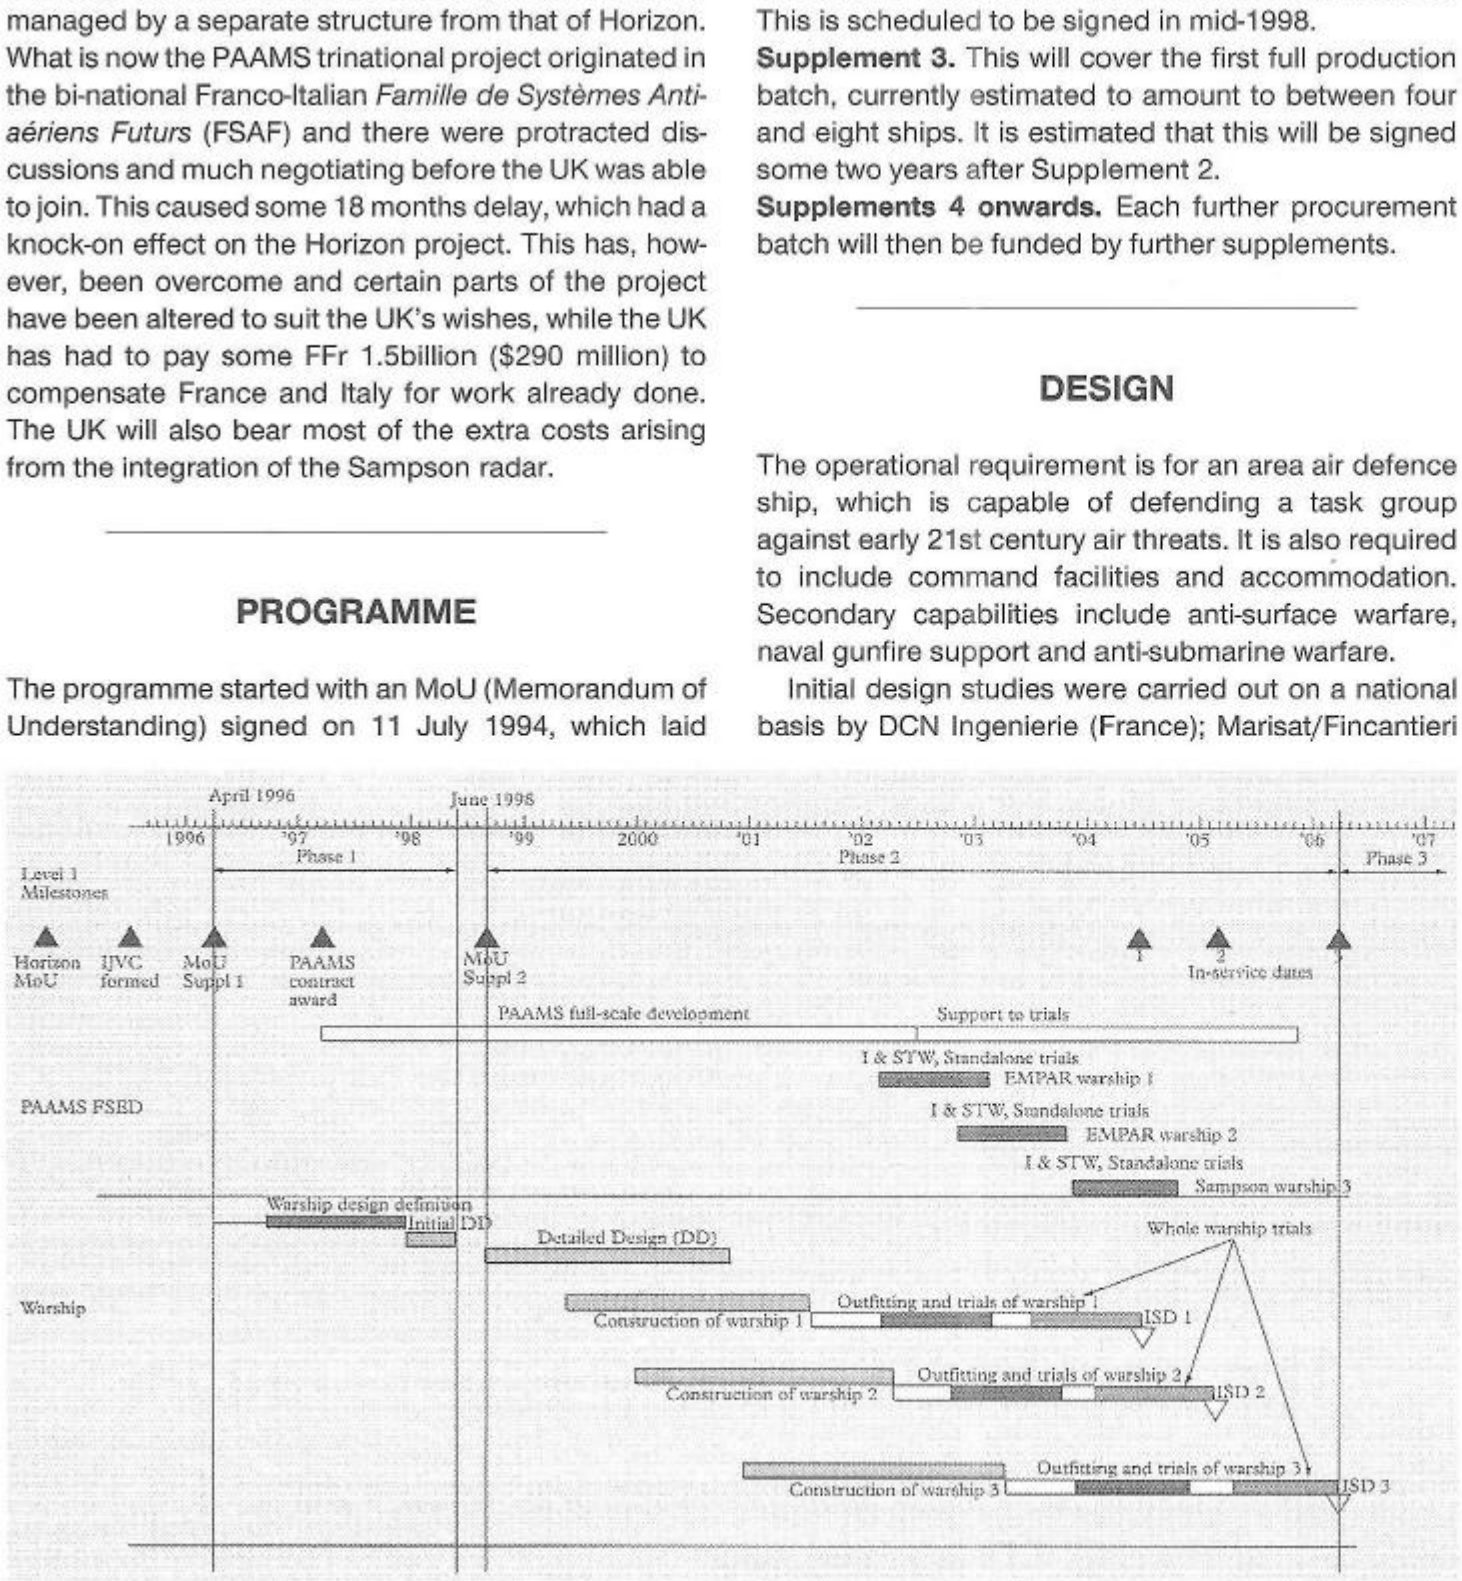
International Joint Venture Consortium (IJVC). The IJVC is owned in equal shares by three national companies: Italy — Orizzonte SpA (jointly owned by Fincantieri and Finmeccanica); France — DCN International; and UK — GEC Marine. IJVC is responsible for managing the programme, subcontracts; and industrial implementation. The IJVC will undertake warship design definition, detailed design, and construction of the three first of class ships. It will also be responsible for systems integration, the Shore Integration Facility (SIF), and procurement, on a best value for money basis, of the three FDIs and all NDIs.

EQUIPMENT FOR PROJECT HORIZON

Equipment for Project Horizon will come from four sources:

Government Furnished Equipment (GFE). The PAAMS system will be produced under separate arrangements and will be transferred to Horizon ships as GFE.

Full Development Items (FDI). FDIs are three major systems which require original design and full development.



This table has been assembled using information released by IJVC Horizon in early 1996. It should be noted that this timetable assumes a three-month gap between the end of Phase 1 and commencement of Phase 2.

The Horizon programme as it stood in late 1996 (Jane's Navy International)

TABLE 1
Air Defence Frigates being Replaced by Project Horizon CNGF

	FRANCE		ITALY		UK
Class	Suffren	Cassard	Doria (Note 1)	Audace	Type 42 (Note 2)
Number in service	2	2	2	2	12
Entered service	1967-1970	1989-1991	1964	1972	1976-1985
Displacement (full load)	6,910 t	4,700 t	6,500 t	4,400 t	4,100 t
Principle weapon system					
Type	Masurca	Standard SM-1MR	Standard SM-1ER	Standard SM-1MR	Sea Dart
Launcher	1	1	1	1	1
Arms	twin arm	one arm	twin arm	single arm	twin arm
No of missiles	48	40		40	22

Number	—	1	3	2	1
Crew	355	244	484	380	253

Notes
1. The Italian 'Andrea Doria' class air defence ships left service in the late 1980s. Nevertheless, it has always been the intention of the Italian Navy to replace this capability.
2. There are differences between Batches 1, 2 and 3; for the purposes of this table Batch 1 specifications are given.

Non-Development Items (NDI). NDIs will be off-the shelf systems procured within the market-place.
Approved national variants. These are items which, as a result of tri-national agreement, will be procured by the nations themselves.

FULL DEVELOPMENT ITEMS (FDI)

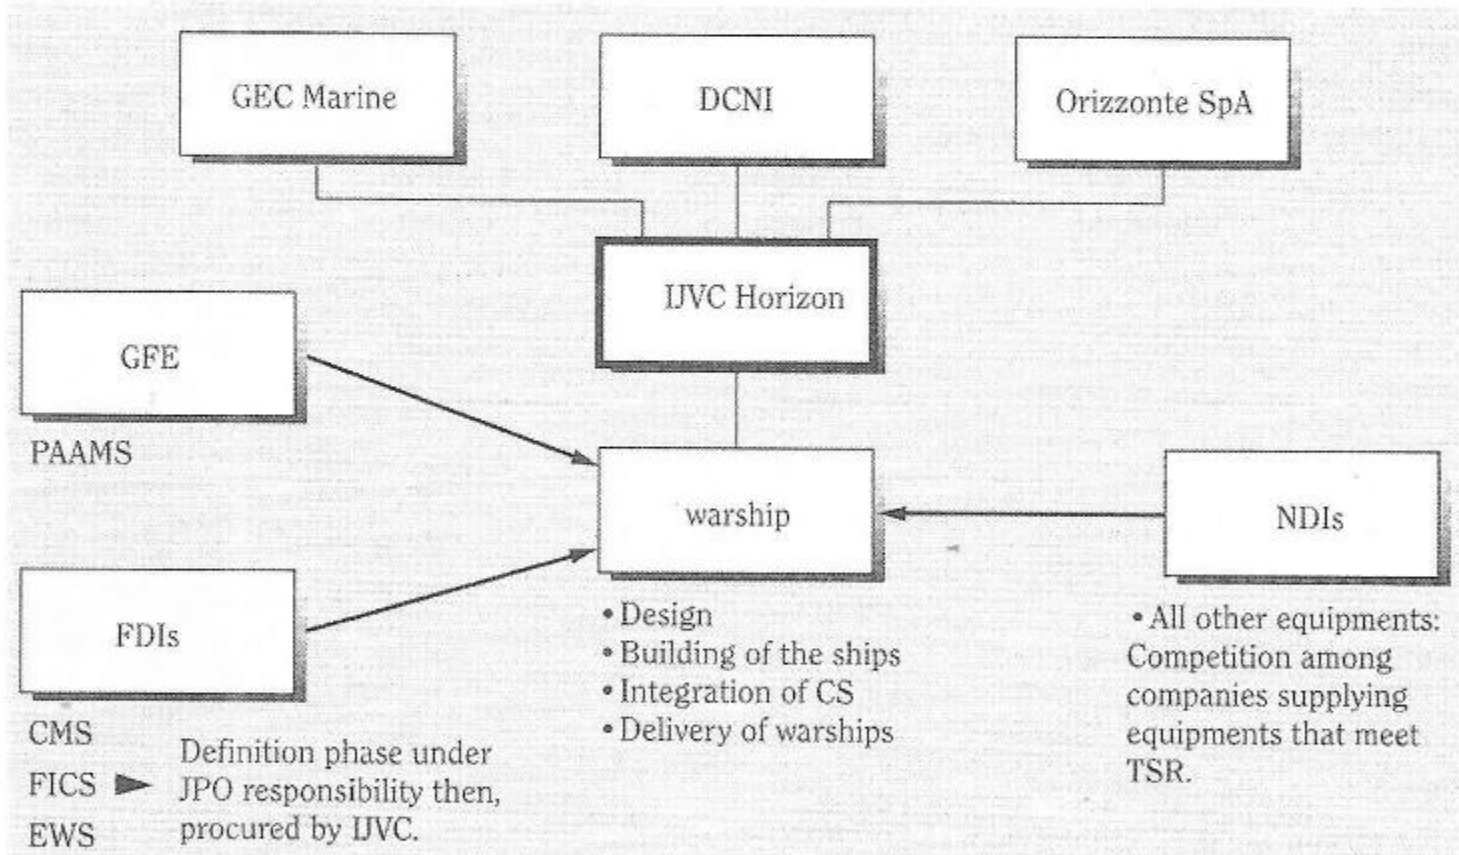
There are three FDIs, each of which will follow the same path of: competitive project definition; selection; full development, acceptance and production. The JPO is leading for the project definition phase and will then hand over responsibility to IJVC Horizon. The three FDIs are:

Combat Management System (CMS). This combines the functions of real-time command and weapon control; longer-term command support; and own-platform operational information. Two industrial consortia started parallel, 2-year, £8 million ($12.4 million), project definition studies in April 1996 for completion in mid-1998:

- EUROCOMBAT. BAeSEMA (UK); Thomson-CSF (France); Alenia Elsag Sistemi Navali (Italy).
- HEPIC EEIG. Ferranti Naval Systems (part of GEC-Marconi S3I (UK); Horizon CMS France (CS Défense, Dassault Electronique, MATRA-CAP Systèmes; Datamat (Italy).

Electronic Warfare System (EWS). The EWS will be a comprehensive soft-kill package, comprising radar band ESM; onboard jammers and offboard decoys, co-ordinated by decision support software (communications band ESM will be the subject of separate national programmes). There is general agreement on the requirement except for one area, where Italy is a proponent of 'cross eye' jamming using solid-state on-board systems, while both France and UK prefer to use offboard decoys for angular seduction. The two groups currently carrying out Phase B project definition are:

- ARCEO. Racal-Thorn Defence (UK); Alenia Elsag Sistemi Navali (Italy); CS Défense (France)
- JANEWS. Elettronica (Italy); Horizon GIE (France) (Thomson-CSF, Dassault Electronique); GEC-Marconi Radar and Defence Systems (UK).



IJVC = International Joint Venture Consortium
GFE = *Government Furnished Equipment*
NDI = *Non-Development Item*
FDI = *Full-Development Item*
CMS = *Combat Management System*
FICS = *Fully Integrated Communication System*
EWS = *Electronic Warfare System*
IJVC Horizon Management Structure (Courtesy: Jane's Navy International)

Fully Integrated Communications System (FICS). FICS will manage all external and internal communications systems, including HF; VHF; UHF; NATO datalinks (Links 11, 14 and 16); and may also include satellite communications (SHF and EHF). FICS will also manage internal communications systems, including message handling/distribution and voice telephone links. Among the issues to be addressed in the PD studies are communications security, interoperability, and, at an industrial level, work-sharing. The three competitors for FICS are:

- NICCO. Thomson-CSF (France); Redifon-MEL and GEC-Marconi Communications (UK); Elmer (Italy)
- Alcatel (France), VSEL (UK); Alcatel Teletra (Italy)
- Italtel (Italy); Siemens Plessey Systems (UK); Racal Communications (UK); Bull SA Europe (France); Dassault Electronique (France).

NON-DEVELOPMENT ITEMS (NDI)

Most of the ships' subsystems will be purchased 'off-the-shelf' as non-development items (NDI). The procurement strategy in this area is that, provided bids meet the technical requirement, first preference will be given to solutions from French, Italian or British companies; second preference will be given to bids from other European Union member nations; finally, the competition will be opened to worldwide competition. Among the systems currently notified to industry as falling in this category are:

Weapons

Medium Calibre Gun System (MCGS), comprising 127 mm gun, complete with mounting, gun control, magazine, handling system, computer controls and all munitions

Small Calibre Gun System (SCGS) with stabilised line of sight

Surface-to-Surface Guided Weapon (SSGW) with 150-300 km range

Inner Layer Missile System (ILMS) for close-range air defence (despite the term 'missile' this could be a gun-based system)

Torpedo Launch System (TLS) capable of launching MU 90 and Stingray.

Sensors

Bow-mounted medium-frequency sonar

IMO-compliant navigation system

IMO-compliant navigation radar

Meteorology and Oceanographic system

Surface surveillance radar.

Communications

Underwater telephone

IFF interrogator/responder compatible with IFF Mk XII.

Data

Data Transfer System (DTS) which will act as the backbone of the combat system, interconnecting the subsystems which require real-time tactical data exchange.

Approved national variants

While it is the intention of the three governments and navies to achieve the maximum commonality, seven national variants have already been approved:

the embarked helicopter, which will be: NH-90 (France); EH-101 (Italy); Merlin (UK)

helicopter-launched air-to-surface missile: AM 39 (France); Marte (Italy); Sea Skua (UK)

lightweight torpedo: MU 90 (France, Italy); Stingray (UK)

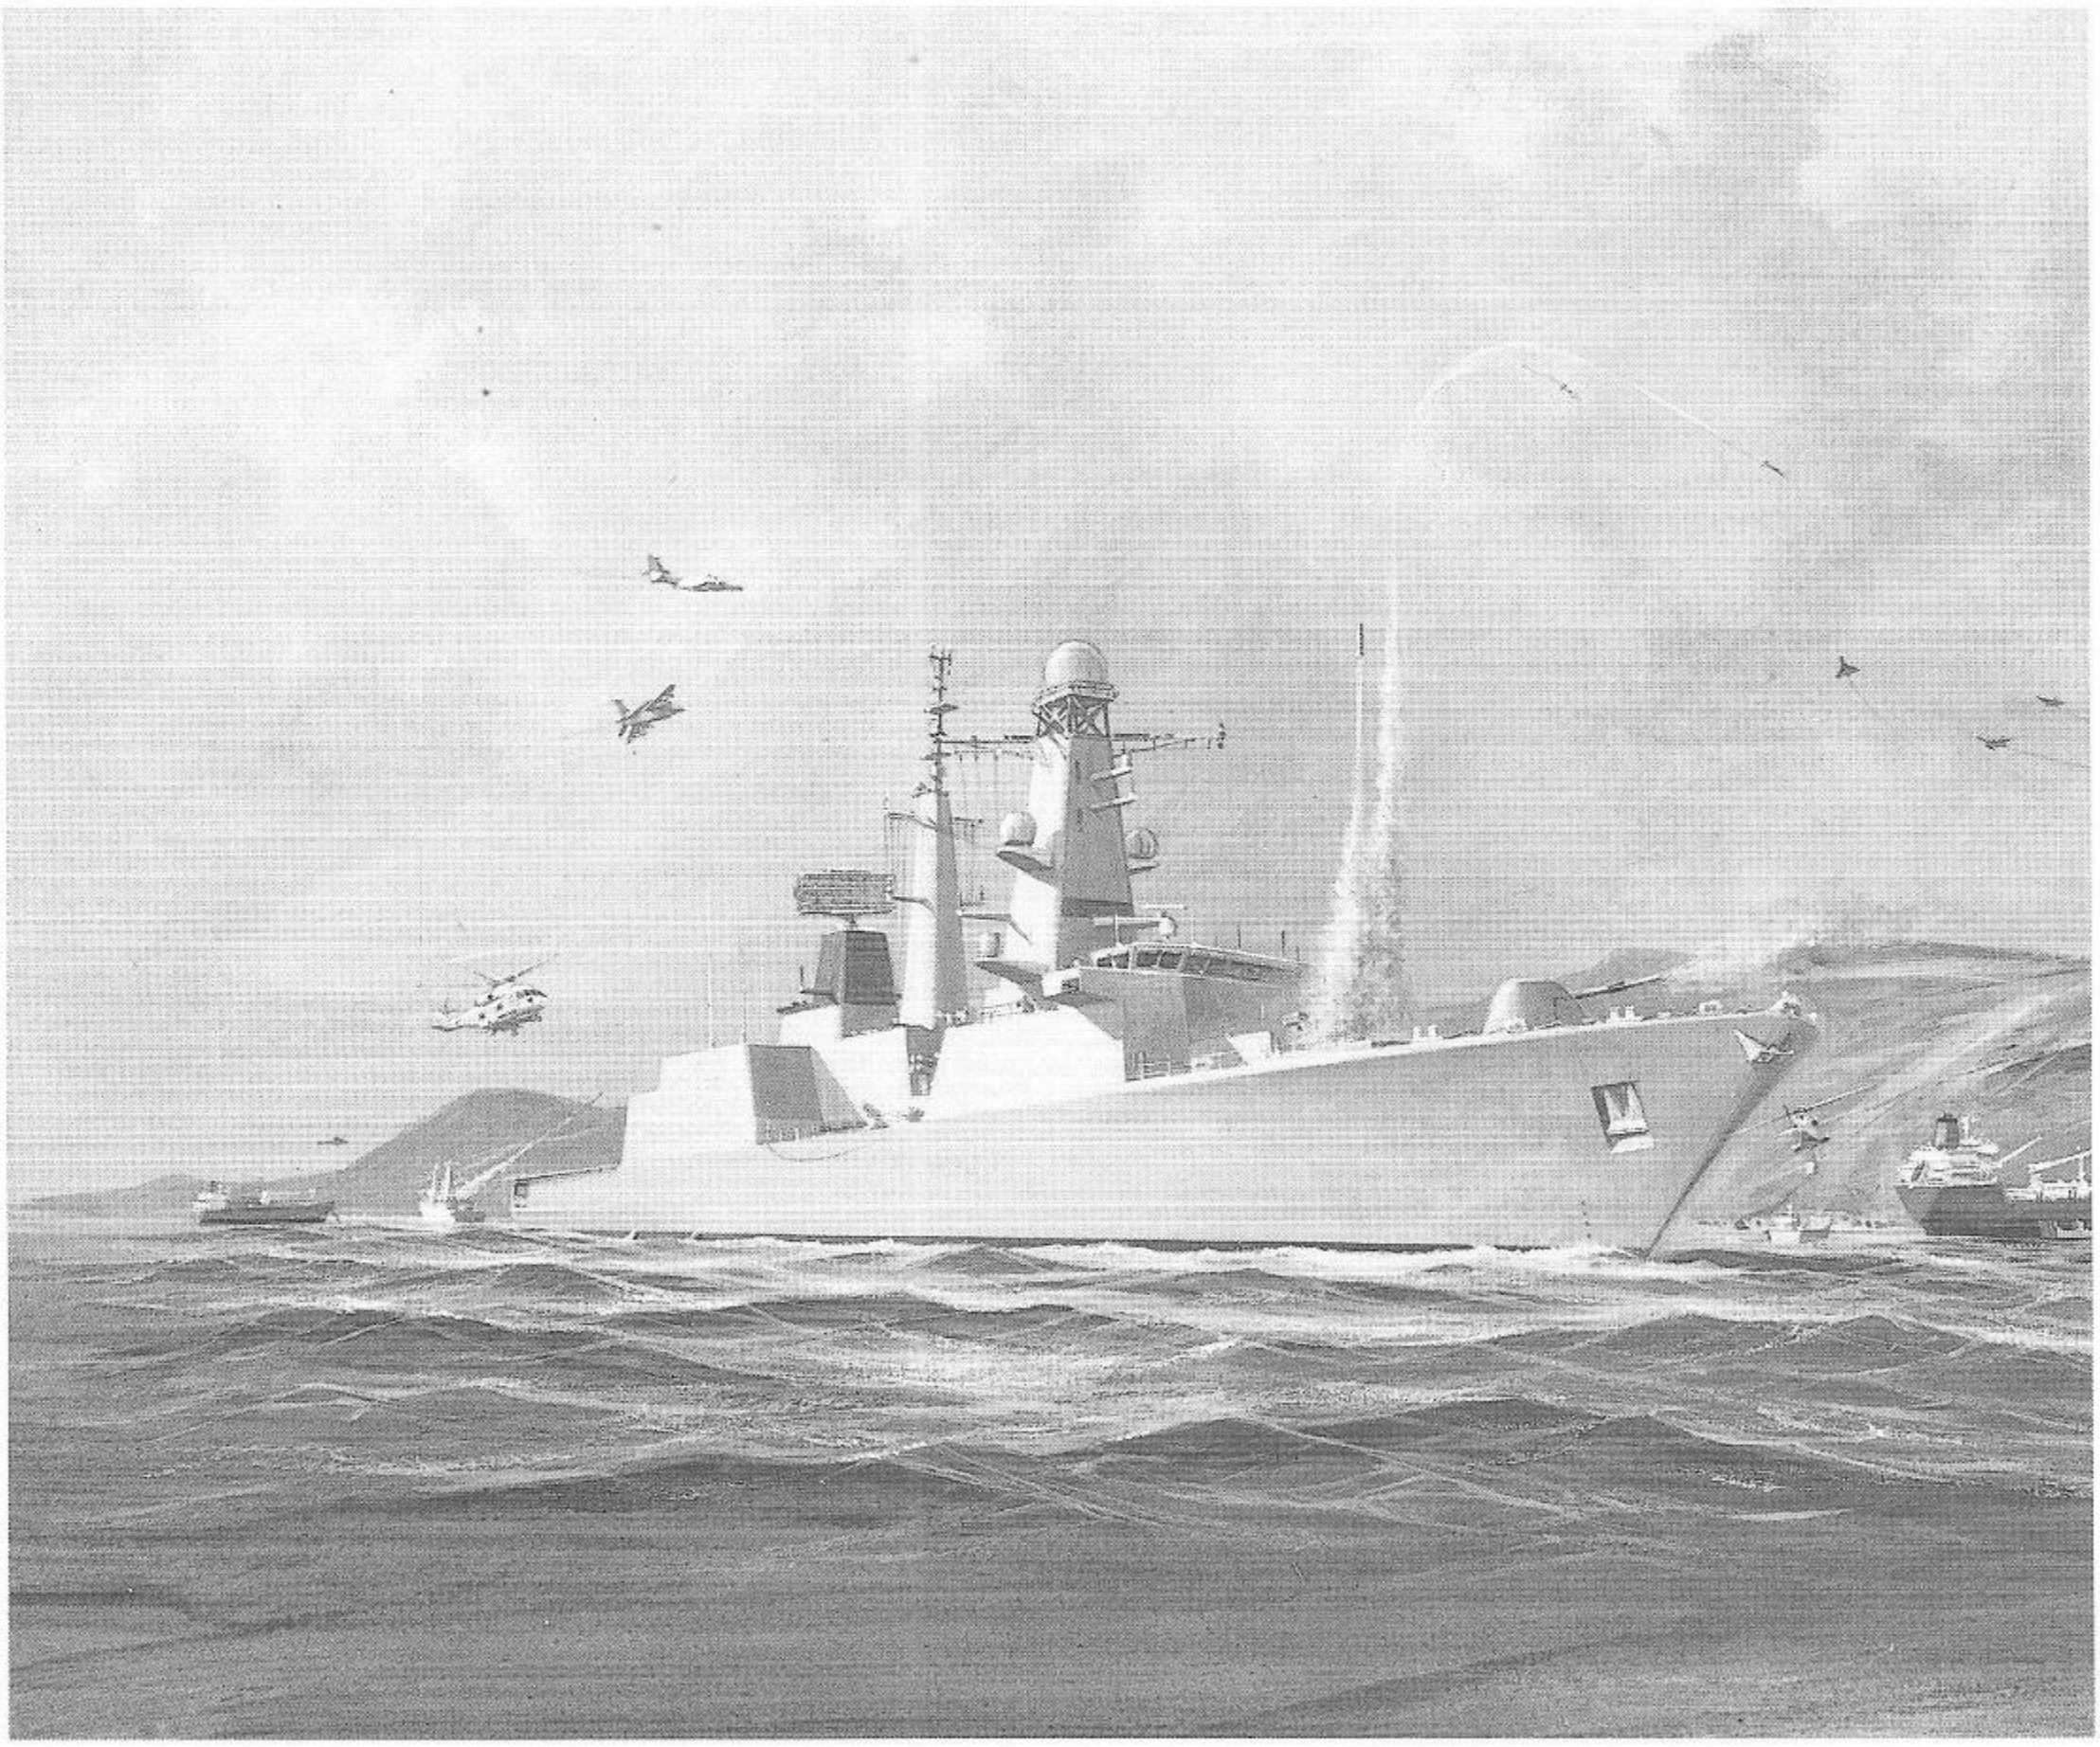
torpedo defence: SLAT (France, Italy); SSTD (UK)

CMS interfaces/interoperability with specific equipments

ship's lifeboats

accommodation (to take account of national differences in space allocation).

Any additional variants must be approved at national armament director/chief of staff level, and the country concerned will bear all additional costs.



Artist's impression of two Horizon frigates providing air defence for an amphibious landing force (Project Horizon JPO)

TRILATERAL FRIGATE CO-OPERATION (TCF) PROGRAMME

(Dutch/German/Spanish Air Defence Frigate)

OVERVIEW

There is no doubt that, for all their good intentions, international collaborative programmes are exceptionally difficult to run, a problem exemplified by the NATO Frigate for the 1990s Programme. As a result, when, in 1989-1990 the NFR 90 project collapsed, the German, Netherlands and Spanish navies, having established that they had generally similar requirements, decided to undertake a much looser form of co-operation. The key to the concept was to co-operate where it was feasible, productive and easy to achieve, and to go their own ways when it was not. What they sought to avoid was the massive bureaucracy, incessant discussions, endless meetings and compromises, and, not infrequently, bad feeling as well, that seemed to be inescapably involved in the more traditional type of collaborative programme.

Their proposal was helped by the fact that all three countries had previous experience of such a project. Germany and the Netherlands had co-operated very well over the Type 122 ('Bremen' class), while the Netherlands and Spain had worked together to their mutual benefit with the AOR ('Patino/Amsterdam' classes) and the LPD ('Rotterdam/Juan de Austria' classes) programmes. The outcome is three types of ship — Type 124 (Germany), LCF (Netherlands) and F 100 (Spain) — as shown in Table 1.

TABLE 1. THE TCF (GERMANY/NETHERLANDS/SPAIN) FRIGATE — SUMMARY OF MAJOR CHARACTERISTICS
(Characteristics of Horizon frigate (UK version) added for purposes of comparison)

Ship	Type 124	LCF	F 100	Horizon (UK version)
Country	Germany	Netherlands	Spain	France/Italy/UK
Number planned	3	2	4	20
Displacement (full load)	4,700 t	5,860 t	5,761 t	6,500 t

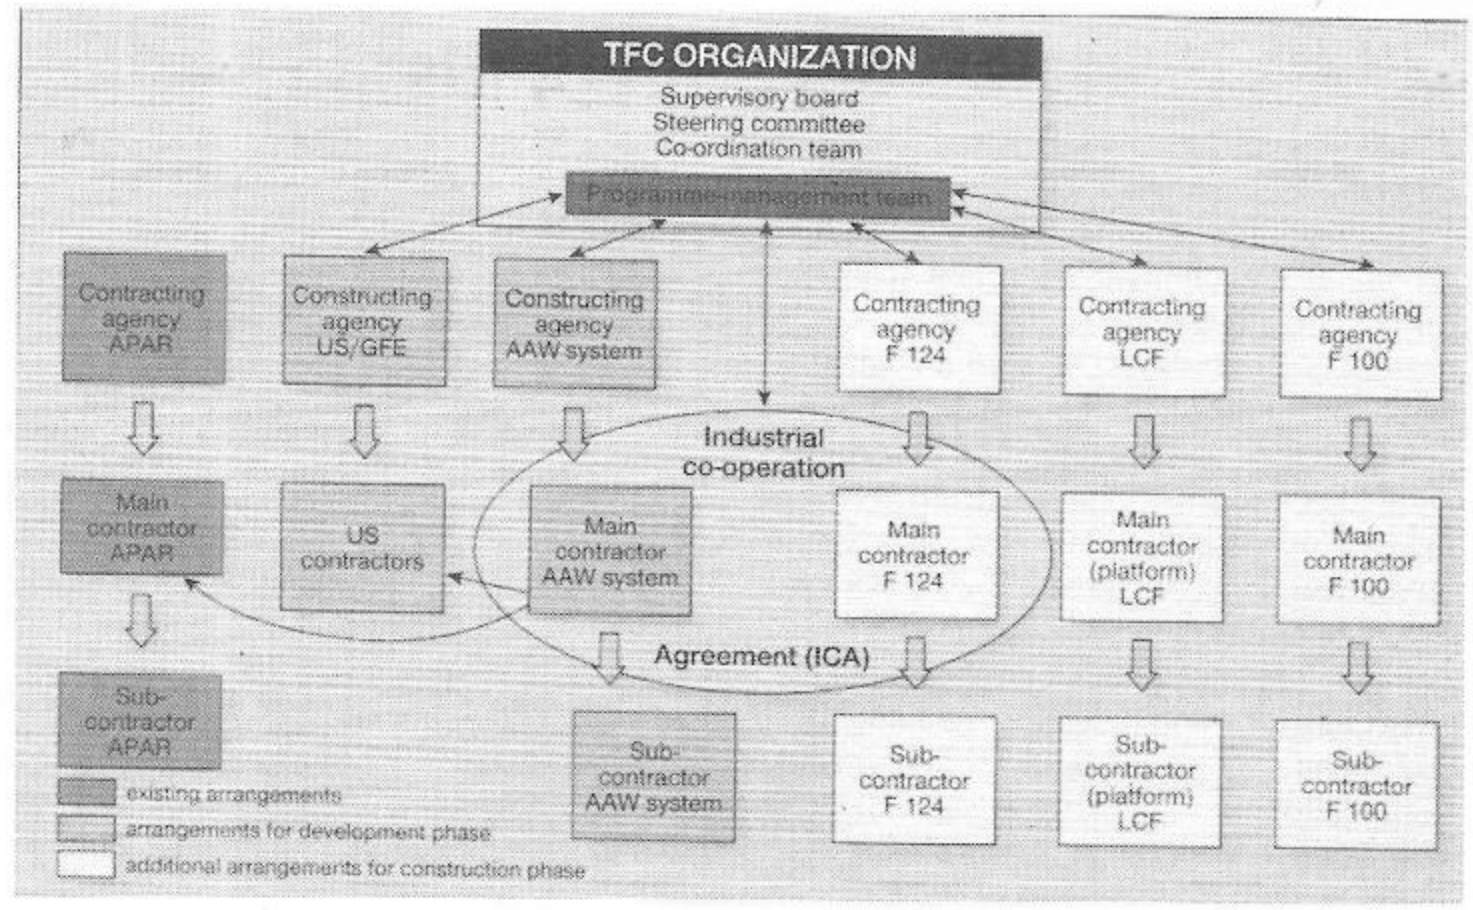
The Memorandum of Understanding (MoU) which established the TCF programme defined five major objectives:

- maximise, as far as is practicable, the harmonisation of the three national ship designs
- co-operate in identifying common ship and combat systems
- share non-recurring development costs
- to use common procurement to maximise economies of scale and reduce purchase price
- establish joint in-service support for the ships

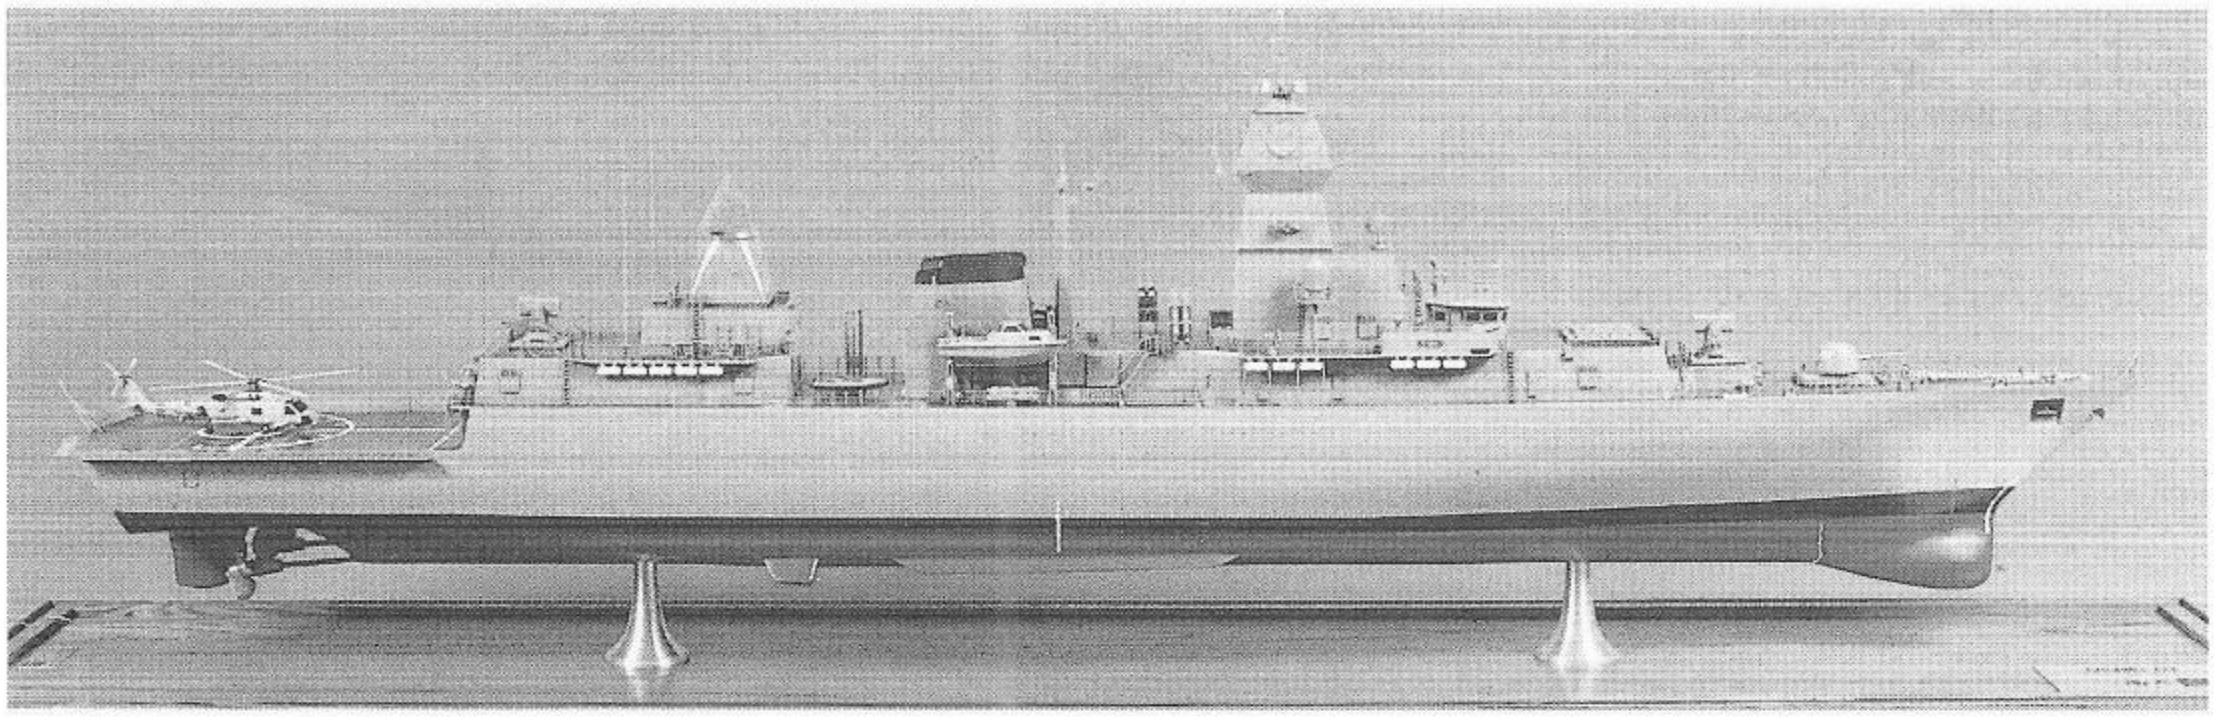
The major area of co-operation was to have been the common anti-air warfare (TFC AAW) system, which would have included the APAR phased-array radar, Standard SM-2 Block III SAM; Evolved Sea Sparrow Missile (ESSM); Mk 41 VLS; and a common C^2 core, linked to national CDS variants. At meetings in late 1994 there were some reservations about the interoperability of APAR with Standard SM-2 and ESSM, since the new Signaal radar uses Interrupted Continuous Wave Illumination (ICWI). Despite assurance that there would be no technical problems, Spain decided to pull out of the AAW project in June 1995.

A Dutch-German-Canadian MoU was signed on 9 July 1996 which sanctioned joint continuation of the project.



The management organization of the Trilateral Frigate Co-operation programme (Jane's Navy International)

SACHSEN (TYPE 124)



A model of Sachsen (ARGE F 124)

GENERAL SPECIFICATIONS

Operator: Germany
Type: Type 124

Class: SACHSEN

Active: 0
Ordered: 3

Proposed: 1

Displacement:
full load: 5,600 t

Dimensions
Length: 143.0 m (469.2 ft)

Beam: 16.7 m (54.8 ft)
Draught: 4.4 m (14.4 ft)

Speed: 29 kts

Complement: 200

SHIPS

The ships will be named *Sachsen* (F 219); *Thüringen* (F 220); *Hessen* (F 221); and (if ordered) *Hamburg* (F 222).

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84B Harpoon

There will be eight Harpoon launcher-containers mounted on the upper deck between the mainmast and the twin stacks, with each group of four facing across the ship at 90° to the centreline.

This missile can either fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses or it can approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. It can also use selectable seeker search expansion patterns and, for the terminal phase, can use either a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

GMVLS Mk 41 Mod 3 Vertical Launch System

The Type 124 frigates will be equipped with a Guided Missile Vertical Launch System (GMVLS) Mk 41 Mod 3 with two 16-cell launch cells for a mix of 32 Standard SM-2 and Evolved Sea Sparrow missiles. Each of the two launcher modules is 6.86 m (22.5 ft) high and contains sixteen Mk 22 canisters which are 5.79 m (19 ft) deep and weigh 1,503 kg (3,314 lb) (complete with missile).

Standard Missile 2 Medium-Range (SM-2MR) Block 3

The Type 124 will carry Standard SM-2MR, which can be used for surface-to-air (including passive home-on-jam) and surface-to-surface engagements. The propulsion section uses the Thiokol Mk 104 dual-thrust rocket motor with ARC acting as second source. The SM-2 missile's course is controlled from the ship by means of an RF link until the target comes within the missile seeker's field of view. This system allows the use of the ship's search radar to provide missile launch data and, by shaping the missile flight path into an energy-efficient trajectory, the effective range of the system is doubled.

Specifications
SM-2MR
Length: 4.72 m (15.49 ft)
Diameter: 34.3 cm (13.5 in)
Wing span: 1.06 m (3.47 ft)
Weight: 706.7 kg (1,558 lb)
Speed: Mach 2.5
Range: 37.75 n miles (70 km)
Altitude: 19,800 m (65,000 ft)
Guidance: Semi-active radar homing

Manufacturers/Contractors
Hughes Missile Systems, Tucson, Arizona, USA.
Raytheon Missile Systems Division, Bedford, Massachusetts, USA.

Evolved Sea Sparrow Missile System (ESSMS)/RIM-7RTC Sea Sparrow point defence system

Type 124 frigates will have the Enhanced Sea Sparrow Missile System (ESSMS), a developed version of the Mk 57 NATO Sea Sparrow Missile System (NSSMS), with the RIM-7RTC missile. RIM-7P, which succeeded the RIM-7M missile on the production lines in 1991, has a Missile-Borne Computer (MBC), which controls overall missile performance and links the major missile subsystems. The missile also has an improved low-altitude guidance mode and enhanced subclutter performance against very low-altitude targets. Other features include a 38.6 kg (85 lb) warhead with new fuze for low-altitude use, a command uplink, sample data homing and multiple target designation. The RIM-7R is similar but in addition has a dual-mode semi-active radar and infrared seeker.

ESSM (RIM-7RTC) will have many of the features of RIM-7P/R, including the same guidance system, but with a new autopilot and a larger rocket motor. It will be wingless and with tail control as well as integral thrust vector control both for vertical launch and to double the manoeuvrability. The system will be compatible with the GMVLS Mk 41 through quad-pack launchers.

Targets are detected by the ship's radar and designated through the combat information centre and the tracker system then traverses onto the relevant bearing and elevation, while radar data from the director is processed in the signal data processor to provide range and angle tracking data. The data is then passed to the

firing officer's console which passes prelaunch data and the firing command to the missile which is then launched. The missile lifts to a height of approximately 4 m (13 ft) and then begins to pitch over in the correct azimuth to the intercept point, controlled by the jet vector control, which is then jettisoned (approximately 2 seconds after lift-off). The missile follows a proportional guidance path directly to the intercept point.

Specifications
RIM-7RTC
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.3 ft)
Weight: 231.5 kg (510 lb)
Speed: Mach 1
Range: 8 n miles (14.5 km)
Guidance: Semi-active radar

Manufacturers/Contractors
Raytheon Company, Equipment Division (prime (system)).
Raytheon Company, Missile Systems Division (prime (missile)).
Hughes Missile Systems (second missile source).

RIM-116A RAM close in weapons system
There will be two 21-cell Mk 49 launchers for the Rolling-Airframe Missile (RAM): one on the foredeck, the other aft on the roof of the twin hangars. RAM is a lightweight, close in, quick reaction, anti-missile defence system, the RIM-116 missile being based on the Sidewinder air-to-air missile, but with significant modifications, enabling it to be used as a fire-and-forget system. There is an infrared, terminal guidance seeker in the nose (taken from the Stinger man-portable surface-to-air missile), behind which is a new dual-mode passive radio frequency seeker for mid-course guidance. Most of the rear of the missile is based upon Sidewinder components. Missiles are stored in sealed launcher-containers, which are manually loaded into the 21-cell Mk 49 RAM Standard Launchers.

Radar and electro-optical sensors provide details of target location, distance and speed, while the ship's ESM system inputs data on the target's radar frequency, as well as correlating radar data on location. On launch, the missile is spun-up by a rifling band as it is driven down the launch tube, and then as it leaves the launcher the four tail fins deploy which maintain the spin. Aerodynamic control is provided by the two canard surfaces, which also deploy after launch. The autopilot and control system maintain the initial line of sight course towards the target and then the RF seeker is activated and once this acquires the target it takes control of the guidance system and makes the appropriate course alterations. The IR seeker is also activated and when a sufficient signal-to-noise ratio is achieved this takes over guidance control for the terminal phase. The missile is capable of manoeuvres up to 20 *g* in any direction. The system can only be fired automatically at the moment, but manual control will become possible with Block 2 missiles.

Specifications
Mk 49 RAM Standard launcher
Traverse: 360°
Elevation: −25 to +80°
Turning circle: 3.27 m (10.7 ft)

RIM-116 missile
Length: 2.79 m (9.1 ft)
Diameter: 12.7 cm (5 in)
Wing span: 43.4 cm (17 in)
Weight: 73.6 kg (241 lb)
Speed: Mach 2
Range: 5.17 n miles (9.6 km)
Warhead: 9.09 kg fragmentation blast WDU-17B
Motor: Hercules/Aerojet Mk 36 solid propellant rocket

Manufacturer/Contractor
RAM Systems GmbH, D-85521 Riemerling, Germany.

TUBES

324 mm US Mk 32 Mod 9 (two twin) torpedo tubes
Four 324 mm (12.75 in) US Mk 32 Mod 9 (two twin) torpedo tubes will be mounted within the superstructure, immediately below the RAS station. The spacious torpedo compartments will be sited either side of the main corridor on the main deck level and will house a number of reloads and reloading gear. The tubes will launch the torpedoes through permanently open apertures in the ship's side at a forward angle of 45° to the ship's centreline.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Under current plans the torpedoes will be Alliant Techsystems Mk 46 324 mm torpedoes, although it seems more probable that the German DM 4A1 will be in use by the time these ships enter service.

GUNS

OTOBREDA 76 mm (3 in)/62 Compact
There will be one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck for use in either air defence or anti-surface roles. If the weapon is designated to the air defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission. In the anti-surface role, the 76 mm gun can be controlled either from the CIC or by a new target designation sight, two of which are installed, one on each bridge wing. This sight will be the same pattern as that used in the Type 123, enabling the 76 mm gun to be fired from the bridge under full visual control.

Specifications
Calibre: 76.2 mm (3.0 in)
Barrel length: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Rheinmetall Rh-202 20 mm cannon
One of the lessons of Gulf deployments is the need for a light, short-range gun. Therefore, the Type 124 ships will mount two Rheinmetall Rh-202 20 mm cannon, which have been taken from decommissioned Klasse 520 landing craft. These are mounted in the bridge wings, abaft the target designation sights.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

OTOBREDA SCLAR launchers
The Type 124 will carry four OTOBREDA SCLAR launchers, firing Buck System IRRAS and DUERAS 118 mm infrared and chaff decoys.

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

DASA FL-1800S-II
The integrated ESM/ECM suite will be the DASA FL-1800S-II as used in the Type 123 ships.

Manufacturer/Contractor
DASA, Ulm, Germany.

DECOYS

Chaff launchers.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Signaal SEWACO FD command and fire-control system
SEWACO FD (FD = Fully Distributed) is an automatic threat evaluation, weapon assignment and sensor allocation system, which can also be used as a planning aid through inputs of intelligence data and decision support facilities. SEWACO FD has been developed from the SEWACO system, with distributed processing power replacing the centralised computer complexes. The processing power is formed by SIGMA (SIGnaal Modular Architecture) nodes, one of which is built into every MOC (Multifunction Operator Console) and Bus Terminal Server (BTS). These SIGMA nodes consist of a number of SUN-1S type processor boards, each with 16 Mbyte RAM and capable of 12.5 Mips. These nodes are housed in both Multifunction Operator Consoles (MOCs) and Bus Terminal Servers (BTSs).

The software package, designated TACTICOS, is written in Ada but includes SPLICE (Subscription Paradigm for the Logical Interconnection of Concurrent Engines) distributed database and data communication modules, which operate alongside UNIX. The hardware is linked through a dual Ethernet (IEEE 802.3) standard LAN (local area network), with subsystems either linked directly to the LAN through a digital data interface bustap, or through a BTSs interface. These BTSs also have spare processing power which they bring into use automatically to compensate for failures in standard processor modes.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

COMMUNICATIONS AND DATALINKS

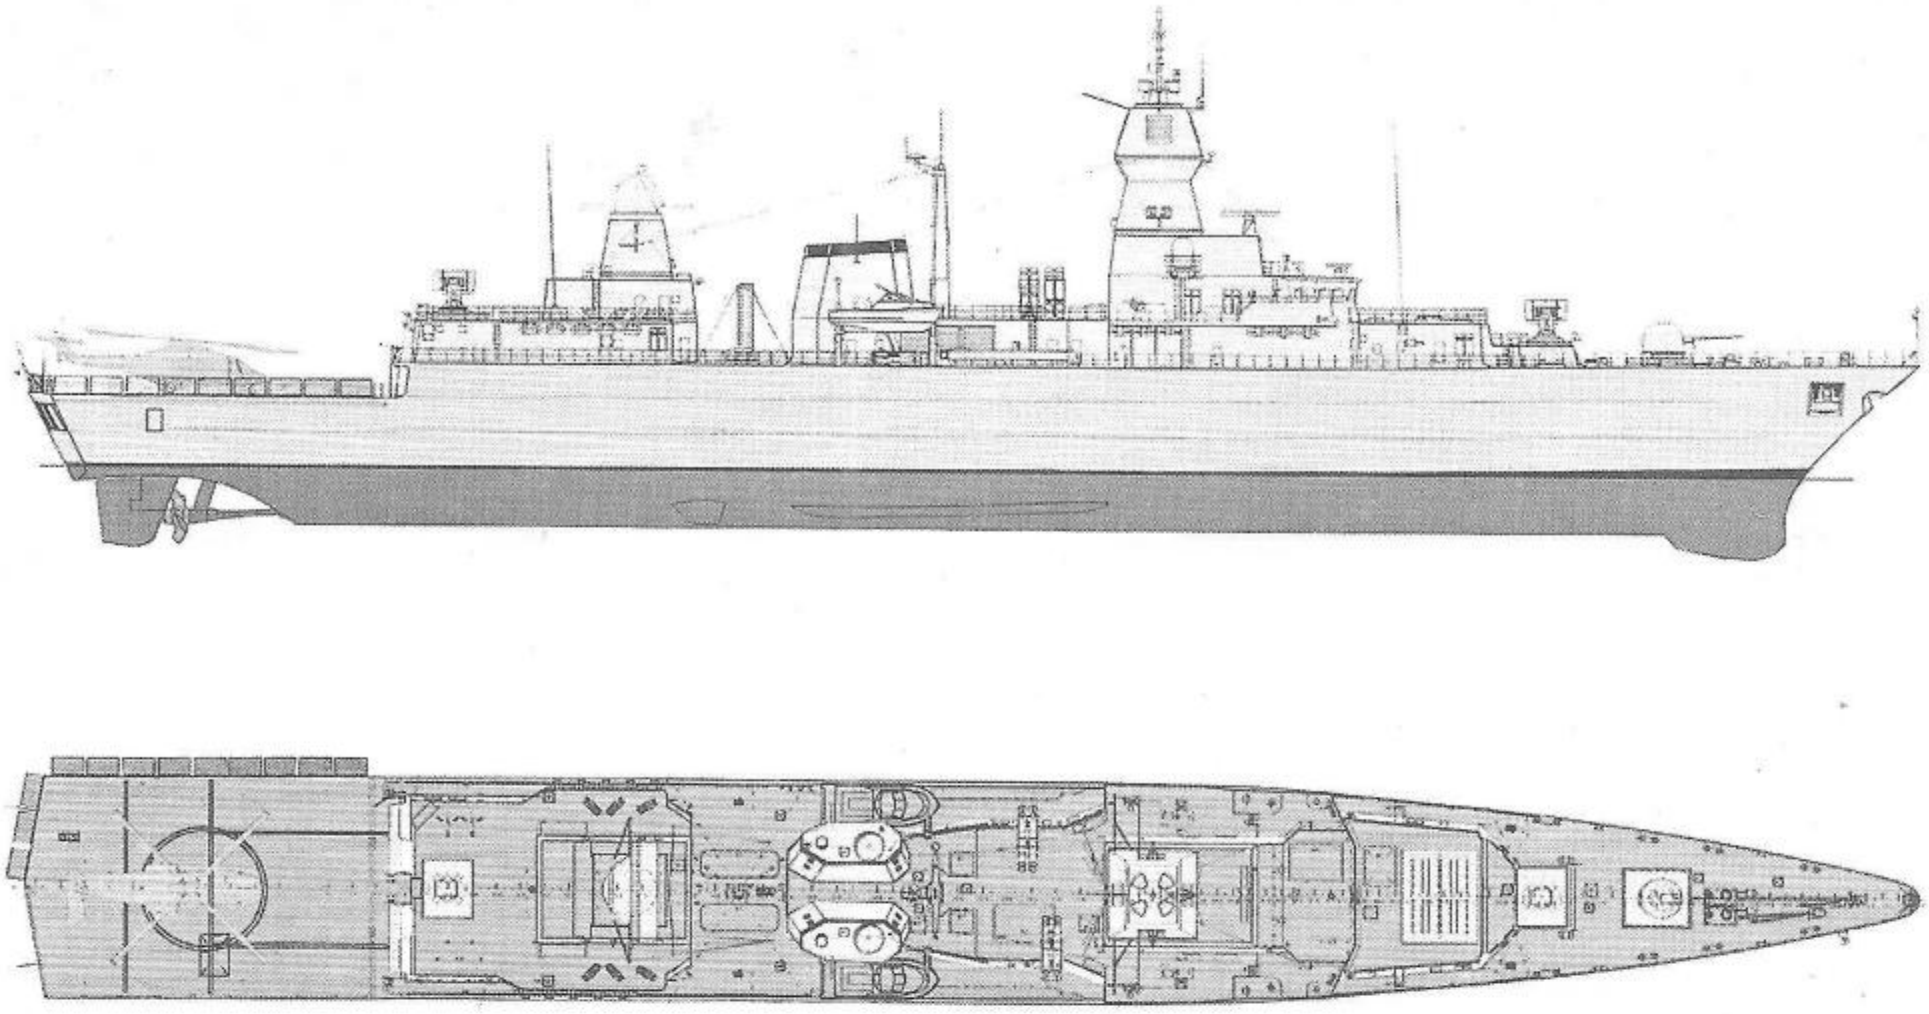
WEAPONS CONTROL

SIRIUS long-range infra-red surveillance and tracking system
The Type 124 will be fitted with at least one Signaal SIRIUS Long-Range Infra-Red Surveillance and Tracking system (LR-IRST), which will reinforce the horizon search capabilities against sea-skimming anti-ship missiles. The system will use both the 3 to 5 µm and 8 to 10 µm thermal infra-red bands to provide the earliest possible detection for the full range of possible threats. High-resolution cameras will be stabilised to cope with



A concept drawing of the 'Sachsen' (F124) class of the German Navy (ARGE F 124)

ship's motion using a patented Signaal-developed wedge stabilised platform. Advanced signal processing will support the long-range detection capability, as well as the automatic tactical arena evaluation for confirmed target data. SIRIUS is designed to compliment the ship's existing radar capabilities by conducting horizon searches in selected scenarios, such as emission control and severe radar jamming conditions. Two operational modes are provided for these conditions, one to ensure the earliest detection of sea-skimming anti-ship missiles for use in multisensor evaluations, and one to provide confirmed, low false alert rate target data for immediate use by air defence systems such as CIWS, NSSM.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

RADARS

SMART-L 3D volume search radar

The air search array will be mounted on the mainmast and this function in the Type 124 is likely to be performed either by the Signaal SMART-L or by the TRS-3D. Details of the former are given below.

SMART-L is the D-band version of the successful family of SMART multibeam 3D radars. SMART-L is designed to provide:

medium-range detection of the latest generation of small 'stealth' air targets
long-range detection of conventional aircraft
high ECCM performance
guidance support for patrol aircraft
surface surveillance up to the radar horizon

SMART-L is optimised for the early detection and tracking of very small aircraft and missiles. The accurate 3D target information (even under multipath conditions), gathered by the SMART-L radar provides an essential contribution to the threat evaluation process, especially in multiple attack scenarios, and it allows the weapon control system to perform the fastest lock on.

The antenna consists of a stack of 24 linear arrays, with all 24 arrays being used during reception while 16 arrays are used during transmission. By controlling the phase of the RF energy, supplied by the 16 transmit elements, the illumination pattern can be controlled and the level stabilised. Received radar energy is processed by 24 receiver channels and fed to a beamforming network in which 14 beams are formed in the elevation coverage of zero to +70°. The output signals of the beamformer are further processed by a Doppler processor for the extraction of the target Doppler speed for clutter rejection, and fast but reliable track initiation and maintenance. SMART-L is capable of automatic detection, track initiation and tracking of 1,000 air targets up to a range of 400 km. Surface surveillance is performed by a dedicated LPI radar using Frequency Modulated Continuous Wave (FMCW) techniques.

Specifications

Antenna
Type: Linear array
Polarisation: Vertical
Horizontal beamwidth: 2.2°
Vertical beamwidth: 0-70° (illumination pattern dependent)
Illumination pattern: Local area, long range, burn-through and customer specific
Vertical beamwidth receiver: 14 beams of 6° approx
Rotation speed: 12 rpm
D-band transmitter
Type: Solid-state
D-band receiver and processor
Beamformer: FFT
Doppler filtering: FFT
Range: Up to 300 km against a fighter aircraft

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

APAR active phased-array radar

Hollandse Signaalapparaten BV (Signaal) and the Royal Netherlands Navy have signed a contract for the product development phase of the APAR (Active Phased-Array Radar) multifunction radar. This contract is based on a Memorandum of Understanding (MoU) between Canada, Germany and the Netherlands in which the three participants stated their intention to develop, build and test the APAR radar system and proceed with the product development phase. For project realisation, Signaal is leading a consortium of Daimler-Benz Aerospace AG, Germany; Northern Telecom Ltd (NTL), Canada; and FEL/TNO Physics and Electronics Laboratory of the Netherlands. Signaal is responsible for the overall system design and programme management. FEL/TNO takes part in the overall system design, Daimler-Benz will design and manufacture the front-end processing chain, while NTL will manufacture the transmit/receive modules. All industries will take part in the design of these modules, including Microwave Monolithic Integrated Circuits (MMIC).

APAR is a multifunction, phased-array radar for anti-air and anti-surface warfare tasks, including:

- multitarget tracking
- weapon control support
- special search functions

APAR is able to perform multiple capabilities simultaneously, such as multitarget tracking and missile guidance, resulting in multiple engagement channels. Other features are the latest adaptive processing and measures against undesired propagation effects.

APAR works in the I/J bands and has four active, phased-array faces, giving a total coverage of 360 × 70°. Each of the four arrays will have 3,200 transmit/receive elements grouped in 32 column assemblies, with each of the latter having a data distribution unit and a converter. The system uses pencil beams with a ±60° off-centreline shifting capability, resulting in a 15° overlap with the adjacent quadrant. The radar's functions include horizon search (to 75 km); multitarget tracking (250-plus tracks to 150 km); missile guidance support for Sea Sparrow (RIM-7P), Enhanced Sea Sparrow, Standard SM-2, and active-homing missiles; surface gunfire support (splash spotting); cued search (confirm/gather targets detected by other sensors); and surface search and track (to 32 km).

APAR will enable the anti-air system to conduct up to 16 simultaneous engagements in the terminal phase, with 32 missiles in the air. APAR has also been tailored to meet the requirements of littoral warfare, using clutter-filter techniques and with the ability to integrate radar returns with digitised maps.

The system is designed to be compatible with a fully distributed architecture command system such as SEWACO, in which it can fulfil the role of a fire-control support sensor, multitarget tracking radar and dedicated sea skimmer detection radar.

Specifications

Frequency: I/J-band
Spatial coverage: 360 × 70°
Instrumented range: Horizon search 75 km; air target search 150 km; surface search 32 km; back-up volume search 150 km
Track capacity: More than 200 targets
Guidance capability for: RIM-7P Sparrow; ESSM (Evolved Sea Sparrow Missile); (SM 2) Standard Missile 2

Manufacturers/Contractors

Hollandse Signaalapparaten, Hengelo, Netherlands (prime).
Daimler-Benz Aerospace, Ulm, Germany.
Northern Telecom (NORTEL), Canada.
FEL/TNO (Physics and Electronics Laboratory), Den Haag, Netherlands.

SONAR

STN Atlas DSQS-23BZ

The Type 124 will have the bow-mounted, active search, DSQS-23BZ, medium-frequency sonar.

Manufacturer/Contractor

STN Atlas Elektronik, Bremen, Germany.

PROPULSION

Specifications

System: Combined diesel and gas turbine (CODAG)
Main machinery: 2 General Electric GE-7LM2500 9A-ML gas turbines; 38 MW (51,600 shp) sustained; 2 MTU 20V 956 TB 92 diesels; 8.14 MW (11,400 bhp) sustained
Shafts: 2
Propellers: cp
Auxiliary power: 4—750kW MWM TBD-602-V16K diesel generators

FURTHER INFORMATION

PROGRAMME

During the early years of the next century numerous NATO navies will require a new class of air defence ship and at one stage there was a plan to develop a NATO frigate to meet all their needs. This plan fell through and while the British, French and Italians opted for a collaborative project (Project Horizon) the Dutch, German, and Spanish navies have taken a different approach. In this the partners will work together only on those elements of the project upon which there is complete agreement, thus, it is hoped, saving money, but without the constant argument and delays which seem to bedevil fully collaborative projects.

Thus, there will be three different hulls, three different propulsion systems, and two different air warning systems, with Germany and Netherlands opting for APAR while Spain has recently decided to adopt Aegis. All three designs will, however, use Evolved Sea Sparrow.

STRUCTURE

All the details are speculative based on the Type 123 hull.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84A/C Block 1C Harpoon

Eight Harpoon anti-ship missile canisters will be mounted immediately abaft the foremast, with two groups of four launchers, each group pointing outwards with the effluxes being led through built-in tubes to vent through the opposite side of the superstructure.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

Mk 41 Mod 0 GMVLS

There will be one Mk 41 Mod 0 guided-missile vertical launch system (GMVLS) situated in the foredeck, consisting of five eight-cell modules. These will contain a mix of Standard SM-2MR Block IIIA missiles and Evolved Sea Sparrow Missile (ESSM) quad packs.

Standard Missile 2 Medium-Range (SM-2MR) Block 4

The LCFs will carry Standard SM-2MR Block IIIA missiles, which can be used for surface-to-air (including passive home-on-jam), surface-to-surface and anti-sea skimmer engagements. The propulsion section uses the Thiokol Mk 104 dual-thrust rocket motor with ARC acting as second source. The SM-2 missile's course is controlled from the ship by means of an RF link until the target comes within the missile seeker's field of view. This system allows the use of the ship's search radar to provide missile launch data and by shaping the missile flight path into an energy-efficient trajectory the effective range of the system is doubled.

Specifications
SM-2MR
Length: 4.72 m (15.49 ft)
Diameter: 34.3 cm (13.5 in)
Wing span: 1.06 m (3.47 ft)
Weight: 706.7 kg (1,558 lb)
Speed: Mach 2.5
Range: 37.75 n miles (70 km)
Altitude: 19,800 m (65,000 ft)
Guidance: Semi-active radar homing

Manufacturers/Contractors
Hughes Missile Systems, Tucson, Arizona, USA.
Raytheon Missile Systems Division, Bedford, Massachusetts, USA.

Evolved Sea Sparrow Missile System (ESSMS)/RIM-7RTC point defence system

The LCFs will also be armed with the Enhanced Sea Sparrow Missile System (ESSMS), a developed version of the Mk 57 NATO Sea Sparrow Missile System (NSSMS), with the RIM-7RTC missile. RIM-7P, which succeeded the RIM-7M missile on the production lines in 1991, has a Missile-Borne Computer (MBC), which controls overall missile performance and links the major missile subsystems. The missile also has an improved low-altitude guidance mode and enhanced subclutter performance against very low-altitude targets. Other features include a 38.6 kg (85.1 lb) warhead with new fuze for low-altitude use, a command uplink, sample data homing and multiple target designation. The RIM-7R is similar, but in addition has a dual-mode semi-active radar and infra-red seeker.

ESSM (RIM-7RTC) will have many of the features of RIM-7P and RIM-7R, including the same guidance system, but with a new autopilot and a larger rocket motor. It will be wingless and with tail control as well as integral thrust vector control both for vertical launch and to double the manoeuvrability. The system is fully compatible with the GMVLS Mk 41, but since each cell was dimensioned to house a Tomahawk missile a special module has been developed which accommodates four Sea Sparrows in a single vertical launch cell. These are known as 'quad packs'.

Targets are detected by the ship's radar and designated through the combat information centre and the tracker system then traverses onto the relevant bearing and elevation, while radar data from the director is processed in the signal data processor to provide range and angle tracking data. The data is then passed to the firing officer's console which passes prelaunch data and the firing command to the missile which is then launched. The missile lifts to a height of approximately 4 m (13 ft) and then begins to pitch over in the correct azimuth to the intercept point, controlled by the jet Vector Control, which is then jettisoned (approximately 2 seconds after lift-off). The missile follows a proportional guidance path directly to the intercept point.

Specifications
RIM-7P/R
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in),
Wing span: 1.02 m (3.34 ft)
Weight: 231.5 kg (510 lb)
Speed: Mach 1
Range: 8 n miles (14.5 km)
Guidance: Semi-active radar

Manufacturers/Contractors
Raytheon Company, Equipment Division (prime (system)).

Raytheon Company, Missile Systems Division (prime (missile)).
Hughes Missile Systems (second missile source).

TUBES

One pair of 324 mm US Mk 32 Mod 9 torpedo tubes will be mounted on each side of the ship at the main deck level. These are the Mod 9 version, which consists of two Mk 10 tubes one above the other and held together by two steel brackets. The tubes are angled at approximately 45° to the ship's centreline and stick out of the torpedo room; there is a pneumatically operated muzzle door. Reloading is carried out using a Hughes Seamaster reloading system

Specifications
Length: 3.56 m (11.68 ft)
Height: 1.38 m (4.53 ft)
Width: 70.3 cm (2.31 ft)
Tubes: 2
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

BOFORS TAK 120 L/50 medium-calibre dual-purpose guns
It has recently been revealed that the gun system will be a twin 120 mm mounting in 'A' position. The guns will be taken from the 'Tromp' class frigates and will be refurbished (and also possibly rehoused in a new 'stealthy' turret. The guns in these mountings were originally installed in single mounts in the Dutch destroyer *Gelderland* (D 811) and were removed when it was stricken in 1973, completey refurbished and then installed in the 'Tromp' class ships. The TAK 120 L/50 barrels are of monobloc construction with exchangeable liners and are water-cooled. They have a vertical, sliding wedge breech block and automatic rammer, each barrel being fed by a separate ammunition hoist.

Specifications
TAK 120 L/50
Calibre: 120 mm (4.7 in)
Length of barrel: 50 calibres
Muzzle velocity: 850 m/s (2,789 ft/s)
Traverse: 360° at 22°/s
Elevation: −9 to +85° at 25°/s
Crew: n/k
Range: 11 n miles (20.5 km)
Rate of fire: 40 rds/min/barrel
Weight of shell: 24 kg (53 lb)

Manufacturer/Contractor
Bofors Ordnance, Sweden.

As this book closed for press the Royal Netherlands Navy announced that instead of the Bofors TAK 120 their ships will mount the OTOBREDA 127 mm.

Signaal/General Electric SGE-30 30 mm Goalkeeper close in weapons system
There will be two Signaal/General Electric 30 mm 7-barrelled Gatling Goalkeeper close in weapons systems. One will be mounted in a central position at the after end of the hangar roof, and the other will be mounted on the bridge roof. Goalkeeper is an autonomous, fully automatic system, consisting of a General Electric Sea Vulcan 30 gun, I-band search radar, I/K-band tracking radar, TV camera, and ancillaries. The Sea Vulcan 30 is based upon the electrohydraulically powered GAU-8/A 30 mm seven-barrel, Gatling gun, with each barrel firing once during each revolution of the barrel cluster. The gun is very reliable, with 33,000 mean rounds between stoppages. The mounting has an ammunition capacity of 1,190 rounds carried in a linkless system using a feed and storage drum, which is claimed to be sufficient for several target engagements before reloading is necessary. The warhead kill capability of Goalkeeper against anti-ship missiles is achieved by use of MPDS rounds which have high-density, tungsten-alloy penetrators. For 'soft' targets, HEI and TP types of ammunition can be used.

The I-band search radar uses a 2,050 × 280 mm linear array antenna with an integrated sidelobe suppression antenna. The antenna rotates at 60 rpm and has a horizontal beam-width of 1.7° and a vertical beam-width of 60°. The radar is powered by a water-cooled, synthesiser-driven, TWT transmitter with high output power for greater frequency and PRF flexibility in the face of ECM threats.

Specifications
Calibre: 30 mm (1.2 in)
Muzzle velocity: 1,020 m/s (3,346 ft/s) (TP, HEI); 1,150 m/s (APDS) (3,773 ft/s)
Traverse: 360°
Elevation: −25 to +85°
Mounting weight: 6,800 kg (14,991 lb)
Crew: 0
Range: 1.61 n miles (200 m to 3 km)
Rate of fire: 4,200 rds/min
Ammunition: 369 g (TP, HEI, HEISD, API, MPDS)

Manufacturers/Contractors
Hollandse Signaalapparaten BV, Hengelo, Netherlands (system/radar).
General Electric Company, Armament Systems Department (gun).

Oerlikon 20mm
Two single Oerlikon 20 mm guns will be mounted either side of the bridge superstructure.

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,739 ft/s)
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +55°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

The ESM/ECM suite will be the ArgoSystems APECS II intercept/jammer.

DECOYS

Countermeasures will include four SRBOC chaff launchers and a Nixie torpedo decoy system.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

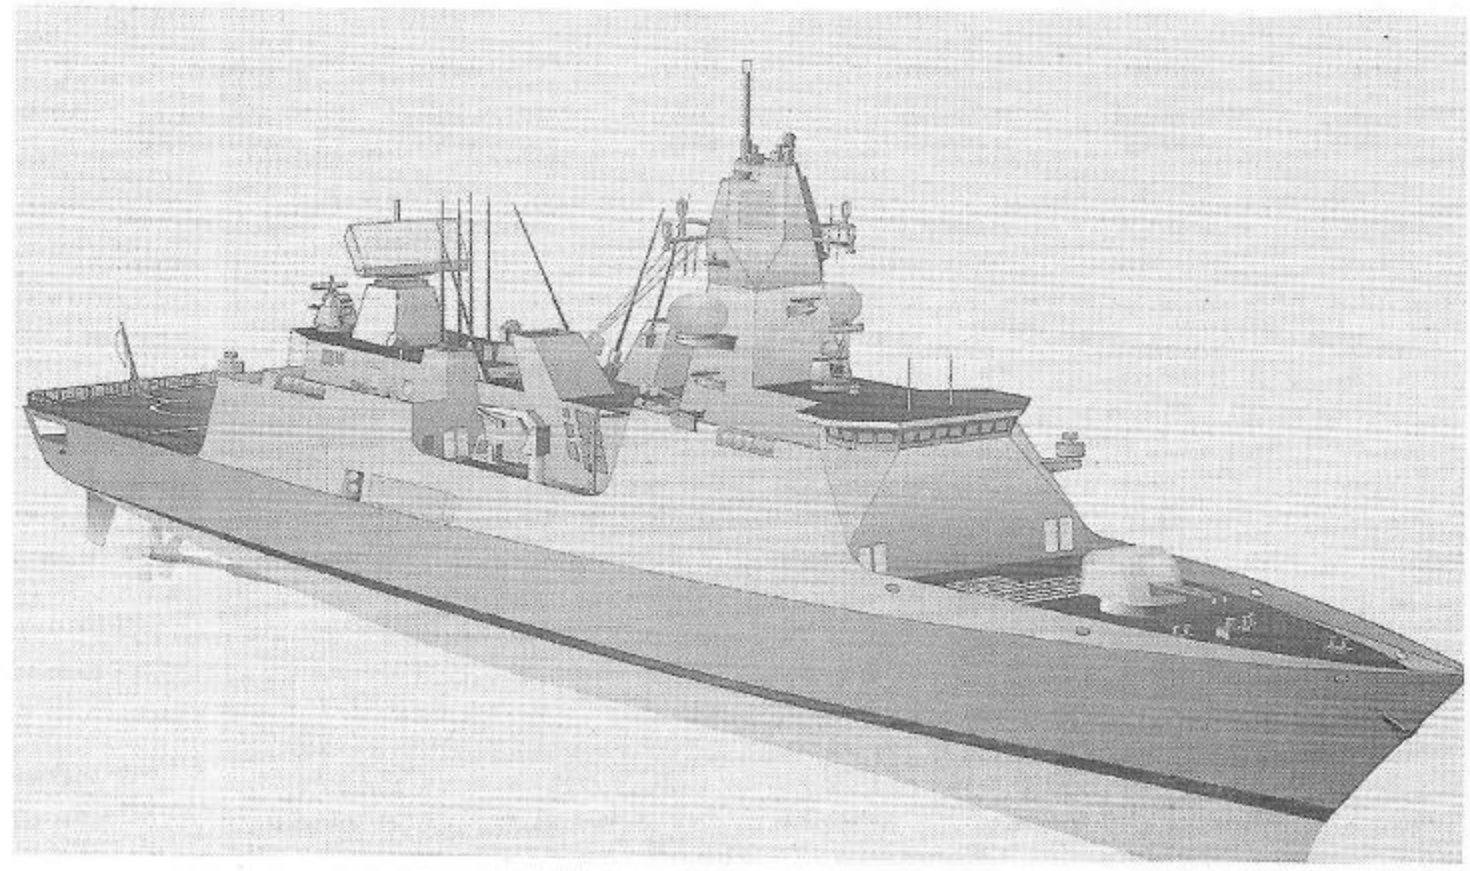
A new version of the Signaal command system, SEWACO XI, is under development for these ships.

COMMUNICATIONS AND DATALINKS

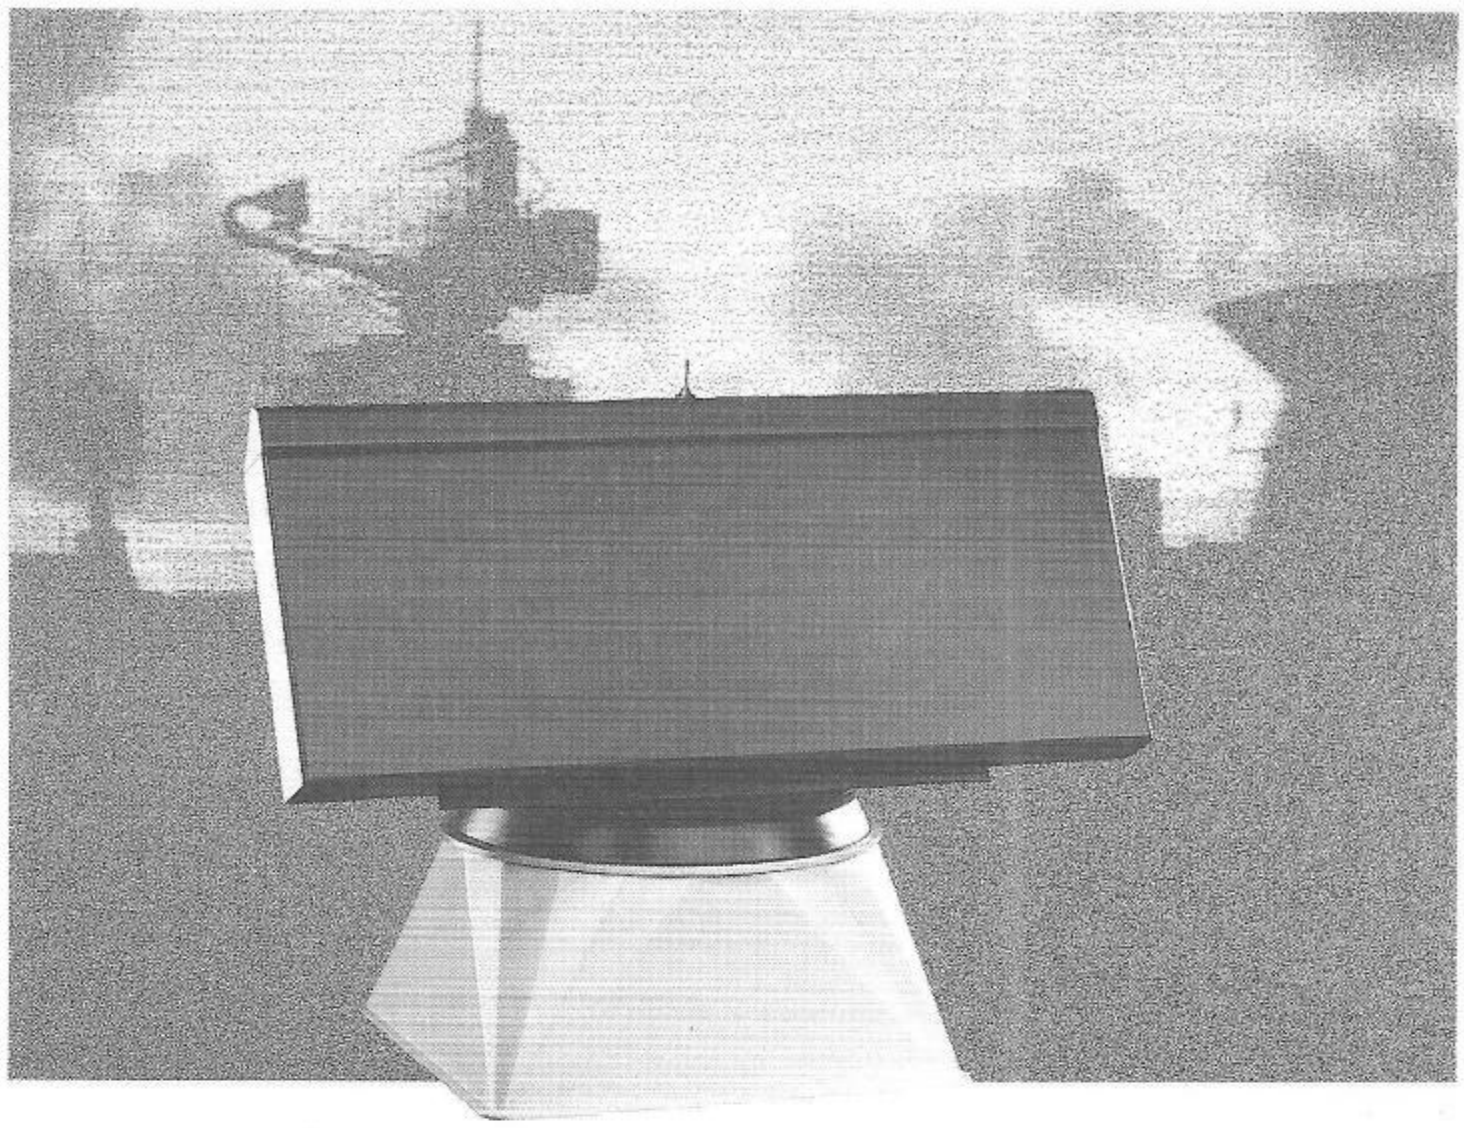
Datalinks: Link 11; Link 16; Satcoms

WEAPONS CONTROL

SIRIUS long-range infra-red surveillance and tracking system
The LCF will be fitted with at least one Signaal SIRIUS Long-Range Infra-Red Surveillance and Tracking system (LR-IRST), which will reinforce the horizon search capabilities against sea-skimming anti-ship missiles. The system will use both the 3 to 5 μm and 8 to 10 μm thermal infra-red bands to provide the earliest possible detection for the full range of possible threats.



Dutch LCF frigate (Royal Schelde)



Signaal's SMART-L is the air-search radar of the Dutch LCF frigate (Signaal)

High-
resolution cameras will be stabilised to cope with ship's motion using a patented Signaal-developed wedge stabilised platform. Advanced signal processing will support the long-range detection capability, as well as the automatic tactical arena evaluation for confirmed target data. SIRIUS is designed to complement the ship's existing radar capabilities by conducting horizon searches in selected scenarios, such as emission control and severe radar jamming conditions. Two operational modes are provided for these conditions, one to ensure the earliest detection of sea-skimming anti-ship missiles for use in multisensor evaluations, and one to provide confirmed, low false alert rate target data for immediate use by air defence systems such as CIWS, NSSM.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

RADARS

SMART-L 3D volume search radar

The air search array will be mounted on the mainmast and this function in the Type 124 is likely to be performed either by the Signaal SMART-L or by the TRS-3D. Details of the former are given below.

SMART-L is the D-band version of the successful family of SMART multibeam 3D radars. SMART-L is designed to provide:

medium-range detection of the latest generation of small 'stealth' air targets
long-range detection of conventional aircraft
high ECCM performance
guidance support for patrol aircraft
surface surveillance up to the radar horizon

SMART-L is optimised for the early detection and tracking of very small aircraft and missiles. The accurate 3D target information (even under multipath conditions), gathered by the SMART-L radar provides an essential contribution to the threat evaluation process, especially in multiple attack scenarios, and it allows the weapon control system to perform the fastest lock on.

The antenna consists of a stack of 24 linear arrays, with all 24 arrays being used during reception while 16 arrays are used during transmission. By controlling the phase of the RF energy, supplied by the 16 transmit elements, the illumination pattern can be controlled and the level stabilised. Received radar energy is processed by 24 receiver channels and fed to a beamforming network in which 14 beams are formed in the elevation coverage of zero to +70°. The output signals of the beamformer are further processed by a Doppler processor for the extraction of the target Doppler speed for clutter rejection, and fast but reliable track initiation and maintenance. SMART-L is capable of automatic detection, track initiation and tracking of 1,000 air targets and up to a range of 400 km. Surface surveillance is performed by a dedicated LPI radar using Frequency Modulated Continuous Wave (FMCW) techniques.

Specifications

Antenna
Type: Linear array
Polarisation: Vertical
Horizontal beamwidth: 2.2°
Vertical beamwidth: 0-70° (illumination pattern dependent)
Illumination pattern: Local area, long range, burn-through and customer specific
Vertical beamwidth receiver: 14 beams of 6° approx
Rotation speed: 12 rpm
D-band transmitter
Type: Solid state
D-band receiver and processor
Beamformer: FFT
Doppler filtering: FFT
Range: Up to 300 km against a fighter aircraft

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

APAR active phased-array radar

Hollandse Signaalapparaten BV (Signaal) and the Royal Netherlands Navy have signed a contract for the product development phase of the APAR (Active Phased-Array Radar) multifunction radar. This contract is based on a Memorandum of Understanding (MoU) between Canada, Germany and the Netherlands in which the three participants stated their intention to develop, build and test the APAR radar system and proceed with the product development phase. For project realisation, Signaal is leading a consortium of Daimler-Benz Aerospace AG, Germany; Northern Telecom Ltd (NTL), Canada; and FEL/TNO Physics and Electronics Laboratory of the Netherlands. Signaal is responsible for the overall system design and programme management. FEL/TNO takes part in the overall system design, Daimler-Benz will design and manufacture the front-end processing chain, while NTL will manufacture the transmit/receive modules. All industries will take part in the design of these modules, including Microwave Monolithic Integrated Circuits (MMIC).

APAR is a multifunction, phased-array radar for anti-air and anti-surface warfare tasks, including:

multitarget tracking
weapon control support
special search functions

APAR is able to perform multiple capabilities simultaneously, such as multitarget tracking and missile guidance, resulting in multiple engagement channels. Other features are the latest adaptive processing and measures against undesired propagation effects.

APAR works in the I/J bands and has four active, phased-array faces, giving a total coverage of 360 × 70°. Each of the four arrays will have 3,200 transmit/receive elements grouped in 32 column assemblies, with each of the latter having a data distribution unit and a converter. The system uses pencil beams with a ±60° off-centreline shifting capability, resulting in a 15° overlap with the adjacent quadrant. The radar's functions include horizon search (to 75 km); multitarget tracking (250-plus tracks to 150 km); missile guidance support for Sea Sparrow (RIM-7P), Enhanced Sea Sparrow, Standard SM-2, and active-homing missiles; surface gunfire support (splash spotting); cued search (confirm/gather targets detected by other sensors); and surface search and track (to 32 km).

APAR will enable the anti-air system to conduct up to 16 simultaneous engagements in the terminal phase, with 32 missiles in the air. APAR has also been tailored to meet the requirements of littoral warfare, using clutter-filter techniques and with the ability to integrate radar returns with digitised maps.

The system is designed to be compatible with a fully distributed architecture command system such as SEWACO, in which it can fulfil the role of a fire-control support sensor, multitarget tracking radar and dedicated sea skimmer detection radar.

Specifications

Frequency: I/J-band
Spatial coverage: 360 × 70°
Instrumented range: Horizon search 75 km; air target search 150 km; surface search 32 km; back-up volume search 150 km
Track capacity: More than 200 targets
Guidance capability for: RIM-7P Sparrow; ESSM (Evolved Sea Sparrow Missile); (SM 2) Standard Missile 2

Manufacturers/Contractors

Hollandse Signaalapparaten BV, Hengelo, Netherlands (prime).
Daimler-Benz Aerospace, Ulm, Germany (Germany).
Northern Telecom (NORTEL), Canada (Canada).
FEL/TNO (Physics and Electronics Laboratory), Den Haag, Netherlands.

Scout surface surveillance and navigation 'quiet' radar

The surface search and navigation radar will be the new Signaal Scout, a low probability of intercept (LPI) radar which uses FMCW (frequency-modulated continuous wave) techniques and a very low transmitter power to ensure that it is virtually non-detectable by ESM systems. It is thus able to offer users the possibility of radar-aided pilotage and surface target surveillance in radar silence conditions.

Specifications

Frequency: I-band
Transmitter: Solid-state, low output
Transmitter power: Selectable 1 mW to 1 W max
Antenna: Dual slotted waveguide
Rotation speed: 24 rpm
Receiver: High dynamic range

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

SONAR

Signaal PHS-36 hull-mounted search and attack sonar

The PHS-36 will provide information for the data handling functions of active sonar, passive sonar, acoustic support and track management and other functions such as equipment monitoring. The sound velocity processing and recording system also provides data for acoustic support.

The transducer is based on that of the French TSM 2080 but with Signaal electronics. A colour-coded presentation on a Signaal GOS, high-resolution console

gives a graphic picture of sonar information. The dual-processing system performs FM and CW processing simultaneously to cope with both noise-limited and reverberation-limited conditions, as well as with a variety of submarine running conditions as provided for ASW scenarios. The main functions performed by the sonar processor are auto-detection, auto-track initiation and auto-track processing.

Specifications

Transmission
Frequencies: 5.5 kHz, 6.5 kHz, 7.5 kHz
Pulse type: CW, FM, FM + CW (a sequential transmission per interval)
Pulse length: 75-1,200 ms depending on range-scale/pulse type selections
Reception
Preformed beams: 32
Bandwidth passive mode: Band I low; Band II high
Accuracy
Range: CW (300 ms) <70 yd; FM <20 yd
Bearing: <2°
Doppler speed: CW (300 ms) <0.2 kts
Vertical beamwidth: 13° (narrow beam); 24° (wide beam)

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

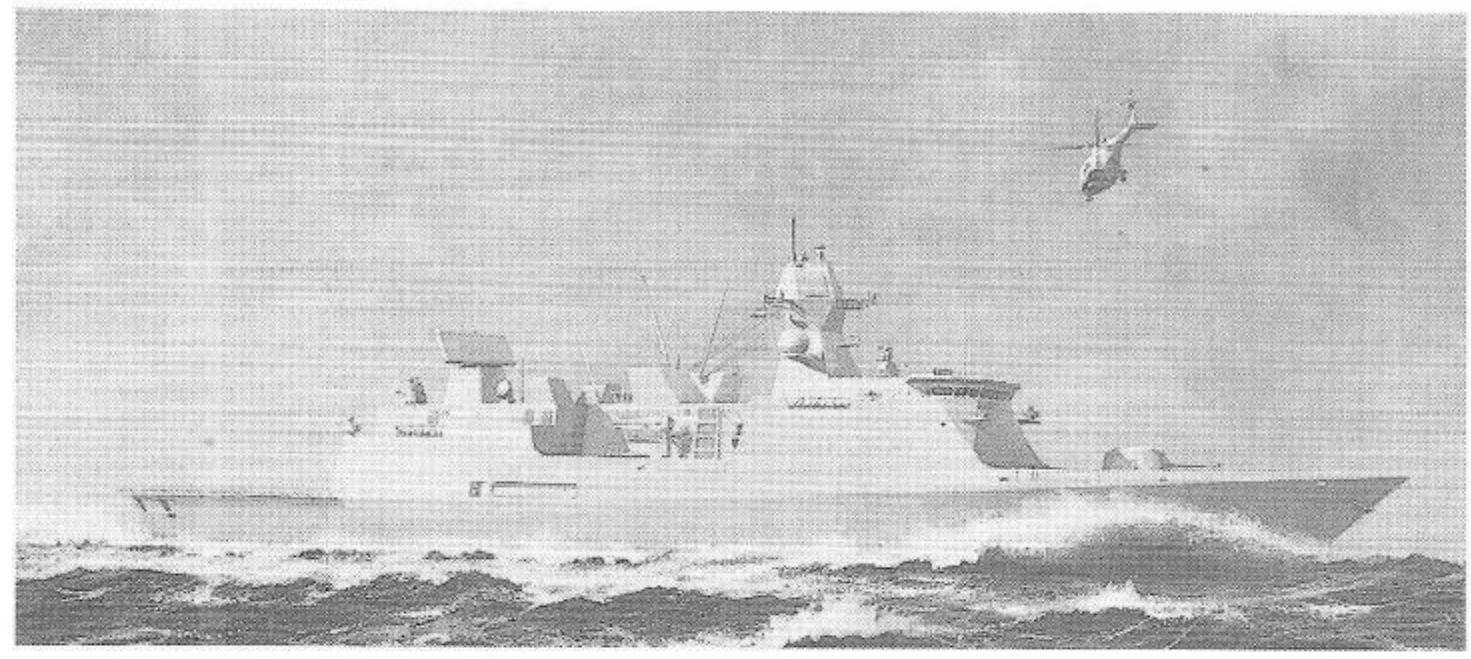
AVIATION

AVIATION FACILITIES

Specifications
Flight deck: 27 × 18.8 m (88.6 × 61.7 ft)

HELICOPTER

One Westland Super Lynx or (later) NH-90.



Artist's impression of Royal Netherlands Navy LCF with NH-90 helicopter overhead (Royal Schelde)

PROPULSION

Specifications
System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 Rolls-Royce Spey SM1C; 25.2 MW (33,800 hp) sustained; 2 Stork-Wärtsila 16V6ST diesels; 8.4 MW (11,424 hp(m))
Shafts: 2
Propellers: cp

FURTHER INFORMATION

PROGRAMME

The RNethN's original intention was to order two new air defence ships in 1996, under the designation LCF (LCF = *Luchtverdeigings en Commando Fregat*). The first of these will be laid down in the last quarter of 1997 for completion in 2003, and the second in May 1998 for completion in 2003/4.

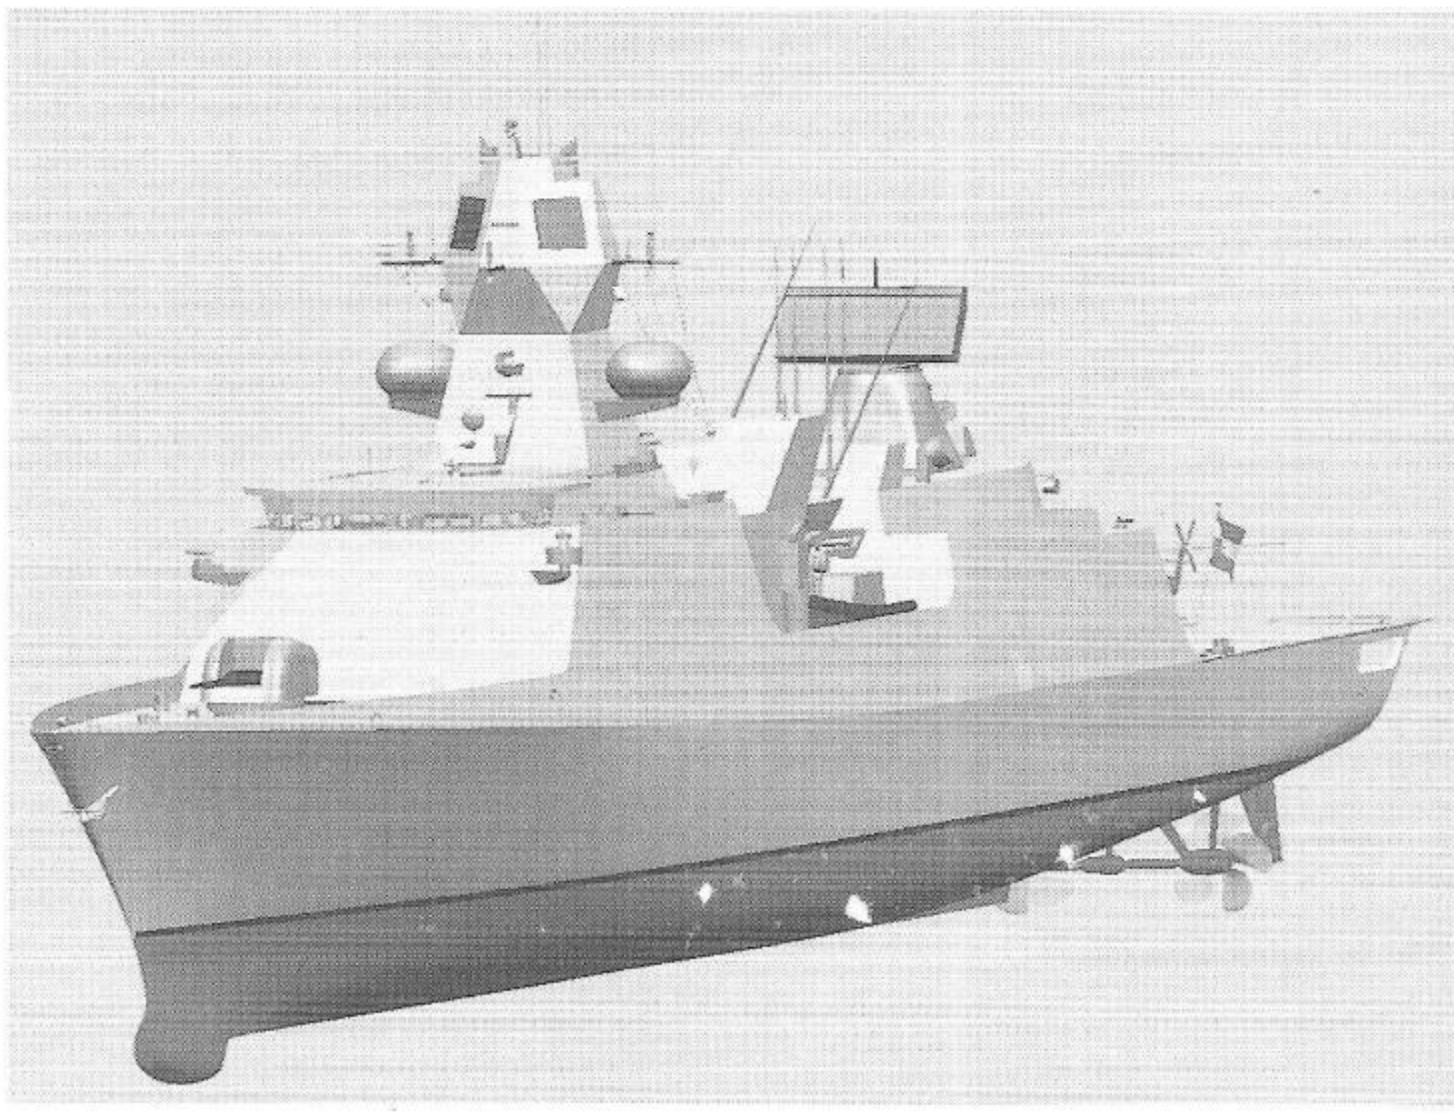
STRUCTURE

The original hull design used in project definition studies was based on a slightly enlarged version of the Karel Doorman (M class) design, but the design is now substantially larger.

Changes are still being made and Tomahawk cruise missiles are being considered.

DAMAGE CONTROL

Very detailed ship vulnerability studies have been carried out and the final hull design has 13 watertight compartments and seven vertical fire zones, bounded by PirMa blast and shrapnel resistant bulkheads. There are also distributed electrical power and chilled water mains.



Computer-generated impression of the LCF. As with the German and Spanish frigates, the Dutch programme seems to have proceeded much more smoothly than Project Horizon and the UAE Navy has expressed a serious interest in an order for four (Royal Netherlands Navy)

GUNS

The twin 120 mm L/50 turrets are being removed from the two 'Tromp' class frigates, which will suffice for the first two LCFs. If, however, further ships are built there may be a problem over the provision of similar guns unless spare turrets were built at the same time as the twin 'Tromp' class turrets.

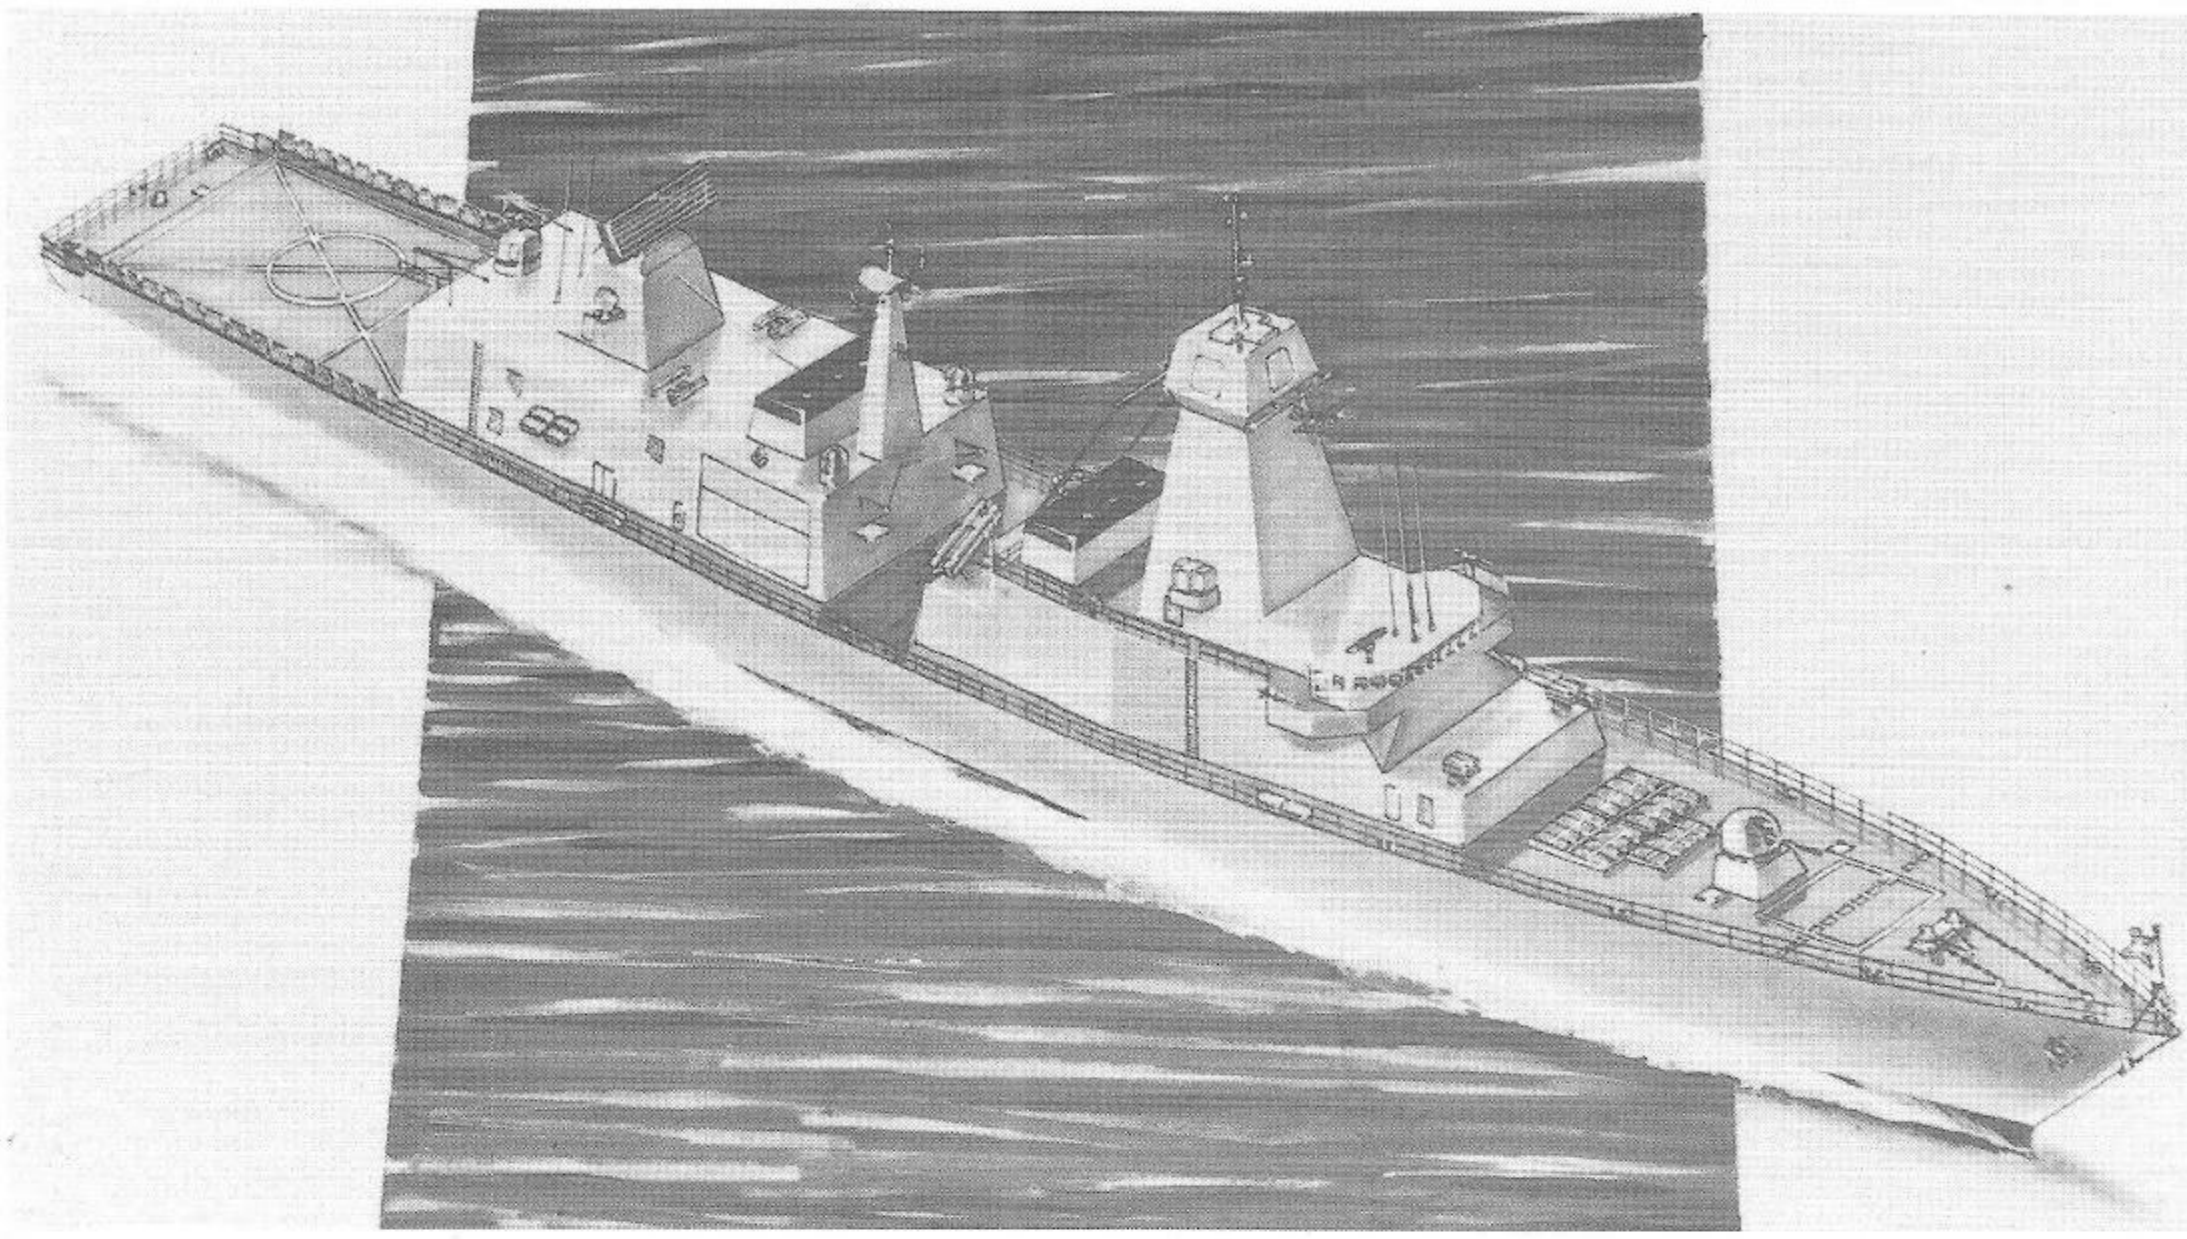
EXPORT

The UAE, which has recently bought two 'Kortenaer' class frigates, expressed strong interest in 1996 in the LCF, suggesting a possibility of an order for up to six. Financial and manpower constraints could well, however, reduce this to two or at most, three ships.

THE FUTURE

The RNethN has designed two slightly cheaper derivatives of the LCF, which are intended for the AAW mission but will lack the command facilities (hence their designation of LF). These would be laid down in 2003 and 2004 and would be funded by deferring the NH-90 helicopter programme, advancing replacement of two of the four remaining Kortenaers by eighteen months, and cancelling the Capability Upkeep Programme (CUP) for the two Jacob van Heemskerck AAW frigates.

F 100



An earlier design study for the F 100

GENERAL SPECIFICATIONS

Operator: Spain

Class: F 100

Planned: 4
Building: 0
Active: 0

Displacement:
full load: 5,761 t

Dimensions
Length: 133.2 m (437.0 ft)
Beam: 15.8 m (51.83 ft)
Draught: 4.7 m (15.4 ft)

Speed: 28 kts
Range: 4,500 n miles at 18 kts

Complement: 220

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84A/C Block 1C Harpoon

Eight Harpoon anti-ship missile canisters will be mounted.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

Mk 41 Mod 0 GMVLS

There will be one Mk 41 Mod 0 guided missile vertical launch system (GMVLS) situated in the foredeck, consisting of five eight-cell modules. These will contain a mix of Standard SM-2MR Block IIIA missiles and Evolved Sea Sparrow Missile (ESSM) quad packs.

Standard Missile 2 Medium-Range (SM-2MR) Block 4

The Standard SM-2MR Block IIIA missiles can be used for surface-to-air (including passive home-on-jam), surface-to-surface and anti-sea skimmer engagements. The propulsion section uses the Thiokol Mk 104 dual-thrust rocket motor with ARC acting as second source. The SM-2 missile's course is controlled from the ship by means of an RF link until the target comes within the missile seeker's field of view. This system allows the use of the ship's search radar to provide missile launch data and, by shaping the missile flight path into an energy-efficient trajectory, the effective range of the system is doubled.

Specifications
SM-2MR
Length: 4.72 m (15.49 ft)
Diameter: 34.3 cm (13.5 in)
Wing span: 1.06 m (3.47 ft)
Weight: 706.7 kg (1,558 lb)
Speed: Mach 2.5
Range: 37.75 n miles (70 km)
Altitude: 19,800 m (65,000 ft)
Guidance: Semi-active radar homing

Manufacturers/Contractors
Hughes Missile Systems, Tucson, Arizona, USA.
Raytheon Missile Systems Division, Bedford, Massachusetts, USA.

Evolved Sea Sparrow Missile System (ESSMS)/RIM-7RTC point defence system

The F 100s will also be armed with the Enhanced Sea Sparrow Missile System (ESSMS), a developed version of the Mk 57 NATO Sea Sparrow Missile System (NSSMS), with the RIM-7RTC missile. RIM-7P, which succeeded the RIM-7M missile on the production lines in 1991, has a Missile-Borne Computer (MBC), which controls overall missile performance and links the major missile subsystems. The missile also has an improved low-altitude guidance mode and enhanced subclutter performance against very low-altitude targets. Other features include a 38.6 kg (85.1 lb) warhead with new fuze for low-altitude use, a command uplink, sample data homing and multiple target designation. The RIM-7R is similar, but in addition has a dual-mode semi-active radar and infra-red seeker.

ESSM (RIM-7RTC) will have many of the features of RIM-7P and RIM-7R, including the same guidance system, but with a new autopilot and a larger rocket motor. It will be wingless and with tail control as well as integral thrust vector control both for vertical launch and to double the manoeuvrability. The system is fully compatible with the GMVLS Mk 41, but since each cell was dimensioned to house a Tomahawk missile a special module

has been developed which accommodates four Sea Sparrows in a single vertical launch cell. These are known as 'quad packs'.

Targets are detected by the ship's radar and designated through the combat information centre and the tracker system then traverses onto the relevant bearing and elevation, while radar data from the director is processed in the signal data processor to provide range and angle tracking data. The data is then passed to the firing officer's console which passes prel-aunch data and the firing command to the missile which is then launched. The missile lifts to a height of approximately 4 m (13 ft) and then begins to pitch over in the correct azimuth to the intercept point, controlled by the jet vector control, which is then jettisoned (approximately 2 seconds after lift-off). The missile follows a proportional guidance path directly to the intercept point.

Specifications

RIM-7P/R
Length: 3.66 m (12 ft)
Diameter: 20.3 cm (8 in)
Wing span: 1.02 m (3.3 ft)
Weight: 231.5 kg (510 lb)
Speed: Mach 1
Range: 8 n miles (14.5 km)
Guidance: Semi-active radar

Manufacturers/contractors;

Raytheon Company, Equipment Division (prime (system)).
Raytheon Company, Missile Systems Division (prime (missile)).
Hughes Missile Systems (second missile source).

TORPEDOES

324 mm Mk 32 Mod 9 torpedo launchers

Two twin Mk 32 Mod 9 324 mm (12.75 in) fixed torpedo launchers will be mounted in the superstructure. 24 torpedoes will be carried.

Mk 46 Mod 5 torpedo

Specification

Mk 46 Mod 5
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight:
torpedo: 230 kg (507 lb)
warhead: 44 kg (97 lb)
Speed: 40 kts (max)
Range: 5.9 n miles (11 km)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg; PBXN-103

ANTI-SUBMARINE MORTARS

There will be two LCASW anti-submarine mortars.

GUNS

OTOBREDA 76 mm (3 in)/62 Compact

There will be one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck for use in either air defence or anti-surface roles. If the weapon is desig-nated to the air defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission. The gun will be directed by the DORNA fire-control system.

Specifications

Calibre: 76.2 mm (3.0 in)
Barrel length: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.

Bazan Meroka

A single Bazan Meroka 12-barrelled 20 mm/120 close in weapons system (CIWS) will be sited centrally at the after end of the hangar roof. Meroka is unique in its con-figuration and operation, consisting of 12 Oerlikon 20 mm KAA barrels arranged in a single unit of two superimposed rows of six with a common breech block. All operations, such as loading, feeding and unlocking, are carried out using compressed air from reservoirs on the mounting, which are recharged from an onboard compressor. Ammunition is brought to the barrels by two belt feeds, supplied by a hydraulically powered, rotating, 72-round magazine. Meroka will be cued by an AESN RAN-12L search radar.

Specifications

Calibre: 20 mm (0.79 in)
Length of barrel: 120 calibres
Muzzle velocity: 1,215 m/s (3,986 ft/s)
Traverse: 360° at 90°/s
Elevation: −20 to +85°
Crew: 0
Range: 0.75 n miles (1.5 km)
Rate of fire: 2,700-3,600 rds/min
Ammunition: 337 g (TP-T, HEI, SAPHEI-T, AP-T); 310 g (APDS-T)

Manufacturer/Contractor

Fabrica de Artilleria de Bazan, Spain.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC COUNTERMEASURES (ECM)

Aldebaran

Aldebaran is an integrated radar intercept and jamming suite; the ESM element is manufactured by ENSA, while the ECM element is produced by Inisel. These are both Spanish companies and Aldebaran is, in fact, the first indigenously designed and developed EW system for Spanish naval use. There is little information on the current status but the first prototype unit was delivered in 1989, and it is believed that production equipments have already been delivered to the Spanish Navy. It is scheduled to be integrated with the Altair IR warning system for protection against sea-skimming missiles.

Elnath

Elnath is a communications intercept and jamming system.

Manufacturer/Contractor

ENSA.

DECOYS

Four Spanish-designed chaff launchers are part of the Aldebaran EW suite.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

The F 100 will be fitted with a specially designed combat data suite being developed by Bazan's FABA combat systems division, with Lockheed Martin serving as prime subcontractor. This will be derived from the Aegis system as installed in the 'Arleigh Burke' (DDG 51) class, and based on the Baseline III Phase 5 system, but with an increased degree of distributed processing.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 11; Link 16.
Satcom: AN/WSN-7.

WEAPONS CONTROL

DORNA fire-control system

DORNA *(Direccion de tiro Optronica y Radarica Naval)* naval fire-control system is being developed by Bazan's FABA division (FABA = *Fabrica de Artilleria de Bazan*) and Inisel.

DORNA will be part of the overall ship's command system, but with specific responsibility for control of the 76 mm gun. It will be of modular, distributed architecture design based upon the Motorola 68020 microprocessor and will run on Ada. The system will consist of a sensor group on a stabilised platform, a dis-play system and a processor for ballistic calculations. The sensor group will consist of a director with a K-band (27 GHz) tracking radar, a high-definition television camera, an infra-red camera and a laser rangefinder. The director will be capable of automatic tracking in both electronic and electro-optic modes. The display system will feature a multifunction console with two high-resolution displays.

Manufacturers/Contractors

Fabrica de Artilleria de Bazan (FABA) (prime).
Inisel (subcontractor).

SIRIUS long-range infra-red surveillance and tracking system

The F 100 will be fitted with at least one Signaal SIRIUS Long-Range Infra-Red Surveillance and Tracking sys-tem (LR-IRST), which will reinforce the horizon search capabilities against sea-skimming anti-ship missiles. The system will use both the 3 to 5 µm and 8 to 10 µm thermal infra-red bands to provide the earliest possible detection for the full range of possible threats. High-resolution cameras will be stabilised to cope with ship's motion using a patented Signaal-developed wedge stabilised platform. Advanced signal processing will support the long-range detection capability, as well as the automatic tactical arena evaluation for confirmed tar-get data. SIRIUS is designed to compliment the ship's existing radar capabilities by conducting horizon searches in selected scenarios, such as emission control and severe radar jamming conditions. Two operational modes are provided for these conditions, one to ensure the earliest detection of sea-skimming anti-ship missiles for use in multisensor evaluations, and one to provide confirmed, low false alert rate target data for immediate use by air defence systems such as CIWS, NSSM.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

RADARS

Air/surface search: Aegis SPY-1D (Baseline III Phase 5)
Surface search: AN/SPS-67
Fire control: Mk 99 slave illuminators.

SONARS

The principle sonar will be the Raytheon DE 1160LF(I), hull-mounted, active search and attack, medium-frequency sonar. It is also possible that an active towed sonar may also be installed.

AVIATION

AVIATION FACILITIES

Specifications
Flight deck: There will be a large flight deck aft.

HELICOPTERS

The F 100 will operate the Sikorsky S-70B-1 Seahwak LAMPS III system.

PROPULSION

Specifications
System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 General Electric LM-2500 gas turbines; 2 Caterpillar/Bazan diesel engines

Shafts: 2
Propellers: cp

FURTHER INFORMATION

PROGRAMME

Project definition took place between September 1992 and mid-1995, with detailed design work starting in January 1996.

Spain withdrew from the APAR air defence radar project in June 1995 and decided to purchase the AN/SPY-1D Aegis system, instead. The in-service date for the first of class has now slipped to 2001.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

OTOBREDA Teseo Mk 2 (TG 2)

There are eight missiles, housed in four pairs of individual launcher-containers; two pairs are mounted either side of the mast, while the other two pairs are mounted on a platform deck either side of the forward end of the hangar. All the launcher-containers face outward at about 30° to the ship's centreline. The Teseo system is based on the Otomat missile, which has folding wings and is powered by a turbojet with solid fuel rocket boosters. The warhead is a semi-armour-piercing type, which is claimed to penetrate up to 8 cm of nickel-chromium armour. The Mk 2 system is designed for over-the-horizon targeting using a co-operating Agusta-Bell AB 212ASW helicopter with SMA MM/APS-705 I-band radar and PRT-405 tracking and datalink system. On the first leg, the missile flies directly towards the helicopter and only when it passes under the helicopter does the latter transmit target location data.

The target may be acquired by the ship's radar, by the radars of friendly ships or by helicopter radars. Data on the target's location are transmitted to the missile's autopilot and the turbojet is started. Once it has reached full power the boosters are ignited and the missile is launched, but as the missile can turn through angles of up to ±200° the warship does not have to be facing the target during the launch phase.

Once launched, the missile climbs to 150 m (492 ft) accelerated by the boosters which burn for 4 seconds until it reaches cruising speed at a distance of some 2.15 n miles (4 km) from the launch point, where the boosters are jettisoned. The missile then descends to a cruising altitude of 15-20 m (48-64 ft), a compromise between ensuring good communications with the mothership and the need to make it difficult for the target to detect it. The missile continues towards the target with mid-course guidance correction until the radar seeker, which is azimuth only, is activated at a predetermined point and scans a 40° sector, then acquires the target at a range of about 6.5 n miles (12 km). For the terminal phase the Otomat drops to sea-skimming height.

The Otomat system is capable of engaging two separate targets simultaneously in sea states up to Force 7.

Specifications

Length: 4.46 m (14.6 ft)
Diameter: 46 cm (18.1 in)
Wing span: 1.36 m (4.46 ft)
Weight:
with booster: 770 kg (1,698 lb)
without booster: 762 kg (1,680 lb)
Range: 86 n miles (160 km)
Speed: Mach 0.9
Guidance: Inertial and active radar homing
Propulsion: Turbomeca TR 281 Arbizon III turbojet; 400 kg st
Booster: Two SNPE solid-propellant boosters; 3,500 kg st each.
Warhead: Semi-armour-piercing; 210 kg (463 lb); HE 65 kg (143 lb)
Fuzes: Impact, proximity

Manufacturer/Contractor

OTOBREDA, Italy

SURFACE-TO-AIR MISSILES (SAM)

Raytheon Sea Sparrow point-defence missile system

There is a single Mk 29 octuple launcher for the Sea Sparrow system, which is located on the hangar roof. The system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg (85.1 lb) blast/fragmentation warhead and a dual-purpose proximity impact fuze. These ships can fire either Sea Sparrow

RIM-7M or Aspide missiles, giving significantly increased capacity. There are no reloads.

Specifications
RIM-7M
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 226.8 kg (500 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturers/Contractors
Raytheon Company, Equipment Division (prime system contractor).
Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited in the waist below the stack.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 127 mm/54 Compatto
There is one OTOBREDA 127 mm/54 Compatto mounting in 'A' position. This weapon is designed to provide naval gunfire support, to engage surface targets and to engage air targets, including anti-ship missiles and fixed-wing aircraft which do not have standoff weapons. The turret is unmanned and is slaved to the fire-control radar. It is totally enclosed in a glass fibre shield. Much of the turret and the lower part of the mounting are made of aluminium alloy. The below-deck element of the mounting consists of three drums each containing 22 rounds, which are stocked automatically from two chain-driven lower hoists which lead to the magazines and are loaded manually. The gun captain uses his control to select which drums are to be replenished and with what ammunition. The weapon is compatible with all US 5 in L/54 ammunition.

Specifications
Gun
Calibre: 127 mm
Length of barrel: 54 calibres
Muzzle velocity: 808 m/s (2,625 ft/s)
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 13,600 m (45,000 ft)
Rate of fire: 45 rds/min
Weight of shell: 32 kg (70 lb)

Mounting
Compatto
Training: 330° at 40°/s
Elevation: −15 to +85° at 30°/s
Ready rounds: 66
Crew: 5

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy

OTOBREDA 40 mm L/70 Compact (Type 70) twin mounting
Two twin 40 mm turrets are mounted at main deck level either side of the hangar.

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −13 to +85° at 60°/s
Rate of fire: 600 rds/min/mount
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Ready rounds: 736
Crew: 2

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Oerlikon 20 mm cannon
Two single, manually operated Oerlikon 20 mm cannon have been fitted as a temporary measure for particular operations.

Specifications
Calibre: 20 mm
Length of barrel : 70 calibres
Muzzle velocity: 835 m/s
Range:
anti-surface: 0.81 n miles (1.5 km)
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +90°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Elettronica Lambda EW system
The EW system in the 'Lupo' class is a combination of the Elettronica SLR-4 radar warning and SLQ-D jammer suites. The ESM section is SLR-4, which provides 100 per cent intercept probability, passive surveillance, automatic instantaneous warning of programmed threat, automatic analysis of threat parameters, automatic identification and tracking of threats, a synthetic data display, instantaneous DF, and broad frequency coverage. The SLQ-D ECM section provides self-protection by using jammers. An assessment of antennas in the ship suggests that included in the suite are the ELT 521 deception jammer and ELT 318 noise jammer. The suite is controlled from a single operator's position.

Manufacturer/Contractor
Elettronica SpA, Rome, Italy.

DECOYS

OTOBREDA SCLAR rocket launchers
Two 20-tube, 105 mm OTOBREDA SCLAR, multipurpose, rocket launchers are sited on the 01 deck level under the bridge wings. The control unit is linked to the ship's radar and a control panel in the ECM compartment to provide the necessary operating signals, with the data needed to stabilise the two launchers against pitch and roll being provided by the ship's gyrocompass. The system provides defence against radar

Orsa *(F 567)*

and IR homing missiles, confuses enemy radars, and provides illumination for visual fire control at night. Provision is made to load different types of rockets in various arrangements (long-range chaff, medium-range chaff, illuminating) to permit mixed salvos. Automatic selection of the rockets to be fired is possible from the remote fire-control unit and the time fuzes and launch sequence may be similarly controlled. The rockets all have double-base propellant motors with folding fins and electronic fuzes while their speed to burnout is 260-645 m/s (853-2,116 ft/s).

Specifications

Launcher weight: 1.15 t (empty); 1.75 t (with 20 rockets)
Trunnion height: 1.17 m (3.84 ft)
Traverse: 300° at 60°/s
Elevation: −5 to +60° at 30°/s
Rate of fire: 1 rd/s

Chaff distraction rocket
Type: SNIA 105 LR-C
Length: 1.85 m (6.0 ft)
Diameter: 105 mm (4 in)
Max range: 12 km
Weight: 27 kg (59.5 lb)
Payload: 10.2 kg (22.5 lb)

Chaff seduction rocket
Type: SNIA 105 MR-C
Length: 1.83 m (6.0 ft)
Diameter: 105 mm (4 in)
Max range: 4.7 km
Weight: 29 kg (63.9 ft) (SNIA 105 MR)
Payload: 17.4 kg (38.36 lb)

Infra-red seduction
Type: SNIA 105 MR-IR

Illumination
Type: SNIA 105 LR-I
Payload: 10.2 kg (22.5 lb)
Range: 4 km

Manufacturers/Contractors

OTOBREDA, Brescia, Italy (launcher).
SNIA BPD, Italy (rockets).

AN/SLQ-25 Nixie noisemaker

One AN/SLQ-25 Nixie (Phase 1), solid-state, modular design electroacoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed through the transom or in a partially or totally enclosed location on the main deck. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm (3.10 ft) long, 15.24 cm (6 in) in diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body at a time is deployed.

Manufacturer/Contractor

Aerojet ElectroSystems, Sacramento, California, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

SADOC 2/IPN 10

SADOC 2/IPN 10 (SADOC = *Systema Direzione della Operazioni di Combattimento)* is a mainframe architecture system designed to acquire, process and present data acquired by sensors. It can also be used for a number of other functions, including threat evaluation and weapons control, ECM management, aircraft control, conducting ASW operations, as well as datalink and databank management. Data are received from onboard and offboard sensors via datalinks. The system has two or three Central Processing Units (CPU) mini-computers (Alenia 32-bit CDG-3032 with a 128 k memory), one of which usually acts as the immediate back-up in the event of system failure. Within the consoles are Alenia 16-bit NDC-160 processors, with 64 k memories. Both possess mass memory modules for handling programmes and large amounts of data and an interface with a 10 Mbit/s serial databus. Programming language is Ada.

There are two TAVITAC operating systems; the disk operating system and a time-sharing executive. The system uses a 10 Mbit/s serial bus. The main displays and command positions are in the COC *(Centrale Operativa Combattimento).* This system designated SADOC 2 in the Italian Navy and IPN-10 for export.

Manufacturer/Contractor

Alenia Elsag Sistemi Navali, Rome, Italy.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 11
Satcom: Satcom
IFF: Mk XII

WEAPONS CONTROL

Argo NA 10 Mod 2 fire-control system

The NA 10 Mod 2 system is designed for surface engagement, air engagements or shore bombardments and can control three guns of two calibres simultaneously, using an RTN 10X fire-control radar. The system is operated through the Main Control Unit (MCU), a console with a ballistic computer, which is used for target acquisition, tracking and engagement either manually or automatically. Two periscopic sights may also be used to provide supplementary target data input to the radar and permit a second target to be engaged. In addition to target data input the MCU receives information from the true wind computer, and data on ship course and speed from the log and gyrocompass, while a vertical reference system provides roll and pitch information.

Manufacturer/Contractor

Alenia Elsag Sistemi Navali, Rome, Italy.

Dardo

There are two Dardo systems, each controlling one 40 mm gun. Dardo is an automatic CIWS, with manual override, designed to engage sea-skimming and diving missiles as well as manned aircraft. It is a mainframe system and consists of a digital data processing and interface unit (DPU), a supervisory console and the Orion RTN 20X radar. Each system controls a single twin 40 mm gun mounting and optional equipment includes optical designators. The DPU uses an 18-bit mini-computer with a 20 k memory, 82 different instructions and a maximum application time of 10.5 µs. Software is written in Assembler language. The DPU receives input from the gyrocompass, inertial reference, the log and the wind reference unit.

The Orion RTN 20X, J-band (10-12 GHz) radar has a stabilised, monopulse, cassegrain antenna with polarisation twist. The transmission frequency and PRF can be changed randomly on a pulse-to-pulse basis over a wide frequency spectrum. The fully digital receiver uses a multicanceller MTI and is equipped to reduce the effects of multipath on low-flying targets. An electro-optical unit (daylight or low-light level TV or infrared) can be installed to the right of the antenna which has maximum slewing speeds of 2.2 rad/s (training), 1.5 rad/s (elevation). The radar can detect missiles at ranges of >10 km.

Initial target acquisition is by the RAN 10S search radar which interfaces directly with the system. Once the RTN 20 radar has acquired the target or targets the system conducts automatic tracking, assigning target priorities where necessary. The operator may override the system to engage lower-priority targets where necessary. Targets can be engaged at distances of 300-3,500 m and up to 10 may be tracked simultaneously.

Manufacturer/Contractor

Alenia Elsag Sistemi Navali, Rome, Italy.

Mk 91 Mod 1 fire-control system

There are two Mk 91 Mod 1 directors: one is on the bridge roof, the other atop a small tower aft. The Mk 91 fire-control system operates in either automatic or semi-automatic modes from target acquisition to interception. It is a mainframe system using an NFT (Norsk Forsvarsteknologi) Mk 157 digital computer which performs all necessary calculations, stores data and is responsible for data distribution.

The Mk 95 tracker-illuminator consists of a Mk 78 radar director with separate transmitting and receiving antennas, a director controller (Mk 106) and a low-light TV camera (Mk 6) with 2.4 × 2.4° and 10 × 10° fields of view. The I-band radar directs the Sea Sparrow missile to fly a lead-angle course to the intercept point enabling the ship to protect both itself and other ships in company. Inboard equipment includes a Mk 73 continuous wave illuminator transmitter, a signal data processor (Mk 17), a signal data converter (Mk 80) and a director controller (Mk 106). There is a radar set console (Mk 83), with Bell Aerospace low-light television monitor and a firing officer's console (Mk 86).

Because of its I-band frequency the Mk 91 will detect sea-skimming missiles sooner than lower-frequency search radars; the system can thus be fully autonomous, conducting search, detection and engagement automatically. It can also accept outside designations from radar, EW or optic sources. Radar data from the director is passed to the signal data processor to provide range and angle tracking data. This data is passed to the firing officer's console from where prelaunch data and firing commands are relayed to the Mk 29 trainable launcher and missile. The launcher then trains in azimuth to the intercept point and in superelevation to optimum angle to maximise missile kinetic energy. Should the correct azimuth be blocked by the ship's superstructure, the launcher trains to the nearest clear azimuth and commands the missile to 'fly around the corner' to the direct path to the intercept. On launch, the missile flies a proportional navigation path (lead angle intercept) directly to the intercept point in a lofted trajectory which maximises energy and minimises image effects.

In 1991 Raytheon modified the Mk 91 systems aboard the 'Lupo' class to enable them to launch either RIM-7M or RIM-7P or Aspide missiles.

Manufacturer/Contractor

Raytheon Company, Equipment Division (prime).

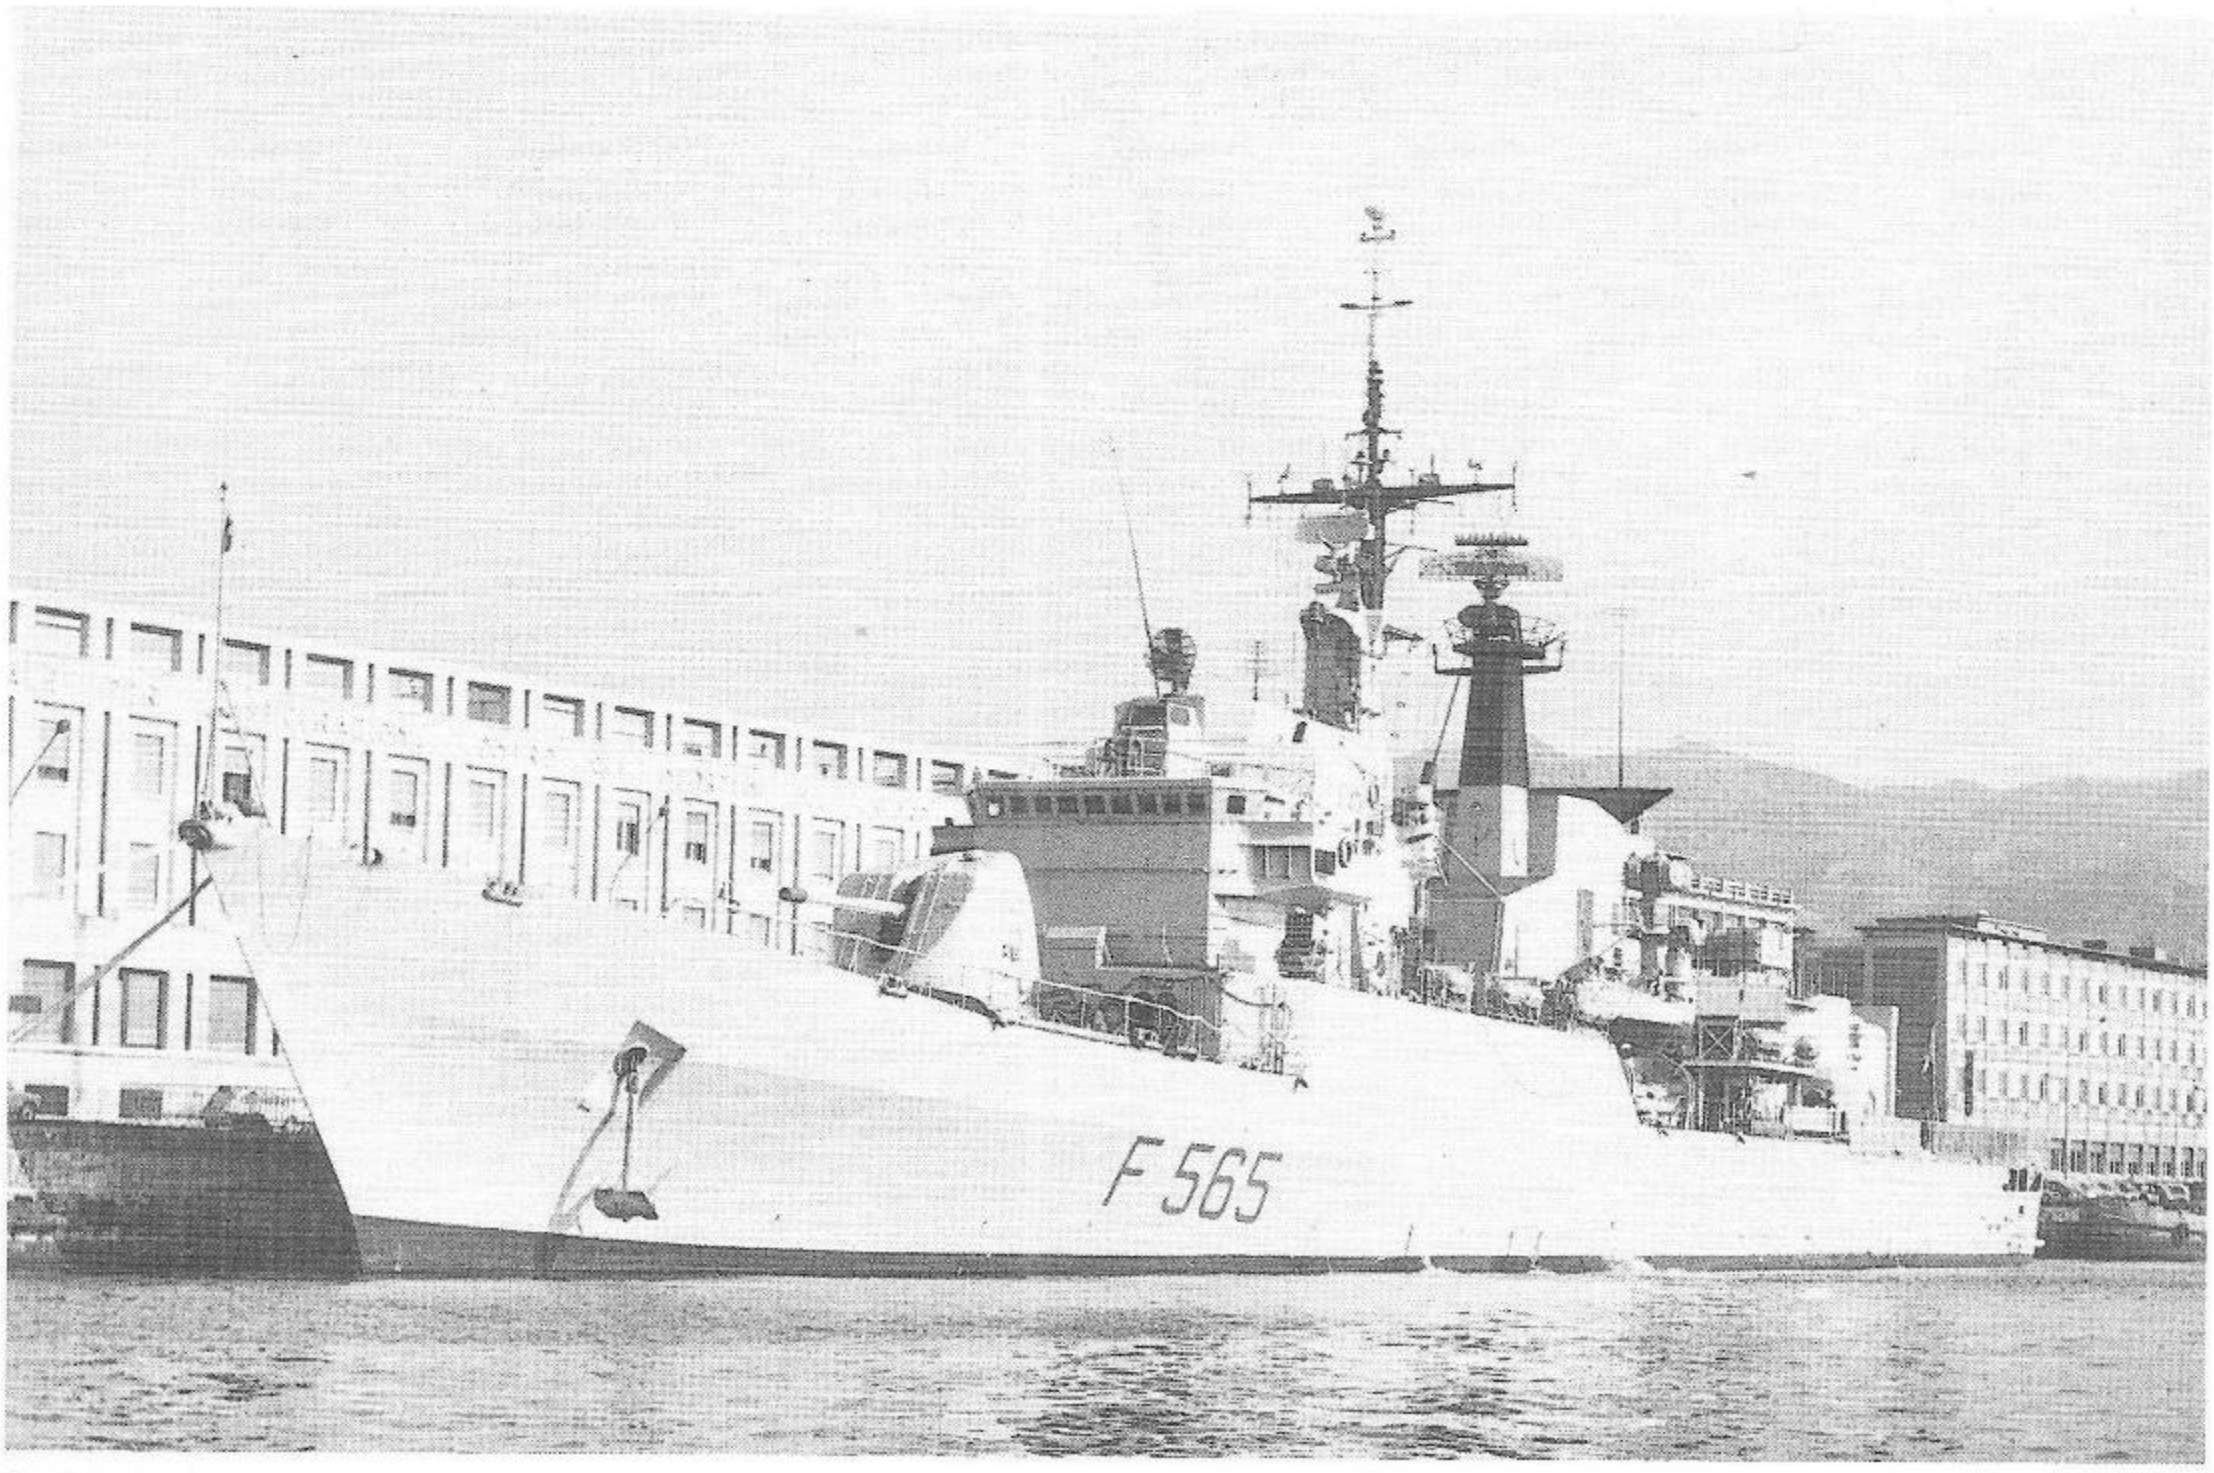
SONAR

Raytheon DE 1160B sonar

The Raytheon DE1160B sonar system is the commercial version of the AN/SQS-56 hull-mounted sonar and is an active/passive, preformed beam, digital sonar providing panoramic echo ranging and panoramic (DIMUS) passive surveillance. All signal processing, except transducer-received signal amplification and linear transducer transmit drive, is accomplished in digital hardware. All visual data are presented on flicker-free, digitally refreshed television-type raster scan CRT displays. System timing, control and interface communication are accomplished by a general purpose mini-computer which is a component of the basic system. Both 400 Hz synchro and MIL-STD-1397 Type A or C, category II digital interfaces are available in the basic sonar system. A single operator can search, track, classify and designate multiple targets from the active system while simultaneously maintaining anti-torpedo surveillance on the passive display. Computer-assisted system control permits the operator to concentrate on the sonar data being displayed rather than on the system control.

Manufacturer/Contractor

Raytheon Company, Submarine Signal Division, Portsmouth, Rhode Island, USA.



Sagittario *(F 565)* (H & L van Ginderen Collection)

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 24 × 11.3 m (79 × 37 ft)

Hangar: The hangar is a telescopic design which extends by some 8 m (28 ft) to enclose the helicopter for protection and maintenance.

HELICOPTERS

One Agusta-Bell AB 212ASW.

Specifications

Dimensions:

main rotor diameter: 14.63 m (48.0 ft)

height to rotor head: 3.91 m (12.82 ft)

rotor disc area: 168.1 m² (1,809 sq ft)

Weight:

max take-off weight: 5,070 kg (11,177 lb)

Performance:

max speed (never exceed): 130 kts (240 km/h)

typical cruising speed: 100 kts (185 km/h)

hovering ceiling (out of ground effect): 396 m (1,300 ft)

range (max standard fuel): 2 n miles (615 km)

Engine: one Pratt & Whitney Canada PT6T-6 Turbo Twin-Pac rated at 1,398 kW (1,875 shp)

Role equipment: torpedoes, AS-12 ASMs or Elettronica Gufo 2000 EW intercept equipment

PROPULSION

Specifications

System: combined diesel or gas turbine (CODOG)

Main machinery: 2 Fiat/General Electric LM-2500 gas turbines; 37.3 MW (50,000 hp) sustained; 2 GMT BL 230.20 M diesels; 7.3 MW (10,000 hp (m)) sustained

Shafts: 2

Propellers: cp

Auxiliary machinery: 4 GMT 236SS diesel generators, 780 kW at 1,200 rpm.

FURTHER INFORMATION

PROGRAMME

The 'Lupo' class frigates were designed for surveillance duties in the Mediterranean waters for which Italy is responsible (which extend as far as Gibraltar in war) patrolling sealanes, escort duties, and other NATO duties.

Four 'Lupo' class frigates were ordered for the Italian Navy, followed by orders from Peru (four), Venezuela (six) and Iraq (four). All have been constructed, but the Iraqi ships were never delivered (see under Modernisation).

DESIGN

The hull is designed for high speed, long range, good manoeuvrability and a low noise signature. The interior is divided into 15 watertight compartments with the requirement that the ship can remain afloat with any three adjacent compartments flooded.

As is customary with Italian designs, the Lupo is both fast and highly manoeuvrable. The ship has demonstrated an ability to attain a speed in excess of 35 knots in less than 60 seconds from a standing start, and to come to a 'crash stop' from maximum speed in less than 40 seconds. The ship's turning circle is less than 500 m (1,640 ft).

MODERNISATION

These ships all underwent a mid-life update, which started in 1991 and was completed in 1994. The work done included installing a new low-altitude CORA SPS 702 search radar (this is the large white radome on the bridge roof), new gyros and improved communications including Satcom.

Iraqi ships

Iraq ordered four ships but these were not delivered. They were transferred to the Italian Navy on 20 January 1992 and are designated the 'Artigliere' class.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

OTOBREDA Teseo Mk 2

There are eight missiles, housed in four pairs of individual launcher-containers; two pairs are mounted either side of the mast, while the other two pairs are mounted on a platform deck either side of the forward end of the hangar. All the launcher-containers face outward at about 30° to the ship's centreline. The Teseo system is based on the Otomat missile, which has folding wings and is powered by a turbojet with solid fuel rocket boosters. The warhead is a semi-armour-piercing type, which is claimed to penetrate up to 8 cm of nickel-chromium armour. The Mk 2 system is designed for over-the-horizon targeting using a co-operating Agusta-Bell AB 212ASW helicopter with SMA MM/APS-705 I-band radar and PRT-405 tracking and datalink system. On the first leg, the missile flies directly towards the helicopter and only when it passes under the helicopter does the latter transmit target location data.

The target may be acquired by the ship's radar, by the radars of friendly ships or by helicopter radars. Data on the target's location are transmitted to the missile's autopilot and the turbojet is started. Once it has reached full power the boosters are ignited and the missile is launched, but as the missile can turn through angles of up to ±200° the warship does not have to be facing the target during the launch phase.

Once launched, the missile climbs to 150 m (492 ft) accelerated by the boosters which burn for 4 seconds until it reaches cruising speed at a distance of some 2.15 n miles (4 km) from the launch point, where the boosters are jettisoned. The missile then descends to a cruising altitude of 15-20 m (49-65.6 ft), a compromise between ensuring good communications with the mothership and the need to make it difficult for the target to detect it. The missile continues towards the target with mid-course guidance correction until the radar seeker, which is azimuth only, is activated at a predetermined point and scans a 40° sector, then acquires the target at a range of about 6.5 n miles (12 km). For the terminal phase the Otomat drops to sea-skimming height.

The Otomat system is capable of engaging two separate targets simultaneously in sea states up to Force 7.

Specifications

Length: 4.46 m (14.6 ft)
Diameter: 46 cm (18.1 in)
Wing span: 1.36 m (4.5 ft)
Weight:
with booster: 770 kg (1,698 lb)
without booster: 762 kg (1,680 lb)
Range: 86 n miles (160 km)
Speed: Mach 0.9
Guidance: Inertial and active radar homing
Propulsion: Turbomeca TR 281 Arbizon III turbojet; 400 kg st
Booster: Two SNPE solid propellant boosters; 3,500 kg st each.
Warhead: Semi-armour-piercing; 210 kg (463 lb); HE 65 kg (143 lb)
Fuzes: Impact, proximity

Manufacturer/Contractor

OTOBREDA, Italy

SURFACE-TO-AIR MISSILES (SAM)

The Albatros Mk 2 Mod 9 system comprises two elements:
Riva-Calzoni launcher
Aspide missile

Riva-Calzoni Albatros launcher

The single, eight-cell Albatros launcher is located on the hangar roof in 'X' position. Produced by Riva-Calzoni, it has eight launch cells, four on each side of

the mounting, each with a frangible front and rear cover. There are no reload facilities.

Specifications
Albatros launcher
Height: 2.98 m (9.2 ft)
Width: 3.82 m (12.5 ft)
Length: 3.82 m (12.5 ft)
Weight (loaded): 8.5 t
Traverse: 360° at 45°/s
Elevation: −5 to +80° at 25°/s.

Alenia Aspide missile
The system uses the Selenia (now Alenia) Aspide SAM, a missile developed by Selenia from the US Sparrow. Targets are detected by the ship's primary search radar and then allocated to the fire-control system. The target is acquired by the fire-control system radar and the CW transmitter group injects signals into the fire-control system tracker as the launcher slews in the target's direction. The missile control system selects the missile or missiles which the power supply units then prepare for launch. Total system reaction time is 8 seconds. When the decision is made to engage the target with missiles the reversible prelaunch commands are issued. The firing command itself can be issued automatically or manually, the operator also having the options of a single shot or salvo mode. In the latter, two missiles are launched sequentially against the same target, the maximum firing rate of the system being one missile every 2.5 seconds. Upon launch the missile is gathered into the tracker-illuminator's beam through a direct signal to the rear receiver and homes on the reflected energy from the target. Up to three missiles at once may be controlled by the tracker, according to the manufacturer who also claims the system can engage horizontal targets at up to 15 km, vertical ones at 5 km and lateral ones at 8 km. A short reaction time gives the system the ability to destroy anti-ship missiles even when detection is late.

Specifications
Aspide missile
Length: 3.7 m (12.1 ft)
Diameter: 20.3 cm (8 in)
Wing span: 80 cm (31.5 in)
Weight: 220 kg (485 lb)
Speed: Mach 2.5
Range: 7 n miles (13 km)
Altitude: 15-5,000 m (49-16,405 ft)
Warhead: 33 kg (72.8 lb)
Guidance: Semi-active radar

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy (system/missile).
Riva-Calzoni, Bologna, Italy (launcher).

TORPEDOES

B515 anti-submarine torpedo launching system.
There are two triple B515 (ILAS) torpedo tubes in the waist. The tubes are manually loaded and trained but remotely operated from the combat information centre, although emergency local operation is possible.

Specifications
Length: 3.4 m (11.15 ft)
Height: 1.2 m (3.9 ft)
Width: 1.285 m (4.2 ft)
Weight: 1,050 kg (2,315 lb) (unloaded)

Manufacturer/Contractor
Whitehead, Division of Gilardini SpA.

A244/S lightweight air-/surface-launched anti-submarine weapon
The torpedo used in these ships is believed to be the Whitehead A244/S. The seeker in the A244/S is the Alenia CIACIO-S which is capable of active, passive or mixed modes for closing on to its target and can discriminate between decoys and real targets in the presence of heavy reverberations by specially emitted pulses and signal processing. It also discriminates between target noise and reverberations, as well as having a series preset of programmable search patterns and tactical manoeuvres (including re-attack procedures). The seeker has a large search volume covered by multiple preformed beams following a number of self-adaptive search patterns and is reported capable of target detection at −5 dB in good acoustic conditions. The computerised homing system also provides for presettable combinations of signal processing, spatial filtering and tactical torpedo manoeuvring. The software may be reprogrammed by the customer to meet new tactical conditions. Upon launching, the A244/S initially steers a straight course and, if the target is not detected, it then begins a search pattern which may be either a spiral between preselected depths or a helix pattern.

Specifications
Length: 2.7 m (8.85 ft)
Diameter: 324 mm (12.75 in)
Weight: 215 kg (474 lb) (warshot version)
Warhead: 34 kg (75 lb) shaped charge HBX-3 HE
Propulsion: Electric; silver/zinc batteries
Range: 3.5 n miles (6 km)
Speed: 30 kts
Guidance: Active/passive sonar, self-adaptive programmed patterns

Manufacturer/Contractor
Whitehead SpA, Salviano, Italy.

Montero *(FM 53). The relatively heavy armament of eight Teseo anti-ship missiles, Aspide SAMs and an AB 212ASW helicopter makes this class one of the most heavily armed frigates in any Pacific Navy*

GUNS

OTOBREDA 127 mm/54 Compatto
There is one OTOBREDA 127 mm/54 Compatto mounting in 'A' position. This weapon is designed to provide naval gunfire support, to engage surface targets and to engage air targets, including anti-ship missiles and fixed-wing aircraft which do not have standoff weapons. The turret is unmanned and is enclosed by a glass fibre shield. Much of the turret and the lower part of the mounting are made of aluminium alloy. The below-deck element of the mounting consists of three drums each containing 22 rounds, which are stocked automatically from two chain-driven lower hoists which lead to the magazines and are loaded manually. The gun captain uses his control to select which drums are to be replenished and with what ammunition. The weapon is compatible with all US 5 in L/54 ammunition.

Specifications
Gun
Calibre: 127 mm
Length of barrel: 54 calibres
Muzzle velocity: 808 m/s (2,625 ft/s)
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 13,600 m (45,000 ft)
Rate of fire: 45 rds/min
Weight of shell: 32 kg (70 lb)

Mounting
Compatto
Training: 330° at 40°/s
Elevation: −15 to +85° at 30°/s
Crew: 5

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

OTOBREDA 40 mm L/70 Compact (Type 70) twin mounting
Two twin 40 mm turrets are mounted aft, either side of the hangar.

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −13 to +85° at 60°/s
Rate of fire: 600 rds/min/mount
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Elettronica Lambda EW system

The EW system in the Peruvian 'Lupo' class ships is a combination of the Elettronica SLR-4 radar warning and SLQ-D jammer suites in the Lambda system. The ESM section is SLR-4, which provides 100 per cent intercept probability, passive surveillance, automatic instantaneous warning of programmed threat, automatic analysis of threat parameters, automatic identification and tracking of threats, a synthetic data display, instantaneous DF, and broad frequency coverage. The SLQ-D ECM section provides self-protection by using jammers. An assessment of antennas in the ship suggests that included in the suite are the ELT 521 deception jammer and ELT 318 noise jammer. The suite is controlled from a single operator's position.

Manufacturer/Contractor

Elettronica SpA, Rome, Italy

DECOYS

OTOBREDA SCLAR rocket launchers

Two 20-tube, 105 mm OTOBREDA SCLAR, multipurpose, rocket launchers are sited beneath the bridge wings. The control unit is linked to the ship's radar and a control panel in the ECM compartment to provide the necessary operating signals, with the data needed to stabilise the two launchers against pitch and roll being provided by the ship's gyrocompass. The system provides defence against radar and IR homing missiles, confuses enemy radars, and provides illumination for visual fire control at night. Provision is made to load different types of rockets in various arrangements (long-range chaff, medium-range chaff, illuminating) to permit mixed salvos. Automatic selection of the rockets to be fired is possible from the remote fire-control unit and the time fuzes and launch sequence may be similarly controlled. The rockets all have double-base propellant motors with folding fins and electronic fuzes while their speed to burnout is 260-645 m/s (853-2,116 ft/s).

Specifications

Launcher weight: 1.15 t (empty); 1.75 t (with 20 rockets)
Trunnion height: 1.17 m (3.83 ft)
Traverse: 300° at 60°/s
Elevation: −5 to +60° at 30°/s
Rate of fire: 1 rd/s

Chaff distraction rocket
Type: SNIA 105 LR-C
Length: 1.85 m (6.0 ft)
Diameter: 105 mm
Max range: 12 km
Weight: 27 kg (59.5 lb)
Payload: 10.2 kg (22.49 lb)

Chaff seduction rocket
Type: SNIA 105 MR-C
Length: 1.83 m (6.0 ft)
Diameter: 105 mm
Max range: 4.7 km
Weight: 29 kg (64 lb) (SNIA 105 MR)
Payload: 17.4 kg (38.4 lb)

Infra-red seduction
Type: SNIA 105 MR-IR

Illumination
Type: SNIA 105 LR-I
Payload: 10.2 kg (22.49 lb)
Range: 4 km

Manufacturers/Contractors

Breda Meccanica Bresciana SpA (launcher).
SNIA BPD (rockets).

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

SADOC 2/IPN 10

SADOC 2/IPN 10 (SADOC = *Systema Direzione della Operazioni di Combattimento)* is a mainframe architecture system designed to acquire, process and present data acquired by sensors. It can also be used for a number of other functions, including threat evaluation and weapons control, ECM management, aircraft control, conducting ASW operations, as well as datalink and databank management. Data are received from onboard and offboard sensors via datalinks. The system has two or three Central Processing Units (CPU) mini-computers (Alenia 32-bit CDG-3032 with a 128 k memory), one of which usually acts as the immediate back-up in the event of system failure. Within the consoles are Alenia 16-bit NDC-160 processors, with 64 k memories. Both possess mass memory modules for handling programmes and large amounts of data and an interface with a 10 Mbit/s serial databus. Programming language is Ada.

There are two TAVITAC operating systems; the disk operating system and a time-sharing executive. The system uses a 10 Mbit/s serial bus. The main displays and command positions are in the COC *(Centrale Operativa Combattimento).* This system is designated SADOC 2 in the Italian Navy and IPN-10 for export.

Manufacturer/Contractor

Alenia Elsag Sistemi Navali, Rome, Italy.

WEAPONS CONTROL

Argo NA21 Mod 2 fire-control system

There are two NA 10 Argo systems, designed for surface engagement, air engagements or shore bombardments which can control three guns of two calibres simultaneously, using an RTN 10X fire-control radar. The system is operated through the Main Control Unit (MCU), a console with a ballistic computer, which is used for target acquisition, tracking and engagement either manually or automatically. Two periscopic sights may also be used to provide supplementary target data input to the radar and permit a second target to be engaged. In addition to target data input the MCU receives information from the true wind computer, and data on ship course and speed from the log and gyrocompass, while a vertical reference system provides roll and pitch information.

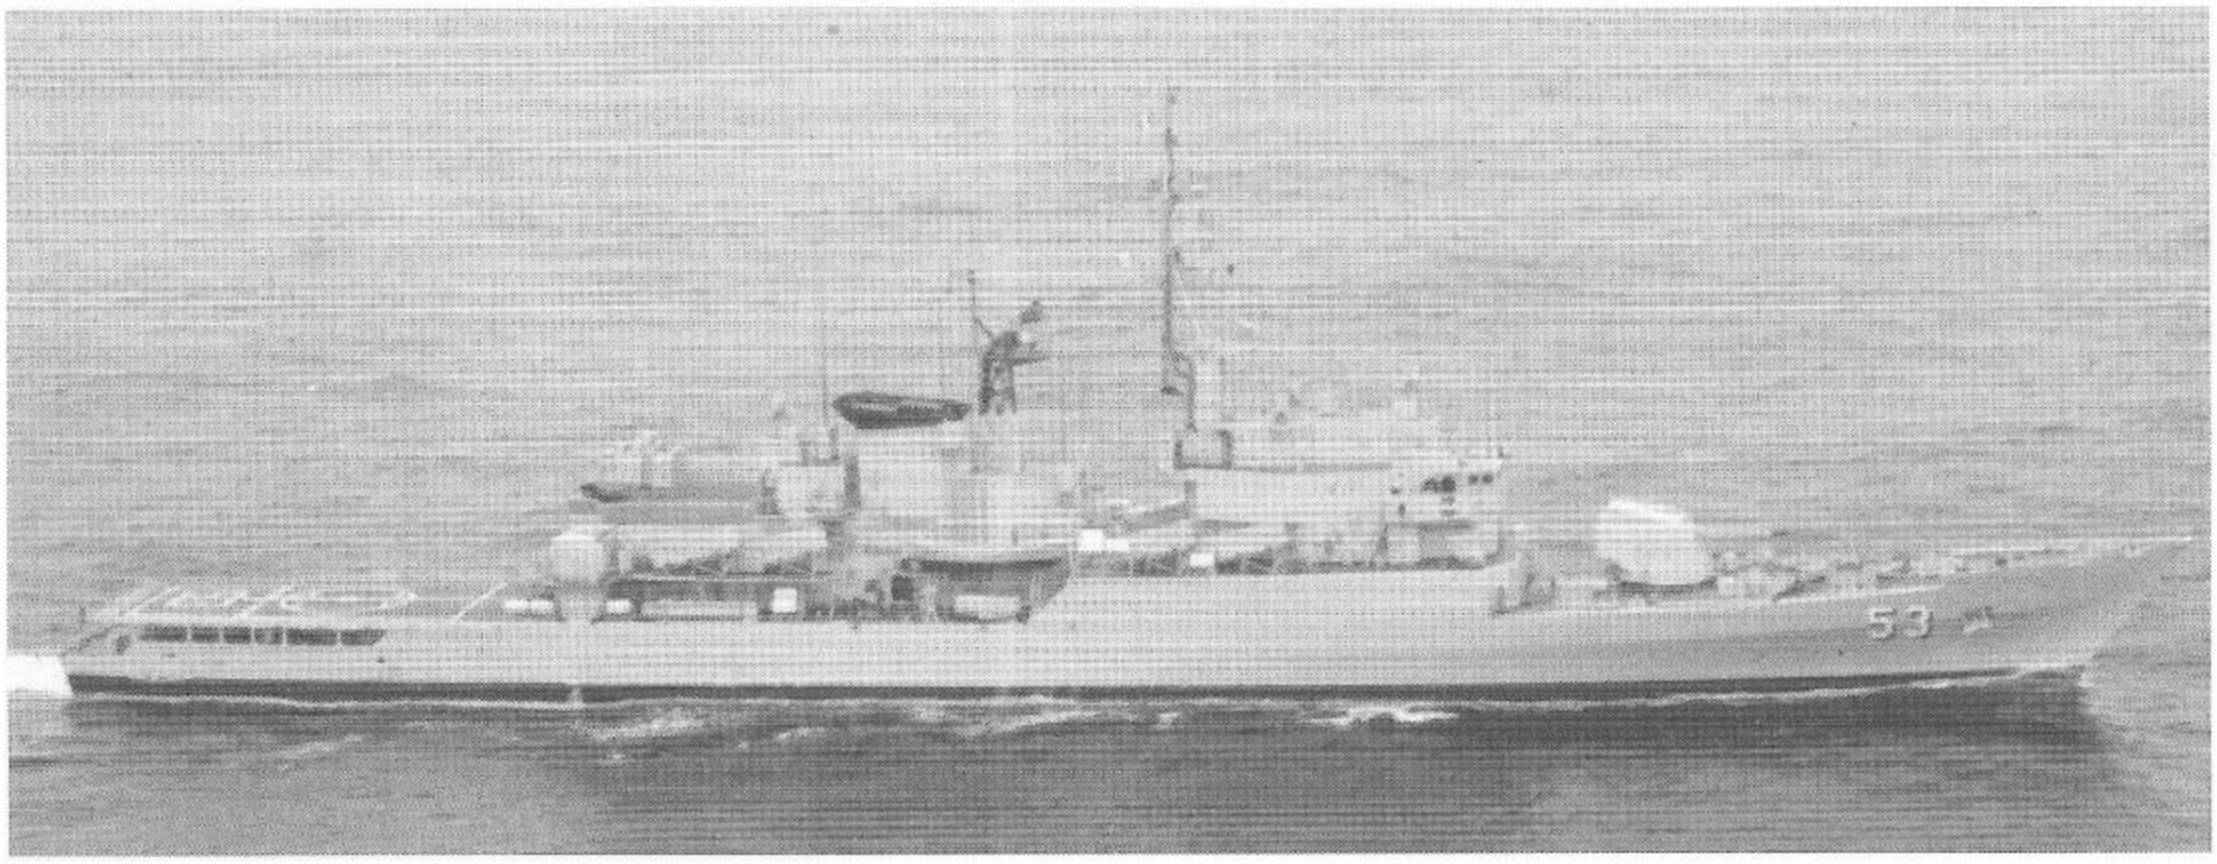
Manufacturer/Contractor

Alenia Elsag Sistemi Navali, Rome, Italy.

Dardo

There are two Dardo systems, each controlling one 40 mm gun. Dardo is an automatic CIWS, with manual override, designed to engage sea-skimming and diving missiles as well as manned aircraft. It is a mainframe system and consists of a digital data processing and interface unit (DPU), a supervisory console and the Orion RTN 20X radar. Each system controls a single twin 40 mm gun mounting and optional equipment includes optical designators. The DPU uses an 18-bit mini-computer with a 20 k memory, 82 different instructions and a maximum application time of 10.5 µs. Software is written in Assembler language. The DPU receives input from the gyrocompass, inertial reference, the log and the wind reference unit.

The Orion RTN 20X, J-band (10-12 GHz) radar has a stabilised, monopulse, cassegrain antenna with polarisation twist. The transmission frequency and PRF can be changed randomly on a pulse-to-pulse basis over a wide frequency spectrum. The fully digital receiver uses a multicanceller MTI and is equipped to reduce the effects of multipath on low-flying targets. An electro-optical unit (daylight or low-light level TV or infrared) can be installed to the right of the antenna which has maximum slewing speeds of 2.2 rad/s (training), 1.5 rad/s (elevation). The radar can detect missiles at ranges of >10 km.



Peruvian frigate Montero *(FM 53) was the first major warship to be constructed in any shipyard on the Pacific coast of South America. The ships are generally similar to the first two ships built in Italy, but the Peruvian-built ships do not have a telescopic hangar and the after end of the flight deck does not reach the transom* (Peruvian Navy)

Initial target acquisition is by the RAN 10S search radar which interfaces directly with the system. Once the RTN 20 radar has acquired the target or targets the system conducts automatic tracking, assigning target priorities where necessary. The operator may override the system to engage lower-priority targets where necessary. Targets can be engaged at distances of 300-3,500 m (984-11,483 ft) and up to 10 may be tracked simultaneously.

Manufacturer/Contractor

Alenia Elsag Sistemi Navali, Rome, Italy.

SONAR

EDO Model 610E hull-mounted active sonar system

The EDO Model 610E sonar is an all solid-state low-frequency (6, 7 and 8 kHz) sonar and is designed for the long-range (up to 29,000 m (32,000 yd)) detection of submarines in deep and shallow water. The hull-mounted transducer has 36 staves and is 1.25 m (4.1 ft) in diameter. It is a scanning sonar with two active consoles, enabling it to perform a search-while-track function. Facilities offered include a search capability in three 120° sectors, passive correlation, and reverberation processing. The transmitter and receiver beams are preformed. Output is available for a fire-control system. All mode changes and range scale changes are controlled by console push-buttons, and displays include a Doppler display on each of the active consoles and a passive sonar bearing time recorder display.

Manufacturer/Contractor

EDO Corporation, Government Systems Division, College Point, New York, USA

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 25.2 × 11.3 m (83 × 37 ft)
Hangar: The hangar was originally a telescopic design but has been fixed in the Peruvian ships.

HELICOPTERS

One Agusta-Bell AB 212ASW.

Specifications

Dimensions:
main rotor diameter: 14.63 m (48.0 ft)
height to rotor head: 3.91 m (12.82 ft)
rotor disc area: 168.1 m² (1,809 sq ft)
Weight:
max take-off weight: 5,070 kg (11,177 lb)

Performance:
max speed (never exceed): 130 kts (240 km/h)
typical cruising speed: 100 kts (185 km/h)
hovering ceiling (out of ground effect): 396 m (1,300 ft)
Engine: 1 Pratt & Whitney Canada PT6T-6 Turbo Twin-Pac rated at 1,398 kW (1,875 shp)
Role equipment: Selenia (now Alenia) radar, Bendix ASQ-18 dipping sonar, ECM. Two Mk 46 or 244/S torpedoes or depth bombs.

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 Fiat/General Electric LM-2500 gas turbines; 37.3 MW (50,000 hp) sustained; two GMT BL 230.20 M diesels; 7.3 MW (10,000 hp(m)) sustained
Shafts: 2
Propellers: cp

FURTHER INFORMATION

PROGRAMME

These four ships were ordered from Fincantieri, with the first two being built in Italy and the second pair at Servicios Industriales de la Marina, (SIMA), Callao, the two ships involved, *Montero* and *Mariategui,* being the first major warships to be built on the Pacific Coast of South America. Virtually all the parts were supplied from Italy and five Italian engineers were resident at the yard throughout the programme. Although experienced in constructing merchant ships, the yard had to modernise many aspects of its work to cope with the warships; it was, for example, the first time that the yard became involved in welding aluminium. Surprisingly, the experience gained through this programme has not been used to build further warships.

DESIGN

The two ships built by Fincantieri in Italy are identical to those built for the Italian Navy, except that the hangar is fixed. The two built in South America however, have several differences:

- They were built by traditional methods, in one piece from the keel up, compared with the Italian-built ships which were constructed by the modular method.
- Instead of being mounted on the main deck, the two twin 40 mm mounts are on a pedestal at 01 deck level.
- Reloading of the Albatros is by hand rather than using power, as the Peruvian naval staff considered it unlikely that they would have to operate under conditions of NBC close-down.
- The flight deck does not extend to the transom (as in the Italian originals) but, because the hangar is fixed, it is actually some 1.22 m (4 ft) longer.
- Facilities and accommodation have been installed for a Flag officer and his staff so that these two ships can act as flotilla leaders when required.
- Some accommodation and storerooms have been rearranged to take account of Peruvian traditions and requirements.

MODERNISATION

The only known change has been the installation of helicopter in-flight refuelling (HIFR) facilities in 1989, so that Sea King helicopters can refuel without landing.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

OTOBREDA Teseo Mk 2

There are eight missiles, housed in four pairs of individual launcher-containers; two pairs are mounted either side of the mast, while the other two pairs are mounted on a platform deck either side of the forward end of the hangar, all the launcher-containers facing outward at about 30° to the ship's centreline. The Teseo system is based on the Otomat missile, which has folding wings and is powered by a turbojet with solid fuel rocket boosters. The warhead is a semi-armour-piercing type, which is claimed to penetrate up to 8 cm of nickel-chromium armour. The Mk 2 system is designed for over-the-horizon targeting using a co-operating Agusta-Bell AB 212ASW helicopter with SMA MM/APS-705 I-band radar and PRT-405 tracking and datalink system. On the first leg, the missile flies directly towards the helicopter and only when it passes under the helicopter does the latter transmit target location data.

The target may be acquired by the ship's radar, by the radars of friendly ships or by helicopter radars. Data on the target's location are transmitted to the missile's autopilot and the turbojet is started. Once it has reached full power the boosters are ignited and the missile is launched, but as the missile can turn through angles of up to ±200° the warship does not have to be facing the target during the launch phase.

Once launched, the missile climbs to 150 m (492 ft) accelerated by the boosters which burn for 4 seconds until it reaches cruising speed at a distance of some 2.15 n miles (4 km) from the launch point, where the boosters are jettisoned. The missile then descends to a cruising altitude of 15-20 m (49-66 ft), a compromise between ensuring good communications with the mothership and the need to make it difficult for the target to detect it. The missile continues towards the target with mid-course guidance correction until the radar seeker, which is azimuth only, is activated at a predetermined point and scans a 40° sector, then acquires the target at a range of about 6.5 n miles (12 km). For the terminal phase the Otomat drops to sea-skimming height.

The Otomat system is capable of engaging two separate targets simultaneously in sea states up to Force 7.

Specifications

Length: 4.46 m (14.6 ft)
Diameter: 46 cm (18.1 in)
Wing span: 1.36 m (4.5 ft)
Weight:
with booster: 770 kg (1,698 lb)
without booster: 762 kg (1,680 lb)
Range: 86 n miles (160 km)
Speed: Mach 0.9
Guidance: Inertial and active radar homing
Propulsion: Turbomeca TR 281 Arbizon III turbojet; 400 kg st
Booster: Two SNPE solid propellant boosters; 3,500 kg st each.
Warhead: semi-armour-piercing; 210 kg (463 lb); HE 65 kg (143 lb)
Fuzes: Impact, proximity

Manufacturer/Contractor

OTOBREDA, Italy

SURFACE-TO-AIR MISSILES (SAM)

The Albatros Mk 2 Mod 9 system comprises two elements:
Riva-Calzoni launcher
Aspide missile

Riva-Calzoni Albatros launcher

The single, eight-cell Albatros launcher is located on the hangar roof in 'X' position. Produced by Riva-Calzoni, it has eight launch cells, four on each side of the mounting, each with a frangible front and rear cover. There are no reloading facilities.

Specifications

Albatros launcher
Height: 2.98 m (9.8 ft)
Width: 3.82 m (11.87 ft)
Length: 3.82 m (11.87 ft)
Weight (loaded): 8.5 t
Traverse: 360° at 45°/s
Elevation: −5 to +80° at 25°/s.

Manufacturer/Contractor

Riva-Calzoni, Rome, Italy.

Selenia Aspide missile

The system uses the Selenia (now Alenia) Aspide SAM, a missile developed by Selenia from the US Sparrow. Targets are detected by the ship's primary search radar and then allocated to the fire-control system. The target is acquired by the fire-control system radar and the CW transmitter group injects signals into the fire-control system tracker as the launcher slews in the target's direction. The missile control system selects the missile or missiles which the power supply units then prepare for launch. Total system reaction time is 8 seconds. When the decision is made to engage the target with missiles the reversible prelaunch commands are issued. The firing command itself can be issued automatically or manually, the operator also having the options of a single shot or salvo mode. In the latter, two missiles are launched sequentially against the same target, the maximum firing rate of the system being one missile every 2.5 seconds. Upon launch the missile is gathered into the tracker-illuminator's beam through a direct signal to the rear receiver and homes on the reflected energy from the target. Up to three missiles at once may be controlled by the tracker, according to the manufacturer who also claims the system can engage horizontal targets at up to 15 km, vertical ones at 5 km and lateral ones at 8 km. A short reaction time gives the system the ability to destroy anti-ship missiles even when detection is late.

Specifications

Aspide missile
Length: 3.7 m (12.14 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 80 cm (31.5 in)
Weight: 220 kg (485 lb)
Speed: Mach 2.5
Range: 7 n miles (13 km)
Altitude: 15-5,000 m (49-16,405 ft)
Warhead: 33 kg (72.7 lb)
Guidance: Semi-active radar

Manufacturers/Contractors

Alenia Elsag Sistemi Navali, Rome, Italy (system/missile).
Riva-Calzoni, Bologna, Italy (launcher).

TORPEDOES

B515 anti-submarine torpedo launching system.

There are two triple B515 (ILAS) torpedo tubes in the waist. The tubes are manually loaded and trained but remotely operated from the combat information centre, although emergency local operation is possible.

Specifications

Length: 3.4 m (11.15 ft)
Height: 1.2 m (3.9 ft)
Width: 1.285 m (4.2 ft)
Weight: 1,050 kg (2,315 lb) (unloaded)

Manufacturer/Contractor

Whitehead, Division of Gilardini SpA, Salviano, Italy.

A244/S lightweight air-/surface-launched anti-submarine weapon

The torpedo used in these ships is believed to be the Whitehead A244/S. The seeker in the A244/S is the Alenia CIACIO-S which is capable of active, passive or mixed modes for closing on to its target and can discriminate between decoys and real targets in the presence of heavy reverberations by specially emitted pulses and signal processing. It also discriminates between target noise and reverberations, as well as having a series preset of programmable search patterns and tactical manoeuvres (including re-attack procedures). The seeker has a large search volume covered by multiple preformed beams following a number of self-adaptive search patterns and is reported capable of target detection at −5 dB in good acoustic conditions. The computerised homing system also provides for presettable combinations of signal processing, spatial filtering and tactical torpedo manoeuvring. The software may be reprogrammed by the customer to meet new tactical conditions. Upon launching, the A244/S initially steers a straight course and, if the target is not detected, it then begins a search pattern which may be either a spiral between preselected depths or a helix pattern.

Specifications

Length: 2.7 m (8.85 ft)
Diameter: 324 mm (12.75 in)
Weight: 215 kg (474 lb) (warshot version)
Warhead: 34 kg (75 lb) shaped charge HBX-3 HE
Propulsion: Electric; silver/zinc batteries
Range: 3.5 n miles (6 km)
Speed: 30 kts
Guidance: Active/passive sonar, self-adaptive programmed patterns

Manufacturer/Contractor

Whitehead SpA, Salviano, Italy.

GUNS

OTOBREDA 127 mm/54 Compatto

There is one OTOBREDA 127 mm/54 Compatto mounting in 'A' position. This weapon is designed to provide naval gunfire support, to engage surface targets and to engage air targets, including anti-ship missiles and fixed-wing aircraft which do not have standoff weapons. The turret is unmanned and is enclosed by a glass fibre shield. Much of the turret and the lower part of the mounting are made of aluminium alloy. The below-deck element of the mounting consists of three drums each containing 22 rounds, which are stocked automatically from two chain-driven lower hoists which lead to the magazines and are loaded manually. The gun captain uses his control to select which drums are to be replenished and with what ammunition. The weapon is compatible with all US 5 in L/54 ammunition.

Specifications

Gun
Calibre: 127 mm (5.0 in)
Length of barrel: 54 calibres
Muzzle velocity: 808 m/s (2,625 ft/s)
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 13,600 m (45,000 ft)
Rate of fire: 45 rds/min
Weight of shell: 32 kg (70 lb)

Mounting
Compatto
Training: 330° at 40°/s
Elevation: −15 to +85° at 30°/s
Crew: 5

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.

OTOBREDA 40 mm L/70 Compact (Type 70) twin mounting

Two twin 40 mm turrets are mounted aft, either side of the hangar, on a plinth which brings them up to the 01 deck level.

Specifications

Traverse: 360° (nominal) at 90°/s
Elevation: −13 to +85° at 60°/s
Rate of fire: 600 rds/min/mount
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

NS-9003A ESM system

The NS-9003A naval ESM system operates in a dense environment to carry out ESM and is able to cope with frequency agility, frequency-hopping, and staggered or wobbulated PRI emitters. The system automatically receives, analyses and identifies over-the-horizon radar signals with a 100 per cent probability of intercept over the frequency range from 2 to 18 GHz (0.5 to 40 GHz optional). The direction of arrival is instantaneously measured per pulse, using an accurate multibeam antenna array. This instantaneous direction-finding enables the system to locate any exotic type radar signal in the reception range within a fraction of a second. The analysed information is presented on a 19 in graphic situation display in several operator-selected modes for various EW tasks. The system has built-in power management provisions for ECM and chaff/flare activation. The NS-9003A antenna assembly includes a multibeam static antenna array with associated RF video and digital DF processing hardware, and an omnidirectional antenna array. Other units in the system are: receiving and processing equipment, and an operator console. Interface to radar blankers, gyro equipment, weapon system, ECM jamming and deception system, chaff/flare equipment and satellite navigation system can also be provided.

Although an integrated EW suite consisting of the NS-9003A and the NS-9005 jamming and deception system is available it does not appear that the Venezuelan Navy has availed itself of the additional ECM capability.

Specifications

Frequency range: 2-18 GHz (0.5-40 GHz optional)
DF accuracy: 1° I- and J-bands; 2° E/F- and G/H-bands
Sensitivity: −70 dBm
Frequency measurement: Instantaneous 2 MHz resolution

Manufacturer/Contractor

Elisra Electronic Systems, Bene Beraq, Israel.

DECOYS

OTOBREDA SCLAR rocket launchers

Two 20-tube, 105 mm OTOBREDA SCLAR, multipurpose, rocket launchers are sited beneath the bridge wings. The control unit is linked to the ship's radar and a control panel in the ECM compartment to provide the necessary operating signals, with the data needed to stabilise the two launchers against pitch and roll being provided by the ship's gyrocompass. The system provides defence against radar and IR homing missiles, confuses enemy radars, and provides illumination for visual fire control at night. Provision is made to load different types of rockets in various arrangements (long-range chaff, medium-range chaff, illuminating) to permit mixed salvos. Automatic selection of the rockets to

be fired is possible from the remote fire-control unit and the time fuzes and launch sequence may be similarly controlled. The rockets all have double-base propellant motors with folding fins and electronic fuzes, while their speed to burnout is 260-645 m/s (853-2,116 ft/s).

Specifications

Launcher weight: 1.15 t (empty); 1.75 t (with 20 rockets)
Trunnion height: 1.17 m (3.83 ft)
Traverse: 300° at 60°/s
Elevation: −5 to +60° at 30°/s
Rate of fire: 1 rd/s

Chaff distraction rocket
Type: SNIA 105 LR-C
Length: 1.85 m (6.0 ft)
Diameter: 105 mm (4 in)
Max range: 12 km
Weight: 27 kg (59.5 ft)
Payload: 10.2 kg (22.49 lb)

Chaff seduction rocket
Type: SNIA 105 MR-C
Length: 1.83 m (6.0 ft)
Diameter: 105 mm (4 in)
Max range: 4.7 km
Weight: 29 kg (64 lb) (SNIA 105 MR)
Payload: 17.4 kg (38.4 lb)

Infra-red seduction
Type: SNIA 105 MR-IR

Illumination
Type: SNIA 105 LR-I
Payload: 10.2 kg (22.49 lb)
Range: 4 km

Manufacturers/Contractors

Breda Meccanica Bresciana SpA (launcher).
SNIA BPD (rockets).

COMMAND AND CONTROL SYSTEMS

COMMUNICATIONS AND DATALINKS

Tacan: SRN 15A

WEAPONS CONTROL

Argo NA21 Mod 2 fire control system

There are two NA 10 Argo systems, designed for surface engagement, air engagements or shore bombardments which can control three guns of two calibres simultaneously, using an RTN 10X fire-control radar. The system is operated through the Main Control Unit (MCU), a console with a ballistic computer, which is used for target acquisition, tracking and engagement either manually or automatically. Two periscopic sights may also be used to provide supplementary target data input to the radar and permit a second target to be engaged. In addition to target data input the MCU receives information from the true wind computer, and data on ship course and speed from the log and gyrocompass, while a vertical reference system provides roll and pitch information.

Manufacturer/Contractor

Alenia Elsag Sistemi Navali, Italy.

Dardo

There are two Dardo systems, each controlling one 40 mm gun. Dardo is an automatic CIWS, with manual override, designed to engage sea-skimming and diving missiles as well as manned aircraft. It is a mainframe system and consists of a digital data processing and interface unit (DPU), a supervisory console and the Orion RTN 20X radar. Each system controls a single twin 40 mm gun mounting and optional equipment includes optical designators. The DPU uses an 18-bit mini-computer with a 20 k memory, 82 different instructions and a maximum application time of 10.5 µs. Software is written in Assembler language. The DPU receives input from the gyrocompass, inertial reference, the log and the wind reference unit.

The Orion RTN 20X, J-band (10-12 GHz) radar has a stabilised, monopulse, cassegrain antenna with polarisation twist. The transmission frequency and PRF can be changed randomly on a pulse-to-pulse basis over a wide frequency spectrum. The fully digital receiver uses a multicanceller MTI and is equipped to reduce the effects of multipath on low-flying targets. An electro-optical unit (daylight or low-light level TV or infrared) can be installed to the right of the antenna which has maximum slewing speeds of 2.2 rad/s (training), 1.5 rad/s (elevation). The radar can detect missiles at ranges of >10 km.

Initial target acquisition is by the RAN 10S search radar which interfaces directly with the system. Once the RTN 20 radar has acquired the target or targets the system conducts automatic tracking, assigning target priorities where necessary. The operator may override the system to engage lower-priority targets where necessary. Targets can be engaged at distances of 300-3,500 m (984-11,483 ft) and up to 10 may be tracked simultaneously.

Manufacturer/Contractor

Alenia Elsag Sistemi Navali, Rome, Italy.

SONARS

EDO Model 610E hull-mounted active sonar system

The EDO Model 610E sonar is an all solid-state low-frequency (6, 7 and 8 kHz) sonar and is designed for the long-range (up to 29,000 m (32,000 yd)) detection of submarines in deep and shallow water. The hull-mounted transducer has 36 staves and is 1.25 m (4.1 ft) in diameter. It is a scanning sonar with two active consoles, enabling it to perform a search-while-track function. Facilities offered include a search capability in three 120° sectors, passive correlation, and reverberation processing. The transmitter and receiver beams are preformed. Output is available for a fire-control system. All mode changes and range scale changes are controlled by console push-buttons, and displays include a Doppler display on each of the active consoles and a passive sonar bearing time recorder display.

Manufacturer/Contractor

EDO Corporation, Government Systems Division, College Point, New York, USA.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 25.2 × 11.3 m (83 × 37 ft)
Hangar: The hangar was originally a telescopic design but has been fixed in the Venezuelan ships.

HELICOPTERS

One Agusta-Bell AB 212ASW.

Specifications

Dimensions:
main rotor diameter: 14.63 m (48.0 ft)
height to rotor head: 3.91 m (12.82 ft)
rotor disc area: 168.1 m² (1,809 sq ft)
Weight:
max take-off weight: 5,070 kg (11,177 lb)

Performance:
max speed (never exceed): 130 kts (240 km/h)
typical cruising speed: 100 kts (185 km/h)
hovering ceiling (out of ground effect): 396 m (1,300 ft)
Engine: 1 Pratt & Whitney Canada PT6T-6 Turbo Twin-Pac rated at 1,398 kW (1,875 shp)
Role equipment: Selenia (now Alenia) radar, Bendix ASQ-18 dipping sonar, ECM. Two Mk 46 or 244/S torpedoes or depth bombs.

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 Fiat/General Electric LM-2500 gas turbines; 37.3 MW (50,000 hp) sustained; two GMT BL 230.20 M diesels; 7.3 MW (10,000 hp(m)) sustained
Shafts: 2
Propellers: cp

FURTHER INFORMATION

PROGRAMME

These six ships were all ordered from Fincantieri on 24 October 1975. They were built in Italy and delivered between 1980 and 1982.

DESIGN

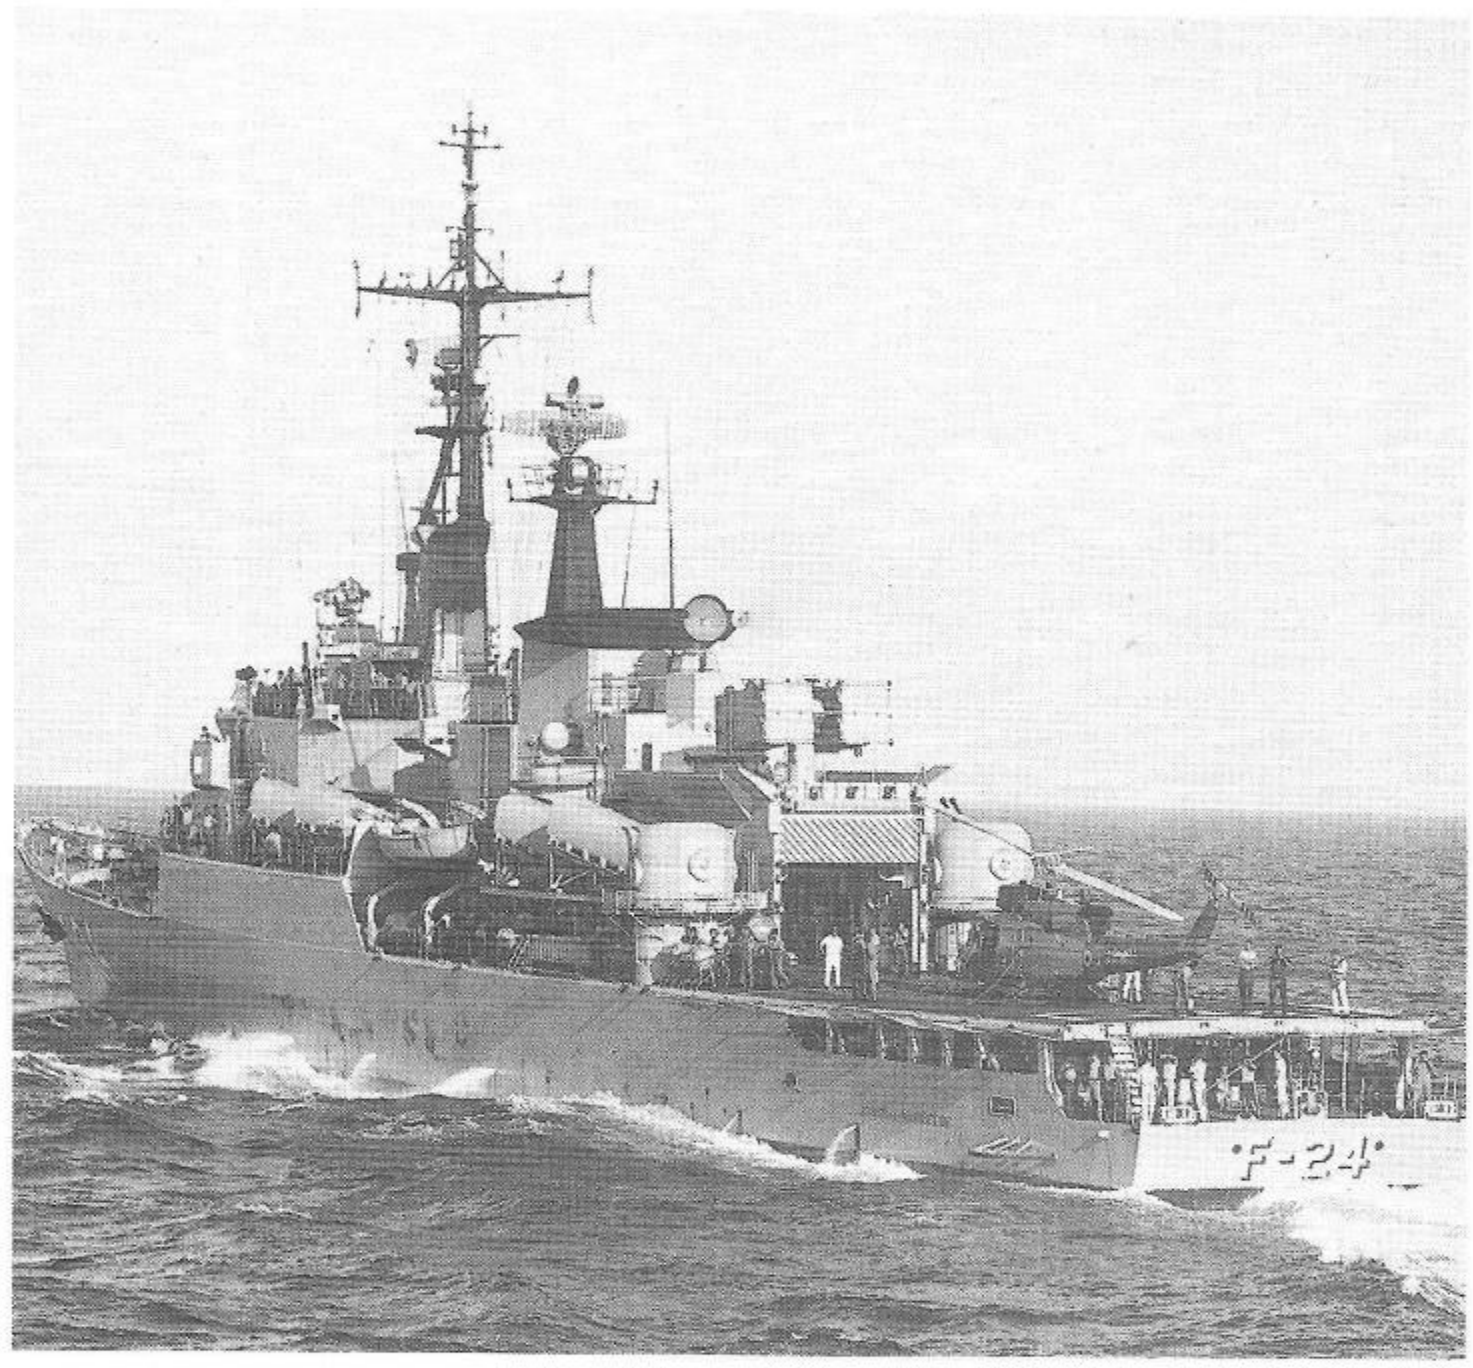
The Venezuelan ships are similar to the other Lupos in the Italian and Peruvian navies, but appear to incorporate virtually all the modifications made to the Peruvian ships:

- The hangar is fixed.
- The flight deck has been enlarged, but does not extend back to the transom.
- The automatic reloading facility for the Albatros missile system has been deleted, reducing the number of Aspide missiles carried to the eight in the launcher.
- The two twin OTOBREDA 40 mm mountings are on a platform at the 01 deck level, rather than on the main deck, as in the Italian ships.

MODERNISATION

Sucre (F 21) and *Brion* (F 22) were scheduled to start a refit at Litton's Ingalls Shipyard in September 1992. The arrangement was eventually suspended in October 1994 due to 'contractual problems.' (There were similar difficulties and at much the same time, over the refit of the Venezuelan submarines — see 'Cabalo' class under 'Type 209'.)

The Venezuelan Navy still has plans to fit new communications, EW and datalink equipment and to upgrade the helicopter.



General Soublette *(F 24)*

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

OTOBREDA Teseo Mk 2 (TG 2)

There are eight missiles, housed in four pairs of individual launcher-containers: two pairs are mounted at the after end of the bridge structure, while the other two pairs are mounted on a platform deck abreast the forward end of the hangar. All the tubes face outward at about 30° to the ship's centreline. The Teseo system is based on the Otomat missile, which has folding wings and is powered by a turbojet with solid fuel rocket boosters. The warhead is a semi-armour-piercing type, which is claimed to penetrate up to 8 cm of nickel-chromium armour. The Mk 2 system is designed for over-the-horizon targeting using a co-operating Agusta-Bell AB 212ASW helicopter with SMA MM/APS-705 I-band radar and PRT-405 tracking and datalink system. On the first leg, the missile flies directly towards the helicopter and only when it passes under the helicopter does the latter transmit target location data.

The target may be acquired by the ship's radar, by the radars of friendly ships or by helicopter radars. Data on the target's location are transmitted to the missile's autopilot and the turbojet is started. Once it has reached full power the boosters are ignited and the missile is launched, but as the missile can turn through angles of up to ±200° the warship does not have to be facing the target during the launch phase.

Once launched, the missile climbs to 150 m (492 ft) accelerated by the boosters which burn for 4 seconds until it reaches cruising speed at a distance of some 2.15 n miles (4 km) from the launch point, where the boosters are jettisoned. The missile then descends to a cruising altitude of 15-20 m (49.2-65.6 ft), a compromise between ensuring good communications with the mothership and the need to make it difficult for the target to detect it. The missile continues towards the target with mid-course guidance correction until the radar seeker, which is azimuth only, is activated at a predetermined point and scans a 40° sector, then acquires the target at a range of about 6.5 n miles (12 km). For the terminal phase the Otomat drops to sea-skimming height.

The Otomat system is capable of engaging two separate targets simultaneously in sea states up to Force 7.

Specifications

Length: 4.46 m (14.6 ft)
Diameter: 46 cm (18.1 in)
Wing span: 1.36 m (4.46 ft)
Weight:
with booster: 770 kg (1,698 lb)
without booster: 762 kg (1,680 lb)
Range: 86 n miles (160 km)
Speed: Mach 0.9
Guidance: Inertial and active radar homing
Propulsion: Turbomeca TR 281 Arbizon III turbojet; 400 kg st
Booster: Two SNPE solid propellant boosters; 3,500 kg st each.
Warhead: Semi-armour-piercing; 210 kg (463 lb); HE 65 kg (143 lb)
Fuzes: Impact, proximity

Manufacturer/Contractor

OTOBREDA, Italy.

SURFACE-TO-AIR MISSILES (SAM)

The Albatros Mk 2 Mod 9 system comprises two elements:
Riva-Calzoni launcher
Aspide missile

Riva-Calzoni Albatros launcher

The single, eight-cell Albatros launcher is located on the hangar roof in 'X' position. Produced by Riva-Calzoni, it has eight launch cells, four on each side of the mounting, each with a frangible front and rear cover. Each cell contains a loading guide to which the launching rail of the missile is electrically and mechanically connected. Sixteen reload missiles are stored horizontally in a hydraulically operated store and reload system in the deckhouse forward of the launcher; they

are in four rows of four missiles each, their location corresponding to that of the launcher cells, and each storage cell has an autonomous missile travel device.

Specifications
(Albatros launcher)
Height: 2.98 m (9.8 ft)
Width: 3.82 m (11.87 ft)
Length: 3.82 m (11.87 ft)
Weight (loaded): 8.5 t
Traverse: 360° at 45°/s
Elevation: −5 to +80° at 25°/s.

Manufacturer/Contractor
Riva-Calzoni, Rome, Italy.

Selenia Aspide missile
The system uses the Selenia (now Alenia) Aspide SAM, a missile developed by Selenia from the US Sparrow. Targets are detected by the ship's primary search radar and then allocated to the fire-control system. The target is acquired by the fire-control system radar and the CW transmitter group injects signals into the fire-control system tracker as the launcher slews in the target's direction. The missile control system selects the missile or missiles which the power supply units then prepare for launch. Total system reaction time is 8 seconds. When the decision is made to engage the target with missiles the reversible prelaunch commands are issued. The firing command itself can be issued automatically or manually, the operator also having the options of a single shot or salvo mode. In the latter, two missiles are launched sequentially against the same target, the maximum firing rate of the system being one missile every 2.5 seconds. Upon launch the missile is gathered into the tracker-illuminator's beam through a direct signal to the rear receiver and homes on the reflected energy from the target. Up to three missiles at once may be controlled by the tracker, according to the manufacturer. They also claim the system can engage horizontal targets at up to 15 km, vertical ones at 5 km and lateral ones at 8 km. A short reaction time gives the system the ability to destroy anti-ship missiles even when detection is late.

Specifications
(Aspide missile)
Length: 3.7 m (12 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 80 cm (31.5 in)
Weight: 220 kg (485 lb)
Speed: Mach 2.5
Range: 7 n miles (13 km)
Altitude: 15-5,000 m (49-16,405 ft)
Warhead: 33 kg (72.7 lb)
Guidance: Semi-active radar

Manufacturers/Contractors
Alenia Elsag Sistemi Navali, Rome, Italy (system/missile).
Riva-Calzoni, Bologna, Italy (launcher).

TORPEDOES

It should be noted that these ships have no torpedo armament.

GUNS

OTOBREDA 127 mm/54 Compatto
There is one OTOBREDA 127 mm/54 Compatto mounting in 'A' position. This weapon is designed to provide naval gunfire support, to engage surface targets and to engage air targets, including anti-ship missiles and fixed-wing aircraft which do not have standoff weapons. The turret is unmanned and is enclosed by a glass fibre shield. Much of the turret and the lower part of the mounting are made of aluminium alloy. The below-deck element of the mounting consists of three drums each containing 22 rounds, which are stocked automatically from two chain-driven lower hoists which lead to the magazines and are loaded manually. The gun captain uses his control to select which drums are to be replenished and with what ammunition. The weapon is compatible with all US 5 in L/54 ammunition.

Specifications
Gun
Calibre: 127 mm
Length of barrel: 54 calibres
Muzzle velocity: 808 m/s (2,625 ft/s)
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 13,600 m (45,000 ft)
Rate of fire: 45 rds/min
Weight of shell: 32 kg (70 lb)
Mounting
Compatto
Training: 330° at 40°/s
Elevation: −15 to +85° at 30°/s
Crew: 5

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

OTOBREDA 40 mm L/70 Compact (Type 70) twin mounting
Two twin 40 mm turrets are mounted aft, either side of the hangar.

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −13 to +85° at 60°/s
Rate of fire: 600 rds/min/mount
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

Oerlikon 20 mm cannon
Two single, manually operated Oerlikon 20 mm cannon can be mounted, if required.

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 0.8 n miles (1.5 km)
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +90°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

INS-3 ESM/ECM system
INS-3 (INS = Integrated Naval System) is an Elettronica ESM/ECM system. The main components are the RQN-3, a 1-18 GHz radar warning system, with a 3,000 emitter library. The ECM system is the Elettronica TQN-2 jammer. INS-3 is used to trigger jamming and the OTOBREDA SCLAR countermeasures system.

Manufacturer/Contractor
Elettronica SpA, Rome, Italy.

DECOYS

OTOBREDA SCLAR rocket launchers
Two 20-tube, 105 mm OTOBREDA SCLAR, multipurpose, rocket launchers are sited beneath the bridge wings. The control unit is linked to the ship's radar and a control panel in the ECM compartment to provide the necessary operating signals, with the data needed to stabilise the two launchers against pitch and roll being provided by the ship's gyrocompass. The system provides defence against radar and IR homing missiles, confuses enemy radars, and provides illumination for visual fire control at night. Provision is made to load different types of rockets in various arrangements (long-range chaff, medium-range chaff, illuminating) to permit mixed salvos. Automatic selection of the rockets to be fired is possible from the remote fire-control unit and the time fuzes and launch sequence may be similarly controlled. The rockets all have double-base propellant motors with folding fins and electronic fuzes while their speed to burnout is 260-645 m/s (853-2,116 ft/s).

Specifications
Launcher weight: 1.15 t (empty); 1.75 t (with 20 rockets)
Trunnion height: 1.17 m (3.83 ft)
Traverse: 300° at 60°/s
Elevation: −5 to +60° at 30°/s
Rate of fire: 1 rd/s

Chaff distraction rocket
Type: SNIA 105 LR-C
Length: 1.85 m (6.0 ft)
Diameter: 105 mm (4 in)
Max range: 12 km
Weight: 27 kg (59.5 lb)
Payload: 10.2 kg (22.5 lb)

Chaff seduction rocket
Type: SNIA 105 MR-C
Length: 1.83 m (6.0 ft)
Diameter: 105 mm (4 in)
Max range: 4.7 km
Weight: 29 kg (64 lb) (SNIA 105 MR)
Payload: 17.4 kg (38.36 lb)

Infra-red seduction
Type: SNIA 105 MR-IR

Illumination
Type: SNIA 105 LR-I
Payload: 10.2 kg (22.5 lb)
Range: 4 km

Manufacturers/Contractors
Breda Meccanica Bresciana SpA (launcher).
SNIA BPD (rockets).

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

IPN 10 mini SADOC action data automation

IPN 10 is a basic version of the SADOC action data system, which was developed specifically for export.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 11
Satcom: Satcom
IFF: Mk XII

WEAPONS CONTROL

Argo NA21 Mod 2 fire-control system

There are two NA 10 Argo systems, designed for surface engagement, air engagements or shore bombardments which can control three guns of two calibres simultaneously, using an RTN 10X fire-control radar. The system is operated through the Main Control Unit (MCU), a console with a ballistic computer, which is used for target acquisition, tracking and engagement either manually or automatically. Two periscopic sights may also be used to provide supplementary target data input to the radar and permit a second target to be engaged. In addition to target data input the MCU receives information from the true wind computer, and data on ship course and speed from the log and gyrocompass, while a vertical reference system provides roll and pitch information.

Manufacturer/Contractor

Alenia Elsag Sistemi Navali, Rome, Italy.

Dardo

There are two Dardo systems, each controlling one 40 mm gun. Dardo is an automatic CIWS, with manual override, designed to engage sea-skimming and diving missiles as well as manned aircraft. It is a mainframe system and consists of a digital data processing and interface unit (DPU), a supervisory console and the Orion RTN 20X radar. Each system controls a single twin 40 mm gun mounting and optional equipment includes optical designators. The DPU uses an 18-bit mini-computer with a 20 k memory, 82 different instructions and a maximum application time of 10.5 µs. Software is written in Assembler language. The DPU receives input from the gyrocompass, inertial reference, the log and the wind reference unit.

The Orion RTN 20X, J-band (10-12 GHz) radar has a stabilised, monopulse, cassegrain antenna with polarisation twist. The transmission frequency and PRF can be changed randomly on a pulse-to-pulse basis over a wide frequency spectrum. The fully digital receiver uses a multicanceller MTI and is equipped to reduce the effects of multipath on low-flying targets. An electro-optical unit (daylight or low-light level TV or infrared) can be installed to the right of the antenna which has maximum slewing speeds of 2.2 rad/s (training), 1.5 rad/s (elevation). The radar can detect missiles at ranges of >10 km.

Initial target acquisition is by the RAN 10S search radar which interfaces directly with the system. Once the RTN 20 radar has acquired the target or targets the system conducts automatic tracking, assigning target priorities where necessary. The operator may override the system to engage lower priority targets where necessary. Targets can be engaged at distances of 300-3,500 m (984-11,483 ft) and up to 10 may be tracked simultaneously.

Manufacturer/Contractor

Alenia Elsag Sistemi Navali, Rome, Italy.

RADARS

Set	SPS-774 (RAN-10S)	SPQ-712 (RAN-12L/X)*	SPN-703	SPG-70 (RTN-10X)	SPG-74 (RTN-20X) (two)

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 24 × 11.3 m (79 × 37 ft)
Hangar: The hangar is a telescopic design which extends by some 8 m (28 ft) to enclose the helicopter for protection and maintenance.

HELICOPTERS

One Agusta-Bell AB 212ASW.

Specifications

Dimensions:
main rotor diameter: 14.63 m (48.0 ft)
height to rotor head: 3.91 m (12.82 ft)
rotor disc area: 168.1 m² (1,809 sq ft)
Weight:
max take-off weight: 5,070 kg (11,177 lb)
Performance:
max speed (never exceed): 130 kts (240 km/h)
typical cruising speed: 100 kts (185 km/h)
hovering ceiling (out of ground effect): 396 m (1,300 ft)
range (max standard fuel): 2 n miles (615 km)
Engine: 1 Pratt & Whitney Canada PT6T-6 Turbo Twin-Pac rated at 1,398 kW (1,875 shp)
Role equipment: Torpedoes, AS-12 ASMs or Elettronica Gufo 2000 EW intercept equipment

PROPULSION

Specifications

System: combined diesel or gas turbine (CODOG)
Main machinery: 2 Fiat/General Electric LM-2500 gas turbines; 37.3 MW (50,000 hp) sustained; 2 GMT BL 230.20 M diesels; 7.3 MW (10,000 hp(m)) sustained
Shafts: 2
Propellers: cp

FURTHER INFORMATION

PROGRAMME

The Iraqi Government placed an order for four 'Lupo' class frigates in February 1981 with (the then) Cantieri Navali Riuniti (CNR). The design ordered was a ship very similar to those ordered by Peru and Venezuela, but with a fixed helicopter hangar. The first problem arose when the US Government objected to the sale of some of the components of the LM 2500 gas turbines. Then the Iraqi Government experienced some difficulty in financing the purchase, following which the Iran-Iraq war gave rise to an embargo on exporting warlike goods to the combat zone. Finally, the Gulf War resulted in another embargo. By this time the ships had been completed and had run trials.

There then followed some considerable political manoeuvring in Italy as the Italian Government sought to compel the Italian Navy to accept the ships. Eventually, and with some reluctance, the Italian Navy did so, but insisted on a complete overhaul as the ships had been lying idle for some three to four years, and on some replacement of equipment to bring them as nearly as possible to the same standard as its own four Lupos.

Artigliere *(F 582), one of four Lupo class frigates built for Iraq, but which were not delivered due to the UN arms embargo. They were accepted under protest by the Italian Navy and have had to undergo a substantial refit. They have no ASW capability and are designated 'Fleet Patrol Ship'*

MODERNISATION

The details given are for the ships on completion of modernisation for Italian service. All ASW equipment has been removed and new combat systems and communications to Italian fleet standards have been installed. There has also been a major upgrading of the damage control and accommodation facilities.

In the event, the first two ships commissioned with only machinery, damage control and accommodation upgraded and had to return to dock in 1995 for the weapon systems changes to be implemented. The second pair, however, entered service fully modified.

DEPLOYMENT

The ships have been accepted into the Italian Navy as 'Fleet Patrol Ships' although they could be used as frigates in war, if required to do so. However, they lack any form of ASW sensor or weaponry, which would impose severe limitations on their tactical usefulness.

Two are based at Augusta and two at Brindisi.

Laid down 15 Mar 1983
Launched 19 May 1984
Commissioned 4 May 1985

Euro *(F 575). Main armament comprises one 127 mm/5 in automatic gun ('A' position), one eight-cell launcher for Aspide SAMs ('B' position) and four Teseo Mk 2 launchers ('Y' position). There are also full flight deck and hangar facilities for an AB 212ASW helicopter* (H & L van Ginderen Collection)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

OTOBREDA Teseo Mk 2 (TG 2)

There are four missiles, housed in two pairs of individual launcher-containers, mounted abaft the stack and facing outward at about 30° to the ship's centreline. The Teseo system is based on the Otomat missile, which has folding wings and is powered by a turbojet with solid fuel rocket boosters. The warhead is a semi-armour-piercing type, which is claimed to penetrate up to 8 cm of nickel-chromium armour. The Mk 2 system is designed for over-the-horizon targeting using a co-operating Agusta-Bell AB 212ASW helicopter with SMA MM/APS-705 I-band radar and PRT-405 tracking and datalink system. On the first leg, the missile flies directly towards the helicopter and only when it passes under the helicopter does the latter transmit target location data.

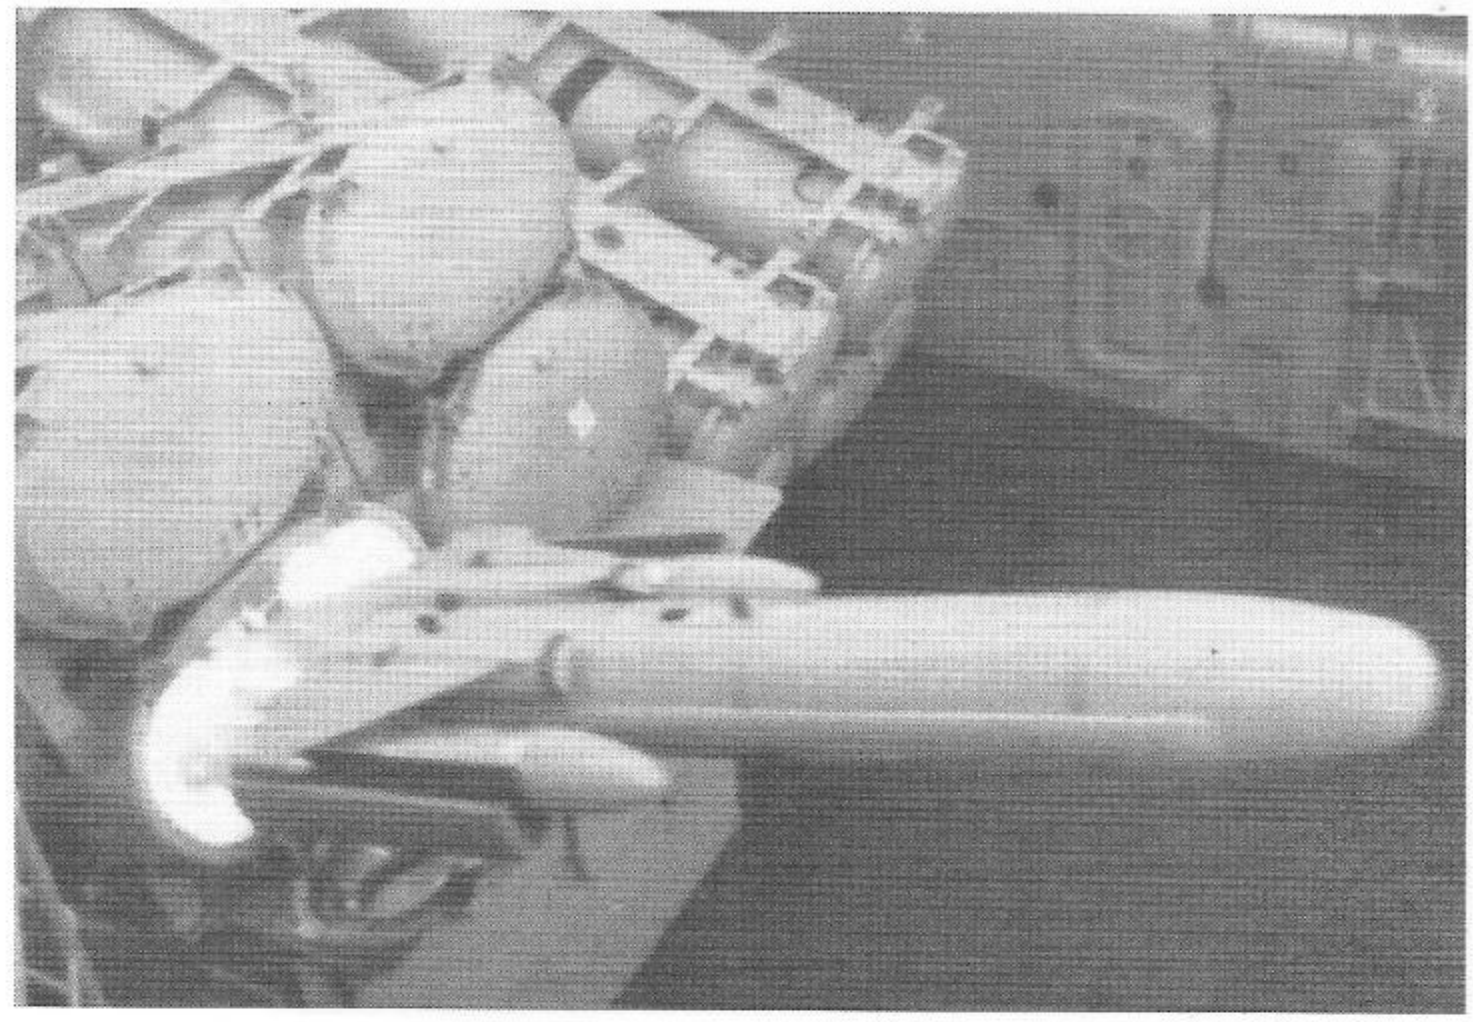
The target may be acquired by the ship's radar, by the radars of friendly ships or by helicopter radars. Data on the target's location are transmitted to the missile's autopilot and the turbojet is started. Once it has reached full power the boosters are ignited and the missile is launched, but as the missile can turn through angles of up to ±200° the warship does not have to be facing the target during the launch phase.

Once launched, the missile climbs to 150 m (492 ft) accelerated by the boosters which burn for 4 seconds until it reaches cruising speed at a distance of some 2.15 n miles (4 km) from the launch point, where the boosters are jettisoned. The missile then descends to a cruising altitude of 15-20 m (49-65 ft), a compromise between ensuring good communications with the mothership and the need to make it difficult for the target to detect it. The missile continues towards the target with mid-course guidance correction until the radar seeker, which is azimuth only, is activated at a predetermined point and scans a 40° sector, then acquires the target at a range of about 6.5 n miles (12 km). For the terminal phase the Otomat drops to sea-skimming height.

The Otomat system is capable of engaging two separate targets simultaneously in sea states up to Force 7.

Specifications

Length: 4.46 m (14.6 ft)
Diameter: 46 cm (18 in)
Wing span: 1.36 m (4.5 ft)
Weight: 762 kg (1,680 lb) without boosters); 770 kg (1,697 lb with boosters)
Range: 86 n miles (160 km)
Speed: Mach 0.9
Guidance: Inertial and active radar homing
Propulsion: Turbomeca TR 281 Arbizon III turbojet; 400 kg st



Otomat Mk 2 at launch (SMA)

Boosters: 2 SNPE solid propellant boosters; 3,500 kg st each
Warhead: Semi-armour-piercing; 210 kg (463 lb); HE 65 kg (143 lb)
Fuzes: Impact, proximity

Manufacturer/Contractor

OTOBREDA, Italy.

SURFACE-TO-AIR MISSILES (SAM)

The Albatros Mk 2 Mod 9 system comprises two elements:

Riva-Calzoni launcher
Aspide missile

Riva-Calzoni Albatros launcher

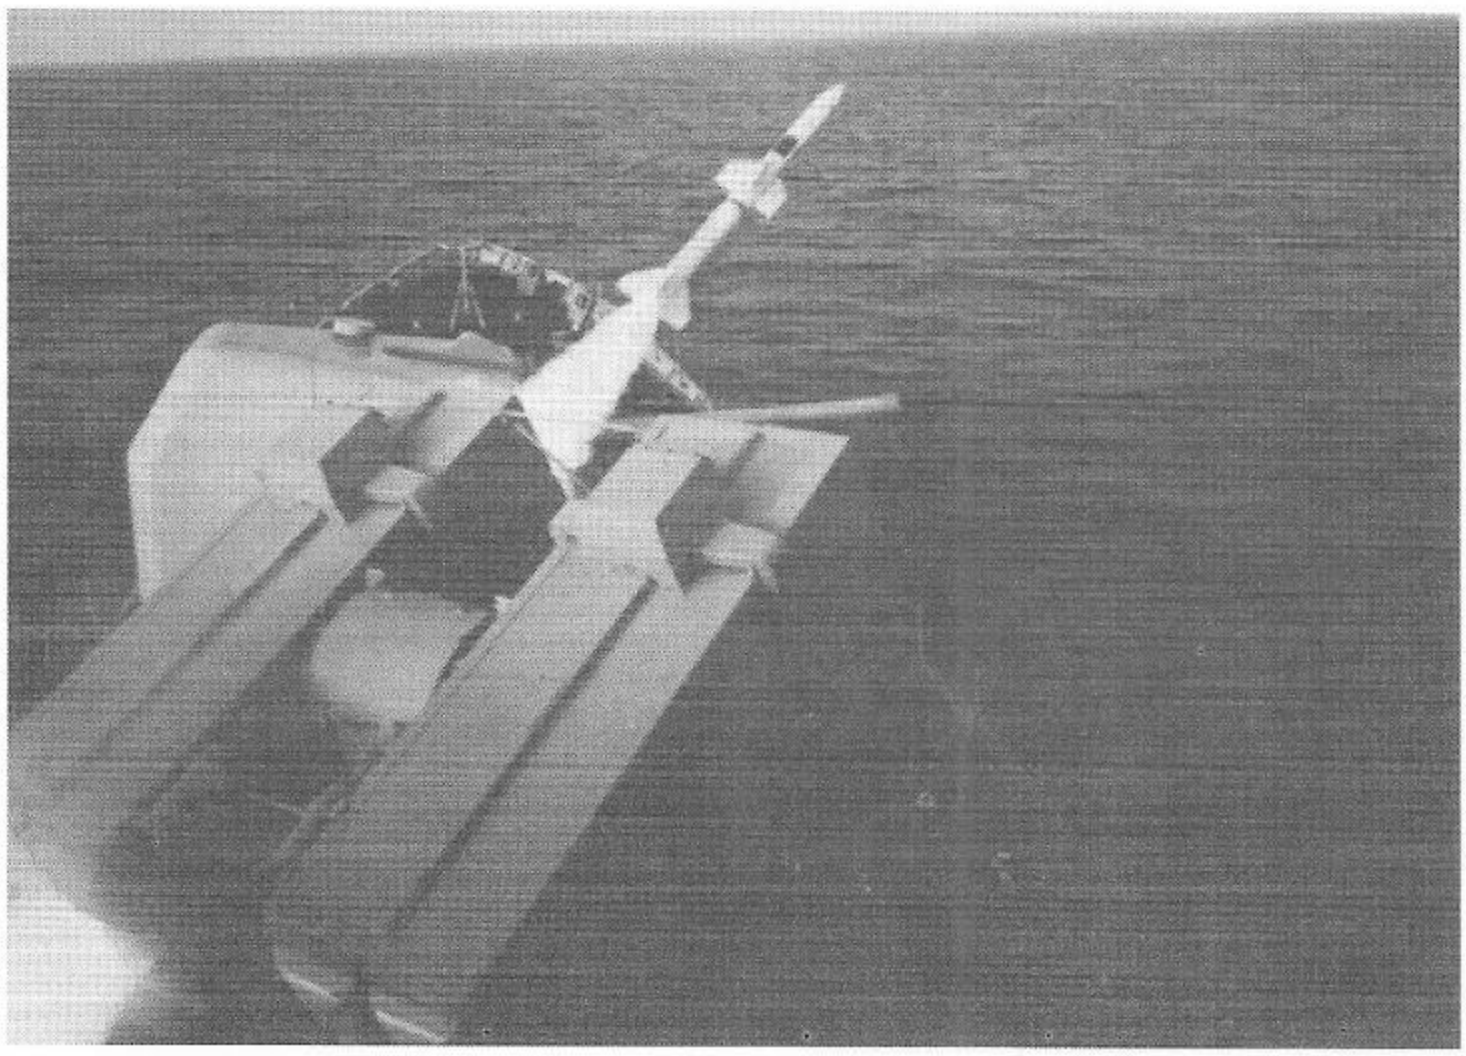
The single, eight-cell Albatros launcher is located on the foredeck in 'B' position. Produced by Riva-Calzoni, it has eight launch cells, four on each side of the mounting, each with a frangible front and rear cover. Each cell contains a loading guide to which the launching rail of the missile is electrically and mechanically connected. Sixteen reload missiles are stored horizontally in a hydraulically operated store and reload system in the deckhouse forward of the launcher; they are in four rows of four missiles each, their location corresponding to that of the launcher cells, and each storage cell has an autonomous missile travel device.

Specifications

Albatros launcher
Height: 2.98 m (9.8 ft)
Width: 3.82 m (12.5 ft)
Length: 3.82 m (12.5 ft)
Weight (loaded): 8.5 t
Traverse: 360° at 45°/s
Elevation: −5 to +80° at 25°/s

Alenia Aspide missile

The system uses the Selenia (now Alenia) Aspide SAM, a missile developed by Selenia from the US Sparrow. Targets are detected by the ship's primary search radar and then allocated to the Signaal WM25 fire-control system. The target is acquired by the fire-control system radar and the CW transmitter group injects signals into the fire-control system tracker as the launcher slews in the target's direction. The missile control system selects the missile or missiles which the power supply units then prepare for launch. Total system reaction time is 8 seconds. When the decision is made to engage the target with missiles the reversible pre-launch commands are issued. The firing command itself can be issued automatically or manually, the operator also having the options of a single shot or salvo mode. In the latter, two missiles are launched sequentially against the same target, the maximum firing rate of the system being one missile every 2.5 seconds. Upon launch the missile is gathered into the tracker-illuminator's beam through a direct signal to the rear receiver and homes on the reflected energy from the target. Up to three missiles at once may be controlled by the tracker, according to the manufacturer. They also claim the system can engage horizontal targets at up to 15 km, vertical ones at 5 km and lateral ones at 8 km. A short reaction time gives the system the ability to destroy anti-ship missiles even when detection is late.



Aspide SAM is launched from Albatros eight-cell launcher (Selenia)

Specifications

Aspide missile
Length: 3.7 m (12 ft)
Diameter: 20.3 cm (8 in)
Wing span: 80 cm (31 in)
Weight: 220 kg (485 lb)
Speed: Mach 2.5
Range: 7 n miles (13 km)
Altitude: 15-5,000 m (49-16,405 ft)
Warhead: 33 kg (73 lb)
Guidance: Semi-active radar

Manufacturer/Contractor

Alenia Elsag Sistemi Navali, Rome, Italy (system/missile).
Riva-Calzoni, Bologna, Italy (launcher).

TUBES

There are two separate types of torpedo tubes:

Two triple 324 mm US Mk 32 torpedo tubes are sited in the waist below the stack.

Two Whitehead 533 mm (21 in) B516 tubes are located on the quarterdeck, firing aft over the transom

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications

Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

Whitehead A184 surface-launched dual-role heavyweight weapons

Specifications

Length: 6 m (19.7 ft)
Diameter: 533 mm (21 in)
Weight: 1,265 kg (2,789 lb)
Warhead: 250 kg (551 lb) HBX HE
Propulsion: Electric
Range: 4.5-10 n miles (10-20 km) (under wire guidance)
Speed: 24 or 36 kts

Manufacturer/Contractor

Whitehead SpA, Salviano, Italy.

GUNS

OTOBREDA 127 mm/54 Compatto

There is one OTOBREDA 127 mm/54 Compatto mounting in 'A' position. This weapon is designed to provide naval gunfire support, to engage surface targets and air targets, including anti-ship missiles and fixed-wing aircraft which do not have standoff weapons. The turret is unmanned and is enclosed by a glass fibre shield. Much of the turret and the lower part of the mounting are made of aluminium alloy. The below-deck element of the mounting consists of three drums each containing 22 rounds, which are stocked automatically from two chain-driven lower hoists which lead to the magazines and are loaded manually. The gun captain uses his control to select which drums are to be replenished and with what ammunition. The weapon is compatible with all US 5 in L/54 ammunition.

Specifications

Gun
Calibre: 127 mm (5 in)
Length of barrel: 54 calibres
Muzzle velocity: 808 m/s (2,625 ft/s)
Range:
anti-air: 13,600 m (45,000 ft)
anti-surface: 8.6 n miles (16 km)
Rate of fire: 45 rds/min
Weight of shell: 32 kg (70 lb)

Mounting Compatto
Training: 330° at 40°/s
Elevation: −15 to +85° at 30°/s
Crew: 5

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.

OTOBREDA 40 mm L/70 Compact (Type 70) twin mounting

Two twin 40 mm turrets are mounted in the waist.

Specifications

Traverse: 360° (nominal) at 90°/s
Elevation: −13 to +85° at 60°/s
Rate of fire: 600 rds/min/mount
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

Manufactuer/Contractor

OTOBREDA, La Spezia, Italy.

Oerlikon 20 mm cannon

Two single, manually operated Oerlikon 20 mm cannon were fitted as a temporary measure during Gulf deployments in 1990-91.

Specifications

Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +90°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

SLR-4/SLQ-D EW system

The EW system in these ships is a combination of the Elettronica SLR-4 radar warning and SLQ-D jammer suites. The ESM section is SLR-4, which provides 100 per cent intercept probability, passive surveillance, automatic instantaneous warning of programmed threat, automatic analysis of threat parameters, automatic identification and tracking of threats, a synthetic data display, instantaneous DF, and broad frequency coverage.

The SLQ-D ECM section provides self-protection by using jammers. An assessment of antennas in the ship suggests that included in the suite are the ELT 521 deception jammer and ELT 318 noise jammer.

This system has been exported as the LAMBDA system.

Manufacturer/Contractor

Elettronica SpA, Rome, Italy.

CO-NEWS ESM system

These ships are fitted with CO-NEWS (COmmunications Naval Electronic Warfare System) communications ESM equipment, which provides full monitoring and analysis of communications in the VHF/UHF frequency band. The system is completely automated to achieve very high intercept probability and to handle high-density traffic. It comprises a lightweight antenna assembly, normally mounted at the masthead, consisting of three co-planar dipole arrays and a switching matrix, and an operator console located below decks. The equipment is modular in design to cater for expansion and for additional units.

CO-NEWS automatically carries out continuous surveillance of the communications band, technical analysis and bearing of the intercepted emissions and real-time data processing and presentation. The intercepted signals can also be demodulated for monitoring purposes. The system operates automatically under the supervision of an operator who can also override the system's automatic operation to solve ambiguous situations or to monitor the emissions.

Manufacturer/Contractor

Elettronica SpA, Rome, Italy.

DECOYS

OTOBREDA SCLAR rocket launchers

Two 20-tube, 105 mm OTOBREDA SCLAR, multipurpose rocket launchers are sited in the waist below the stack. The control unit is linked to the ship's radar and a control panel in the ECM compartment to provide the necessary operating signals, with the data needed to stabilise the two launchers against pitch and roll being provided by the ship's gyrocompass. The system provides defence against radar and IR homing missiles, confuses enemy radars, and provides illumination for visual fire control at night. Provision is made to load different types of rockets in various arrangements (long-range chaff, medium-range chaff, illuminating) to permit mixed salvos. Automatic selection of the rockets to be fired is possible from the remote fire-control unit and the time fuzes and launch sequence may be similarly controlled. The rockets all have double-base propellant motors with folding fins and electronic fuzes while their speed to burnout is 260-645 m/s (853-2,116 ft/s).

Specifications

Launcher weight: 1.15 t (empty); 1.75 t (with 20 rockets)
Trunnion height: 1.17 m (3.8 ft)
Traverse: 300° at 60°/s
Elevation: −5 to +60° at 30°/s
Rate of fire: 1 rd/s

Chaff distraction rocket
Type: SNIA 105 LR-C
Length: 1.85 m (6.0 ft)
Diameter: 105 mm (4 in)
Max range: 12 km
Weight: 27 kg (59 lb)
Payload: 10.2 kg (22 lb)

Chaff seduction rocket
Type: SNIA 105 MR-C
Length: 1.83 m (6.0 ft)
Diameter: 105 mm (4 in)
Max range: 4.7 km
Weight: 29 kg (64 lb) (SNIA 105 MR)
Payload: 17.4 kg (38 lb)

Infra-red seduction
Type: SNIA 105 MR-IR

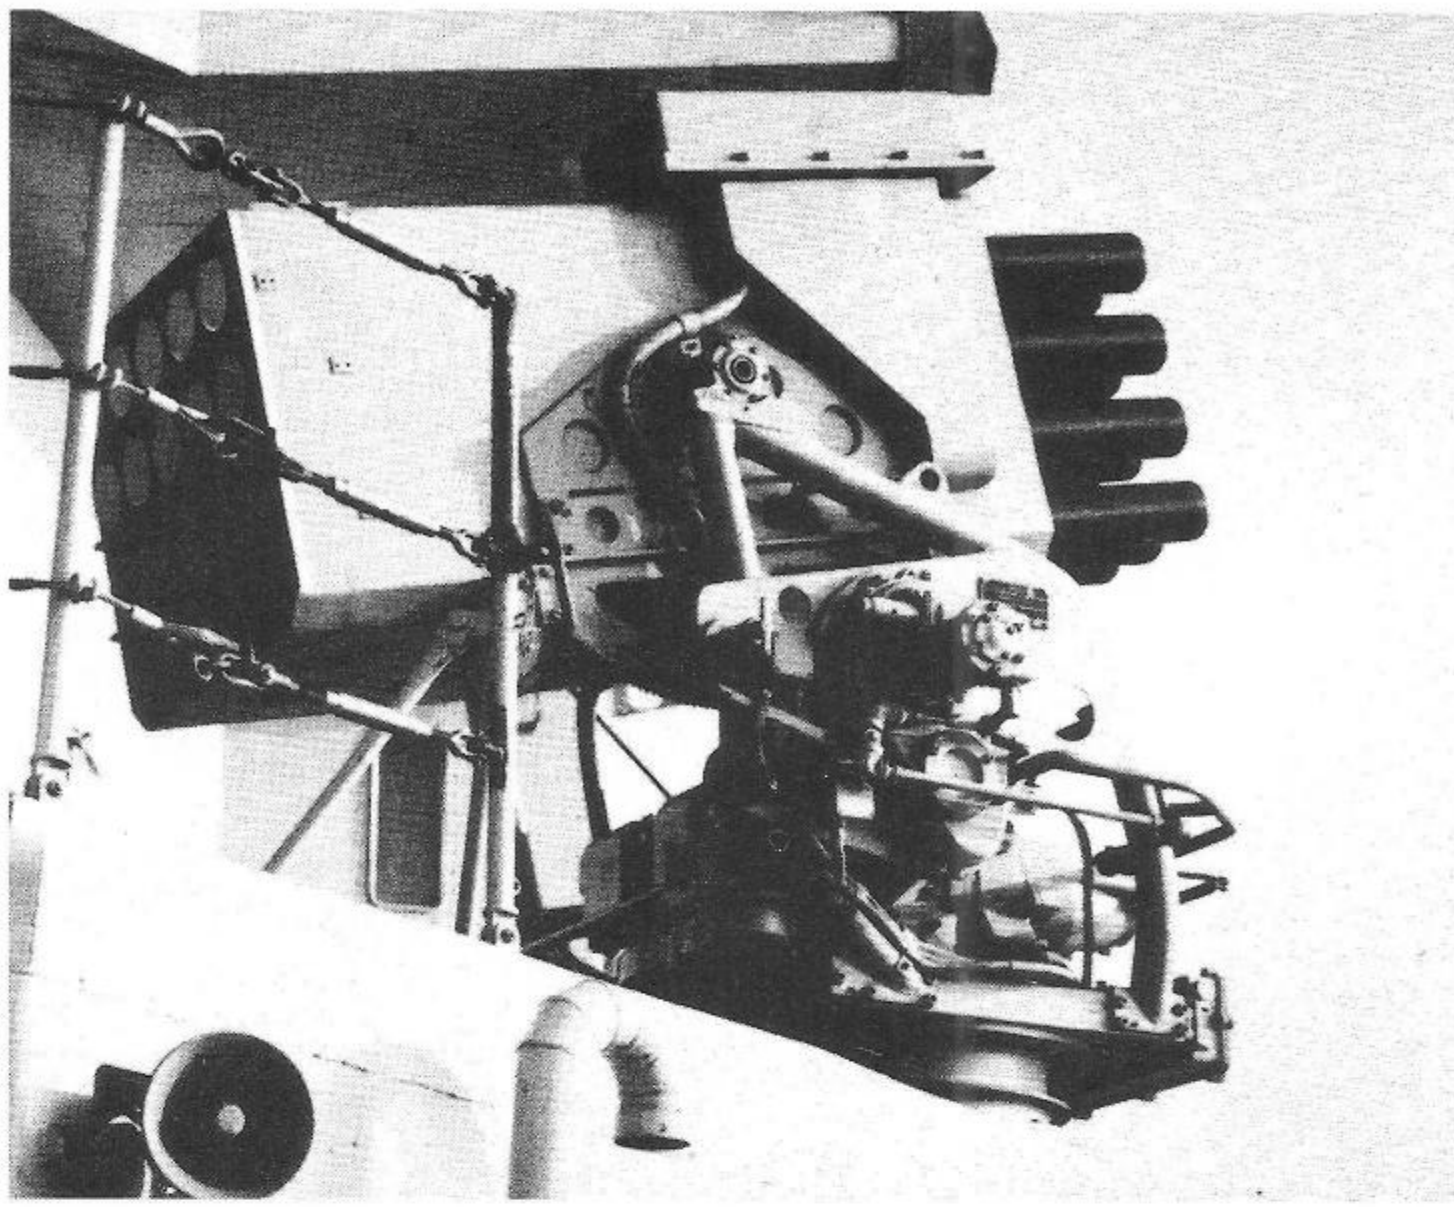
Illumination
Type: SNIA 105 LR-I
Payload: 10.2 kg (22 lb)
Range: 4 km

Manufacturers/Contractors

Breda Meccanica Bresciana SpA (launcher).
SNIA BPD (rockets).

AN/SLQ-25 Nixie noisemaker

One AN/SLQ-25 Nixie (Phase 1), solid-state, modular design electroacoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed through the transom or in a partially or totally enclosed location on the main deck. Immediately forward of the winch compartment is the



SCLAR launcher (OTOBREDA)

Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm (3.10 ft) long, 15.24 cm (6 in) in diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body at a time is deployed.

Manufacturer/Contractor

Aerojet ElectroSystems, Sacramento, California, USA.

Masker/Prairie Masker noise suppression systems

The ships are fitted with both Masker and Prairie-Masker radiated noise suppression systems. In Masker, high-pressure air is bled off from either the ship's gas turbine or dedicated compressors and ejected from a pipe placed laterally across the ship's hull just forward of the machinery spaces. The forward motion of the ship causes the air to form a layer separating the hull from the water and thus masking the machinery noises which would otherwise be radiated directly into the water. Such a system is less effective at slow speeds where the air bubbles tend to rise to the surface rather than remain attached to the hull.

In Prairie Masker air is passed down the propeller shaft and ejected from a groove in the leading edge of the blade, thus delaying the onset of cavitation.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

SADOC 2

SADOC 2/IPN 10 (SADOC = *Systema Direzione della Operazioni di Combattimento)* is a mainframe architecture system designed to acquire, process and present data acquired by sensors. It can also be used for a number of other functions, including threat evaluation and weapons control, ECM management, aircraft control, conducting ASW operations, as well as datalink and databank management. Data are received from onboard and offboard sensors via datalinks. The system has two or three Central Processing Units (CPU) mini-computers (Alenia 32-bit CDG-3032 with a 128 k memory), one of which usually acts as the immediate back-up in the event of system failure. Within the consoles are Alenia 16-bit NDC-160 processors, with 64 k memories. Both possess mass memory modules for handling programs and large amounts of data and an interface with a 10 Mbit/s serial databus. Programming language is Ada.

There are two TAVITAC operating systems; the disk operating system and a time-sharing executive. The system uses a 10 Mbit/s serial bus. This system is designated SADOC2 in the Italian Navy and IPN-10 for export.

Manufacturer/Contractor

Alenia Elsag Sistemi Navali, Rome, Italy.

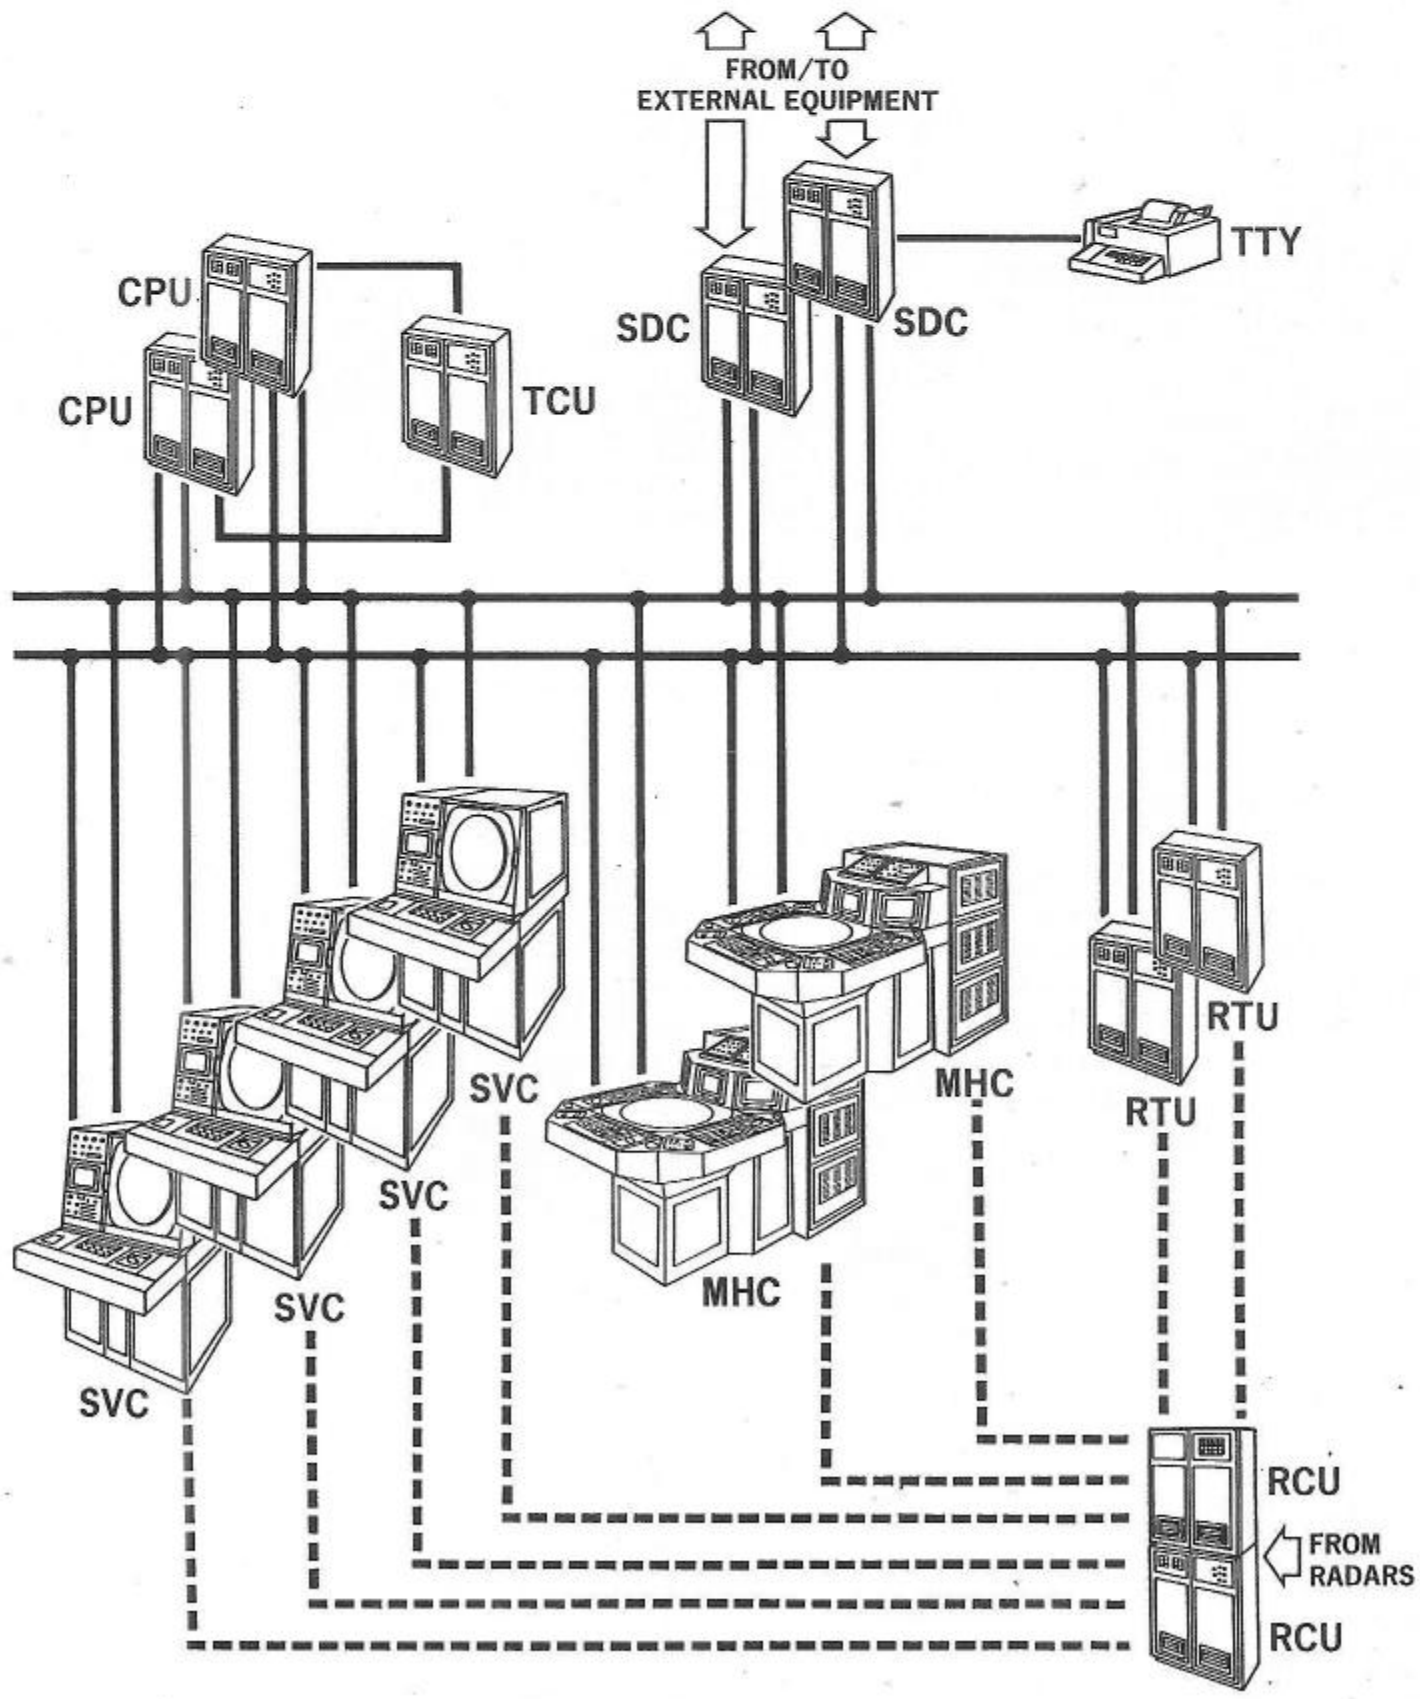
WEAPONS CONTROL

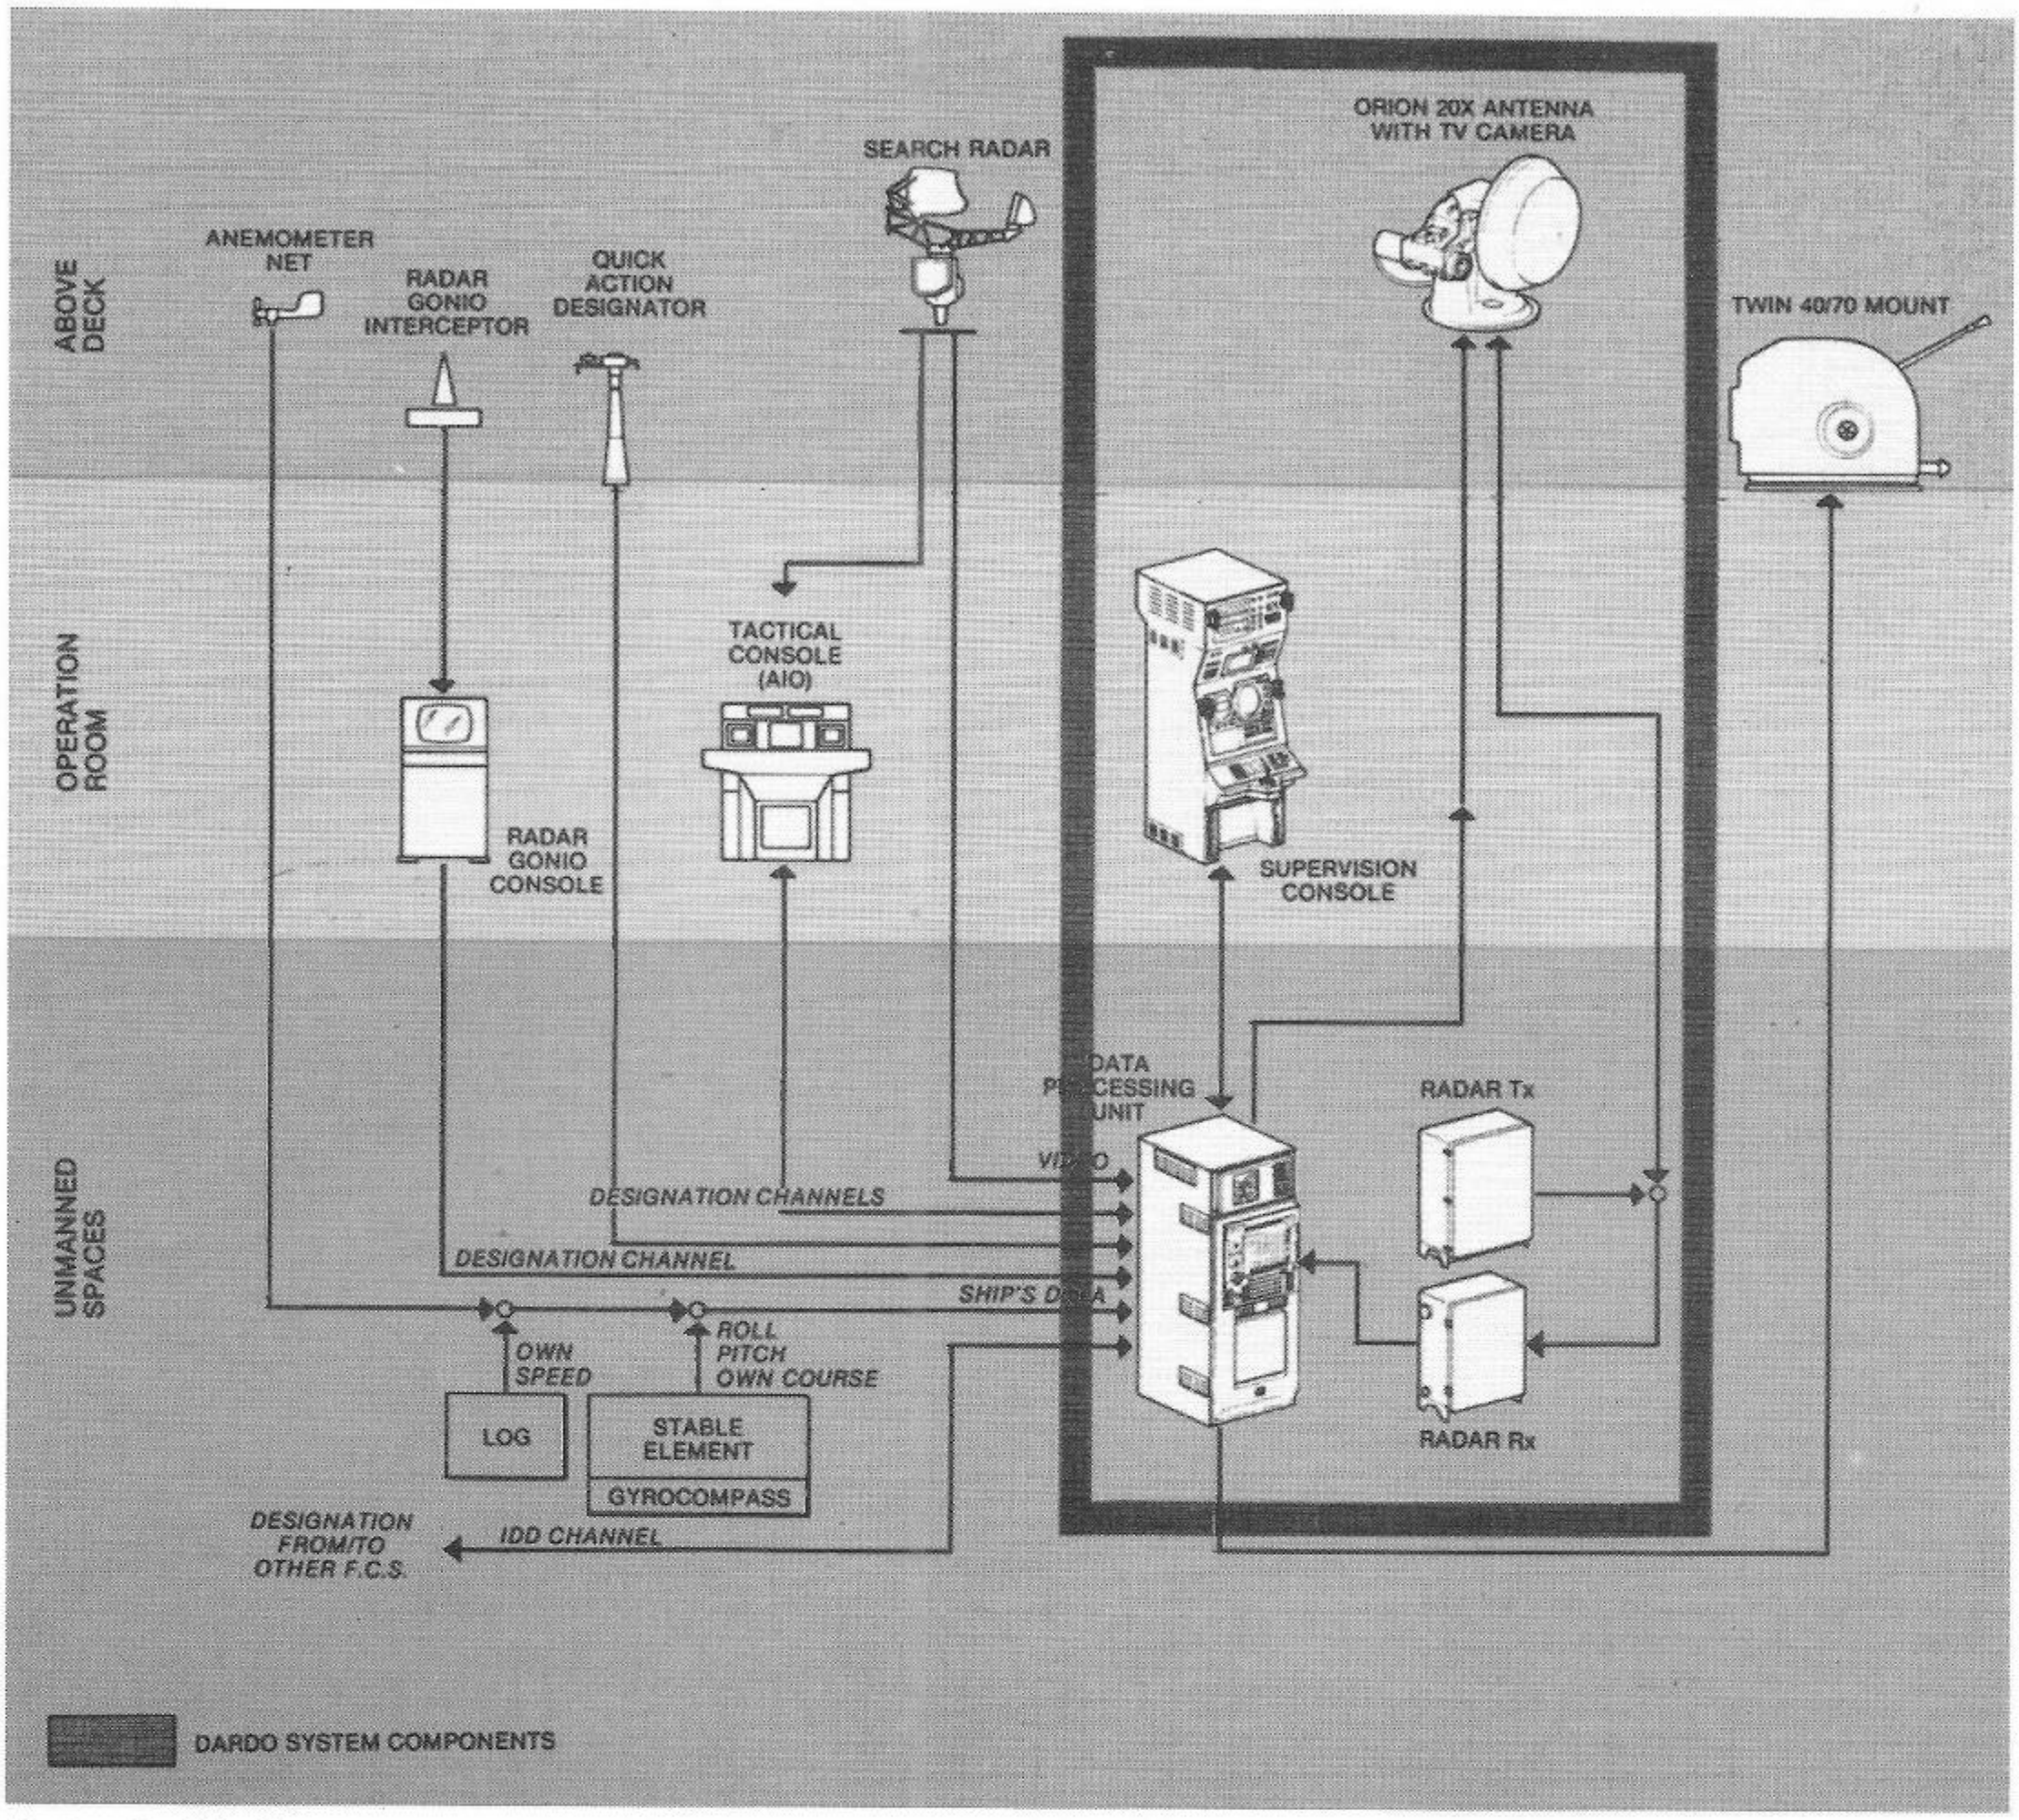
NA 30/Dardo-E

NA 30 (also known as Dardo — Extended) is a multipurpose fire-control system designed to control the guns as well as Albatros point defence surface-to-air missiles and the anti-ship missiles. It consists of a DPU, a supervisory console and the Orion RTN 30X fire-control radar. The DPU is based upon the Selenia (now Alenia) ESA 24 24-bit microprocessor with a memory access time of 250 µs and up to 21 I/O channels. The MCI consists of a multifunction keyboard, numeric keyboard, rollerball and joystick. A missile operating panel is also included.

The RTN 30 is an I-band (8-10 GHz) radar whose above-deck equipment consists of the stabilised director with radar antenna, an infra-red thermal camera and a daylight TV camera. The director covers −30 to +85° in elevation and has slewing speeds of 126°/s (training) and 86°/s (elevation). The IR camera is either



SADOC configured for use aboard a frigate (Alenia)



Dardo system (Alenia)

a 3-5 µm pointer or an 8-12 µm imager with Sprite detectors. The silicon target TV camera can operate in light conditions down to 2 lux and has a field of view of 3.01°. Below-decks equipment includes the transmitter and receiver cabinets as well as the servo unit. The range against missiles is >25 km. The antenna is of the monopulse horn cassegrain type with polarisation twist. The transmission chain is fully coherent and uses a high-average power transmitter with a peak power of 12 kW. This can operate in two modes; long pulse with coded waveform (0.5 µs compressed, 6.5 µs uncompressed) and short, single pulse (0.5 µs). In both, the final amplification is accomplished by a TWT. A multi-canceller MTI and a data processor are in the receiver to perform accurate tracking in all conditions. Accuracy is enhanced by a special anti-nodding and air defence spotting devices.

The engagement process is completely automatic following target acquisition either through the ship's search radar or through the RTN 30 director. The system is capable of engaging targets up to Mach 3 and travelling only 3 m (10 ft) above the surface.

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy.

Dardo
There are two Dardo systems, each controlling one 40 mm gun. Dardo is an automatic CIWS, with manual override, designed to engage sea-skimming and diving missiles as well as manned aircraft. It is a mainframe system and consists of a digital data processing and interface unit (DPU), a supervisory console and the Orion RTN 20X radar. Each system controls a single twin 40 mm gun mounting and optional equipment includes optical designators. The DPU uses an 18-bit mini-computer with a 20 k memory, 82 different instructions and a maximum application time of 10.5 µs. Software is written in Assembler language. The DPU receives input from the gyrocompass, inertial reference, the log and the wind reference unit.

The Orion RTN 20X, J-band (10-12 GHz) radar has a stabilised, monopulse, cassegrain antenna with polarisation twist. The transmission frequency and PRF can be changed randomly on a pulse-to-pulse basis over a wide frequency spectrum. The fully digital receiver uses a multicanceller MTI and is equipped to reduce the effects of multipath on low-flying targets. An electro-optical unit (daylight or low-light level TV or infrared) can be installed to the right of the antenna which has maximum slewing speeds of 2.2 rad/s (training), 1.5 rad/s (elevation). The radar can detect missiles at ranges of >10 km.

Initial target acquisition is by the RAN 10S search radar which interfaces directly with the system. Once the RTN 20 radar has acquired the target or targets the system conducts automatic tracking, assigning target priorities where necessary. The operator may override the system to engage lower-priority targets where necessary. Targets can be engaged at distances of 300-3,500 m (984-11,483 ft) and up to 10 may be tracked simultaneously.

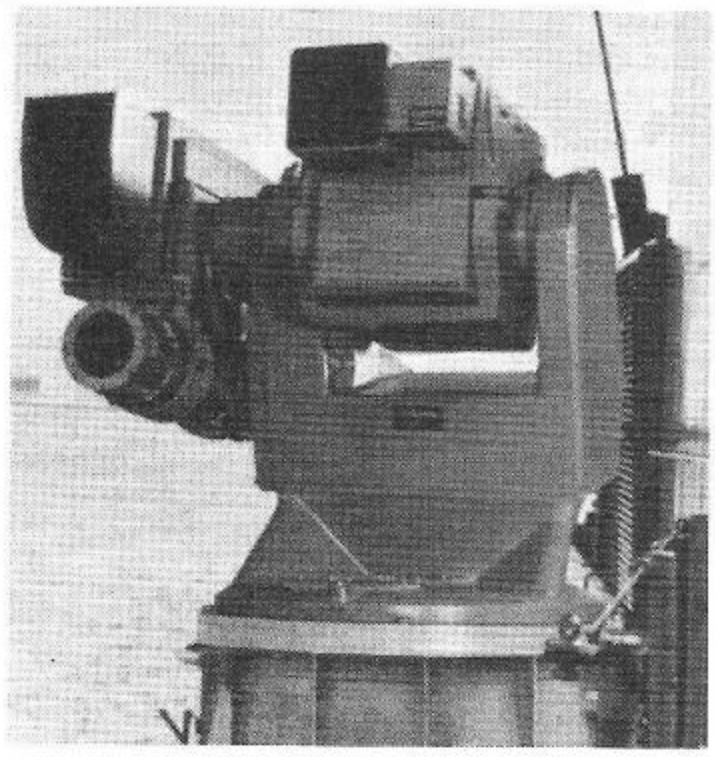
Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy.

Officine Galileo OGR7/2 optical directors
There are two OGR7/2 optical directors, which serve as standbys to back up the Dardo fire-control system and can be used to control the 40 mm gun against air and surface targets. The director consists of a tracking system, provided with a high-luminosity binocular telescope and open sight, and a computer through which the train and elevation lead angles and the super-elevation are computed with high accuracy. A single gunlayer/operator controls the speed in train and elevation by means of a joystick. The line of sight is stabilised so that the operator only has to account for the motion of the target. The OGR7/2s are located immediately forward of their associated 40 mm turret.

Specifications
Telescope
Magnification: ×2.3 and ×7
Optical field: 30° and 10°
Max train speed: 100°/s
Max elevation speed: 60°/s
Max train lead angle: ±25°
Max elevation lead angle: ±20°
Crossing range limits: 100-2,000 m (328-6,562 ft)
Target speed limits: 60-350 m/s (197-1,148 ft/s)

Manufacturer/Contractor
Officine Galileo SpA, Firenze, Italy.

Officine Galileo OG 30 electro-optical director
OG 30 serves as an electro-optical back-up to the NA 30 fire-control system, providing a means for panoramic surveillance, observation and identification, target acquisition and automatic tracking. It consists of the Officine Galileo thermal imaging camera, the FIAR P0700 laser rangefinder and the P4651 TV camera, mounted on a servo-controlled two-axis stabilised pedestal.



OG 30 electro-optic director (Officine Galileo)

Specifications
OG 30A
Daylight TV camera: P4651

SONAR

Raytheon DE1164 sonar

The DE1164 sonar system consists of two elements: Raytheon DE1160 (the commercial version of the AN/SQS/56) hull-mounted sonar; and a fully integrated variable depth sonar subsystem. All sonar functions of the DE1164 are identical to those of the DE1160, except that the DE1164 provides transmission and reception via various combinations of the hull-mounted and/or the towed Variable Depth Sonar (VDS) transducer arrays.

DE1160 is an active/passive, preformed beam, digital sonar providing panoramic echo ranging and panoramic (DIMUS) passive surveillance. All signal processing, except transducer-received signal amplification and linear transducer transmit drive, is accomplished in digital hardware. All visual data are presented on flicker-free, digitally refreshed television-type raster-scan CRT displays. System timing, control and interface communication are accomplished by a general purpose mini-computer which is a component of the basic system. Both 400 Hz synchro and MIL-STD-1397 Type A or C, category II digital interfaces are available in the basic sonar system. A single operator can search, track, classify and designate multiple targets from the active system while simultaneously maintaining anti-torpedo surveillance on the passive display. Computer-assisted system control permits the operator to concentrate on the sonar data being displayed rather than on the system control.

Addition of the VDS subsystem (which changes the designation from DE1160 to DE1164) improves overall sonar operational flexibility, and allows the VDS transducer array to operate at acoustically favourable depths and in a much quieter environment. In addition to the components of the full DE1160 hull-mounted system, the DE1164 includes one extra cabinet of electronics, a VDS towed body with associated cable, and the electrohydraulic mechanism associated with launching, towing, and retrieving the VDS body. The VDS handling equipment provides for one-man operation for launching and retrieving and unattended no-power towing. For reliability two independent hydraulic power supplies are provided, either of which may support the entire operation; an emergency retrieval system is available as an option. The towing cable is 300 m (984 ft) long and depth capability is some 300 m (984 ft) at 20 knots of ship's speed, while the maximum speed at which the VDS can be towed is 28 knots.

Both the hull-mounted and VDS arrays use the common set of DE1160 transmitting, receiving, and display electronics. Selection of the particular combination of transmit/receive array functions is ordered by the operator via the sonar console input keyboard; the system computer then sets up the required sequence. Alphanumeric symbols on the display inform the operator about which particular array is in use during any specific ping cycle. The hull-mounted sonar may be operated as a DE1160 when the VDS is stowed or being launched/ recovered.

The Italian version has been modified to include a mine detection capability.

Manufacturer/Contractor
Raytheon Company, Submarine Signal Division, Portsmouth, Rhode Island, USA.

AVIATION

AVIATION FACILITIES

Specifications
Flight deck: 27 × 12 m (89 × 39 ft)

HELICOPTERS

Two Agusta-Bell AB 212ASW

Specifications
Dimensions:
main rotor diameter: 14.63 m (48.0 ft)
height to rotor head: 3.91 m (12.82 ft)
rotor disc area: 168.1 m² (1,809 sq ft)
Weight:
max take-off weight: 5,070 kg (11,177 lb)
Performance:
max speed (never exceed): 130 kts (240 km/h)
typical cruising speed: 100 kts (185 km/h)
hovering ceiling (out of ground effect): 396 m (1,300 ft)
Engine: 1 Pratt & Whitney Canada PT6T-6 Turbo Twin-Pac rated at 1,398 kW (1,875 shp)
Role equipment: AS-12 ASMs or Elettronica Gufo 2000 EW intercept equipment

Espero *(F 576). The AB 212ASW helicopter on the flight deck is an ASW development of the Bell 212 and is one of the few helicopter types with a skid undercarriage to operate regularly at sea. Note also the large recess in the transom for the Raytheon DE1164 VDS 'fish' which is flanked by the two 533 mm (21 in) torpedo tubes* (Jane's/H M Steele)

PROPULSION

Specification
System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 Fiat/General Electric LM-2500 gas turbines; 37.3 MW (50,000 hp) sustained; 2 GMT BL 230.20 DVM diesels; 9.3 MW (12,600 hp(m)) sustained
Shafts: 2
Propellers: cp
Auxiliary machinery: 4 GMT/Ansaldo diesel generator sets

FURTHER INFORMATION

PROGRAMME

The 'Maestrale' class was designed for ASW operations in the Mediterranean, one of the major roles allotted to the Italian Navy by NATO, where they would form part of task groups consisting of a helicopter carrier or cruisers, air defence destroyers and replenishment vessels. The first six ships were ordered in December 1976 followed by the last two in October 1980. The hulls were built at Riva Trigoso and Muggiano, but all were fitted out at Muggiano.

DESIGN

The design was based on that of the Lupo, but with an increase of 10.4 m (34 ft) in length and 1.5 m (5 ft) in beam to allow for a fixed hangar, a second helicopter and the VDS. The result has been a more comfortable ship and only a small loss in top speed, although at 32 knots, this is still well up to the usual Italian standards.

The superstructure is made of aluminium to save top weight, which was the usual practice in most navies before the Falklands (Malvinas) war. The ship is fitted with stabilisers.

Maestrale has four machinery spaces, with the furthest forward containing two of the four GMT/Ansaldo diesel generators, the second the two LM-2500 gas turbines, the third the two GEC Marine gearboxes, and the fourth the two GMT B.230 cruise diesels and the remaining two diesel generator sets. As the ships' primary role is ASW, strict limits were set on noise emissions, with particular attention being paid to the propellers. Those on the Maestrale are considerably larger in diameter than those on the Lupo and rotate more slowly for a given ship's speed: 208 rpm at 32 kts, for example, compared with 250 rpm at the same speed for the Lupo.

Maestrale also has both Prairie and Masker air emission systems, and has a very quiet gearbox.

DAMAGE CONTROL

There is an NBC citadel which includes both the torpedo room and the hangar, whose door can be fully sealed. Damage control teams are normally directed from the machinery control centre amidships but, if this is out of action, the ship is divided into three zones, each with its own damage control station at which fire-fighting teams have access to the ring main, as well as to an electrical motor and, as a last resort, a two-stroke petrol motor capable of pumping 60 t/h of water.

MODERNISATION

The ships were already under construction when the Falklands (Malvinas) war took place and so it was impossible to incorporate the lessons of that conflict in the design. Steps have, however, been taken to reduce fire hazards, by, for example, replacing the foam rubber which had been used to clad the water pipes to prevent condensation forming and dripping on electrical equipment.

Consideration has been given for some time to improving the performance of the sonar. The preferred plan is believed to be lengthening the VDS towing cable from its present 600 m (1,969 ft) to 900 m (2,953 ft) and then streaming a low-frequency towed array from the VDS, which would be modified to serve as a depressor. No firm plan to implement this has yet been announced, however.

In the meantime, both the hull sonar and VDS were modified from 1994 onwards to give better shallow water performance and a mine detection capability.

Espero (F 576) was fitted with a twin Breda-Oerlikon 25 mm mounting for evaluation in 1991.

WEAPONS SYSTEMS

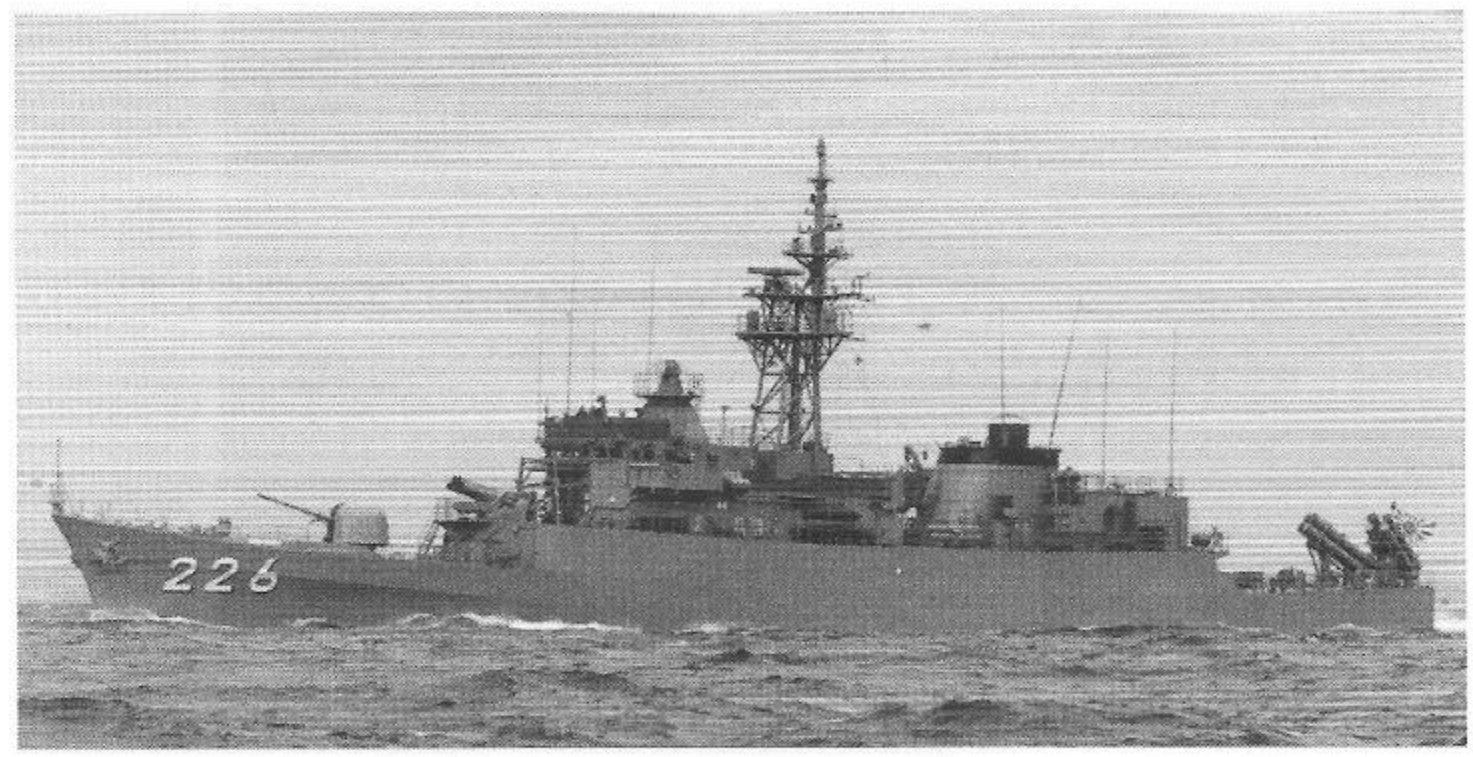
SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84B Harpoon

There are eight Harpoon missiles in two groups of four launcher-containers on the stern. This missile can either fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low land-masses or it can approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. It can also use selectable seeker search expansion patterns, and for the terminal phase, can use either a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 kg)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg (11,904 lb) thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).



Ishikari *(DE 226). Note the four-barrel 375 mm Bofors ASW mortar, which was widely used in JMSDF destroyers and frigates in the 1970s and early 1980s* (Hachiro Nakai)

TUBES

Two triple 324 mm Type 68 torpedo tubes are sited amidships, one on either beam. This is a US Mk 32 installation, manufactured under licence in Japan.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 (Neartip) 324 mm torpedoes

Specification
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)

Warhead: 44 kg (97 lb) HE
Propulsion: liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 76 mm (3 in)/62 Compact

There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck for use in either air defence or anti-surface roles. If the weapon is designated to the air defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission.

Specifications
Calibre: 76.2 mm (3.0 in)
Barrel length: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

ASW MORTAR

Mitsubishi (Bofors) Type 71 375 mm ASW rocket system

There is a single, four-tube Type 71 ASW rocket launcher located in the 'B' gun position. This is the Bofors 375 mm rocket system, produced in Japan under licence by Mitsubishi Heavy Industries. The system consists of a rocket launcher, a handling system, the ship sonar and a fire-control system.

The four launch tubes are mounted on trunnions with an automatic contact device to connect the rockets with the fire-control system. The hydraulic laying machinery is in the front of the mounting and a flame deflector in the rear. Each system features an automatic electrohydraulic handling system. The rounds are stored vertically beneath the mounting and selected by an operator. A grab on a roof-mounted rail picks up the round by the nose and transfers it to the loading table. A hoist brings this through the deck hatch to where the launch tubes have been elevated to their loading position. The rounds are then inserted through the rear of the launch tube.

The magazine holds 48 rounds and reload time is three minutes, each tube being loaded separately. The rate of fire is one round a second and rockets may be fired singly or in salvos. There are two types of rocket, both with Hexotonal filling. The Type E (Erika) rocket has Stidar time and impact fuzes, while the Type N (Nelli) uses the Zambo proximity and impact fuzes.

Specifications
Launcher
Tubes: 4
Traverse: 260° at 18°/s
Elevation: −15 to +90° at 18°/s
Crew: 4

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

NEC NOLR-6C

NOLR-6C is a radar intercept system, which was developed from the NOLR-5 in order to counter anti-ship missiles. It uses two rotating DF antennas to cover the main radar frequencies, with a circular dipole array mounted on the foretop to carry out direction-finding in the VHF and UHF bands. It uses electronic scanning. It is reported to be similar in many respects to the US Navy's AN/WLR-8.

ELECTRONIC COUNTERMEASURES (ECM)

Fujitsu OLT-2

All ships are fitted with the Fijitsu OLT-2 jammer.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled chaff launchers

There are four Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)

Rounds
Diameter: 130 mm (5.1 in)
Length, weight:
Mk 182: 1,209 mm; 22.7 kg
Super Chaffstar: 1,209 mm; 20.9 kg
Super Gemini: 451 mm; 5.5 kg
Super Hiram III: 1,220 mm; 13.6 kg
Super Hiram IV: 467 mm; 3.8 kg
Super Loroc: 734 mm; 13.2 kg

Manufacturers/Contractors

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Mitsubishi GFCS Type 2-21

Ishikazi is fitted with a Mitsubishi Electric GFCS Type 2-21 (also known as the Type 79) to control the fire of the OTOBREDA 76 mm gun. The radar director operates in the I/J band.

Manufacturer/Contractor
Mitsubishi Electric Corp (MELCO), Tokyo, Japan.

RADARS

JRC OPS 28C/D

OPS-28 is a surface search and short-range air search radar, operating in the G- and H-bands.

Fujitsu OPS 19B

OPS-19B is used for navigation. It operates in the I-band.

Type 2-21

The fire-control radar is the Type 2-21 operating in the I/J band.

SONAR

NEC OQS-4A

OQS-4A is a Japanese-designed, improved version of the OQS-3, which was a licence-produced version of the US Navy's SQS-23. OQS-4A is a hull-mounted, active search and attack sonar, operating at low frequencies.

PROPULSION

Specifications
System: Combined diesel or gas turbine (CODOG)
Main machinery: 1 Kawasaki/Rolls-Royce Olympus TM3B gas turbine; 18.4 MW (24,700 hp); 1 Mitsubishi/MAN 6DRV diesel; 3.45 MW (4,700 hp(m))

Shafts: 2
Propellers: 2 Kawasaki-Escher Wyss, cp propellers

FURTHER INFORMATION

PROGRAMME

The JMSDF had not designed a destroyer escort (frigate) since the mid-1960s and it appears that this, allied to the numerous new systems becoming available, prompted the decision to construct what amounted to a prototype of a new design.

The original programme called for a class of 20 and two were actually authorised, the first in the 1977 estimates and the second in 1979. In the event, however, only one was built.

DESIGN

The Ishikari design was entirely new and seems to have owed little to the previous 'Chikuma' class. It seems clear, however, that too much was attempted on too small a hull, perhaps the most surprising feature being that, although the ship was intended primarily for the ASW mission, its actual ASW sensor and weapons fits were not particularly imposing, the weapons, for example, being confined to a Bofors four-barrelled rocket launcher and two triple torpedo tubes.

MODERNISATION

Despite its apparent shortcomings, *Ishikari* has remained in service and is to be fitted with a Mk 15 Vulcan Phalanx CIWS when a weapon is available.

Ishikari *(DE 226). This relatively small ship (full load displacement: 1,450 tonnes) was a prototype for the 'Yubari' class* (H & L van Ginderen Collection)

Laid down 27 Jan 1976
Launched 23 Dec 1976
Commissioned 30 Jun 1977

WEAPONS SYSTEMS

ANTI-SUBMARINE MISSILES

Honeywell RUR-5A ASROC

The 'Chikugo' class has a single, eight-cell Mk 112 ASROC launcher amidships, but with no below-decks magazine or reloads. ASROC is a Mk 46 torpedo with strap-on aerodynamic surfaces and a rocket motor to enable it to fly to within range of its submarine target. Attached to the rear end of the torpedo is a short airframe assembly of clam-like construction, held together by a steel band, with a Naval Propulsion Plant solid propellant booster and four trapezoidal aerodynamic surfaces to provide stability in flight. The torpedo has a dome-shaped frangible plastic nose cap to protect the transducer as it enters the water. Payload is an Alliant Mk 46 Mod 5 torpedo, which has a seeker designed specifically to detect most types of target including submarines with anechoically coated hulls and has an estimated acquisition range of 460 m (1,509 ft).

When a submarine target is detected it is tracked and the attack console's fire-control computer predicts the target's position. The launcher is turned in the appropriate direction and elevated to an angle appropriate to the range. The fire-control computer then orders the launch and the booster burns for a programmed time of between 1 and 4 seconds, by which time the missile will have reached a height of between 60 (196) and 305 m (1,000 ft), although the aerodynamically stable airframe enables it to coast up to 600 m (1,968 ft). On reaching the programmed position, an explosive bolt cuts the steel band holding the airframe assembly sections together and, as they separate, the parachute deploys to retard the torpedo's fall, water entry taking place some 14 to 50 seconds after launch. As the torpedo enters the water the frangible nose cap breaks off and the torpedo begins its search for the target using a predetermined pattern.

Specifications

ASROC missile
Length: 4.6 m (15.1 ft)
Diameter: 32.5 cm (12.8 in)
Span: 84.5 cm (33.3 in)
Weight: 435 kg (959 lb)
Range: 0.86-5.39 n miles (1.6-10 km)
Speed: Mach 0.9

Mk 46 Mod 5 torpedo
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight: 230 kg (507 lb)

Speed: 40 kts (max)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg (97 lb); PBXN-103

Manufacturer/Contractor
Loral Defense Systems, Akron, Ohio, USA.

TUBES

Two triple 324 mm Type 68 torpedo tubes are sited amidships, one on either beam. This is a US Mk 32 installation, manufactured under licence in Japan.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 (Neartip) 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

Twin Mk 33 76 mm (3 in) L/50 gun mounting
There is one twin 76 mm mounting in 'A' position. The Mk 33 is a twin Mk 22 gun, power-driven, base-ring mount with local or remote control. The automatic loading mechanism is above each Mk 22 gun and is fed manually from either side, with motor-driven sprockets moving the shell into the centre of the loader from where it is dropped onto a transfer tray, which pushes it into the breech for ramming. The mounting operates with the Type 1B fire-control system.

Specifications
Gun
Calibre: 76.2 mm
Length of barrel: 50 calibres (4.05 m)
Muzzle velocity: 823 m/s (2,700 ft/s) (new gun, nominal); 808 m/s (2,651 ft/s) (mid-life)
Range: 7 n miles (13 km)
Altitude: 8,951 m (29,367 ft/s)
Weights:
complete round: 10.9 kg (24 lb)
projectile: 5.9 kg (13 lb)
Barrel life: 4,300 EFC (effective full charges)

Mk 33 mounting
Traverse: 360° at 30°/s
Elevation: −14/15° to +85° at 24°/s
Rate of fire: 50 rds/min/barrel

Bofors 40 mm/60
There is one twin Mk 1 40 mm gun mounting on the afterdeck.

Specification
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity:
new barrel: 881 m/s (2,890 ft/s)
mid-life: 850 m/s (2,789 ft/s)
Rate of fire: 120 rds/min (cyclic)
Max range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,638 ft)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC COUNTERMEASURES (ECM)

NEC NOLR-5
NOLR-5 is an early radar intercept set, with limited effectiveness against incoming anti-ship missiles. The antennas for this system are located under the cylindrical, flat-topped radomes at the end of the yard-arms atop the stubby main mast.

Manufacturer/Contractor
NEC, Tokyo, Japan.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

GFCS Model 1B
GFCS (Gun Fire Control System) Model 1B (also known as the Type 72) is the control system for the 76 mm (3 in) gun. The director is atop a small tower on the bridge roof.

Manufacturer/Contractor
Mitsubishi Electric, Japan.

GFCS Mk 51
The Mk 51 GFCS is a US Navy lead-computing gunsight for the 40 mm Bofors twin mounting.

COMMUNICATIONS AND DATALINKS

IFF: US Mk 10

RADARS

Mitsubishi OPS 14B
OPS-14B is a B/C-band air search radar. Peak power is 400 kW and beamwidth is 5°.

Manufacturer/Contractor
Mitsubishi Electric Corporation (MELCO), Tokyo, Japan.

Teshio *(DE 222)* (Hachiro Nakai)

JRC OPS 16
OPS-16 is a surface search radar, operating in the D band.

Type 1B
The radar associated with the GFCS Type 72 is the Type 1B. It operates in the I/J band.

SONARS

NEC OQS 3A
OQS-3A is a licence-built, Japanese version of the US Navy's hull-mounted, active search and attack, medium-frequency AN/SQS-23.

EDO SQS-35(J)
DE 221 to DE 225 only. The EDO AN/SQS-35 variable depth sonar (VDS) was installed in the last five ships only. This sonar is designed to detect submarines at medium ranges and has a large "fish" containing an array with 24 staves, operating at 13 kHz and with a peak power of 30 kW. The 'fish' is lowered over the stern on a large gantry and then streamed on a long cable. SQS-35 is a single console system with miniaturised vacuum-tube electronics.

PROPULSION

Specifications
System: Diesels
Main machinery:
DE 216, DE 220, DE 222, DE 224: 4 Mitsubishi-Burmeister & Wain 12UEV30/40N diesels; 11.8 MW (16,000 hp(m))
DE 215, DE 217, DE 218, DE 219, DE 221, DE 223, DE 225: 4 Matsui 1228 V 3BU-38V diesels; 11.8 MW (16,000 hp(m))
Shafts: 2

FURTHER INFORMATION

PROGRAMME

For many years following the end of the Second World War the JMSDF followed US Navy doctrine and practice. Thus, one of the types of ship developed was the 'destroyer escort' (DE), of which the first to be operated were former US 'Tacoma' and 'Cannon' class ships on loan from the US Navy. It should be noted, however, that despite the adoption by the US Navy of the 'frigate' category, the JMSDF continues to refer to these ships as 'destroyer escorts' and to give them 'DE' pennant numbers.

In the destroyer category there has been a consistent building policy with at least one (and sometimes two) classes under construction at a time, and a steady development in design and capability. The destroyer escort category, however, does not seem to have followed the same logical progress, with long gaps between classes and the development giving the outward appearance of an irregular progression.

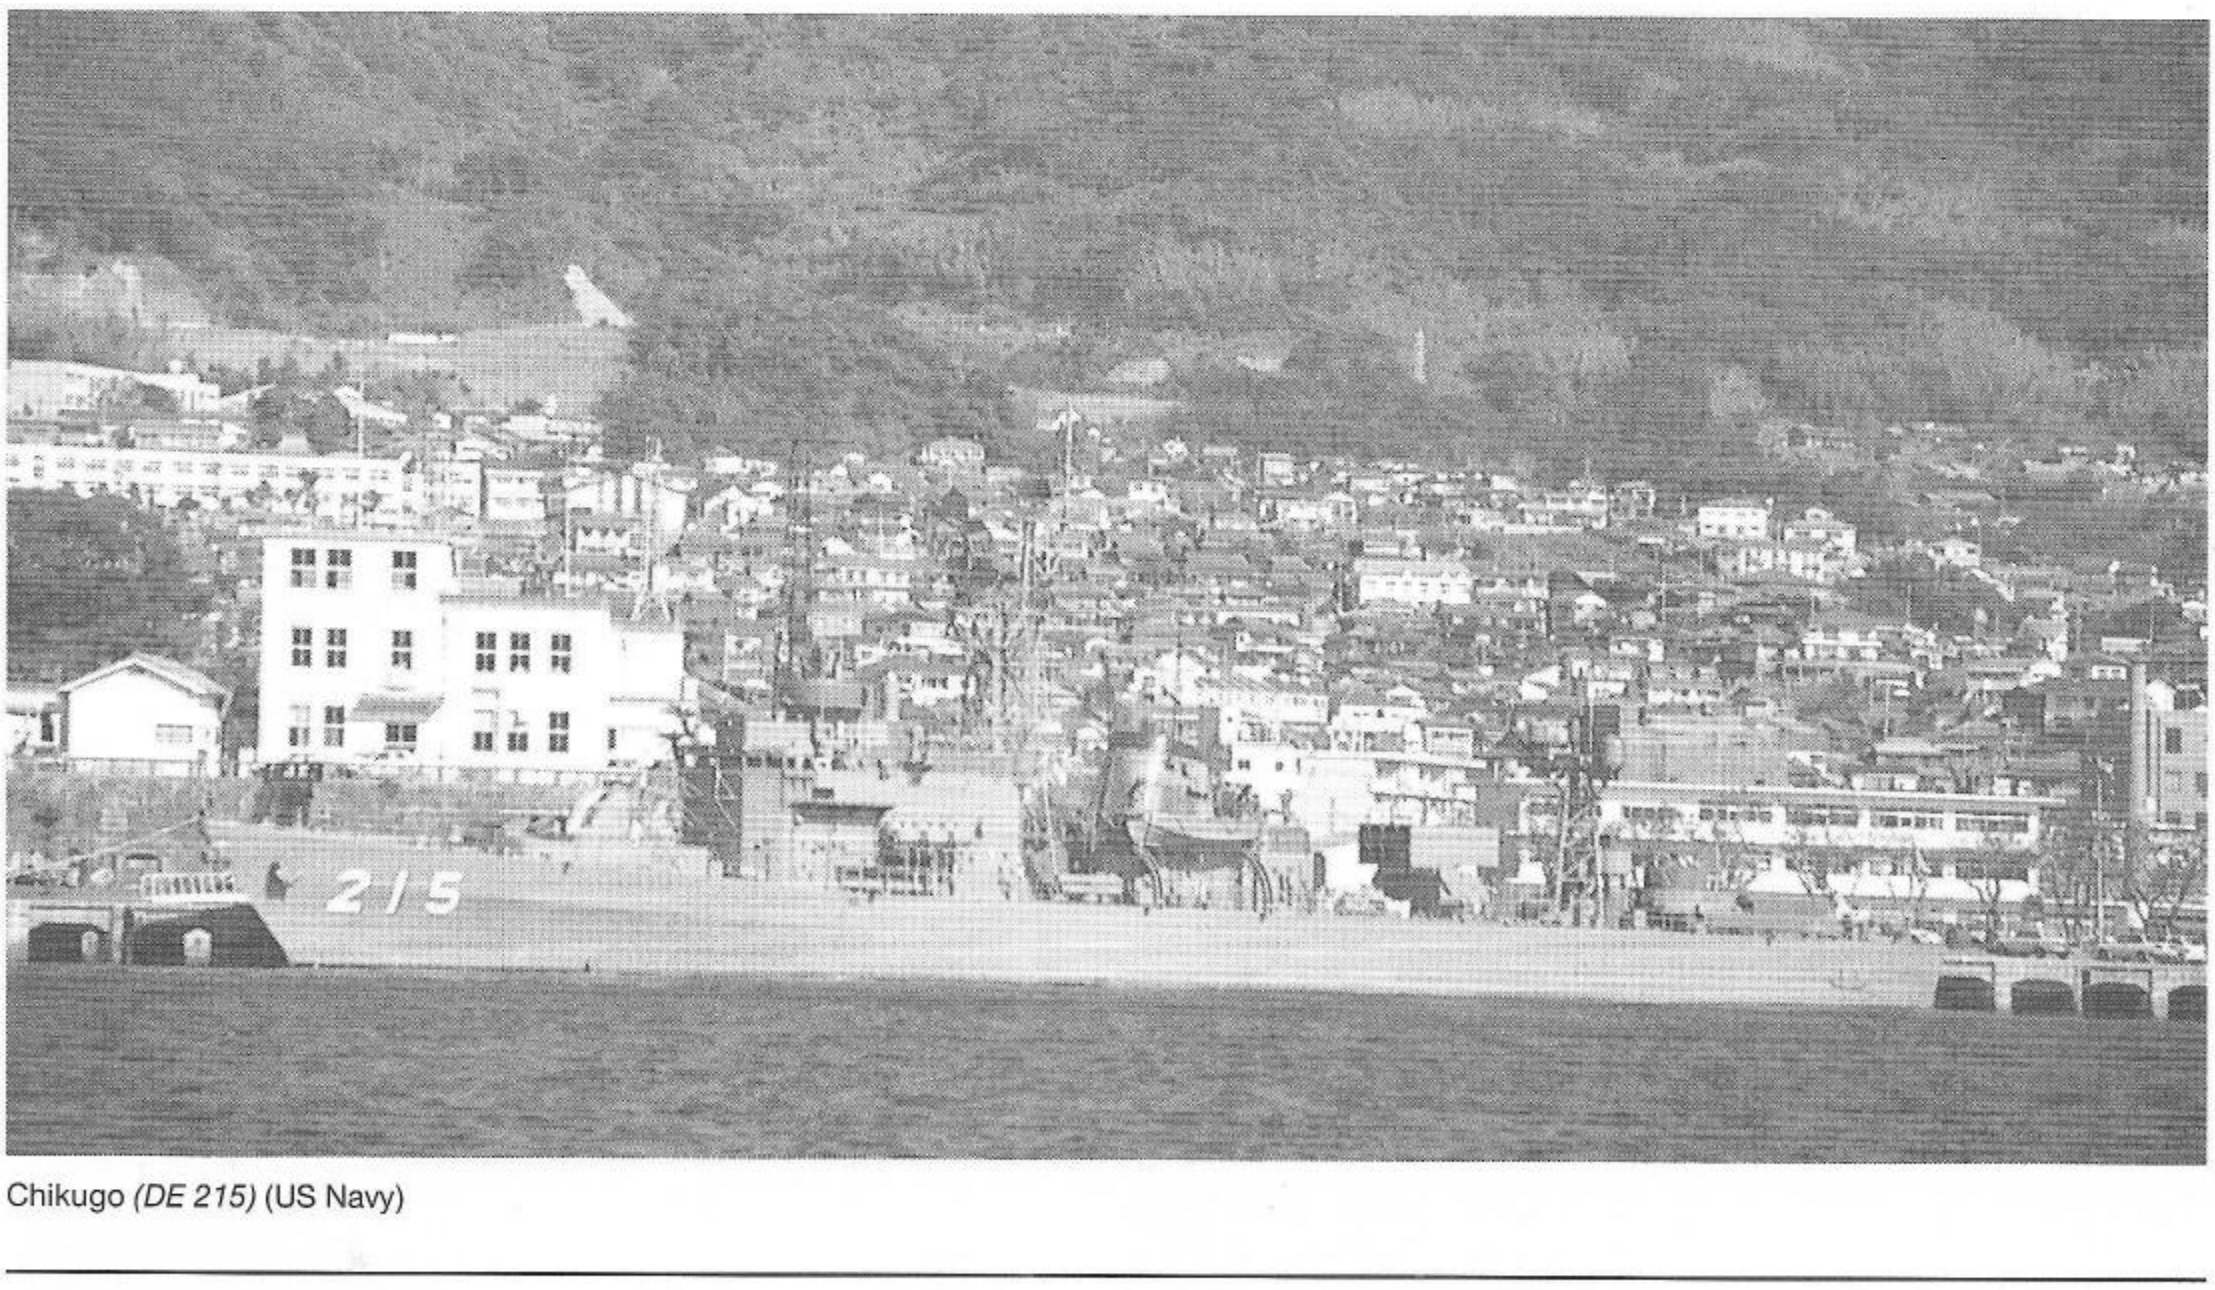
The 'Chikugo' class was designed in the early 1960s and constructed between 1968 and 1977. Eleven ships were built.

DESIGN

These ships were designed specifically for the anti-submarine mission and particular attention was paid to quiet operation and stability. Their surface and air defence armament is minimal, since it is planned that JMSDF ships would never operate further than 1,000 n miles from their home shores and would thus always be provided with air cover by Japanese fighters and long-range patrol aircraft. (Whether or not that is still a valid assumption in the post-Cold War era is a matter of debate in Japanese naval circles).

The ships' principle ASW weapon system is ASROC, and they are, in fact, the smallest platforms to carry the Mk 112 launcher.

These were the last JMSDF destroyer escorts to have an all-diesel propulsion system.



Chikugo *(DE 215)* (US Navy)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84B Harpoon

There are eight Harpoon missiles in two groups of four launcher-containers on the stern. This missile can either fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low land-masses or it can approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. It can also use selectable seeker search expansion patterns and, for the terminal phase, can use either a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 kg)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg (11,905 lb) thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

TUBES

Two triple 324 mm Type 68 torpedo tubes are sited amidships, one on either beam. This is a US Mk 32 installation, manufactured under licence in Japan.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 (Neartip) 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 76 mm (3 in)/62 Compact

There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck for use in either air defence or anti-surface roles. If the weapon is designated to the air defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission.

Specifications
Calibre: 76.2 mm (3.0 in)
Barrel length: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

ASW MORTAR

Mitsubishi (Bofors) Type 71 375 mm ASW rocket system

There is a single, four-tube Type 71 ASW rocket launcher located in the 'B' gun position. This is the Bofors 375 mm rocket system, produced in Japan under licence by Mitsubishi Heavy Industries. The system consists of a rocket launcher, a handling system, the ship sonar and a fire-control system.

The four launch tubes are mounted on trunnions with an automatic contact device to connect the rockets with the fire-control system. The hydraulic laying machinery is in the front of the mounting and a flame deflector in the rear. Each system features an automatic electrohydraulic handling system. The rounds are stored vertically beneath the mounting and selected by an operator. A grab on a roof-mounted rail picks up the round by the nose and transfers it to the loading table. A hoist brings this through the deck hatch to where the launch tubes have been elevated to their loading position. The rounds are then inserted through the rear of the launch tube.

The magazine holds 48 rounds and reload time is three minutes, each tube being loaded separately. The rate of fire is one round a second and rockets may be fired singly or in salvos. There are two types of rocket, both with Hexotonal filling. The Type E (Erika) rocket has Stidar time and impact fuzes, while the Type N (Nelli) uses the Zambo proximity and impact fuzes.

Yubari *(DE 227). Weapons include an OTOBREDA 76 mm gun, six-barrel Bofors ASW mortar, 324 mm torpedoes and Harpoon missiles (eight can be mounted, but only six in this picture). Space and weight have also been reserved for a Vulcan CIWS aft* (Hachiro Nakai)

Specifications

Launcher
Tubes: 4
Traverse: 260° at 18°/s
Elevation: −15 to +90° at 18°/s
Crew: 4

Rockets

	Type E	Type N
Weight	250 kg (551 lb)	230 kg (507 lb)
Muzzle velocity	130 m/s (427 ft/s)	205 m/s (673 ft/s)
Explosive weight	107 kg (236 lb)	80 kg (176 lb)
Range	0.35-0.87 n miles (0.65-1.63 km)	0.85-2.11 n miles (1.58-3.62 km)
Sinking speed	10.7 m/s (35.1 ft/s)	9.2 m/s (30.2 ft/s)

Manufacturer/Contractor

Mitsubishi Heavy Industries, Kobe, Japan.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

NEC NOLR-6C

NOLR-6C is a radar intercept system, which was developed from the NOLR-5 in order to counter anti-ship missiles. It uses two rotating DF antennas to cover the main radar frequencies, with a circular dipole array mounted on the foretop to carry out direction-finding in the VHF and UHF bands. It uses electronic scanning. It is reported to be similar in many respects to the US Navy's AN/WLR-8.

Fujitsu OLT 3

All ships are fitted with the OLT-3 jammer.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled chaff launchers

There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications

Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)

Rounds
Diameter: 130 mm (5.1 in)
Length, weight:
Mk 182: 1,209 mm; 22.7 kg
Super Chaffstar: 1,209 mm; 20.9 kg
Super Gemini: 451 mm; 5.5 kg
Super Hiram III: 1,220 mm; 13.6 kg
Super Hiram IV: 467 mm; 3.8 kg
Super Loroc: 734 mm; 13.2 kg

Manufacturers/Contractors

Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Mitsubishi GFCS Model 2-21

Both ships are fitted with a Mitsubishi Electric GFCS Model 2-21 (also known as the Type 79) to control the fire of the OTOBREDA 76 mm gun. The radar director operates in the I/J band.

Manufacturer/Contractor

Mitsubishi Electric Corp (MELCO), Tokyo, Japan.

RADARS

JRC OPS 28C/D

OPS-28 is a surface search and short-range air search radar, operating in the G- and H-bands.

Fujitsu OPS 19B

OPS-19B is used for navigation. It operates in the I-band.

Type 2-21

The fire-control radar is the Type 2-21 operating in the I/J band.

SONAR

NEC OQS-4A

OQS-4A is a Japanese-designed, improved version of the OQS-3, which was a licence-produced version of the US Navy's SQS-23. OQS-4A is a hull-mounted, active search and attack sonar, operating at low frequencies.

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 1 Kawasaki/Rolls-Royce Olympus TM3B gas turbine; 18.4 MW (24,700 hp) sustained; 1 Mitsubishi/MAN 6DRV diesel; 3.45 MW (4,700 hp(m))
Shafts: 2
Propellers: cp

FURTHER INFORMATION

PROGRAMME

The Yubari is essentially an improved *Ishikari* (DE 226) but only two were built: the first joining the fleet in 1983 and the second in 1984.

DESIGN

The Yubari hull is 6.5 m (21 ft) longer than that of the *Ishikari,* but the weapons fit is essentially the same, enabling the accommodation arrangements to be improved and an increase in the size of the fuel oil bunkers.

MODERNISATION

It was planned that a Hughes 20 mm Phalanx CIWS Mk15 would be fitted, but this has not yet happened.

US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

ANTI-SUBMARINE MISSILES

Honeywell RUR-5A ASROC

The 'Abukuma' class has a single, eight-cell Mk 112 ASROC launcher amidships, but without a magazine beneath it. ASROC is a Mk 46 torpedo with strap-on aerodynamic surfaces and a rocket motor to enable it to fly to within range of its submarine target. Attached to the rear end of the torpedo is a short airframe assembly of clam-like construction, held together by a steel band, with a Naval Propulsion Plant solid propellant booster and four trapezoidal aerodynamic surfaces to provide stability in flight. The torpedo has a dome-shaped frangible plastic nose cap to protect the transducer as it enters the water. Payload is an Alliant Mk 46 Mod 5 torpedo, which has a seeker designed specifically to detect most types of target including submarines with anechoically coated hulls and has an estimated acquisition range of 460 m (1,509 ft).

When a submarine target is detected it is tracked and the attack console's fire-control computer predicts the target's position. The launcher is turned in the appropriate direction and elevated to an angle appropriate to the range. The fire-control computer then orders the launch and the booster burns for a programmed time of between 1 and 4 seconds, by which time the missile will have reached a height of between 60 (197) and 305 m (1,000 ft), although the aerodynamically stable airframe enables it to coast up to 600 m (1,968 ft). On reaching the programmed position, an explosive bolt cuts the steel band holding the airframe assembly sections together and, as they separate, the parachute deploys to retard the torpedo's fall, water entry taking place some 14 to 50 seconds after launch. As the torpedo enters the water the frangible nose cap breaks off and the torpedo begins its search for the target using a predetermined pattern.

Specifications

ASROC missile
Length: 4.6 m (15.1 ft)
Diameter: 32.5 cm (12.8 in)
Span: 84.5 cm (33.3 in)
Weight: 435 kg (959 lb)
Range: 0.86-5.39 n miles (1.6-10 km)
Speed: Mach 0.9

Mk 46 Mod 5 torpedo
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight: 230 kg (507 lb)
Speed: 40 kts (max)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor

Warhead: Mk 103 Mod 1; 44 kg (97 lb); PBXN-103

Manufacturer/Contractor
Loral Defense Systems, Akron, Ohio, USA.

TUBES

Two triple 324 mm Type 68 torpedo tubes are sited either side of the after deckhouse. This is a US Mk 32 equipment, manufactured under licence in Japan.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 (Neartip) 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 76 mm (3 in)/62 Compact
There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck for use in either air defence or anti-surface roles. If the weapon is designated to the air defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission.

Specifications
Calibre: 76.2 mm (3.0 in)
Barrel length: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Hughes Mk 15 CIWS Phalanx
There is one Hughes Mk 15 Phalanx close in weapons system (CIWS) situated on the afterdeck. The mount consists of a 20 mm M61A1 Vulcan, six-barrel, Gatling-principle gun with a cylindrical magazine and feeding mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications
Gun
Calibre: 20 mm
Barrel length: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 3,000 rds/min (Block 0, Block 1 Baseline 0), 4,500 rds/min (Block 1 Baseline 1)
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor
Hughes Missile Systems, Tucson, Arizona, USA (systems).

Japanese frigate Chikuma *(DE 233) of the 'Abukuma' class* (Hachiro Nakai)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

NEC NOLR-6C
NOLR-6C is a radar intercept system, which was developed from the NOLR-5 in order to counter anti-ship missiles. It uses two rotating DF antennas to cover the main radar frequencies, with a circular dipole array mounted on the foretop to carry out direction-finding in the VHF and UHF bands. It uses electronic scanning. It is reported to be similar in many respects to the US Navy's AN/WLR-8.

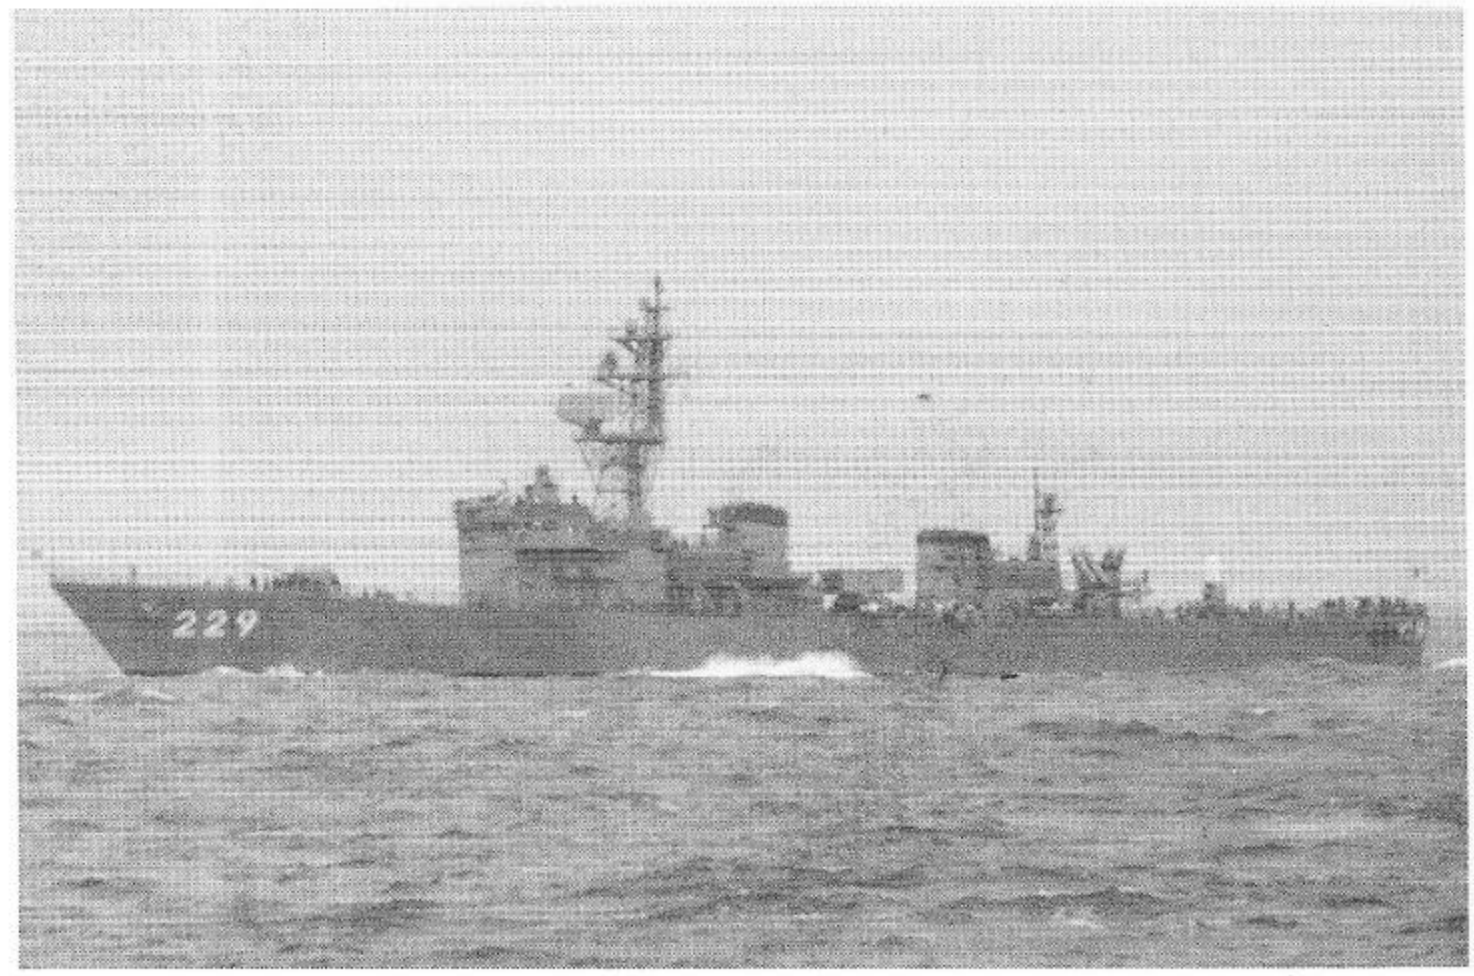
ELECTRONIC COUNTERMEASURES (ECM)

Fujitsu OLT 3
All ships are fitted with the OLT-3 jammer.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled chaff launchers
There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)



Abukuma *(DE 229)*

Rounds
Diameter: 130 mm (5.1 in)
Length, weight:
Mk 182: 1,209 mm; 22.7 kg
Super Chaffstar: 1,209 mm; 20.9 kg
Super Gemini: 451 mm; 5.5 kg
Super Hiram III: 1,220 mm; 13.6 kg
Super Hiram IV: 467 mm; 3.8 kg
Super Loroc: 734 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

OYQ-6 action data automation

OYQ-6 is similar to the earlier OYQ-3 but has a Link 11 capability, enabling it to exchange encrypted digital data over HF and UHF links.

COMMUNICATIONS AND DATALINKS

Data links: Link 11
Satcom

WEAPONS CONTROL

Mitsubishi GFCS Type 2-21

The ships are fitted with a Mitsubishi Electric GFCS Type 2-21 (also known as the Type 79) to control the fire of the OTOBREDA 76 mm gun. The radar director operates in the I/J band.

RADARS

Mitsubishi OPS 14B

OPS-14B is a B/C-band air search radar. Peak power is 400 kW and beamwidth is 5°.

Manufacturer/Contractor

Mitsubishi Electric Corporation (MELCO), Tokyo, Japan.

JRC OPS 28

OPS-28 is a surface search and short-range air search radar, operating in the G- and H-bands.

Type 2-21

The fire-control radar is the Type 2-21 operating in the I/J band.

SONAR

Hitachi OQS-8

OQS-8 is a relatively new, Japanese-designed, hull-mounted, active search and attack sonar, operating at medium frequencies.

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 Rolls-Royce Spey SM1A gas turbines; 19.9 MW (26,650 hp) sustained; 2 Mitsubishi S12U-MTK diesels; 4.4 MW (6000 hp(m))
Shafts: 2
Propellers: 2 Kawasaki-Escher Wyss five-bladed, 3,550 mm diameter propellers

FURTHER INFORMATION

PROGRAMME

The first pair of this class was approved in the 1986 estimates, ordered in March 1987, and entered service in 1989/90. These were followed by four more, the last of which was commissioned in 1993.

DESIGN

These ships show the growth that seems an inevitable part of modern naval development and whereas previous Japanese destroyer escorts were quite small, the 'Abukuma' class is virtually the same size as the British 'broad-beamed Leander' and the US 'Bronstein' classes.

The Japanese ships feature some early 'stealth' features, such as sloping surfaces which would otherwise have been vertical and rounding corners.

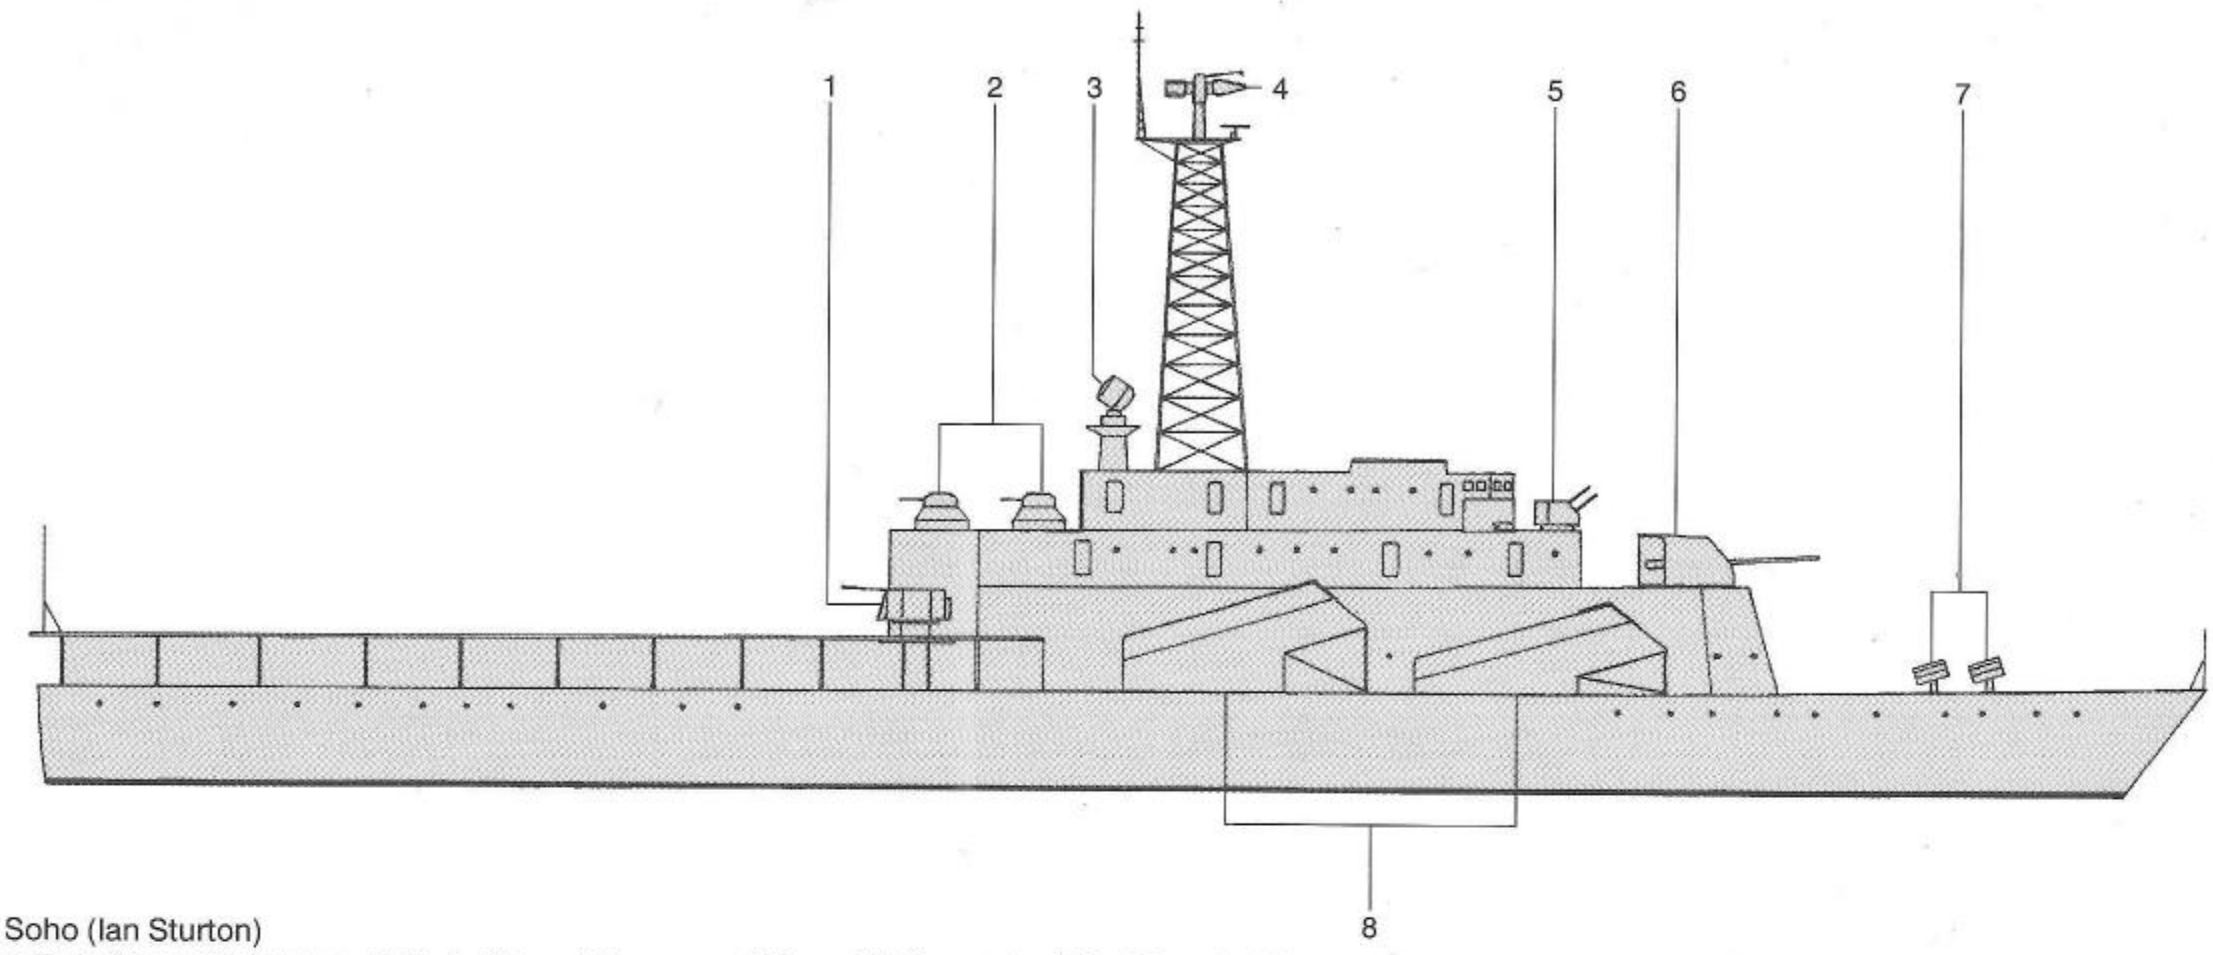
NAMES

All ships in this class carry names last used for cruisers in the Imperial Japanese Navy in the Second World War.

MODERNISATION

Improvements to the class are scheduled to include:
SQR 19A towed passive array
RAM PDMS

SOHO



Soho (Ian Sturton)

1 *Twin 37 mm/63 cannon* **2** *Twin 30 mm/65 cannon* **3** *Drum Tilt fire control (for 30 mm)* **4** *Square Tie surface search radar* **5** *Twin 25 mm/60 cannon* **6** *Single 100 m (3.9 in)/56* **7** *RBU-1200 fire tube anti-submarine/torpedo rocket launcher* **8** *CSS-N-2 Styx anti-ship missile*

GENERAL SPECIFICATIONS

Operator: Korea, Democratic People's Republic

Class: SOHO

Built: 1
Active: 1

Displacement:
standard: 1,600 t
full load: 1,845 t

Dimensions
Length: 75 m (246 ft)

Beam: 15 m (49.2 ft)
Draught: 3.8 m (12.5 ft)

Speed: 23 kts

Complement: 190

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

P-15 (SS-N-2a 'Styx') medium-range anti-ship missile

The principal armament of the Soho ship is the P-15 (NATO = SS-N-2a 'Styx') missile with two single launch-bins one behind the other on either side of the bridge structure. There are no reloads. The probable reason for using this very elderly missile is that North Korea has many of them in service aboard its numerous FACs.

Specifications

SS-N-2A
Length: 5.8 m (19.0 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.9 ft)
Speed: Mach 0.9
Weight (without booster): 2,300 kg (5,071 lb)
Warhead: 454 kg (1,000 lb) hollow-charge
Fuzes: Impact, proximity
Range: 3-24 n miles (5.5-45 km)
Guidance: Autopilot with active radar (supplemented in some with IR)

Manufacturer/Contractor

Raduga, Moscow, Russia.

GUNS

100 mm (3.9 in) L/70 gun

One Russian-pattern 100 mm (3.9 in) L/70 gun is in a turret on the foredeck. This weapon fires at 15 rounds per minute and is water-cooled, the hose running along the left of the barrel to the water reservoir, which is on the left of the mounting. The weapon fires fixed rounds, probably using a drum feed, with a total of about 80 rounds on the mounting. The turret is unmanned. There is an electro-optic sensor at the front to the left of the elevating mass and the L/70 is associated with the Kite Screech, G/I-band fire-control radar. It is probable that the radar compartment for this sensor also acts as the fire-control centre.

Specifications

Calibre: 100 mm (3.9 in)
Length of barrel: 70 calibres
Muzzle velocity: 850 m/s (2,789 ft/s)
Traverse: 360°
Elevation: −10 to +40°
Weight of projectile: 6.8 kg (15 lb)
Weight of complete round: 13.5 kg (30 lb)
Rate of fire: 15 rds/min
Range:
anti-surface: 8 n miles (15 km)
anti-air: 8,000 m (26,248 ft)

37 mm (W-11-M) Mountings

There are two twin 37 mm mounts at main deck level, sited at either side of the after end of the hangar. It seems most probable that these are Chinese-pattern open mounts. The 37 mm gun is a 62.8 calibre (generally referred to as '63 calibre') weapon with a flash suppressor with the barrels enclosed in separate water jackets with exposed spring recuperators, and a hydraulic recoil buffer underneath the barrel. The loading mechanism consists of guides for ammunition, which is in five-round clips, the clips being automatically removed on the loading tray. The first round is loaded manually into the breech. The breech block rises and the gun fires when the firing pin strikes the cartridge percussion cap. Upon recoil, the breech block opens and extractor arms propel the case along the loading tray and down an ejection chute. The recoil forces activate the loading mechanism and allow following rounds to be rammed automatically into the breech.

Specifications

Calibre: 37 mm
Length of barrel: 62.8 calibres
Muzzle velocity: 886 m/s (2,907 ft/s)
Traverse: 360° at 17°/s
Elevation: −10 to +85° at 13°/s
Rate of fire: 80 rds/min/barrel
Ammunition (projectile): 0.732 kg
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 3,000 m (9,843 ft)
Crew: 3

Ammunition (HE-T)
Projectile weight: 708 g (25 oz)
Explosive charge: 36 g (1.27 oz) (RDX/aluminium)

2-M-3 25 mm/60 (quad)

There are two twin 25 mm mounts immediately in front of the bridge. In the 2-M-3 mount the two guns are positioned one above the other in separate cradles and mounted on their sides so that they can be fed from their sides, which in the case of the Type 61 is the right-hand side. The 1.5 m (4.9 ft) long air-cooled barrels have a flash suppressor and an exposed spring recuperator wrapped around the barrel near the breech, with a hydraulic recoil buffer on the underside.

Specifications

2-M-3
Calibre: 25 mm
Length of barrel: 60 calibres
Traverse: 360° at 25°/s
Elevation: −10 to +85°at 15°/s
Rate of fire: 450 rds/min/barrel
Projectile: 0.28 kg HEI-T
Range:
anti-surface: 1.5 n miles (2.75 km)
anti-air: 2,800 m (9,187 ft)

ANTI-SUBMARINE MORTARS

RBU 1200

There are two RBU 1200 ASW rocket launchers in the bows. RBU 1200 is about 1.5 m (4.9 ft) high and has a pyramid-shaped pintle with five rocket launcher tubes; a row of three along the top and one each on either

side. The tubes cannot be trained and have a maximum elevation of +65°. Each tube has a diameter of 250 mm, is 1.4 m (4.6 ft) long and is reloaded manually. The 70 kg (154 lb) RGB-12 rocket has a 34 kg (75 lb) warhead and a range of about 0.8 n miles. The RBU 1200 is associated with the old short-range HF (25-30 kHz), 'searchlight' attack sonar which was given the NATO codename Stag Ear and has the Soviet designation Tamir.

Specifications
RBU 1200
Calibre: 250 mm
Tubes: 5
Elevation: +65°
Warhead: 34 kg (75 lb)
Range: 0.8 n miles (2.7 km)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

RW-23 Jug Pair (Watch Dog)
There are two small domes which are designated Jug Pair under the US Navy system, and appear to be a Chinese-produced version of the Russian Watch Dog radar warning equipment.

COMMAND AND CONTROL SYSTEMS

RADARS

Type 254
The search radar is the Type 254, an I-band (8-10 GHz) set which appears to be a Chinese copy of the Russian Square Tie radar. Type 254 is characterised by an elliptical parabolic array, which is illuminated by an overhung horn feed. Maximum range is estimated to be approximately 70 n miles (130 km).

Drum Tilt
Drum Tilt is the H/I band radar used in the fire-control system for the 30 mm guns. Normally there is one Drum Tilt to each pair of AK-630s, but it appears that in this ship the single Drum Tilt controls both pairs.

Kite Screech
The 100 mm mount requires a Kite Screech gun control system unless it is fired under local control. This is a G/I-band radar which appears to incorporate monopulse tracking. It features a circular dish antenna, with central feed, behind which are transmitter, receiver, turning and stabilisation gear housings. All are mounted upon a pedestal which is about 2 m (6.5 ft) high. It could well be that the radar compartment for this sensor also acts as the fire-control centre.

AVIATION

AVIATION FACILITIES

Flight deck: There is a very large flight deck approximately 29 × 15 m (96 × 51 ft)

HELICOPTERS

The platform is reported to be used by one medium helicopter although it seems large enough to operate two smaller helicopters without any great difficulty.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 diesels; 11.03 MW (15,000 hp(m))
Shafts: 2

FURTHER INFORMATION

PROGRAMME

One of the characteristics of failing regimes seems to be a desire to build grandiose warships for which there is little strategic or tactical justification. Examples are the Romanian 'Marasesti' class and the Russian 'Kirov' class, both dubbed 'battlecruisers'. The North Korean equivalent is this 'Soho' class twin-hulled frigate. It is a matter for speculation as to why such a small navy, operating a large number of very elderly fast attack craft, should seek to build such an unusual design.

The ship was built at the naval yard at Najin. It was laid down in June 1980, launched in November 1981 and commissioned in May 1982.

DESIGN

This is by no means the largest twin-hull ship in service; the US Military Sealight Command's 'Victorious' class AGOS is about the same size and the 'Impeccable' class AGOS is rather larger. But, the Soho is certainly one of the largest twin-hull warships yet built.

The weapon fit is bizarre and is essentially a collection of the elderly weapons already available to the North Korean Navy — SS-N-1; 100 mm guns; 37 mm and 30 mm cannon; and RBU-1200s — which would be of limited use in any modern naval engagement. In addition, the sensors would have little effect in a contemporary ECM/ECCM environment. The one possible tactical justification for the design is the large helicopter deck aft, although North Korea has few helicopters and virtually no experience of operating them at sea.

DEPLOYMENT

It is reported that this vessel is now spending more time at sea, suggesting that earlier problems may have been resolved.

NAJIN

531 631

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

P-15 (SS-N-2a 'Styx') medium-range anti-ship missile

The principal armament of the 'Najin' class is the P-15 (NATO = SS-N-2a 'Styx') missile with two single launch-bins one behind the other on either side of the bridge structure. There are no reloads. The probable reason for using this very elderly missile is that North Korea has many of them in service aboard its numerous FACs.

Specifications
SS-N-2a
Length: 5.8 m (19.0 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.9 ft)
Speed: Mach 0.9
Weight (without booster): 2,300 kg (5,071 lb)
Warhead: 454 kg (1,000 lb) hollow-charge
Fuzes: Impact, proximity
Range: 3-24 n miles (5.5-45 km)
Guidance: Autopilot with active radar (supplemented in some with IR)

Manufacturer/Contractor
Raduga, Moscow, Russia.

Najin *No: 531. These ships carry many weapons but virtually all mounts are open and fire-control arrangements minimal. Their combat potential must, therefore, be very low* (JMSDF)

GUNS

100 mm (3.9 in) L/56 gun

Two Russian-pattern 100 mm (3.9 in) L/56 guns are mounted in turrets in 'A' and 'Y' positions. This weapon fires at 15 rounds per minute. The weapon fires fixed rounds, probably using a drum feed, with a total of about 80 rounds on the mounting.

Specifications
Calibre: 100 mm (3.9 in)
Length of barrel: 56 calibres
Muzzle velocity: 900 m/s (2,952 m/s)
Traverse: 360°
Elevation: −10 to +85°
Weight of projectile: 6.31 kg (13.9 lb)
Rate of fire: 15 rds/min
Range:
anti-surface: 8.5 n miles (15.7 km)
anti-air: 15,000 m (26,248 ft)

57 mm twin L/75 (ZIF-72/AK 725)

There are two twin 57 mm L/75 mountings in open mounts in 'B' and 'X' positions. This Russian weapon was designed for prolonged air defence engagements, but can also be used against seaborne and land targets. The 4.275 m (14 ft) long barrels are water cooled and the mounting consists of the elevating mass with two automatic weapons and the cradle, the rotating structure for the elevating mass with gun drives, firing system and other elements, all on a slip ring with two arrays of ball-bearings. Below decks are the ammunition handling system and the magazine.

The 550-round linked belt is initially threaded into the feeder mechanism by hand and is advanced by the cocking mechanism; thereafter, the hydraulic mechanism takes over. The feeder system is capable of operating in bursts or in a sustained form with automatic interruption when only 50 rounds remain in the belt. Each round weighs 6.61 kg (14.6 lb) and the feeder mechanism has 15 rounds per barrel within the turret.

Specifications
Length of barrel: 75 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Traverse: ±200°
Elevation: −10 to +85°
Range:
anti-surface: 3.25 n miles (6 km)
anti-air: 6,000 m (19,686 ft)
Rate of fire: 120 rds/min/barrel
Projectile weight: 6.61 kg (14.6 lb)
Power requirements: 220 or 380 V, three phase

30 mm/65 AK-230 close in weapons system

There are two 30 mm Gatling-type AK-230, one abaft each stack. These have five roles, engaging anti-ship missiles, aircraft, small surface vessels, drifting mines and unprotected targets ashore.

Specifications
Calibre: 30 mm
Length of barrel: 65 calibres
Number of barrels: 2
Muzzle velocity: 1,050 m/s (3,440 ft/s)
Cooling: Water
Traverse: 360° at 70°/s
Elevation: ±100° at 55°/s
Crew: 1 (off mount)
Range: 4,000 m (13,120 ft) (radar fire control), 5,000 m (16,400 ft) (electro-optic fire control)
Rate of fire: 400-480 rds/min

14.5 mm KPV heavy machine gun

There are 12,14.5 mm KPV heavy machine guns in six twin mounts. The KPV (Vladimirov Heavy Machine Gun) was designed during the Second World War but is still an effective short-range weapon. It is short-recoil operated with gas assistance supplied by a muzzle booster. The body is a simple metal cylinder to which various attachments are riveted. The barrel is chromium plated with a flash suppressor. API, API-T and I-T rounds are available.

Specifications
KPV
Weight: 49.1 kg (108 lb)
Length: 2 m (6.5 ft)
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 600 rds/min (cyclical)

DEPTH CHARGES

There are two projectors and two racks for depth charges.

MINES

North Korea makes considerable use of mines both on land and at sea, and these ships are capable of carrying up to 30 mines.

COMMAND AND CONTROL SYSTEMS

COMMUNICATIONS AND DATALINKS

IFF: Ski Pole

WEAPONS CONTROL

There is an optical director on the bridge roof. No details are available.

RADARS

Slim Net

Slim Net is an E/F band (2,840 MHz) set, which is used for both air and surface search. In the (then) Soviet Navy it was mounted on many 1950/1960-vintage destroyers, frigates and corvettes.

Pot Head

Pot Head is an I-band surface search radar, operating in the I-band (9,275 - 9,460 MHz). The antenna is mounted in a large diameter, low-height radome.

Pot Drum

Pot Drum is generally similar to Pot Head and appears to be used in this instance as a navigation radar.

Drum Tilt

There is one 'Rys' (NATO = Drum Tilt) fire-control system for the AK-230. This is an I/J-band system with a pedestal-mounted director whose antenna is in a weatherproof container and is mounted atop a small tower just forward of the after stack. Maximum acquisition range is approximately 22 n miles (40 km).

SONAR

There is a hull-mounted, active search, high-frequency sonar.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 diesels; 11.03 MW (15,000 hp(m))
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These two ships entered service in the early 1970s. Built at Najin and Nampo shipyards. First completed 1973, second 1975.

DESIGN

Apart from the two SS-N-2 missiles, which are 1950s-vintage weapons, these two ships are essentially designed to Second World War concepts. They are certainly heavily armed but the weapons are short ranged, most of the mounts are open, giving the gun crews scant protection, and the fire-control arrangements appear to be non-existent.

One extraordinary feature is that the two SS-N-2A launchers are fixed and face forwards. Thus, the slightest deviation in the first 50 m (164 ft) would result in a major disaster; indeed, the bridge wing appears to be actually within the flight path, which might affect the captain's wish to use the weapon.

There is some resemblance to the 'Kola' class, which was built for the (then) Soviet Navy in the early 1950s. The dimensions are very similar, as is the weapon fit, the main difference being that the Kolas were powered by steam turbines, while these Korean ships are diesel-powered.

MODERNISATION

The weapons fits in these ships have varied over their years of service. The original torpedo tubes were first replaced by trainable Styx missile launchers and then by the present fixed mounts. The various lighter guns have been changed repeatedly and the RBU 1200 mortars have been removed in at least one of the class.

GENERAL SPECIFICATIONS

Operator: Korea, Republic

Class: ULSAN

Built: 9
Active: 9

Displacement:
light: 1,496 t
full load: FF 951 to FF 956: 2,180 t;
FF 957 to FF 961: 2,300 t

Dimensions
Length: 102.0 m (334.6 ft)

Beam: 11.5 m (37.7 ft)
Draught: 3.5 m (11.5 ft)

Speed: 34 kts; 18 kts (diesels)
Range: 4,000 n miles at 15 kts

Complement: 150 (16 officers)

SHIPS

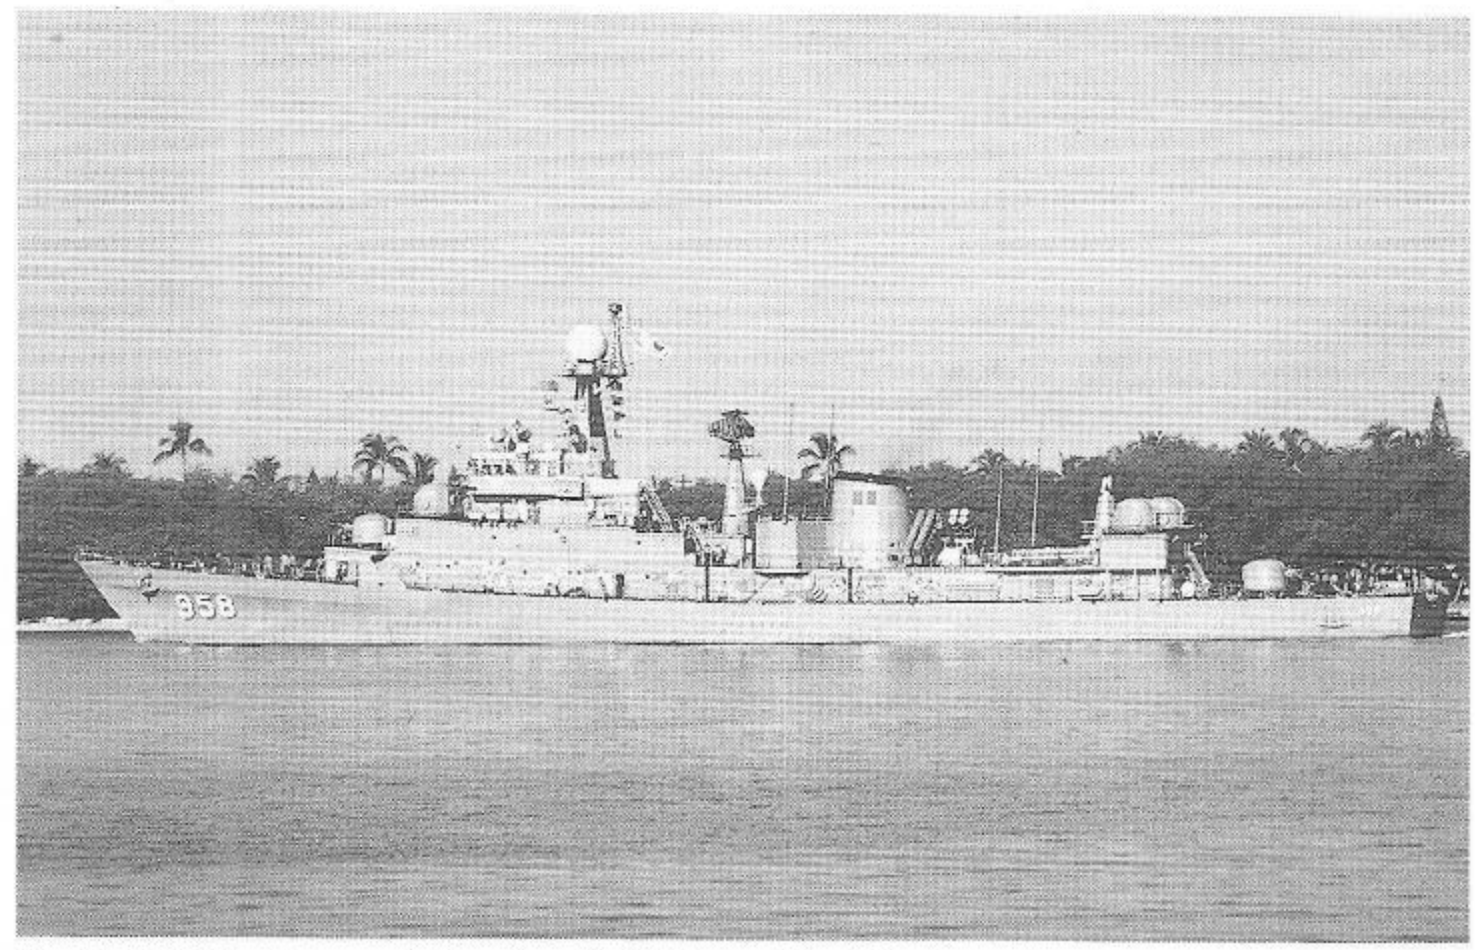
ULSAN (FF 951)
Builder Hyundai, Ulsan, South Korea
Laid down 1979
Launched 8 Apr 1980
Commissioned 1 Jan 1981

SEOUL (FF 952)
Builder Hyundai, Ulsan, South Korea
Laid down 1982
Launched 1984
Commissioned 30 Jun 1985

CHUNG NAM (FF 953)
Builder Korean SEC, Pusan, South Korea
Laid down 1984
Launched 1985
Commissioned 1 Jun 1986

MASAN (FF 955)
Builder Korea Tacoma, Masan, South Korea
Laid down 1983
Launched 26 Oct 1984
Commissioned 20 Jul 1985

KYONG BUK (FF 956)
Builder Daewoo, Okpo, South Korea



Che Ju *(FF 958), a Korean-designed and built frigate of the 'Ulsan' class* (H & L van Ginderen Collection)

Laid down 1984
Launched 15 Jan 1986
Commissioned 30 May 1986

CHON NAM (FF 957)
Builder Hyundai, Ulsan, South Korea
Laid down 1986
Launched 19 Apr 1988
Commissioned 17 Jun 1989

CHE JU (FF 958)
Builder Daewoo, Okpo, South Korea
Laid down 1986
Launched 3 May 1988
Commissioned 1 Jan 1990

BUSAN (FF 959)
Builder Hyundai, Ulsan, South Korea
Laid down 1990
Launched 20 Feb 1992
Commissioned 1 Jan 1993

CHUNG JU (FF 961)
Builder Daewoo, Okpo, South Korea
Laid down 1990
Launched 20 Mar 1992
Commissioned 1 Jun 1993

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84B Harpoon

Eight Harpoon anti-ship missile canisters are mounted immediately abaft the stack. The missiles are the Block 1C version with additional options, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications

Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

TUBES

Six 324 mm US Mk 32 torpedo tubes in two triple mounts are located on the after superstructure aft of the Harpoon launchers.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

Manufacturer/Contractor

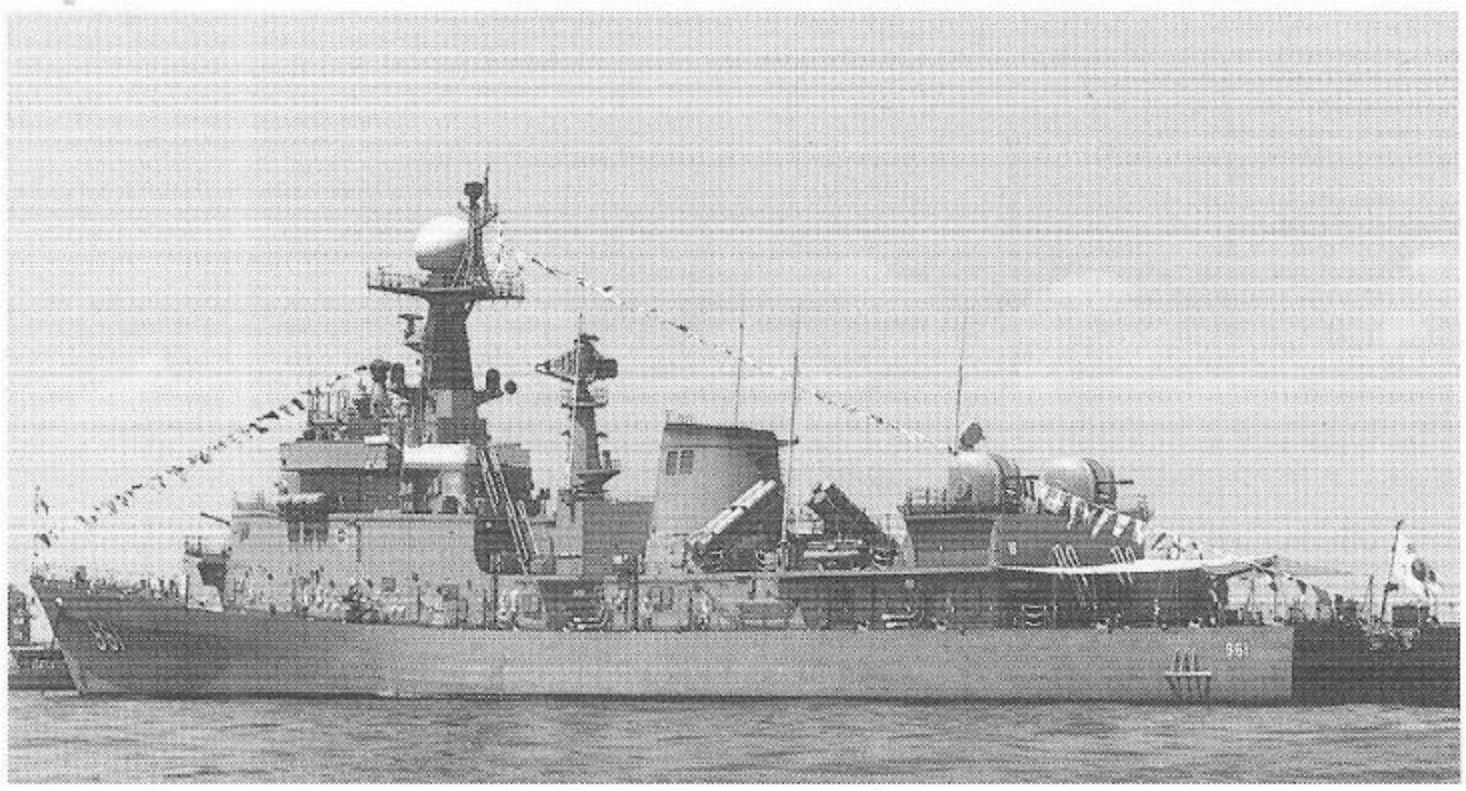
GEC-Marconi Naval Systems, UK.

TORPEDOES

Specifications

Mk 46 Mod 1 torpedo
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight: 230 kg (507 lb)
Speed: 40 kts (max)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg (97 lb); PBXN-103

Masan *(FF-955). The fairleads in the transom are for Nixie torpedo decoys. The gun on the quarterdeck is an OTOBREDA 76 mm/62 Compact and behind it (underneath the temporary canopy) is a ESCO (formerly Emerson Electronic) twin 30 mm with the gunner's cabin between the two guns* (Jane's/HM Steele)



Chung Ju *(FF 961). Last of the class of nine,* Chung Ju *has revised armament. The ESCO twin 30 mm has been deleted and replaced by two twin OTOBREDA 'Fast Forties' and a GEC-Marconi ST 1802 fire director, all mounted atop a new deckhouse* (H & L van Ginderen Collection)

Manufacturer/Contractor
Loral Defense Systems, Akron, Ohio, USA.

GUNS

OTOBREDA 76 mm (3 in)/62 Compact
There are two OTOBREDA 76 mm (3 in) guns sited in the 'A' and 'Y' positions for use in either air defence or anti-surface roles. If the weapon is designated to the air defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission.

Specifications
Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

ESCO 30 twin 30 mm mounting
FF 951 to FF 953 and FF 955 only. The first four ships carry four twin ESCO 30—30 mm cannon: one immediately before the bridge, two in the waist and one aft in 'X' position. The ESCO 30 is a twin 30 mm, 70 calibre weapon designed for air defence, surface engagement and anti-missile operations, using either local or remote control.

The ESCO 30 employs two Oerlikon KCB positively locked, gas-operated cannon with a cabin between them, and forward of the elevating mass. Behind the cabin, and in a sealed compartment, are the elevating and training drives together with flexible chutes to channel ammunition from the magazine.

The gunner's cabin is equipped with a daylight reflex, or an image-intensifier, sight, together with gyro-assisted line of sight stabilisation. Ready-use ammunition is stored in an integral, below-deck, drum magazine with a capacity of 985 rounds for each barrel in a continuous, disintegrating-link belt. These are transferred to the guns through separate chutes by means of electrically operated drives which automatically respond to the individual demand for ammunition supply. Normally, the mount uses ship's power supplies, but this is backed up by an on-mount battery, providing sufficient power to fire a full complement of ammunition, and, finally, there is the traditional hand-crank mechanism operated by the gunner.

Specifications
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Traverse: 360° at 80°/s
Elevation: −15 to +80° at 80°/s
Crew: 1
Range: 3.25 n miles (6 km) (anti-ship) (max)
Rate of fire: 600 rds/min/barrel (nominal) or 140 rds/min/barrel (nominal)
Ammunition: 870 g (HEI/HEI-T, SAPHEI, TP/TP-T)

Manufacturer/Contractor
Electronics & Space Corporation (ESCO), St Louis, Missouri, USA.

OTOBREDA 40 mm L/70 Compact (Type 70) twin mounting
FF 956 to FF 959 and FF 961 only. The last five ships are armed with three twin OTOBREDA 40 mm/70 in place of the ELCO 30: one mount is in 'B' position and two are side by side atop a new after deckhouse, which is considerably higher than in the first four ships, possibly to give the 40 mm mounts a better field of fire.

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −13 to +85° at 60°/s
Rate of fire: 600 rds/min/mount
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

DEPTH CHARGES

There is a rack in the stern for 12 depth charges.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Goldstar ULQ-11K
ULQ-11K is a South Korean radar intercept (ESM) equipment. (This would appear to be a South Korean designation and unrelated to the United States' AN/ULQ-11 equipment (also known as Cefirm Leader), which is a US Army system, involving RU-21 aircraft.)

DECOYS

Loral Hycor SRBOC
There are four Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm
Weight: 173 kg (381.4 lb)
Range: 4 km (2.2 n miles)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiran III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturer/Contractor
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

AN/SLQ-25 Nixie noisemaker
One AN/SLQ-25 Nixie (Phase 1), a soild-state, modular design electro-acoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. The two ports are in the starboard side of the transom. Nixie consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system

Che Ju *(FF 958). The two black radomes immediately above the bridge are part of the ULQ-11K ESM system* (Jane's/H M Steele)

include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed through the transom or in a partially or totally enclosed location on the main deck. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm long (3.10 ft), 15.24 cm (6 in) in diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body is deployed at a time.

Manufacturer/Contractor
Aerojet ElectroSystems, Sacramento, California, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Signaal WM28 'mini' command system
FF 951 to FF 953, FF 955 to FF 956. The first five ships have a 'mini' command system based on an expansion of the Signaal WM28 fire-control system (a similar system is installed in South Korean 'Corvette' classes). The system includes a LIROD electro-optic director.

Samsung/Ferranti WSA 423 action data automation
FF 957 to FF 959, FF 961 only. The last four ships of the 'Ulsan' class have the Ferranti/Samsung WSA 423 command and weapon control system in place of the earlier Signaal system. This system has a federated architecture based upon a single FM1600E computer and the associated radars are the GEC-Marconi S1801 search radar and the GEC-Marconi ST1802 fire-control radar, together with a Radamec 2400 electro-optic director.

The Ferranti FM1600E is a 24-bit computer, with an operating speed of 650 Kops (thousand operations per second) and a memory of 1.2 million words, and in this federated system there is one computer housed in each console. Programming is carried out using Coral 66.

WSA 423 controls two types of gun (76 mm and 40 mm) and the Harpoon anti-ship missile. The system can track up to 120 targets of which up to 100 are automatic and is compatible with Link Y and Link 14. It is also capable of ECM direction and helicopter control.

Three 'Ulsan' class vessels have supplemented their WSA 423 systems with the Litton Tactical Display Console (TDC) as part of the Korean Navy Tactical Data System (KNTDS). The TDC will be capable of receiving, processing and displaying data from the KNTDS and Link 11 systems and transmitting data through either link.

Manufacturers/Contractors
Ferranti International Plc, Defence Systems Integration.
Samsung, Seoul, South Korea

Korean Naval Tactical Data System (KNTDS)
Three ships only. The Korean Naval Tactical Data System (KNTDS) is not, as the name suggests, an action data automation system for ships at sea, but is a national, joint-service system for seaward defence against infiltration operations, particularly from North Korea. KNTDS is designed to improve naval and coastal defence through the real-time exchange of tactical information among various land-based and shipboard sensors. A shore-based command centre co-ordinates the system, providing the co-ordination necessary to bring the most effective response to bear on the enemy. To achieve this, the system collects, analyses, evaluates and displays tactical information from radar sites, warships, patrol aircraft and the national Air Defence Ground Environment (ADGE) system to assist the commander in making decisions. The KNTDS also exchanges evaluated track information with participating naval units and provides a medium for ordering or commanding naval forces and tactical air and weapon systems in accomplishing the mission.

The seaborne element of KNTDS are three 'Ulsan' class frigates, each of which has one KNTDS console and is linked via Link 11 to the Fleet Command Centre (FCC) ashore, where there are seven consoles. The frigates lead groups of smaller craft in carrying out their mission to detect and intercept small coastal craft trying to penetrate South Korean coastal waters. Five shore-based radars, the main air control centre and the South Korean marines also feed the FCC over two systems: Link 11 and the high-frequency Inter-Site DataLink (ISDL). (It is not known which are the three ships fitted with KNTDS, but presumably they are included in the four ships fitted with WSA 423.)

Manufacturers/Contractors
Litton Data Systems, Agoura Hills, California, USA.
Samsung, Seoul, South Korea.

WEAPONS CONTROL

Signaal LIROD electro-optic director
FF 951 to FF 953, FF 955, FF 956. The first five ships (those fitted with the Signaal WM28-based 'mini' command system) have a LIROD (Lightweight Radar Optronic Director) on the bridge roof. LIROD is a lightweight fire-control system based upon a K-band tracking radar and a TV camera, and is designed for simultaneous control of two dual-purpose guns while tracking one air and one surface target. The system reaction time from detection to the beginning of the engagement is about 4.5 seconds. It is based upon a 0.6 m (1.97 ft) diameter parabolic antenna with

monopulse cluster. It has a very narrow pencil beam and is resistant to clutter through the application of pulse Doppler tracking combined with FFT techniques. There are also sophisticated ECCM facilities. The radar can track fighter-size targets up to 18 km away and is capable of tracking targets with a maximum speed of 1,000 m/s (3,280 ft/s). In addition to the radar there is a militarised TV camera with CCIR standard video format, which can detect fighter-size targets at about 5.44 n miles (10 km) and large surface ships at about 10.9 n miles (20 km).

Specifications

Director
Traverse: 360° at 120°/s
Elevation: −25 to +150° at 80°/s
Radar: K-band
Field of view:
TV camera: 3-30° (2-20°)
IR camera: 3°

Laser rangefinder
Pulse length: 20 ns
Max repetition frequency: 10 Hz
Beam divergency: 1.2-1.5 mrad

Laser tracker
Max repetition frequency: 25 Hz
Beam divergency: 1.5 and 6 mrad

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Netherlands.

Radamec System 2400 electro-optic director

FF 957 to FF 959, FF 961. The ships with the Samsung/Ferranti WSA 423 command system have a Radamec 2400 electro-optic director in place of the Signaal LIROD. System 2400 is an electro-optical surveillance system with a stabilised, remotely operated, director. It has a full sector auto-scan facility and is used for target identification. It may be integrated with display systems of the customer's choice. Sensors include the HK 203 low-light TV cameras and a thermal imager. The HK 203 can detect a 10 m² target at 4 km, while the thermal imager can detect such a target at 13-18 km.

Manufacturer/Contractor

Radamec Defence Systems, Chertsey, Surrey, UK.

SONAR

Signaal PHS-32 hull-mounted search and attack sonar system

PHS-32 is a medium-range, high-performance search and attack sonar which includes signal processing facilities for fast Fourier transformation processing of all preformed beam receiving channels. All data are presented on a single TV-type display, while operation has been much simplified by the use of light pen control. The system can track up to four targets automatically. A circular transducer permits all-round coverage in various modes of transmission such as: Omni, TRDT, MCC (wide vertical beam), LISTEN (passive with time/bearing recorder presentation). An audio beam is also available.

Specifications

Frequencies: 3
Pulse lengths: 12.5, 25, 50, 100 ms and 400 ms long pulse (CW or FM)
Detection range: >10,000 yd
Vertical beamwidth: 12 or 20°
Bearing accuracy: 1° RMS
Range accuracy: ±0.5-2%
Notch filtering: Selectable rejection bandwidth
Own Doppler correction: On all 60 channels
Roll and pitch performance: Automatic co-ordination of transmitting pulse and vertical beamwidth in rough weather

Manufacturer/Contractor

Hollandse Signaalapparaten, Hengelo, Netherlands.

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 General Electric LM-2500 gas turbines; 40 MW (53,640 hp) sustained; 2 MTU 16V 538 TB82 diesels; 4/37 MW (5,940 hp(m)) sustained

Shafts: 2
Propellers: Hyundai/Escher Wyss five-bladed, 3,660 mm diameter, cp

FURTHER INFORMATION

PROGRAMME

South Korea has one of the most sophisticated and capable shipbuilding industries in Asia which has followed a policy of steady expansion. The 'Ulsan' class were the first major surface combatants to be designed and built in the country and have proved very successful. They were ordered in three batches and their construction was spread between a number of yards.

DESIGN

This is a well-armed and fast design, intended for a variety of missions. The hull is constructed of steel, with an aluminium alloy superstructure. The design is, in general, well-balanced, although the lack of a helicopter places a limit on their overall tactical capabilities (it should be noted that the 'Ulsan' variant designed for India has a large flight deck and hangar).

The basic design is the same for all nine South Korean ships, but there are a number of variations in weapons and sensor fits:

Weapons. All ships have two 76 mm guns and eight Harpoon launchers. The first four ships, however, have four twin ESCO 30 mm mounts, while the last five have three twin OTOBREDA 40 mm mounts.

Sensors. All have the Signaal DA-05 air/surface search radar, but there are differences in the other sets. The first five ships have Signaal equipment including ZW-06, WM28 and the LIROD electro-optic director. The last four ships, however, have GEC-Marconi sets for surface surveillance and fire direction, a Raytheon set for navigation and a Radamec electro-optic director.

Command systems. The first five ships have a 'mini' command system, based on an expanded version of the Signaal WM28 weapons control system. The last four ships, however, have a Samsung/Ferranti WSA-423 action automation system.

Pennant numbers
It should be noted that the pennant numbers do not run consecutively, there being no 954 or 960. The two missing numbers have not been allocated to other ships and the reason for their omission is not known.

EXPORTS

The Ulsan design has achieved one export order, with seven being built for the Indian Navy and three for the Indian coastguard 'Sukanya' class. These are patrol ships used for EEZ protection and have much lighter armament and a large helicopter flight deck and hangar. Three were built in South Korea, the remainder in India.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84B Harpoon

Eight Harpoon anti-ship missile canisters will be mounted in the gap between the stack and the hangar.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

GMVLS Mk 48 Mod 2A missile launching system

Two Guided Missile Vertical Launch Systems (GMVLS) Mk 48 Mod 2 will be mounted in the foredeck. Each system consists of two sets, each of four pairs of Mk 164 vertical launcher groups, a Mk 220 missile launch controller and a Mk 63 shipboard mounting interface-electrical (SMI-E). The Mk 164 launcher group consists of pairs of aluminium honeycomb launcher canisters, each 3.97 m (13.0 ft) long, attached to an aluminium framework, with each container having its own vertical efflux system with the exhaust gases vented up pipes running alongside the containers. The Mod 2 system is mounted inside the superstructure in four lines of four canisters with vertical efflux pipes in pairs between canisters. There is one Mk 220 launch controller for every 16 missiles and one bulkhead-mounted Mk 62 SMI-E for every four missiles.

Manufacturers/Contractors
Raytheon Company, Equipment Division (prime).
NEA-Lindberg, Denmark (SMI-E).
EBCO, Canada (SMI-M).
Bronswerk, Belgium (Mk 20 canister).
MBLE, Netherlands (Mk 220 missile launch controller).

Raytheon Sea Sparrow point-defence missile system

The SAM is the RIM-7M Sea Sparrow missile. The system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg (85.1 lb) blast fragmentation warhead and a dual-purpose proximity impact fuze.

Specifications
RIM-7M
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 226.8 kg (500 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturers/Contractors
Raytheon Company, Equipment Division (prime system contractor).
Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

TUBES

Two 324 mm US Mk 32 torpedo tubes will be mounted in the waist.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 127 mm/54 Compatto

There will be one OTOBREDA 127 mm/54 Compatto mounting in 'A' position. This weapon is designed to provide naval gunfire support, to engage surface targets and to engage air targets, including anti-ship missiles and fixed-wing aircraft which do not have standoff weapons. The turret is unmanned and is enclosed by a glass fibre shield. Much of the turret and the lower part of the mounting are made of aluminium alloy. The below-deck element of the mounting consists of three drums each containing 22 rounds, which are stocked automatically from two chain-driven lower hoists which lead to the magazines and are loaded manually. The gun captain uses his control to select which drums are

to be replenished and with what ammunition. The weapon is compatible with all US 5 in L/54 ammunition.

Specifications
Gun
Calibre: 127 mm
Length of barrel: 54 calibres
Muzzle velocity: 808 m/s (2,625 ft/s)
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 13,600 m (45,000 ft)
Rate of fire: 45 rds/min
Weight of shell: 32 kg (70 lb)

Mounting Compatto
Training: 330° at 40°/s
Elevation: −15 to +85° at 30°/s
Crew: 5

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Signaal/General Electric SGE-30, 30 mm Goalkeeper close in weapons system
Two Signaal/General Electric 30 mm 7-barrelled Gatling Goalkeeper close in weapons systems will be mounted, one on the hangar roof, the other on the bridge roof. Goalkeeper is an autonomous, fully automatic system, consisting of a General Electric Sea Vulcan 30 gun, I-band search radar, I/K-band tracking radar, TV camera, and ancillaries. The Sea Vulcan 30 is based upon the electrohydraulically powered GAU-8/A 30 mm seven-barrel, Gatling gun, with each barrel firing once during each revolution of the barrel cluster. The gun is very reliable, with 33,000 mean rounds between stoppages. The mounting has an ammunition capacity of 1,190 rounds carried in a linkless system using a feed and storage drum, which is claimed to be sufficient for several target engagements before reloading is necessary. The warhead kill capability of Goalkeeper against anti-ship missiles is achieved by use of MPDS rounds which have high-density, tungsten-alloy penetrators. For 'soft' targets, HEI and TP types of ammunition can be used.

Specifications
Calibre: 30 mm
Muzzle velocity: 1,020 m/s (3,347 ft/s) (TP, HEI); 1,150 m/s (3,773 ft/s) (APDS)
Traverse: 360°
Elevation: −25 to +85°

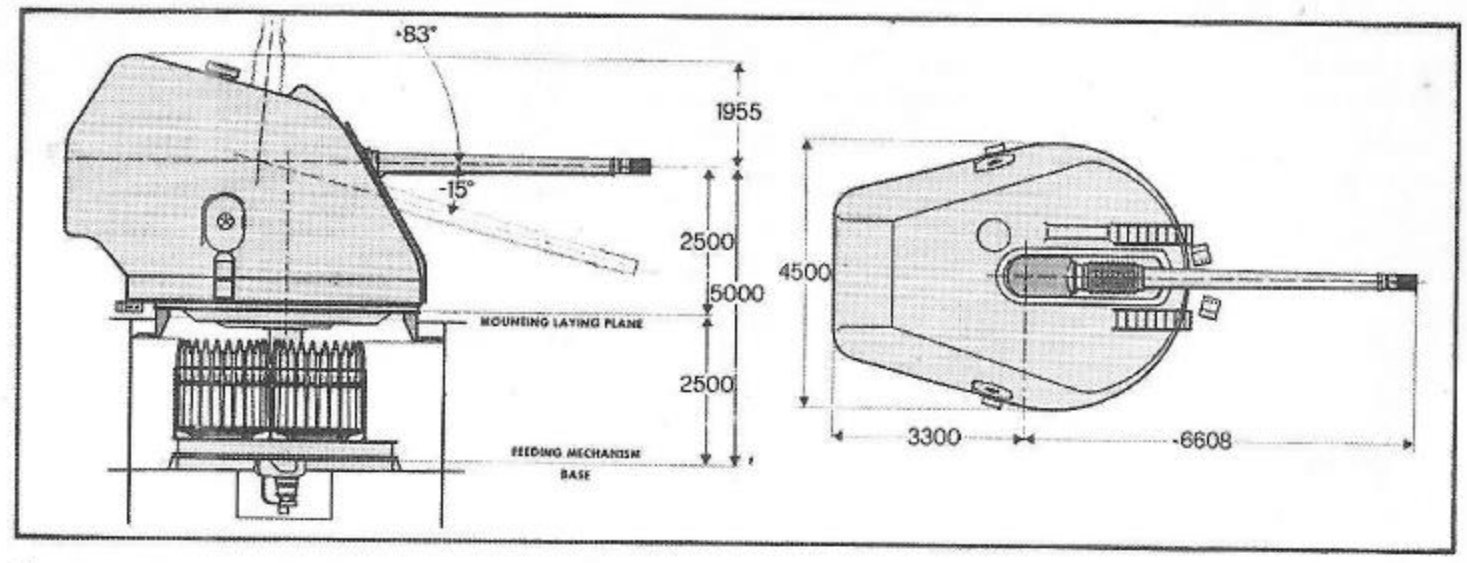

Diagram of the OTOBREDA 127 mm/54 Compatto to be installed in the KDX-2000 (OTOBREDA)

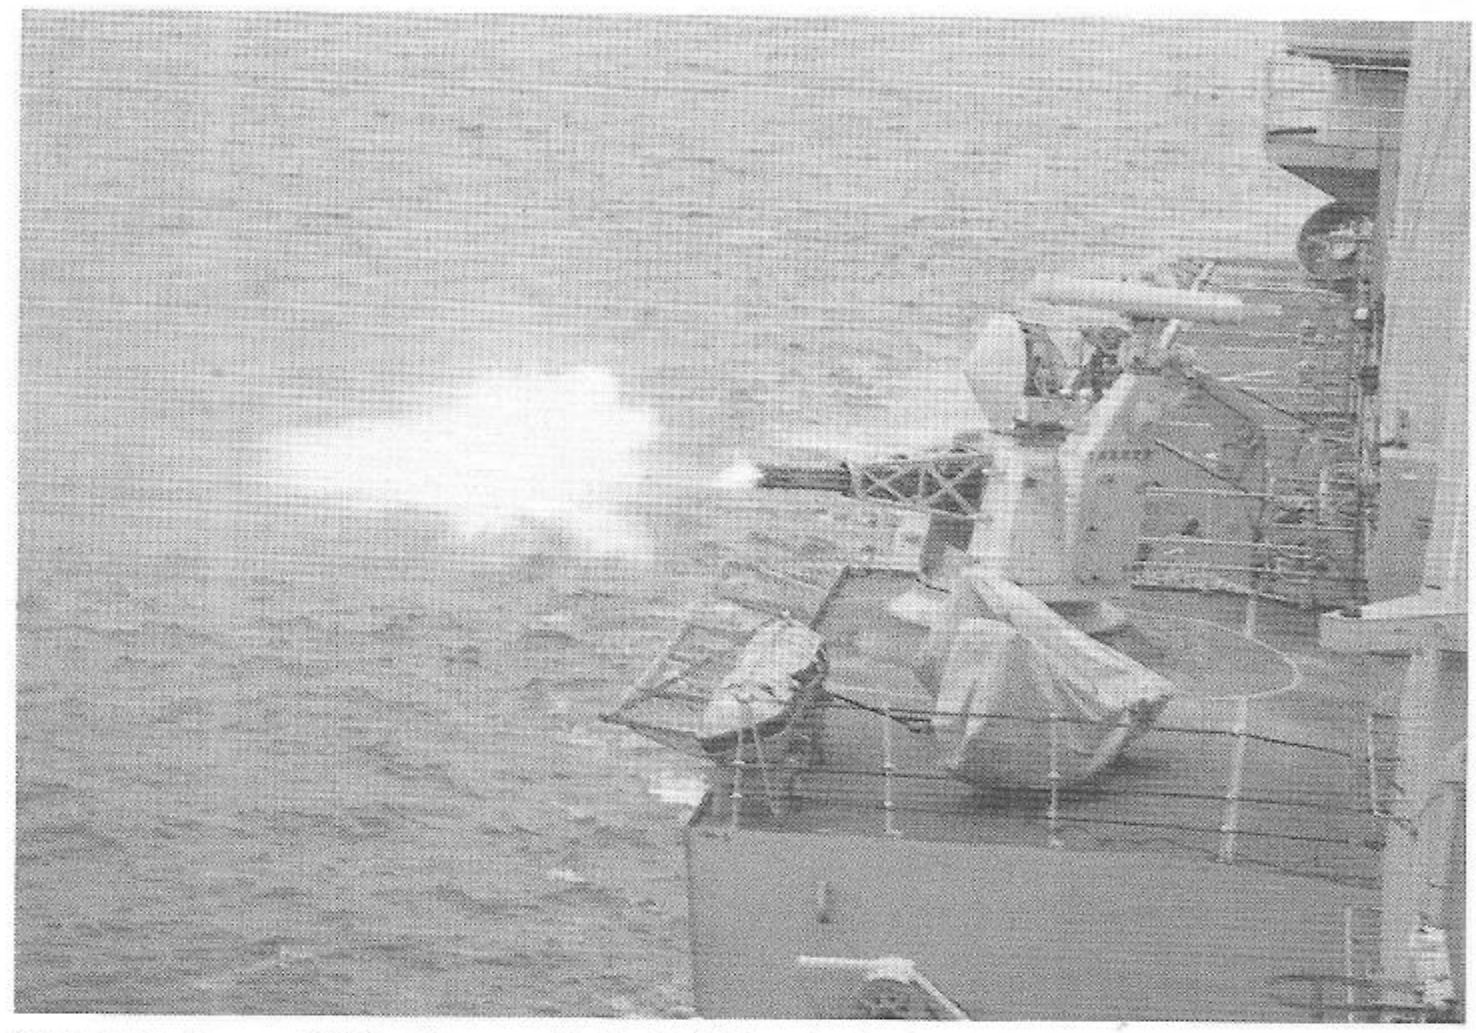

Signaal Goalkeeper CIWS will be used by the RoK Navy for the first time in the KDX-2000 (Signaal)

Mounting weight: 6,800 kg (14,994 lb)
Crew: 0
Range: 200 m to 3 km (1.61 n miles)
Rate of fire: 4,200 rds/min
Ammunition: 369 g (TP, HEI, HEISD, API, MPDS)

Manufacturers/Contractors
Hollandse Signaalapparaten BV, Hengelo, Netherlands (system/radar).
General Electric Company, Armament Systems Department (gun).

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

ARGOSystems AR 700 APECS II radar detection and jamming system
AR 700 APECS II is an advanced modular ESM/ECM system covering frequencies from 0.5 to 18 GHz, which is designed to counter most known radar threats. It is a fully automatic system, identifying and jamming threat emitters using a mixture of IFM receivers and microprocessor-controlled jammers, with high-speed switching enabling up to 16 threats to be jammed simultaneously. The antenna array consists of a mast-mounted ESM antenna assembly with two DF arrays, one omnidirectional unit and two monopulse units; system processing equipment; operator's console and two ECM transmitters (port and starboard) with their antenna systems located inside the transmitter units.

Specifications
ESM frequency coverage: 0.5-18 GHz
High sensitivity: up to −67 dBm
Detection range: 200 n miles ships; 50 n miles aircraft
DF accuracy: 4° RMS; 2° RMS fine DF
Automatic tracking: 500 active signals in dense signal environment
Signal identification speed: <1s
ECM azimuth coverage: 360° using a 60-beam jammer (one beam per 6° azimuth sector)
Radiated power: 180 kW nominal mid-band
ECM frequency coverage: 7.5-18 GHz

Manufacturer/Contractor
ARGOSystems Inc, Sunnyvale, California, USA.

DECOYS

CSEE DAGAIE Mk 2 countermeasures system
There will be four CSEE DAGAIE Mk 2 ten-barrelled, trainable launchers mounted immediately abaft the mast. These can be loaded with either IR or chaff rockets. The firing sequence runs automatically, once triggered by a missile alarm from a variety of sources, such as radar, ESM systems, or optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, windspeed and direction, ship heading and speed data.

The launching of radar and IR decoys is so arranged that advanced mixed-guidance missile systems cannot discriminate between them and thus collocation of both decoys is achieved. The installation is a double mounting and comprises two trainable mountings carrying 10 replaceable containers (suitcases), each of which is loaded with either 3-5 μm and 8-14 μm IR or I/J-band chaff projectiles.

A wide range of ammunition is provided by Etienne Lacroix Défense providing seduction, distraction and seduction/dissimulation modes. The electromagnetic decoys are normally based upon aluminised glass fibre chaff with rapid bloom time and they cover the I and J frequency bands. The infra-red decoys cover both the 3-5 and the 8-14 μm bands.

Specifications
Traverse: 330° at 21°/s
Average reaction time: Within 4 s
REM rocket dimensions: 850 × 127 mm (33.5 × 5 in)
Rocket weight: 13 kg (28.66 lb)
Container dimensions: 900 × 130 mm (35.4 × 5.1 in)
Container weight: 20 kg (44.1 lb)
LIR/LEM container dimensions: 780 × 630 × 134 mm (30 × 24.8 × 5.3 in)

Manufacturer/Contractor
CSEE Défense, Paris, France.

AN/SLQ-25 Nixie noisemaker
An AN/SLQ-25 Nixie solid-state, modular design electroacoustic countermeasures decoy system will be used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed through the transom or in a partially or totally enclosed location on the main deck. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor

controller, the coaxial switching unit dummy loads, and the transmitter are located. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm (3.10 ft) long, 15.24 cm (6 in) in diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body at a time is deployed.

Manufacturer/Contractor
Aerojet ElectroSystems, Sacramento, California, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Samsung/BAeSEMA/Signaal SSCS Mk 7

In May 1994 BAeSEMA announced it had won a contract to supply three SSCS Mk 7 systems to the Republic of Korea for the 'KDX-2000' class frigates. This system will:

- Prepare and co-ordinate a tactical database from all available sensor data and collate it into an accurately defined tactical situation
- Present the information comprising the agreed tactical picture in the appropriate manner to suit the current requirement of each member of the command team.
- Perform track management and link data co-ordination functions
- Carry out and present threat evaluation
- Provide the means to execute and monitor weapons and sensor management policies in accordance with mission plans, rules of engagement, tactical doctrine and current tactical situation.
- Prepare and present weapon and situation status reports, including the identification of any conflicts in weapon/sensor assignment or the engagement process.
- Provide automatic assistance with combat system or data management tasks, including special-to-task functions.
- Provide the facilities for planning, data recording, post-action analysis and training.

The nodal architecture will make the overall system highly reliable and involves Racal-made software-driven Multifunction Consoles (MFC) linked by a fibre optic local area network (LAN). The LAN will be to the IEE 802.5 standard and gateways will be provided between the combat system and the other weapons and sensors because it is neither practical nor desirable for all the consoles to interface with the data highway. These gateways, which will be duplicated to provide redundancy, will perform the functions of interface conversion, preprocessing and filtering of data before it is passed to the command system.

The Racal Multifunction Consoles (MFCs) will have a 32-bit databus, with databus input/output, general purpose and node service cards, two display generator cards and a 60 Mbyte hard disk drive. The applications processors will be based upon Intel 80286 32-bit microprocessors. In consoles requiring mathematical facilities for tasks such as TMA, the processor will be supplemented by Inmos T800 high-speed (10 Mips) transputer arrays. The display processors will be based upon the Motorola 68030 microprocessor, with as many operations as possible taking place in parallel to provide higher performance, increase redundancy and reduce bottlenecks. The MFCs will be two-man displays incorporating common service nodes.

The Korean SSCS Mk 7 will have eight MFCs with two Signaal fire-control system consoles of the MOC type from the SIGHT family, with the two systems linked by a Signaal Data Highway. The input/output nodes are the same as in the RN system but are linked not only to the MFCs but also to peripherals including maintenance facilities, the contact evaluation plot and a bridge display. In the applications processor 13 of the 17 cards are common with the RN system, and the two systems will both involve some 280 processors and 1.5 million lines of code.

The software architecture for the Korean system will use the Outfit DNA core system infrastructure software including the Ada-language run-time manager. The application software is added and the distributed database management systems ensure the data is handled quickly and reliably. The majority of the software has been provided by BAeSEMA Group Systems' Scientific Division and there will be 60 per cent commonality between the Royal Navy and Korean Navy software. From System 02 onwards there will be an increasing Korean hardware element provided under licence by Samsung Electronics.

RADARS

Type	MW 08	SPS-55M	STIR 180
Maker	Signaal	ISC Cardion	Signaal
Role	Air/surface search (3D)	Navigation	Fire control
Band	G	I/J	I/J/K
Beam	2 × 9°	1.5 × 20°	1.4°
Peak power	150 kW	130 kW	220 kW
Gain	23 dB	31 dB	–

Signaal's MW-08 will be the 3D air and surface search radar in the KDX-3000 (Signaal)

Manufacturers/Contractors
BAeSEMA Combat Systems Division.
Samsung Electronics, Korea.

Korean Naval Tactical Data System (KNTDS)

It is reported that all three of the KDX-2000 frigates will also be outfitted for the Korean Naval Tactical Data System (KNTDS). This is a national, joint-service system for seaward defence against infiltration operations, particularly from North Korea and is designed to improve naval and coastal defence through the real-time exchange of tactical information among various land-based and shipboard sensors. A shore-based command centre co-ordinates the system, providing the co-ordination necessary to bring the most effective response to bear on the enemy. To achieve this, the system collects, analyses, evaluates and displays tactical information from radar sites, warships, patrol aircraft and the national Air Defence Ground Environment (ADGE) system to assist the commander in making decisions. The KNTDS also exchanges evaluated track

information with participating naval units and provides a medium for ordering or commanding naval forces and tactical air and weapon systems in accomplishing the mission. The current seaborne element of KNTDS are three 'Ulsan' class frigates, each of which has one KNTDS console and is linked via Link 11 to the Fleet Command Centre (FCC) ashore, and these will be joined by the three KDX-2000 frigates. The frigates lead groups of smaller craft in carrying out their mission to detect and intercept small coastal craft trying to penetrate South Korean coastal waters. Five shore-based radars, the main air control centre and the South Korean Marines also feed the FCC over two systems: Link 11 and the high-frequency Inter-Site DataLink (ISDL).

Manufacturers/Contractors

Litton Data Systems, Agoura Hills, California, USA.
Samsung Electronics, Seoul, South Korea.

COMMUNICATIONS AND DATALINKS

Datalink: Litton Link 11
IFF: UPX-27.

SONAR

STN Atlas DSQS-23 (ASO 96)

The KDX-2000 frigates will be fitted with the DSQS-23 hull-mounted, low-frequency sonar, which has the STN Atlas designation ASO 96. DSQS-23 is designed for computer-aided detection, localisation and classification over an entire 360° azimuth. It is modular in design, enabling it to provide: underwater telephone; automatic target tracking; classification; ray trace; intercept; torpedo warning; vertical stabilisation; simulation; interface to 'own ship's' fire-control system; underwater survey display and torpedo command functions and, if one is fitted, interface to towed array sonar. The hull-mounted transducer is 2.5 m (8.2 ft) in diameter and 1 m (3.28 ft) high. The system is designed to transfer data on up to 10 targets automatically into the command system.

Manufacturer/Contractor

STN Atlas Elektronik GmbH, Bremen, Germany.

AVIATION

AVIATION FACILITIES

Flight deck: 21 × 14.2 m (70 × 46 ft) (estimated)

HELICOPTER

The KDX-2000 will embark one Westland Super Lynx Mk 99, some of which are already in operation with the Korean Navy.

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 General Electric LM-2500 gas turbines; 43.42 MW (58,200 hp) sustained; 2 MTU or SEMT-Pielstick diesels; 5.88 MW (8,000 hp(m))
Shafts: 2

FURTHER INFORMATION

PROGRAMME

This programme has suffered from a number of delays. It was originally planned that the first keel would be laid down at Daewoo in late 1992, with a planned completion date of 1996, but the definition studies extended to late 1993. At that point some contracts for the weapon systems were signed.

The first batch of three ships is now under construction, with the first of class launched by Daewoo in September 1996 and due to be completed in 1998. This will be followed by the second and third of class, both of which are also being built by Daewoo.

It was announced in April 1996 that the KDX-1 programme would involve only the three ships currently under construction. These will, however, be followed by six KDX-2 ships, which will essentially be stretched KDX-1s with an increased displacement of some 5,000 tonnes. These new ships will have a Mk 41 vertical launch system in 'B' position launching Standard SM-2MR Block III missiles and it is also reported that they will have the SSCS-7 command system. They will probably also have a towed sonar array.

There are also unconfirmed reports of a possible KDX-3 design, displacing some 7,000 tonnes and equipped with an AEGIS system. Such a vessel would appear to have much in common with the JMSDF's 'Kongo' class.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 38 medium-range anti-ship missile

Ship-launched MM 38 Exocets are carried in two twin launcher-containers sited immediately abaft the stack, pointing across the ship at an angle of 90°. In addition to the launcher installations there is a control console and there is a co-ordinate converter to interface the missile with the ship's sensors.

Targets are acquired by the ship's search radar and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence. This involves turning on the thermal battery, releasing the mechanical safety locks, igniting the booster and, finally, breaking the umbilical cord; the total process takes some 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change of course during its flight.

The attack consists of three phases:

Cruise phase. The cruise phase starts as the missile clears the container and the missile, powered by the sustainer motor, flies towards the general location of the target at a height of about 100 m (328 ft) which is low enough to reduce the chance of detection but adequate for target acquisition. This phase can be as long as 22 km and ends when the seeker acquires the target. This seeker is a Dassault Electronique ADAC (Auto Directeur Anti-Clutter) active monopulse radar, working in the I-band (8-10 GHz), which has a typical range of 13 n miles (24 km) against FACs.

Approach phase. On detecting the target the missile descends to 9-15 m (30-50 ft) in the approach phase.

Terminal phase. During this final phase the missile descends to 8 m (26 ft) (2-5 m (6.5-16 ft) in a calm sea) for a sea-skimming run in to the target.

A salvo may be fired in 12-20 seconds.

Specifications

MM 38
Length: 5.21 m (17 ft)
Diameter: 35 cm (14 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,621 ft)
Speed: Mach 0.9
Range: 2-22.5 n miles (4-42 km)
Guidance: Inertial and active radar
Sustainer motor: SNPE Eole alloy-cased CDB; weight 151 kg (333 lb); max burn time 93 s
Booster: 100 kg SNPE Epervier boost motor, weight 100 kg, burn time of 2.4 s
Warhead: Luchaire 165 kg fragmentation warhead
Fuzes: Delayed impact fuze and autopilot-controlled proximity fuze

Manufacturer/Contractor

Aerospatiale Missiles. France.

TUBES

Fatahillah (361) and *Malahayati* (362) both have six 324 mm US Mk 32 torpedo tubes sited in two triple mounts either side of the after deckhouse. Twelve torpedoes are carried. (There are no tubes in *Nala*, as they have been displaced by the two Bofors 40 mm mounts).

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Specifications

Mk 46 Mod 5 torpedo
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight: 230 kg (507 lb)
Speed: 40 kts (max)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg (97 lb); PBXN-103

Malahayati *(362). These 1,450 t ships carry a heavy armament for their size. On the foredeck is a Bofors 120 mm gun and a twin-barrelled Bofors 375 mm ASW mortar. There are four MM 38 Exocet launchers amidship, while aft are two triple torpedo tubes and a Bofors 40 mm gun. Virtually all electronics in this Dutch-built ship are by Signaal.*

Manufacturer/Contractor
Loral Defense Systems, Akron, Ohio, USA.

GUNS

BOFORS TAK 120/46 dual-purpose gun
There is a single 120 mm (4.7 in) mounting in 'A' position. The barrel of the TAK 120 L/46 barrel is water-cooled and has an exchangeable liner. There is an automatic loader. This gun is only to be found in the Indonesian 'Fatahillah' class and Finnish 'Turunmaa' class corvettes.

Specifications
TAK 120 L/46
Calibre: 120 mm
Length of barrel: 46 calibres
Muzzle velocity: 800 m/s (2,625 ft/s)
Traverse: 360° at 40°/s
Elevation: −10 to +80° at 32°/s
Crew: 3-4
Range: 10 n miles (18.5 km)
Rate of fire: 80 rds/min/barrel
Shell weight: 21 kg (46 lb)

Manufacturer/Contractor
Bofors Ordnance, Sweden.

Bofors 40 mm/70
Fatahillah (361) and *Malahayati* (362) have one Bofors 40 mm mount each, located at the after end of the main deck. *Nala* (363) has two 40 mm mounts, one either side of the hangar.

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −3 to +85° at 60°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Max range:
anti-surface: 6.5 n miles (12 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

Rheinmetall Rh-202 20 mm cannon
All three ships mount two Rheinmetall Rh-202 20 mm cannon, which are mounted in the bridge wings. They are mounted on a simple pedestal and are manually operated.

Specifications
S20
Calibre: 20 mm
Length of barrel: 85 calibres
Muzzle velocity: 1,050-1,250 m/s (3,297-4,101 ft/s)
Traverse: 360°
Elevation: −10 to +55°
Crew: 1-2
Range: 1 n mile (1.85 km)
Rate of fire: 80 rds/min/barrel
Shell weight: 21 kg (46 lb)

Manufacturer/Contractor
Bofors Ordnance, Sweden.

ANTI-SUBMARINE MORTARS

Bofors 375 mm ASW rocket system
There is a single, Bofors twin-tube, 375 mm ASW rocket launcher located in the 'B' gun position. The system consists of a rocket launcher, a handling system, the ship sonar and a fire-control system. The two launch tubes are mounted on trunnions with an automatic contact device to connect the rockets with the fire-control system. The hydraulic laying machinery is in the front of the mounting and a flame deflector in the rear; there is also an automatic electrohydraulic handling system. The rounds are stored vertically beneath the mounting and selected by an operator. The rate of fire is one round a second and rockets may be fired singly or in a salvo. There are two types of rocket, both with Hexotonal filling. The Type E (Erika) rocket has Stidar time and impact fuzes, while the Type N (Nelli) uses the Zambo proximity and impact fuzes. A total of 54 rounds is carried.

Specifications
Launcher
Tubes: 4
Traverse: 260° at 18°/s
Elevation: −15 to +90° at 18°/s
Crew: 4

Rockets

	Type E	Type N
Weight	250 kg (551 lb)	230 kg (507 lb)
Muzzle velocity	130 m/s (427 ft/s)	205 m/s (673 ft/s)
Explosive weight	107 kg (236 lb)	80 kg (176 lb)
Range	0.35-0.87 n miles (0.65-1.63 km)	0.85-2.11 n miles (1.58-3.62 km)
Sinking speed	10.7 m/s (35.1 ft/s)	9.2 m/s (30.2 ft/s)

Manufacturer/Contractor
Bofors, Sweden.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

MEL Susie-1

Susie-1 is a solid-state ESM equipment covering the range 2-18 GHz and is used to trigger the Corvus chaff launchers. It is capable of auto-tracking seven signals.

DECOYS

CORVUS chaff decoy launching system

Corvus is a simple, lightweight, quick reaction system for the self-defence of surface vessels against surface-to-surface and air-to-surface missiles. Window (chaff) dispensing rockets are fired to form a radar decoy screen around the vessel. Two modes of operation are available for the system. The two modes — distraction decoy and centroid decoy — differ in the azimuth angle at firing and the range at which window is released. A cylindrical rotating structure carries eight launching tubes mounted in two sets of three, one above the other, and crossed at 90° in azimuth with two further tubes set above, and aligned midway between the other tubes, all at a fixed elevation of 30°. A deck-mounted pedestal supports the rotating structure on its training bearing and also houses a self-contained electrical power conversion unit for the control circuits and the associated electrical equipment.

Specifications

Training
Bearing arc (normal) that is, launcher axis: 60-120°
Bearing arc (max) that is, tube axis: 15-165°
Launcher weight: 585 kg (1,290 lb)
Off-launcher equipment weight: 42 kg (92.6 lb)
Tube diameter: 195 mm
Tube length: 1.6 m (5.24 ft)
Weight (empty): 25 kg (55 lb)
No of guides: 4, RH spiral

Manufacturer/Contractor

Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

T-Mk 6 Fanfare

The T-Mk 6 torpedo decoy consists of two winches each with a cable and a 'fish' containing a mechanical acoustic device.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

SEWACO-RI action data automation/ Daisy data processing

SEWACO-RI (RI = Republik Indonesia) was specifically assembled for Indonesian use and is based on an expansion of the WM28 weapons control system.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

WEAPONS CONTROL

Signaal WM28/61

The three Indonesian ships are fitted with the Signaal WM28/61 fire-control system. Like other members of the WM20 family, WM28 radar has two antennas sharing a common, stabilised mounting and housed in a distinctive, egg-shaped radome — the famous 'Signaal egg' — which is located on top of the prominent plated mast. The stabilisation system permits operation at roll angles of ±30° and pitch angles of ±10°. The upper antenna, which is of the cassegrain type, is used for searching as well as for automatic tracking of surface targets for weapon control. The lower antenna is of the paraboloid segment type with horn feed and is used for tracking air targets and for controlling air defence weapons. The antennas are fed from a common I/J-band transmitter but during surveillance all the transmitter output is channelled to the search antenna.

Peak pulse power is 180 kW and output power is shared by waveguide switching. The search radar has a range of between 30 and 32 km against surface targets and 7,600 m (24,936 ft) against air targets, while the tracker has a range of about 29 km. With the larger search antenna the search radar is increased to about 46 km. The tracker is capable of monitoring the movement of aircraft with a 1 m² cross-section at velocities up to 900 m/s (2,953 ft/s)and similar size objects moving at or near the surface at maximum velocities of between 34 and 55 m/s (111 and 180 ft/s).

The computer, controls and displays are in a two- or three-man console which includes firing pedals. The consoles feature a small PPI display, an A-scope to present data on the tracking radar and shell splashes and a B-scope for presenting search radar video and the predicted hitting point. The PPI display has range scales of 10, 30 and 60 km. The console also has an alphanumeric display capable of presenting 16 lines, each of 32 characters.

WM28/61 (the suffix '61' denotes that it uses the SMR-MU computer) is a weapon control system for ships up to destroyer size to control light or medium calibre guns and an ASV missile using semi-active guidance. It can engage either an air or a surface target with the gun and a surface target with the missile system.

The radar can automatically track one air and one surface target simultaneously. For use with the missile the air target tracking antenna is slaved to the surface target tracking programme and linked with a CW transmitter in order to illuminate the target. It can control a second light or medium calibre gun for engaging an air and/or surface target. The system can track automatically an air and/or two surface targets.

Manufacturer/contractor

Hollandse Signaalapparaten, Hengelo, Netherlands.

Signaal LIROD 8 electro-optic director

LIROD (Lightweight Radar Optronic Director) is a lightweight fire-control system based upon a K-band tracking radar and a TV camera, and is designed for simultaneous control of two dual-purpose guns while tracking one air and one surface target. The system reaction time from detection to the beginning of the engagement is about 4.5 seconds. It is based upon a 0.6 m (1.97 ft) diameter parabolic antenna with monopulse cluster. It has a very narrow pencil beam and is resistant to clutter through the application of pulse Doppler tracking combined with FFT techniques. There are also sophisticated ECCM facilities. The radar can track fighter-size targets up to 18 km away and is capable of tracking targets with a maximum speed of 1,000 m/s (3,280 ft/s). In addition to the radar there is a militarised TV camera with CCIR standard video format, which can detect fighter-size targets at about 5.44 n miles (10 km) and large surface ships at about 10.9 n miles (20 km).

Specifications

Director
Traverse: 360° at 120°/s
Elevation: −25 to +150° at 80°/s
Radar: K-band
Field of view:
TV camera: 3-30° (2-20°)
IR camera: 3°
Laser rangefinder
Pulse length: 20 ns
Max repetition frequency: 10 Hz
Beam divergency: 1.2-1.5 mrad

Laser tracker
Max repetition frequency: 25 Hz
Beam divergency: 1.5 and 6 mrad

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

RADARS

Set	DA 05	WM 28	AC 1229*
Company	Signaal	Signaal	Racal-Decca

SONAR

PHS-32 hull-mounted search and attack sonar system

PHS-32 is a medium-range, high-performance search and attack sonar which includes signal processing facilities for fast Fourier transformation processing of all preformed beam receiving channels. All data are presented on a single TV-type display, while operation has been much simplified by the use of light pen control. The system can track up to four targets automatically. A circular transducer permits all-round coverage in various modes of transmission such as: Omni, TRDT, MCC (wide vertical beam), LISTEN (passive with time/bearing recorder presentation). An audio beam is also available.

Specifications

Frequencies: 3
Pulse lengths: 12.5, 25, 50, 100 ms and 400 ms long pulse (CW or FM)

Detection range: >10,000 yd
Vertical beamwidth: 12 or 20°
Bearing accuracy: 1° RMS
Range accuracy: ±0.5-2%
Notch filtering: Selectable rejection bandwidth

Own Doppler correction: On all 60 channels
Roll and pitch performance: Automatic co-ordination of transmitting pulse and vertical beamwidth in rough weather

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

AVIATION

AVIATION FACILITIES

Nala (363) is the only ship in the class with aviation facilities. The hangar closes over the helicopter.

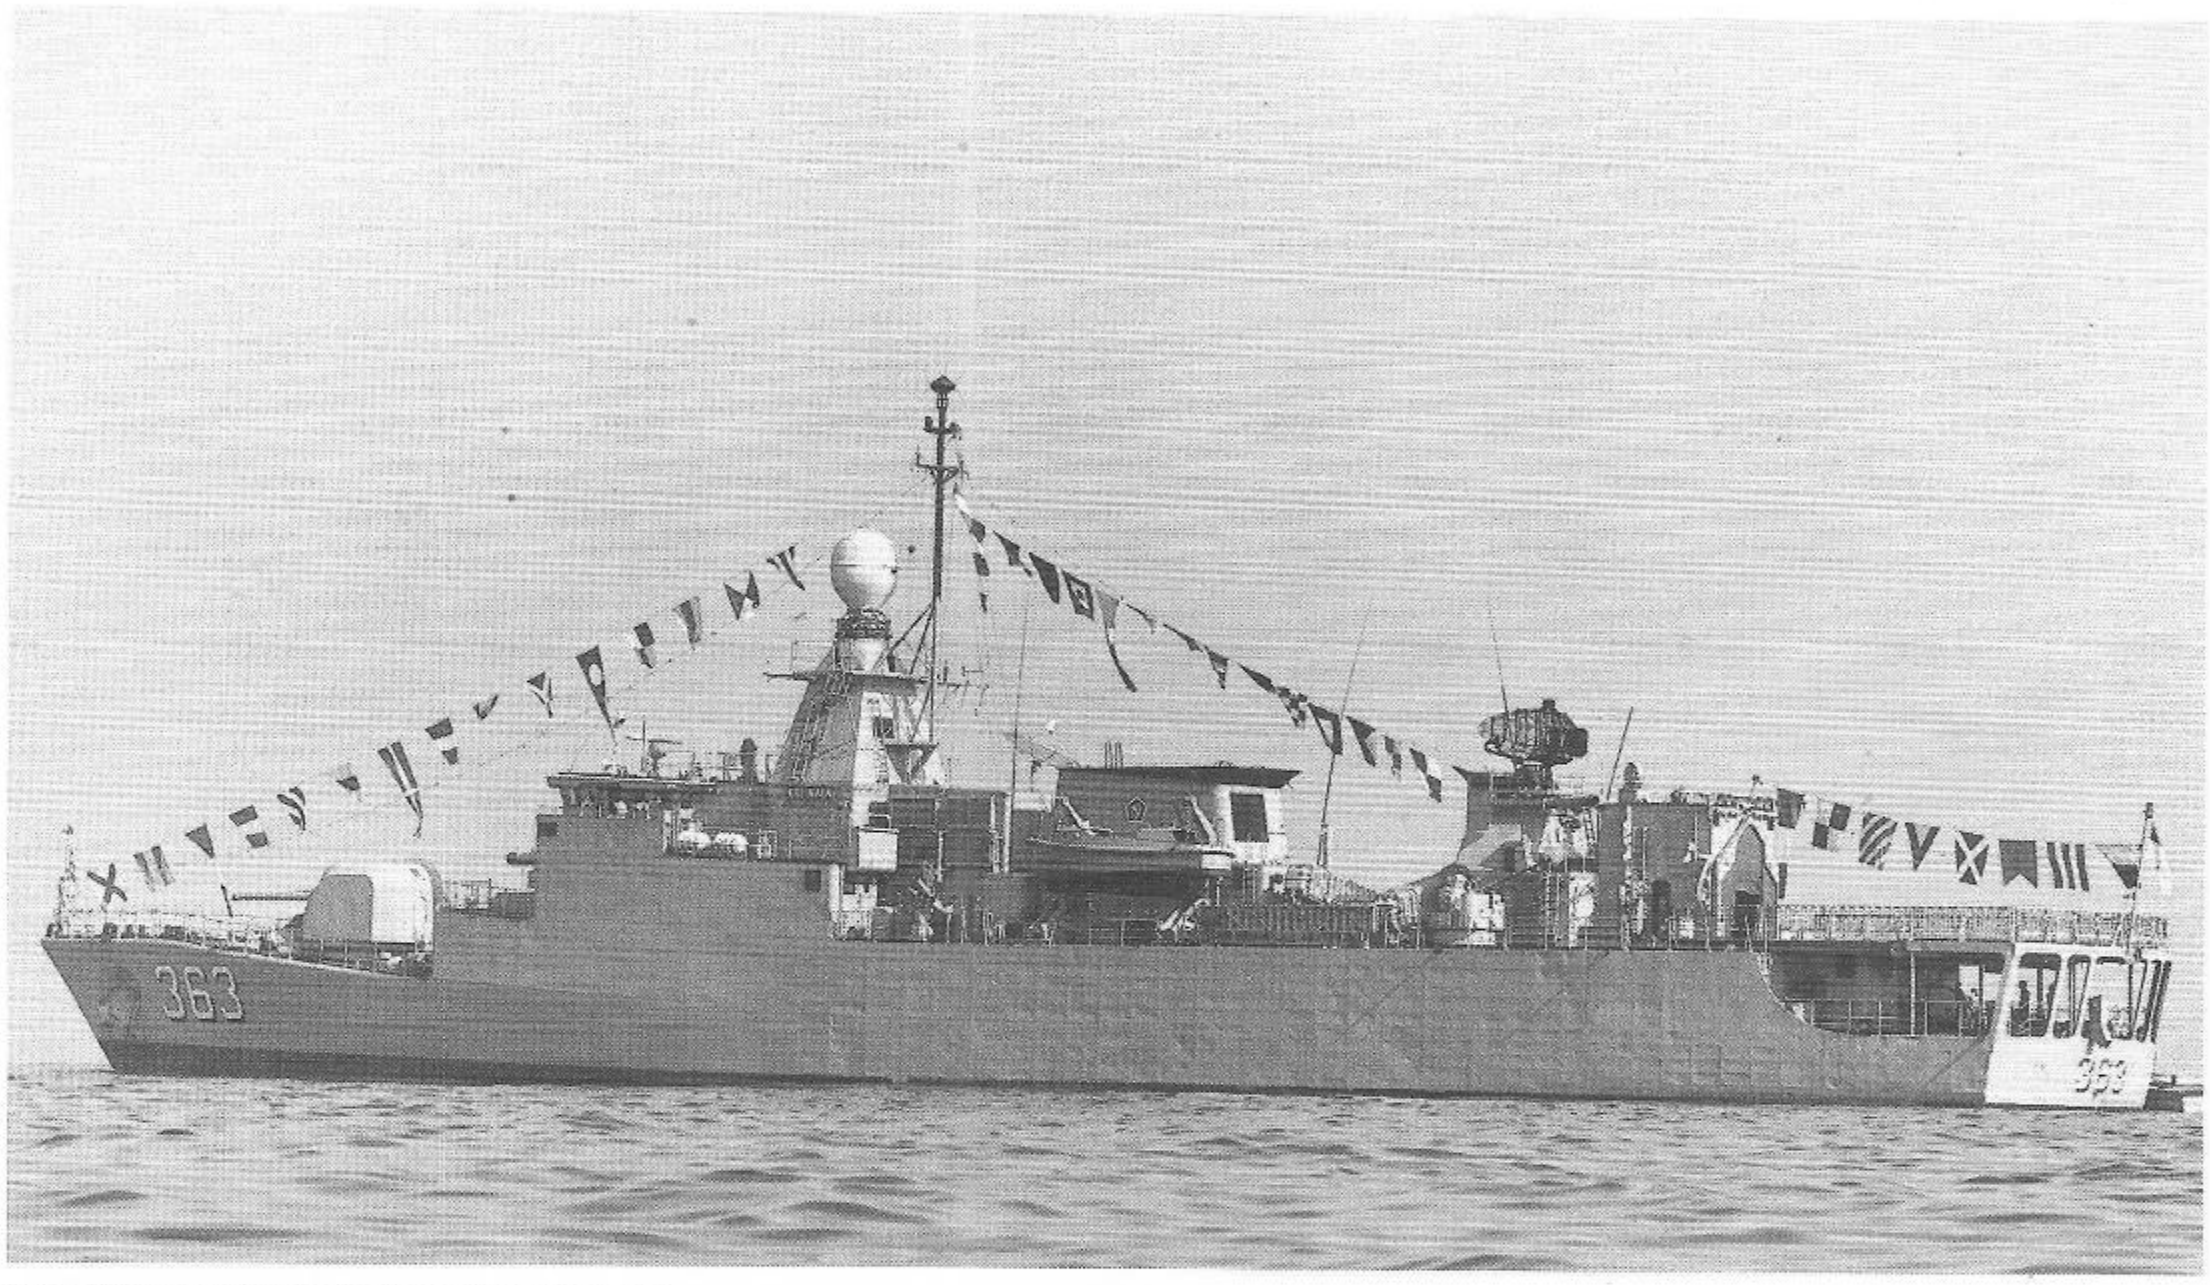
HELICOPTERS

One Westland Wasp
(*Nala* only).

Specifications

Wasp HAS Mk 1
Dimensions
Main rotor
diameter: 9.83 m (32.25 ft)
Tail rotor
diameter: 2.29 m (7.5 ft)
Fuselage length: 9.24 m (30.33 ft)
Height to top of rotor hub: 2.72 m (8.92 ft)
Weights:
empty: 1,566 kg (3,452 lb)
max take-off: 2,495 kg (5,500 lb)

Performance:
max level speed (sea level): 104 kts (193 km/h)
economic cruising speed: 96 kts (177 km/h)
max range: 263 n miles (488 km)
Power plant: 1 — 710 ehp (derated) Rolls-Royce/Bristol Nimbus 503 turboshaft
Avionics: PTR 170 and PV 141 UHF and UHF homing radio, and standby UHF
Weapons: 2 Mk 44 or 1 Mk 46 torpedoes, or 2 AS.12 anti-ship missiles



Nala *(363) showing the flight deck and hangar.*

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 1 Rolls-Royce Olympus TM3B gas turbine; 19 MW (25,440 hp) sustained; 2 MTU 20V 956 TB92 diesels; 8.14 MW (11,070 hp(m)) sustained
Shafts: 2
Propellers: 2 LIPS cp

FURTHER INFORMATION

PROGRAMME

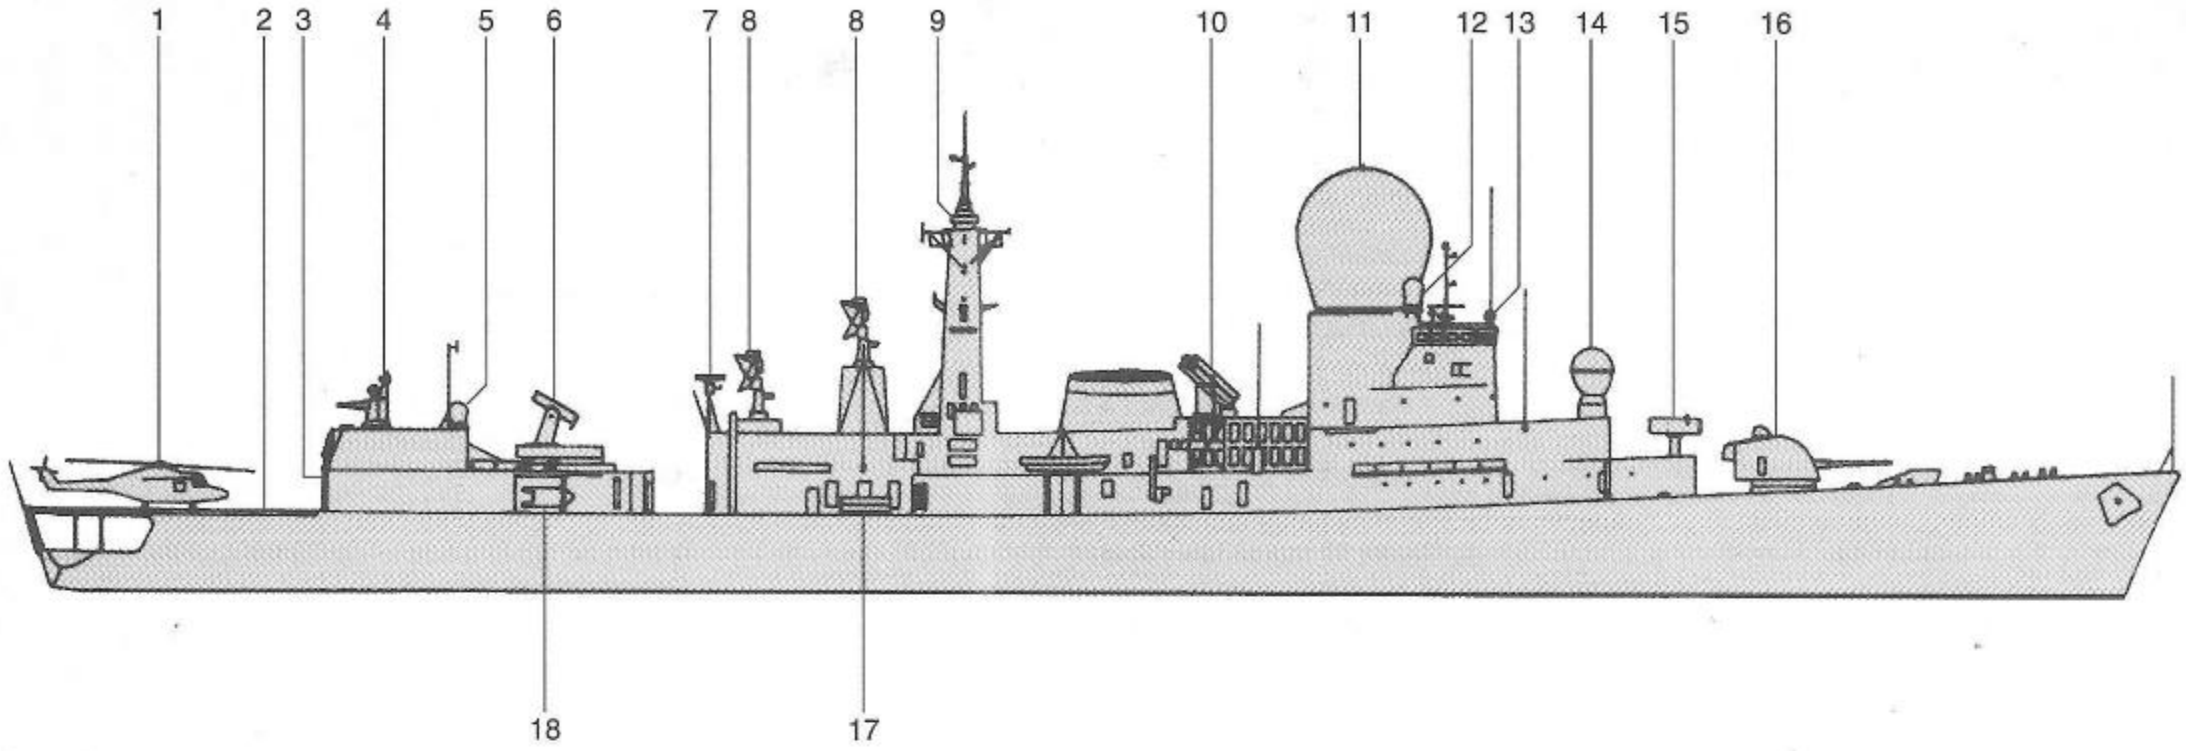
These are the only major warships ever to have been built specifically for the Indonesian Navy. They are very compact ships and are officially rated by the Indonesian Navy as corvettes, although they are generally considered to be frigates. They were ordered in August 1975 from NEVESBU, the Dutch design and construction consortium and were delivered between 1978 and 1980.

DESIGN

These ships manage to pack considerable capability into a small hull with the automatic 120 mm gun, in particular, appearing to be particularly heavy.

The first two ships do not have the facilities for a helicopter, but the last ship, *Nala* (363), has a full flight deck with an unusual hangar which closes across the top of the helicopter. Initially, *Nala* embarked an MBB BO-105 helicopter, but more recently it has embarked one of the navy's Westland Wasps.

TROMP



De Ruyter (Ian Sturton)

(Royal Netherlands Navy)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84A/C Block 1C Harpoon

Eight Harpoon anti-ship missile canisters are mounted immediately before the stack; there are two groups of four launchers each, with the groups pointing across the ship to the opposite beam. The missiles are the Block 1C version, which flies at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns and, for the terminal phase, have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 kg)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

Tromp *(F 801). The most characteristic feature of these ships is the large radome for the Signaal 3D MTTR/SPS-01. The MTTR (Multi Target Tracking Radar) is an integral part of the SEWACO-I command system* (Royal Netherlands Navy)

SURFACE-TO-AIR MISSILES

Mk 13 Mod 4 launcher
There is a single Mk 13 Mod 4 launcher located aft, just forward of the hangar. There are 40 missiles stored vertically in a below-decks magazine in two concentric rings. Launching rate is one missile every 10 seconds.

Standard Missile-1 Medium Range (SM-1MR)
Main air defence armament is the SM-1MR. SM-1MR Block IV missiles have a Naval Weapon Center Mk 51 expanding rod warhead, while Block V missiles have a Naval Weapon Center Mk 90 blast fragmentation warhead.

Specifications
Length: 4.48 m (14.7 ft)
Diameter: 34.3 cm (13.5 in)
Wing span: 1.06 m (3.48 ft)
Weight: 642.3 kg (1,416 lb)
Speed: Mach 2
Range: 20.5 n miles (38 km)
Altitude: 19,800 m (65,000 ft)

Manufacturers/Contractors
Hughes Missile Systems, Tucson, Arizona, USA.
Raytheon, Missile Systems Division, Bedford, Maryland, USA.

Raytheon Sea Sparrow point-defence missile system
Both ships are fitted with a Mk 29 octuple launcher for the Sea Sparrow system, which is located on the foredeck in 'B' position. Sixteen RIM-7 Sea Sparrow missiles are carried and the system uses the WM-25 fire-control system. The system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg blast fragmentation warhead and a dual-purpose proximity impact fuze.

Specifications
RIM-7M
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 226.8 kg (500 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturers/Contractors
Raytheon Company, Equipment Division (prime system contractor).
Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Aircraft Company, Missile Systems Group (second missile source).
Naval Weapons Center, Crane, USA (warhead).

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited amidships, below the forward SPG-51C director.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

Manufacturer/Contractor
GEC-Marconi Naval Systems, UK.

TORPEDOES

Alliant Techsystems 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

Bofors TAK 120 medium-calibre dual-purpose guns
The twin 120 mm mounting is in 'A' position. The two mountings required for the 'Tromp' class were taken from the Dutch destroyer *Gelderland* (D 811) when it was stricken in 1973, completey refurbished and then installed in the 'Tromp' class ships. The TAK 120 L/50 barrels are of monobloc construction with exchangeable liners and are water-cooled. They have a vertical, sliding wedge breech block and automatic rammer, each barrel being fed by a separate ammunition hoist. The turret is made of steel with the captain's position on the right. Although the weapon is fully automatic the turret includes one manned position on each side for local control.

Specifications
TAK 120 L/50
Calibre: 120 mm
Length of barrel: 50 calibres
Muzzle velocity: 850 m/s
Traverse: 360° at 22°/s
Elevation: −9 to +85° at 25°/s
Crew: n/k
Range: 11 n miles (20.5 km)
Rate of fire: 40 rds/min/barrel
Weight of shell: 24 kg

Manufacturer/Contractor
Bofors Ordnance, Sweden.

Signaal/General Electric SGE-30 30 mm Goalkeeper close in weapons system
One Signaal/General Electric 30 mm 7-barrelled Gatling Goalkeeper close in weapons system is mounted in the hangar roof. Goalkeeper is an autonomous, fully automatic system, consisting of a General Electric Sea Vulcan 30 gun, I-band search radar, I/K-band tracking radar, TV camera, and ancillaries. The Sea Vulcan 30 is based upon the electrohydraulically powered GAU-8/A 30 mm seven-barrel, Gatling gun, with each barrel firing once during each revolution of the barrel cluster. The gun is very reliable, with 33,000 mean rounds between stoppages. The mounting has an ammunition capacity of 1,190 rounds carried in a linkless system using a feed and storage drum, which is claimed to be sufficient for several target engagements before reloading is necessary. The warhead kill capability of Goalkeeper against anti-ship missiles is achieved by use of MPDS rounds which have high-density, tungsten-alloy penetrators. For 'soft' targets, HEI and TP types of ammunition can be used.

The I-band search radar uses a 2,050 × 280 mm linear array antenna with an integrated sidelobe suppression antenna. The antenna rotates at 60 rpm and has a horizontal beamwidth of 1.7° and a vertical beamwidth of 60°. The radar is powered by a water-cooled, synthesiser-driven, TWT transmitter with high output power for greater frequency and PRF flexibility in the face of ECM threats.

Specifications
Calibre: 30 mm
Muzzle velocity: 1,020 m/s (TP, HEI); 1,150 m/s (APDS)
Traverse: 360°
Elevation: −25 to +85°
Mounting weight: 6,800 kg (14,991 lb)
Crew: 0
Range: 200 m to 3 km (1.61 n miles)
Rate of fire: 4,200 rds/min
Ammunition: 369 g (TP, HEI, HEISD, API, MPDS)

Manufacturers/Contractors
Hollandse Signaalapparaten BV, Hengelo, Netherlands (system/radar).
General Electric Company, Armament Systems Department (gun).

Oerlikon 20 mm
Two Oerlikon 20 mm cannon may be mounted, if tactically necessary.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC COUNTERMEASURES (ECM)

AN/SLQ-503 (RAMSES) ECM SYSTEM

The AN/SLQ-503 Reprogrammable Advanced Multimode Shipborne ECM System (RAMSES) countermeasures system provides protection against I/J-band radar threats. It is an integrated responsive jammer capable of long-range jamming of search radars and the deception of missiles once launched. In its normal mode of operation, RAMSES is interconnected to and controlled from the ship's ESM systems and a dedicated ECM operator is not required, but in the back-up mode RAMSES can be manually controlled (target designation and jamming) from a remote-control panel located conveniently near the EW operator. RAMSES is capable of high pulse and CW Effective Radiated Power (ERP). Multimode jamming operation is possible with multitarget handling capability. The system is reprogrammable and power management is provided. The antennas are fully trainable (port and starboard, each through 180°) and are stabilised for roll and pitch.

Manufacturer/Contractor
Lockheed Canada Inc, Kanata, Ontario, Canada.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher

There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units located at the forward end of the hangar.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Signaal SEWACO-I

SEWACO-I comprises four major elements. The sensors include the SPS-01 3D radar system; secondary radar sensors such as IFF and helicopter transponders; the CWE-610 hull-mounted sonar system; and passive sensors, such as the ESM suite and IR sensors. The second element is the DAISY action information system, which including consoles, plotting table, conference display and the command and control software package. Third element is the weapon control system, comprising active and passive target tracking and illumination systems, weapon interface systems for interfacing with hard-kill and soft-kill weapons and close in weapon control systems. Finally, there is the communications system, with internal and external communication equipment and automatic datalink systems.

SEWACO-I's functions include:
air, surface and subsurface warning
compilation and display of tactical air, surface and subsurface situations
threat evaluation and target engagement in AAW, EW, ASuW, ASW and NGS
navigation including ASW helicopter direction
communication including tactical datalink operation
onboard scenario-driven training
organisation and system management.

The principal sensors of the SEWACO-I system in the Royal Netherlands Navy's guided missile frigates are

Satcom: SCOT 1D

WEAPONS CONTROL

Signaal WM25 fire-control system

The WM25 is the fire-control system for Sea Sparrow and is housed in the egg-shaped radome on the platform before the bridge. The radar operates in the I and J bands and has a range of some 25 n miles (46 km). Inside the 'egg' the search and tracking antennas are mounted one above and one below a common stabilised platform within a spherical radome, which eliminates most of the time-consuming acquisition search pattern of the tracking antenna after designation, and provides direct acquisition. WM25 has a short reaction time against medium- and short-range air and surface targets, and is able to engage both air and surface targets simultaneously, using an SMR computer (SMR = Signaal Micromin Rekenaar). In addition, WM25 is linked to DAISY-1 via an intercomputer interface, which results in the joint availability of relevant DAISY data, transfer of target designation data and commands and tell-backs of weapons status.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

SONAR

CWE-610 hull-mounted active sonar system

The Model CWE-610 low-frequency (LF) sonar is designed for the long-range detection of submarines in deep and shallow water. There is a 36 stave transducer in a dome under the hull and two active consoles, enabling it to perform a search-while-track function. Facilities offered include a search capability in three 120° sectors, passive correlation, and reverberation processing. Transmissions are at 6, 7 and 8 kHz and use 10° preformed reveiver beams. Range of the active system is approximately 30,000 m (98,425 ft) and there is a passive display for greater ranges. The sonar system outputs data automatically into SEWACO-1. All mode changes and range scale changes are controlled by console push-buttons, and displays include a Doppler display on each of the active consoles and a passive sonar bearing time recorder display. CWE-610 was designed specifically to meet Dutch requirements for the 'Tromp' class, although there have been subsequent sales to other navies.

Manufacturer/Contractor

EDO Corporation, Government Systems Division, College Point, New York.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 19.39 m (63.6 ft) × 14.8 m (48.6 ft)
Hangar: 1 hangar, 9.7 m (32 ft) × 14.8 m (48.6 ft)

HELICOPTER

One Westland SH-14D Lynx

(Note: all RNethN SH-14B/C Lynxes have now been converted to SH-14D standard.)

Specifications

SH-14D
Dimensions:
main rotor diameter: 12.80 m (42.00 ft)
tail rotor diameter: 2.21 m (7.25 ft)
length overall (rotors turning): 15.165 m (49.75 ft)
Weights
empty: 2,740 kg (6,040 lb)
empty, equipped (ASW): 3,343 kg (7,370 lb)
Performance:
cruising speed: 125 kts (232 km/h)
speed for max endurance: 70 kts (130 km/h)
max rate of climb: 661 m (2,170 ft)/min
time on station (ASW) 50 n miles (93 km) radius: 2 h
max range: 320 n miles (593 km)
max endurance: 2 h 50 min
Power plant: 2 Rolls-Royce Gem 42-1 with max contingency rating of 835 kW (1,120 shp)
Crew: 2 (pilot and co-pilot/observer)
Radar: Ferranti Sea Spray Mk 1 lightweight search and tracking radar
Mission: Alcatel DUAV-4 dipping sonar; FLIR systems 2000HP FLIR
Navigation: Trimble Type 2200; Doppler 91
ESM: Ferranti AWARE-3 ESM
ASW armament: 2 Mk 46 homing torpedoes; depth charges

PROPULSION

Specifications

System: Combined gas turbine or gas turbine (COGOG)
Main machinery: 2 Rolls-Royce Olympus TM3B gas turbines; 37.9 MW (50,880 hp) sustained; 2 Rolls-Royce Tyne RM 1C gas turbines; 7.4 MW (9,900 hp) sustained
Shafts: 2
Auxiliary machinery: 4 Smit-Slikerveer/Paxman Valenta RP-200, 12-cylinder diesels; each 1,000 kW

FURTHER INFORMATION

PROGRAMME

Tromp and *De Ruyter* were built as replacements for the two gun-armed cruisers *De Ruyter* (C 801) and *De Zeven Provincien* (C 802), which had joined the fleet in 1953, and which are both still in service as the Peruvian *Almirante Grau* (81) and *Aguirre* (82), respectively. The two new ships were required to combine the roles of ASW task group flagship with that of area air defence ship. Their principal air defence system is Standard SM-1MR, with a single Mk 13 launcher aft and close in protection provided by NATO Sea Sparrow, with a single launcher forward of the bridge. Surface warfare weapons include eight Harpoon SSMs and a single twin 120 mm mount, the guns for which came from a scrapped 'Holland' class destroyer.

The first design allowance was voted for in 1967 estimates. Final design began in January 1968 and was ready by September 1969 when invitations to tender were issued. The ships were laid down in 1971 and were commissioned in 1975/76.

DESIGN

The preliminary design was for a ship with a conventional steam-turbine propulsion system driving fixed-blade propellers, but it was eventually decided to use the (then) novel gas turbines with controllable-pitch propellers. Apart from the technical reasons for this choice, it enabled significant reductions in manpower to be achieved, while, by using the Olympus/Tyne combination, commonality with the contemporary Royal Navy Types 21 and 42 could be achieved.

One pair of roll dampers is fitted, positioned low on the hull, immediately under the main mast. There are two spade rudders, positioned perpendicularly to the hull, each with its own electrohydraulic steering gear; the two systems are electrically synchronised, but can operate independently should this be required.

Because the two ships were destined to spend most of their operational lives in the North Atlantic, considerable emphasis was placed on seaworthiness. One of the key factors in this is the large freeboard, raising the centre of gravity, which, in its turn, required a greater beam to maintain stability, although fortunately, this created the extra space needed to house the many new electronic equipments being fitted in the ship. The hull shape is conventional, with V-formed frames, and both weather and main decks run the full length of the hull. The hull is constructed of steel plate on long-stem T-bars, and the tower supporting the air defence radar is also made of steel. The remainder of the superstructure is, however, made of seawater-resistant aluminium alloy.

MODERNISATION

A complete modernisation had been planned for the early 1990s, although this was cancelled in 1988 as an economy measure. Despite this, new equipment has been repeatedly added to these two ships, including new radomes for the SPS-01 3D radar in 1980; a new EW suite and Link 11 in 1984; and SCOT satellite terminals in 1988-90. Weapons additions have included Harpoon in 1977/78 and Goalkeeper, which was fitted first to *De Ruyter* (F 806) and later to *Tromp* (F 801).

It had been intended from very early in the ships' lives to replace the Tynes with a more fuel-efficient engine, but this has never happened, probably due to the cancellation of the mid-life update.

THE FUTURE

The intention is to replace both ships by the two LCF air defence frigates. Two of these are planned, the first of which is due to commission in July 2001.

Builder Koninklijke Maatschappij De Schelde, Flushing, Netherlands
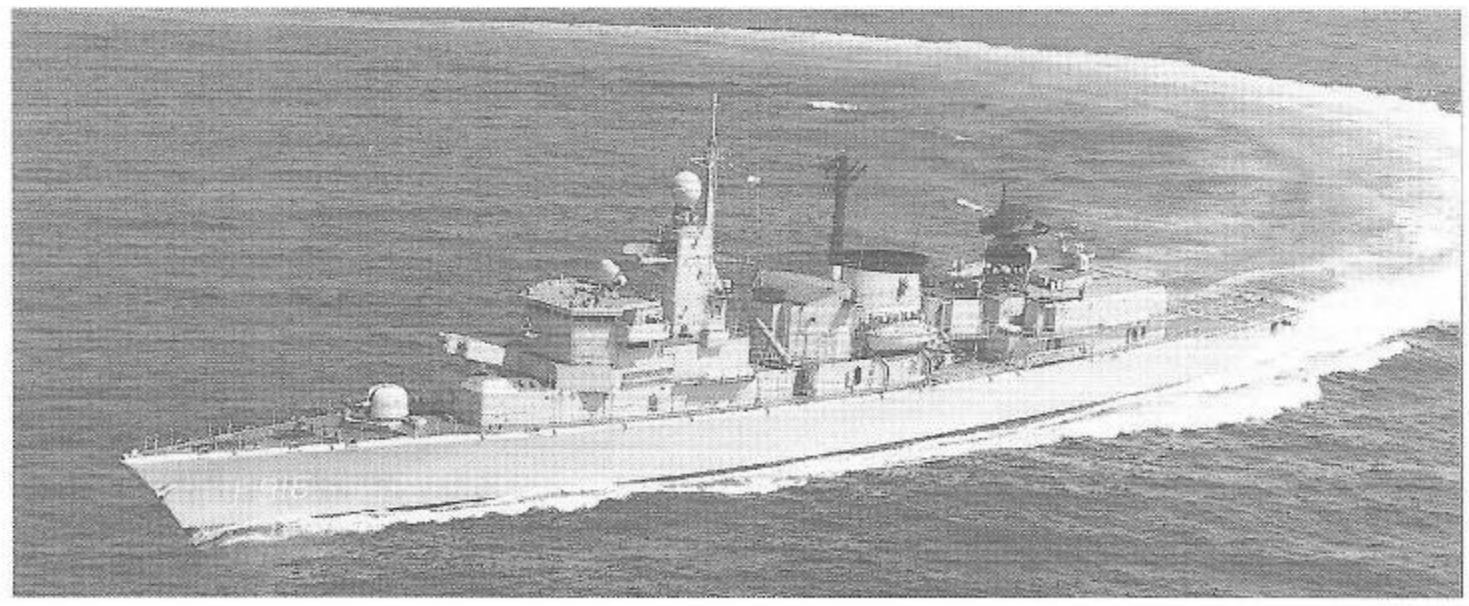
Laid down 21 Jan 1981
Launched 8 May 1982
Commissioned 1 Oct 1983

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84A/C Block 1C Harpoon

Eight Harpoon anti-ship missile canisters are mounted immediately abaft the foremast; there are two groups of four launchers, with each group pointing across the ship to the opposite beam. The missiles are the Block 1C version, which has additional options, compared to previous blocks, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.



Abraham Crijnsen *(F 816), one of ten 'Kortenaer' class frigates built for the RNethN, of which only four remain in Dutch service. Three were sold to Greece in 1993-95 and in 1996 two were sold to the UAE, including* Abraham Crijnsen (RNethN)

Specifications

Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s.
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

Raytheon Sea Sparrow point-defence missile system

The Mk 29 octuple launcher for the Sea Sparrow system is located on the foredeck in 'B' position. Twenty-four RIM-7 Sea Sparrow missiles are carried and the system uses the STIR fire-control system. The system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-

to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg blast fragmentation warhead and a dual-purpose proximity impact fuze.

Specifications
RIM-7M
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 226.8 kg (500 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturers/Contractors
Raytheon Company, Equipment Division (prime system contractor).
Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

TUBES

Two twin 324 mm US Mk 32 torpedo tubes are mounted at the forward end of the after superstructure.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 76 mm (3 in)/62 Compact
There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck for use in either air defence or anti-surface roles. If the weapon is designated to the air defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission.

Specifications
Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/sec
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy

Signaal/General Electric SGE-30 30mm Goalkeeper close in weapons system
One Signaal/General Electric 30 mm 7-barrelled Gatling Goalkeeper close in weapons system is mounted in the hangar roof. Goalkeeper is an autonomous, fully automatic system, consisting of a General Electric Sea Vulcan 30 gun, I-band search radar, I/K-band tracking radar, TV camera, and ancillaries. The Sea Vulcan 30 is based upon the electrohydraulically powered GAU-8/A 30 mm seven-barrel, Gatling gun, with each barrel firing once during each revolution of the barrel cluster. The gun is very reliable, with 33,000 mean rounds between stoppages. The mounting has an ammunition capacity of 1,190 rounds carried in a linkless system using a feed and storage drum, which is claimed to be sufficient for several target engagements before reloading is necessary. The warhead kill capability of Goalkeeper against anti-ship missiles is achieved by use of MPDS rounds which have high-density, tungsten-alloy penetrators. For 'soft' targets, HEI and TP types of ammunition can be used.

The I-band search radar uses a 2,050 × 280 mm linear array antenna with an integrated sidelobe suppression antenna. The antenna rotates at 60 rpm and has a horizontal beamwidth of 1.7° and a vertical beamwidth of 60°. The radar is powered by a water-cooled, synthesiser-driven, TWT transmitter with high output power for greater frequency and PRF flexibility in the face of ECM threats.

Specifications
Calibre: 30 mm
Muzzle velocity: 1,020 m/s (TP, HEI); 1,150 m/s (APDS)
Traverse: 360°
Elevation: −25 to +85°
Mounting weight: 6,800 kg (14,994 lb)
Crew: 0
Range: 200 m to 3 km (1.61 n miles)
Rate of fire: 4,200 rds/min
Ammunition: 369 g (TP, HEI, HEISD, API, MPDS)

Manufacturers/Contractors
Hollandse Signaalapparaten BV, Netherlands (system/radar).
General Electric Company, Armament Systems Department (gun).

Oerlikon 20 mm
Two single Oerlikon 20 mm guns are mounted either side of the bridge superstructure abreast the foremast.

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +55°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Signaal Sphinx ESM system
Sphinx (System for Passive Handling of INtercepted Xmissions) is a radar warning system covering the frequencies 1-18 GHz.

Signaal RAMSES ECM system
The Signaal Reprogrammable Advanced Multimode Shipborne ECM System (RAMSES) countermeasures system provides protection against I/J-band radar threats. It is an integrated responsive jammer capable of long-range jamming of search radars and the deception of missiles once launched. In its normal mode of operation, RAMSES is interconnected to and controlled from the ship's ESM systems and a dedicated ECM operator is not required, but in the back-up mode RAMSES can be manually controlled (target designation and jamming) from a remote-control panel located conveniently near the EW operator. RAMSES is capable of high pulse and CW Effective Radiated Power (ERP). Multimode jamming operation is possible with multitarget handling capability. The system is reprogrammable and power management is provided. The antennas are fully trainable (port and starboard, each through 180°) and are stabilised for roll and pitch.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

DECOYS

Loral Hycor SRBOC Mk 6-barrelled Chaff Launcher
There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units mounted at the forward end of the hangar.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

SEWACO II sensor, weapon control and command system
SEWACO II is installed in all Dutch-built 'Kortenaer' class frigates, including those supplied to Greece. Sensors include the Signaal LW-08, and ZW-06 radars, the combined search and tracking radar of the WM25 weapon control system and ESM system, two optical target designation sights and an automatic datalink. Non-Signaal sensors include IFF, a helicopter transponder system and the AN/SQS-505 sonar set. The SEWACO system consists of Signaal's Digital Action Information SYstem (DAISY), WM25 weapon control system, including a Separate Tracking and Illumination Radar (STIR) on which a TV camera is mounted, while the weapons fit comprises the OTO Melara 76/62 dual-purpose gun, Harpoon SSM, NATO Sea Sparrow, ASW torpedoes and a Lynx ASW helicopter. SEWACO II's functions include:

air, surface and subsurface warning
compilation and display of tactical air, surface and subsurface situations
threat evaluation and target engagement in AAW, EW, ASuW, ASW and NGS
navigation including ASW helicopter direction
communication including tactical datalink operation
onboard scenario-driven training
organisation and system management.

A 'Kortenaer' class frigate exposes its Westinghouse AN/SPS-509 bow-mounted sonar dome in typical North Atlantic weather (Royal Netherlands Navy)

RADARS

COMMUNICATIONS AND DATALINKS

Datalinks: Link 11

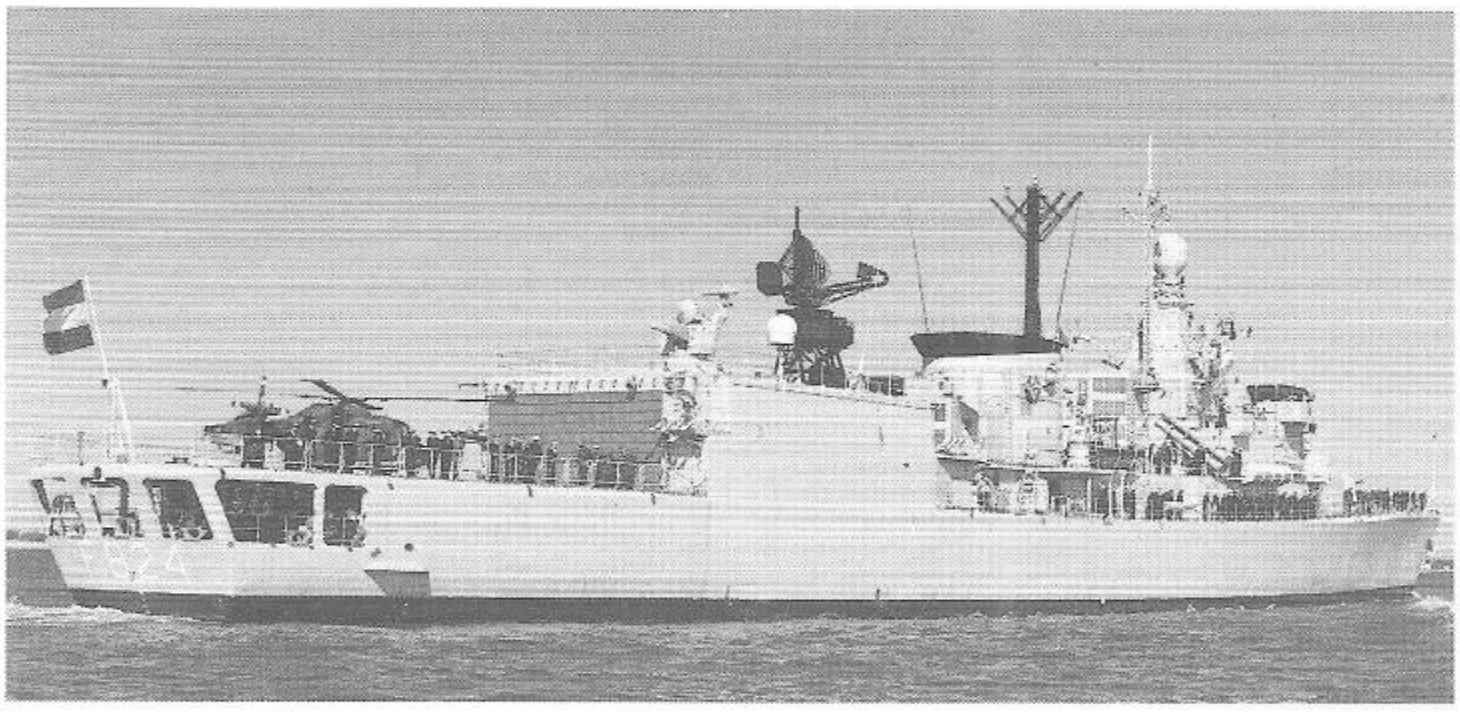
Satcom: F 823 to F 826 only. Electrospace SHF. This recently installed SHF system is based on the US Navy's AN/WSC-6, with twin antennas under the pan-cake-shaped domes providing 360° coverage, even at high latitudes.

SONARS

Westinghouse AN/SQS-505 hull-mounted search and attack sonar

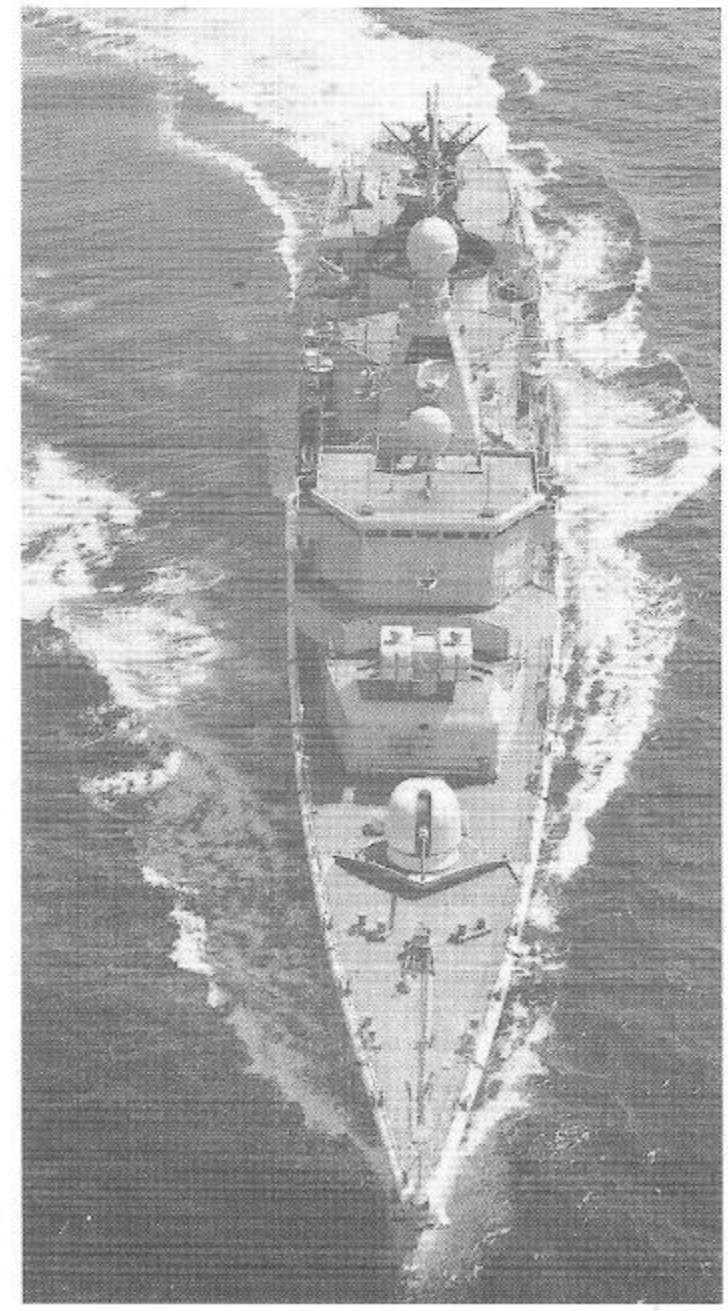
AN/SQS-505 was installed in F 807, 811 and 816, as built. The Canadian Westinghouse AN/SQS-505 sonar

Signaal LW08 2D L-band long-range air and surface search (Signaal)



Bloys van Treslong *(F 824) with its Westland SH-14D Super Lynx on the flight deck. Note the Satcom dome on the hangar roof* (H & L van Ginderen Collection)

Bloys van Treslong *(F 824) is one of the four 'Kortenaer' class ships still in service with the Royal Netherlands Navy. The radar on the bridge roof is the Signaal STIR, with behind it the ZW06 surface search antenna. At the top of the tower is the Signaal 'egg' housing the WM25 fire-control radar while below is a 'collar' of small radomes which are part of the RAMSES ESM/ECM system* (Jane's/H M Steele)



A 'Kortenaer' class frigate. Ten of these ships were built for the RNethN: eight by de Schelde and two by Wilton-Fijenoord

Pieter Florisz *(F 826). This ship has the same 'mushroom-shaped' radomes for satellite communications as fitted in the 'Karel Doorman' class* (H & L van Ginderen Collection)

is a hull-mounted 7 kHz, search and attack sonar. It is a deep water, omnidirectional, surveillance system, but is also able to operate in a directional mode that can maintain search ability while tracking defined targets. Three selectable frequencies are available so that several ships can survey an area in close proximity without cross-talk. In high sea states leading to excessive roll and pitch of the ship, the AN/SQS-505 utilises transmit beam stabilisation, which delays transmission until near optimum roll and submergence conditions prevail, thereby minimising chances of the target being missed altogether.

Specifications

Coverage: 360° (azimuth)
Range: 183-3,000 m (200-3,200 yd)
Doppler range: ± 40 kts (7.2 kHz)
Displays: Range (A Scan); Bearing (B Scan)
Doppler frequencies: 6.4, 7.2 and 8.0 kHz
Source levels: From 224.233 dB/µPa/m (transmission mode dependent)
Initial detection: 12 ping history of returns
Bearing accuracy: 1° RMS
Range accuracy: ±1% range reading
Transmission modes: Omni, TRDT, DT, ASPECT
Power level: High and low (10 dB reduction)

Manufacturer/Contractor

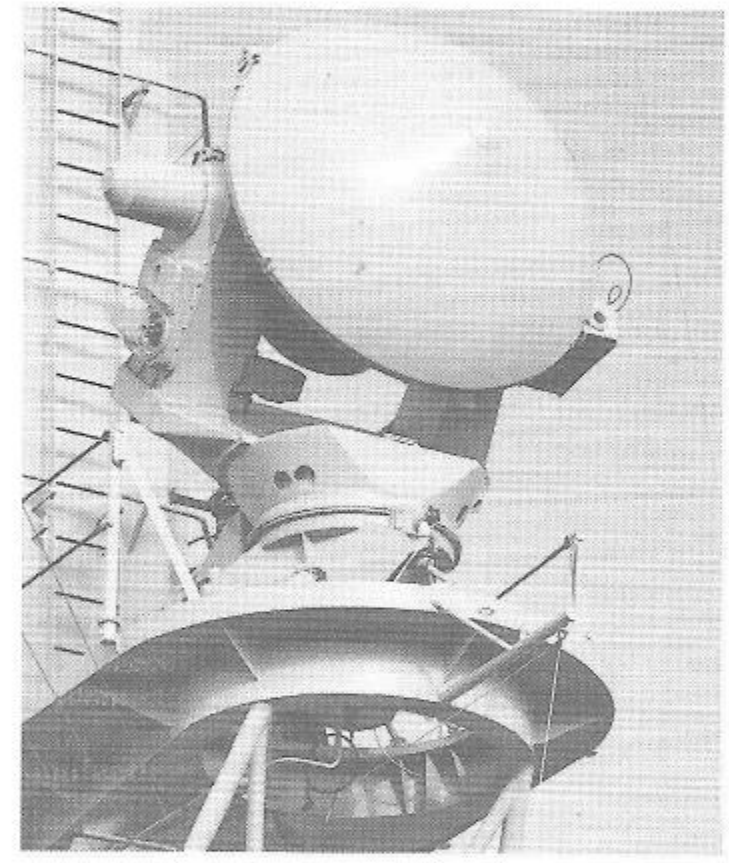
Westinghouse Canada Inc, Burlington, Ontario, Canada.

AN/SQS-509 hull-mounted search and attack sonar

AN/SQS-509 was installed in the last four ships to be built: F 823 to F 826. This is an improved version of AN/SQS-505.

Specifications

Coverage: 360° (azimuth)
Range: 183-3,000 m (200-3,200 yd)
Doppler range: ± 40 kts (7.2 kHz)
Displays: Range (A Scan); Bearing (B Scan)
Doppler frequencies: 4.8, 5.4 and 6.0 kHz
Doppler limits: ±40 kts
Passive frequency: 3.125 kHz
Source levels: From 224.233 dB/µPa/m (transmission mode dependent)
Initial detection: 12 ping history of returns
Bearing accuracy: 1° RMS
Range accuracy: ±1% range reading
Transmission modes: Omni, TRDT, DT, ASPECT
Power level: High and low (12 dB reduction)



STIR, I- and K-band tracking and illumination radar (Signaal)

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 24.5 m (80 ft) × 14.6 m (47.9 ft)
Hangar: The hangar is large enough to accommodate two Lynx helicopters, but only one is normally carried.
Helicopter: 2 Westland SH-14D Lynx (note: all RNethN SH-14B/C Lynxes have now been converted to SH-14D standard)

Westland SH-14D Lynx

Specifications

Dimensions:
main rotor diameter: 12.80 m (42.00 ft)
tail rotor diameter: 2.21 m (7.25 ft)
length overall (rotors turning): 15.165 m (49.75 ft)
Weights:
empty: 2,740 kg (6,040 lb)
empty, equipped (ASW): 3,343 kg (7,370 lb)
Performance:
cruising speed: 125 kts (232 km/h)
speed for max endurance: 70 kts (130 km/h)
max rate of climb: 661 m (2,170 ft)/min
time on station (ASW) 50 n miles (93 km) radius: 2 h
max range: 20 n miles (593 km)
max endurance: 2 h 50 min
Power plant: 2 Rolls-Royce Gem 42-1 with maximum contingency rating of 835 kW (1,120 shp).
Crew: 2 (pilot and co-pilot/observer)
Radar: Ferranti Sea Spray Mk 1 lightweight search and tracking radar.
Mission: Alcatel DUAV-4 dipping sonar; FLIR systems 2000HP FLIR.
Navigation: Trimble Type 2200; Doppler 91
ESM: Ferranti AWARE-3 ESM
ASW armament: 2 Mk 46 homing torpedoes; depth charges

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 Rolls-Royce Olympus TM3B gas turbines; 37.9 MW (50,880 hp) sustained; 2 Rolls-Royce Tyne RM1C gas turbines; 7.4 MW (9,900 hp) sustained
Shafts: 2
Propellers: cp
Auxiliary power: 4 SEMT-Pielstick generators driving Smit-Slikkerveer generators.

FURTHER INFORMATION

PROGRAMME

The 'Kortenaer' class was designed to replace the four 'Holland' and eight 'Friesland' class destroyers, which had been built between 1950 and 1958. The requirement was for a ship which would:

- operate in the North Atlantic in any weather and under threat from air, surface and submerged attack
- have a maximum speed of about 30 knots, a cruising speed of 20 knots and a range of about 4,000 n miles
- have the latest weapons and sensors, including a helicopter capable of autonomous ASW operations
- have the greatest degree of automation to reduce manning to a minimum
- achieve maximum standardisation with NATO
- have a reserve of space and weight for future modifications and updating

Approaches were made to other NATO navies, many of whom were then also working on new frigate designs. Initial discussions were held with the UK Navy, with a view to developing a common hull form, but all efforts to reach agreement failed. Then the US Navy tried to interest the Dutch in the Patrol Frigate design ('Oliver Hazard Perry' class), but the Dutch did not like its single screw design, excessive draught and high cost. The French C70ASW design ('Georges Leygues' class) was also examined, but was found unsuitable. All these discussions meant that by 1972 the RNethN still did not have a design and work then went ahead on a national design.

An initial order for four was placed on 10 October 1974, followed by an order for a further four on 28 November 1974, and for the final four in 1976. The Greek Navy then indicated an intention to purchase two ships and, in order to ensure the sale, two ships already fitting out were selected for the sale: the original *Pieter Florisz* (F 812) and the original *Witte de With* (F 813), respectively. In the moves to resolve the situation for the RNethN it was decided to:

- order two new ships, but as anti-air warfare (AAW) ships, rather than as ASW, which became the 'Jacob van Heemskerk' class
- nameship of the class was *Jacob van Heemskerk* (F 312), which took the pennant number of the first ship sold to Greece, but with a new name.
- second ship in the class took the name and pennant number of the second ship sold to Greece: *Witte de With* (F 813).
- rename the final ship ordered as part of the Kortenaer ASW programme, but without changing its pennant number. Thus, the ship ordered as *Willem van der Zaan* (F 826) became *Pieter Florisz* (F 826).

In summary, the RNethN originally ordered twelve ASW versions, but ended up with ten ASW versions ('Kortenaer' class) and two AAW versions ('Jacob van Heemskerk' class).

DESIGN

The flush-deck hull has upper (weather) and main decks running the full length of the ship, giving considerable strength, with high freeboard and negative sheer. Fin stabilisers are fitted and there is a single rudder and a single anchor, the latter being positioned high on the stem of the clipper bow to keep the chain clear of the bow-mounted sonar. There are three deckhouses, the forward one accommodating the bridge, ship's offices and officers' living quarters, and supporting the mast, radars and two weapons systems. The central deckhouse accommodates the inlets and uptakes for the main and auxiliary engines, while the after deckhouse accommodates the hangar and torpedo room. The whole of the after end of the weather deck is devoted to the flight deck, which meant that openings had to be made in the after end of the main deck to provide berthing facilities.

The same COGAG system was adopted as in the 'Tromp' class, with the two Olympus main engines in the forward engine room and the two Tynes in the after engine room, together with the synchro-self-shifting couplings, the main gearboxes and the thrust blocks. There are four auxiliary diesel-generator sets, of which two are always in use, one is on standby and one is assumed to be undergoing maintenance. Two boilers are used to raise steam for evaporators and for domestic use.

MODERNISATION

As built, the first two ships (F 807 and F 808) mounted a second 76 mm gun on the hangar roof, but the third ship onwards mounted a single 40 mm Bofors instead. The first two were then modified to the same standard. Subsequently all have had the 40 mm replaced by a single Goalkeeper mount.

During refit in 1985-86 *Pieter Florisz* (F 826) was adapted for a limited number of female crew (about 25) and the others have since been similarly converted.

At one stage it was planned to fit SMART fire-control radars but this plan has since been cancelled, although SMART radars have been installed in the two 'Jacob van Heemskerck' class ships. It was also planned to fit towed arrays, and F 825 and F 826 were fitted with such a system for a short period, but this has now been shelved.

It is currently planned to fit the four remaining Dutch ships with the new 100 rds/min version of the OTO-BREDA 76 mm gun.

TRIALS

The SMART radar was given sea trials in *Jan Van Brakel* (825) in 1990. The radar was installed on the hangar roof, with the control room in the hangar.

SALES

Two were sold to Greece while fitting out (see 'Elli' class below) and were transferred in mid-1980 and mid-1981, respectively.

Of the ten Kortenaer ships then completed for the RNethN three more were later sold to Greece, under an agreement signed on 11 November 1992. This agreement included refits by De Schelde, Flushing, Netherlands, the removal of Goalkeeper CIWS and the extension of the hangar by 2 m (6.56 ft) to accommodate the AB 212ASW. The ships were then transferred to the Greek Navy: *Banckert* on 14 May 1993 (*Aegeon* (F460)); *Callenburg* on 30 March 1994 (*Adrias* (F 459)); and *Van Kinsbergen* on 1 February 1995 (*Navarinon* (F 462)). *Kortenaer* is also due for sale and may also go to Greece.

A $360 million contract was signed on 2 April 1996 for the sale of Dutch naval equipment to the UAE, which includes two 'Kortenaer' class frigates. The two ships concerned are *Piet Hein* (F 811), and *Abraham Crijnsen* (F 816), which were commissioned into the RNethN in 1980 and 1983, respectively. Both ships are being refitted and modified to make them more suitable for continuous operations in the Gulf environment. Among the modifications so far announced are new Goalkeeper CIWS and fitting Scout LPI radar.

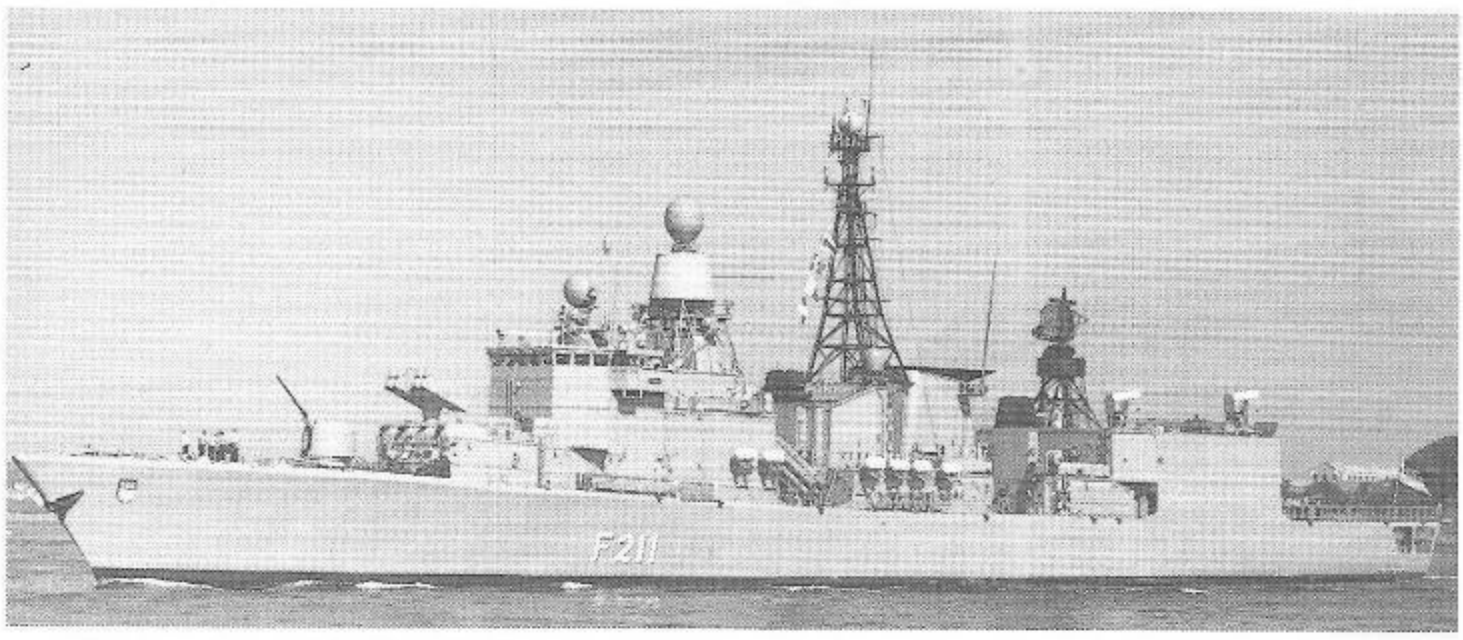
WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84C Block 1C Harpoon

Eight Harpoon anti-ship missile canisters are mounted immediately abaft the forward deckhouse; there are two groups of four launchers, with each group pointing across the ship to the opposite beam. The missiles are the Block 1C version, which has additional options, compared to previous blocks, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)



Köln *(F 211) with two Mk 49 RAM launchers* (Jane's/H M Steele)

Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

Raytheon Sea Sparrow point-defence missile system

The Mk 29 octuple launcher for the Sea Sparrow system is located on the foredeck in 'B' position. Sixteen RIM-7 Sea Sparrow missiles are carried and the system uses the WM25/STIR fire-control system. The system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg (85.1 lb) blast fragmentation warhead and a dual-purpose proximity impact fuze.

Specifications

RIM-7M
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 226.8 kg (500 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturers/Contractors

Raytheon Company, Equipment Division (prime system contractor).
Raytheon Company, Missile Systems Division (Prime missile contractor).
Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

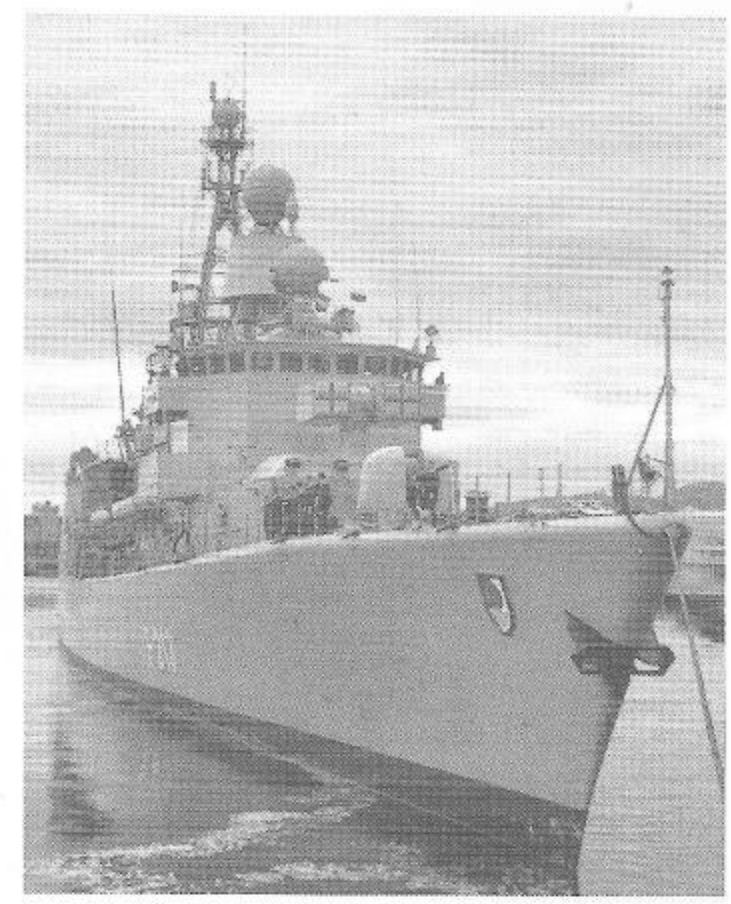
RIM-116A RAM close in system

There are two 21-cell Mk 49 launchers for the Rolling-Airframe Missile (RAM): one on the foredeck, the other aft on the roof of the twin hangars. RAM is a lightweight, close in, quick reaction, anti-missile defence system, the RIM-116 missile being based on the Sidewinder air-to-air missile, but with significant modifications, enabling it to be used as a fire-and-forget system. There is an infra-red, terminal guidance seeker in the nose (taken from the Stinger man-portable surface-to-air missile), behind which is a new dual-mode passive radio frequency seeker for mid-course guidance. Most of the rear of the missile is based upon Sidewinder components. Missiles are stored in sealed launcher-containers which are manually loaded into the 21-cell Mk 49 RAM Standard Launchers.

Radar and electro-optical sensors provide details of target location, distance and speed, while the ship's ESM system inputs data on the target's radar frequency, as well as correlating radar data on location. On launch, the missile is spun-up by a rifling band as it is driven down the launch tube, and then as it leaves the launcher the four tail fins deploy which maintain the spin. Aerodynamic control is provided by the two canard surfaces, which also deploy after launch. The autopilot and control system maintain the initial line of sight course towards the target and then the RF seeker is activated and once this acquires the target it takes control of the guidance system and makes the appropriate course alterations. The IR seeker is also activated and when a sufficient signal-to-noise ratio is achieved this takes over guidance control for the terminal phase. The missile is capable of manoeuvres up to 20 *g* in any direction. The system can only be fired automatically at the moment, but manual control will become possible with Block 2 missiles.

Specifications

Mk 49 RAM Standard launcher
Traverse: 360°
Elevation: −25 to +80°
Turning circle: 3.27 m (10.72 ft)



Augsberg *(F 213). On the foredeck are an OTOBREDA 76 mm/62 Mk 75 and a Mk 29 eight-cell launcher for NATO Sea Sparrow missiles. On the bridge roof are STIR target indication radar and the Signaal WM25 'egg', with between them (with the conical tip) is the omnidirectional antenna of the ESM part of the FL1800S EW suite. The sphere at the masthead is also part of the FL1800S system* (Jane's/H M Steele)

RIM-116 missile
Length: 2.79 m (9.15 ft)
Diameter: 12.7 cm (5 in)
Wing span: 43.4 cm (17.0 in)
Weight: 73.6 kg (162.3 lb)
Speed: Mach 2
Range: 5.17 n miles (9.6 km)
Warhead: 9.09 kg (20.0 lb) fragmentation blast WDU-17B
Motor: Hercules/Aerojet Mk 36 solid propellant rocket.

Manufacturer/Contractor

RAM Systems GmbH, D-85521 Riemerling, Germany.

TUBES

Two twin 324 mm US Mk 32 torpedo tubes are mounted internally at the forward end of the after superstructure. Eight Mk 46 Mod 1 torpedoes are carried.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 1 324 mm torpedoes

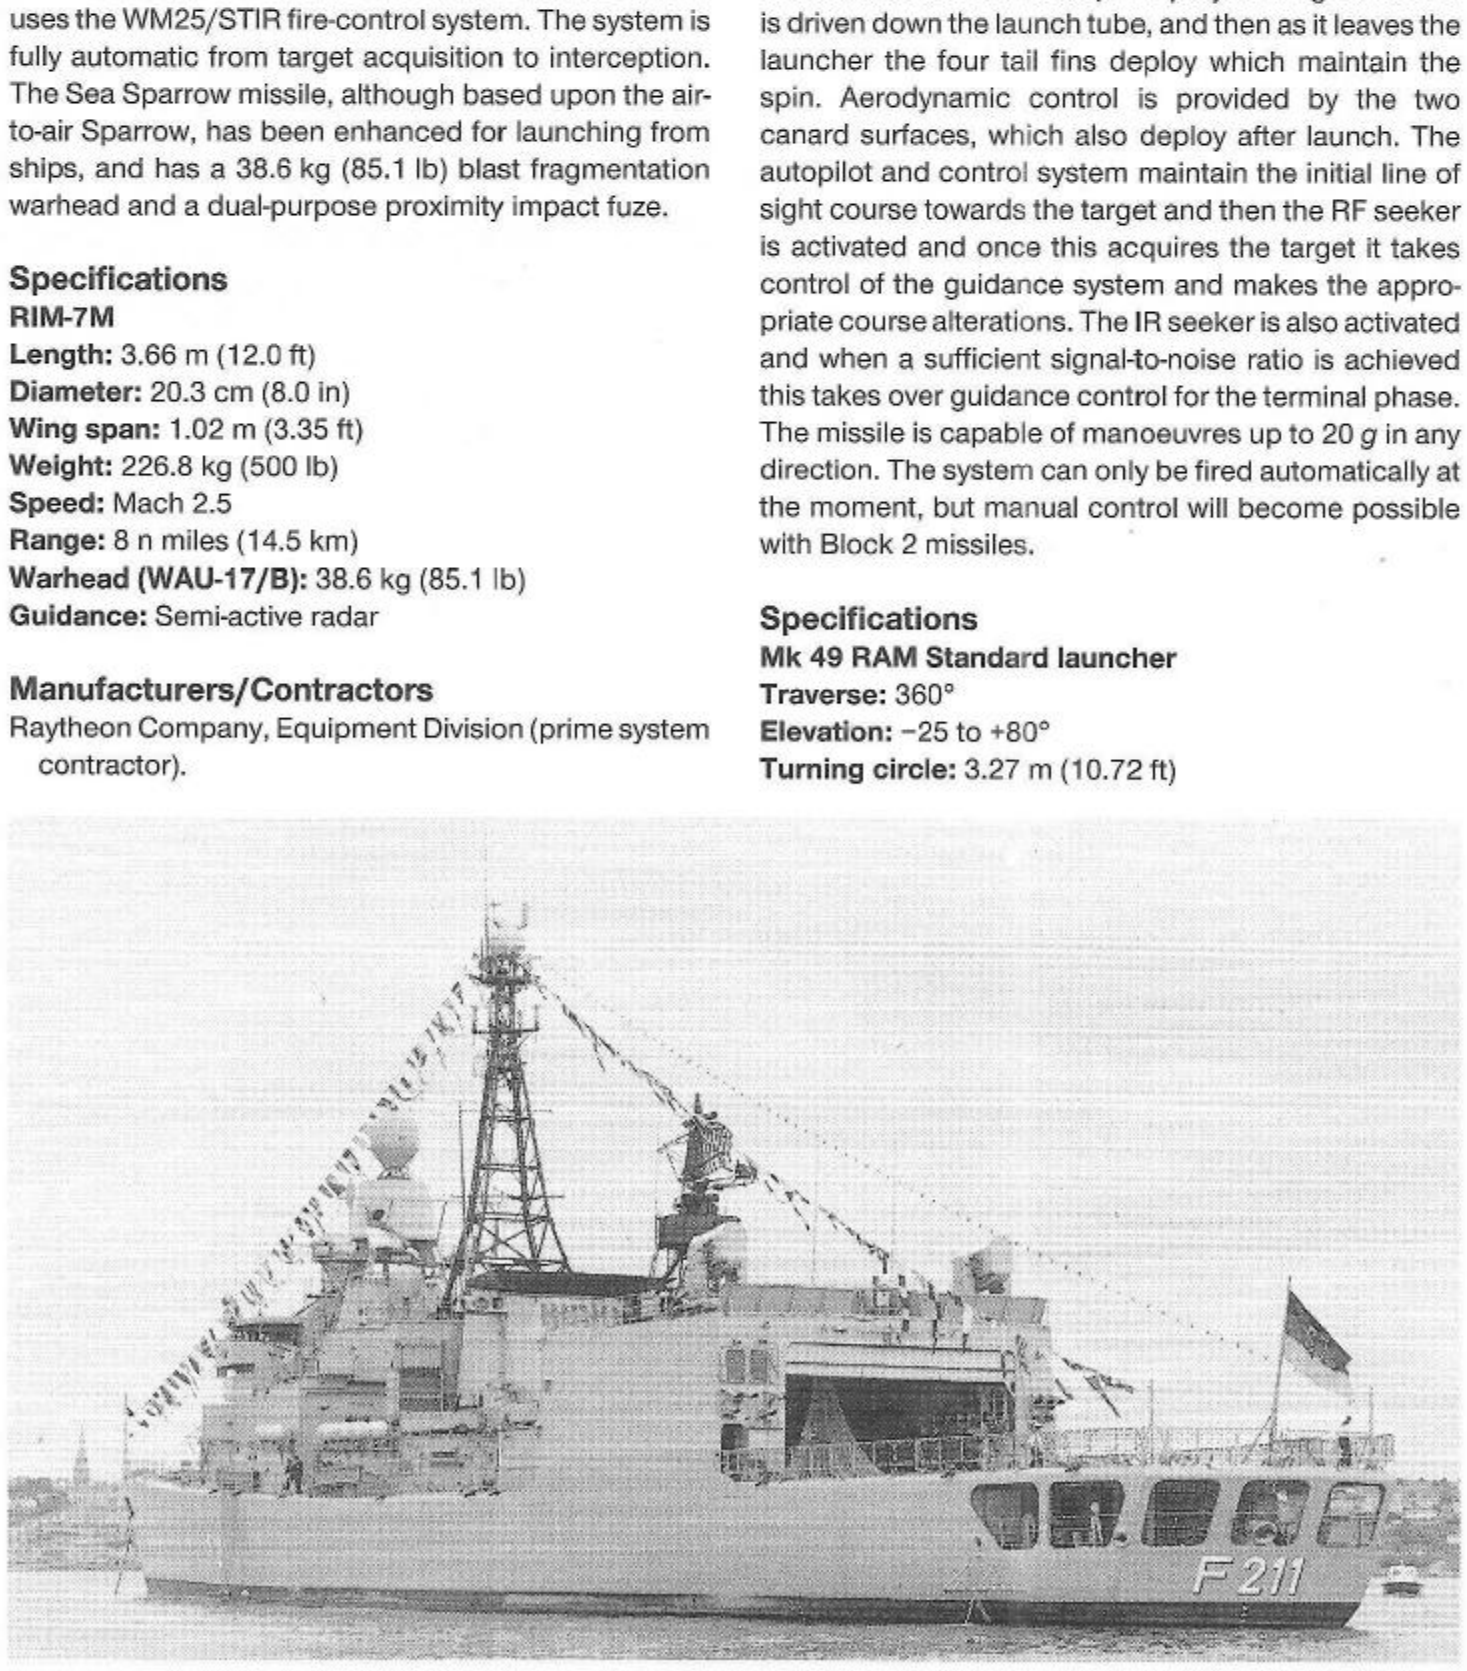
Specifications

Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

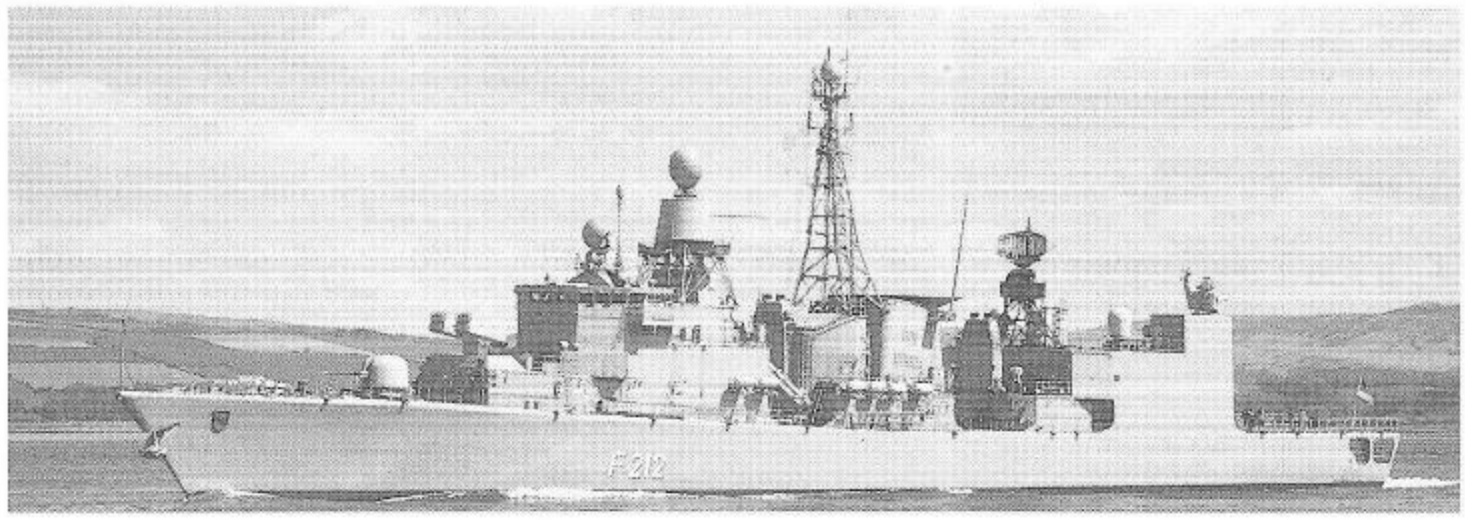
GUNS

OTOBREDA 76 mm (3 in)/62 Compact

There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck for use in either air defence or anti-surface roles. If the weapon is designated to the air defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission.



Köln *(F 211) with two RAM launchers on the hangar roof* (H & L van Ginderen Collection)



Karlsruhe *(F 212) is one of eight Type 212 frigates built for the German Navy between 1979 and 1990. The German design is based on that of the Dutch* Kortenaer, *but there are differences as the ships had to meet different operational requirements. Note that in this shot, the ship has a Signaal Goalkeeper CIWS on the hangar roof, which was installed for a 1992-93 overseas deployment; it has since been replaced by two RAM launchers* (Jane's/H M Steele)

Specifications
Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)

Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Oerlikon 20 mm
Two single Oerlikon 20 mm guns can be mounted in the bridge wings, if required.

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +55°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

DASA FL 1800S Stage II
The FL 1800S Stage II ESM/ECM suite is based on the earlier FL 1800S, but with considerable improvements in the areas of signal processing, analysis, MMIC and ECM. A new channelised receiver with nine sub-bands provides extremely accurate frequency measurement and CW resistance. Two fully integrated superheterodyne receivers have been incorporated for special analysis of pulses and for later upgrade to fit in a 'fingerprinting' system. Expanded capacity threat libraries are provided, which include onboard reprogrammable modules for use in out-of-area missions. The system handles several threats simultaneously, regardless of frequency or direction of arrival.

The ECM system consists of a tracking processor for tracking ECM emitters and to control the timing of both synchronous and asynchronous ECM, modulators for generating ECM modes (ECM-RF), and multibeam array ECM antennas for simultaneous generation of countermeasures, even against multiple threats. A different collection of ECM modes is used to counter each threat, with a look-through mode employed to verify the effectiveness of jamming, and to update the ESM situation in general. The effective radiated power of the jamming is such that it is sufficient to cover the ship's radar cross-section.

Specifications
(ESM)
Frequency range: 2-18 GHz
Azimuth coverage: 360°
Elevation coverage: −10 to +60°
Polarisation: 45° linear for receiving channel; circular for DF
DF accuracy: 5° typical RMS

Manufacturer/Contractor
Daimler-Benz Aerospace AG, Sensor Systems Division, Ulm, Germany

DECOYS

Loral Hycor SRBOC Mk 6-barrelled Chaff Launcher
There are four six-barrelled Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units mounted at the forward end of the hangar.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

AN/SLQ-25 Nixie noisemaker
One AN/SLQ-25 Nixie (Phase 1), solid-state, modular design electroacoustic countermeasures decoy system is mounted on the port side of the quarterdeck. It protects the ship from acoustic homing torpedoes and consists of a remote-control unit; a countermeasures transmitter which generates and amplifies the signals; a power-operated double-drum winch for streaming/recovering the towed bodies; and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them, while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located on the quarterdeck, with the towed bodies deployed through the transom. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm long (3.10 ft), 15.24 cm (6 in) in diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body at a time is deployed.

Manufacturer/Contractor
Aerojet ElectroSystems, Sacramento, California, USA.

Prairie noise suppression systems
The ships are fitted with the Prairie radiated noise suppression system, in which high-pressure air is bled off from the ship's gas turbine and ejected from a pipe placed laterally across the ship's hull just forward of the machinery spaces. The forward motion of the ship causes the air to form a layer separating the hull from the water and thus masking the machinery noises which would otherwise be radiated directly into the water. Such a system is less effective at slow speeds where the air bubbles tend to rise to the surface rather than remain attached to the hull.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

SATIR F 122 tactical data handling system
SATIR *(System zur Auswertung Taktischer Informationen auf Raketenzerstoerren)* is a command and weapon control system *(Führungs und Waffeneinsatzsystem FüWes)* with the hardware and software integrated by the Bundesamt für Wehrtechnik und Beschaffung (BWB) and the Kommando Marine Führungssystems (KdoMFüSys) and then interfaced with sensor and weapon systems.

SATIR F 122 was designed for the F 122 frigates and has a mainframe architecture running on BWB software written in the CMS-2Y language. The mainframe itself is a dual-bay UniSys 32-bit AN/UYK-7.

SATIR acquires data from a variety of sensors, processes them and then displays them to ensure effective engagement of airborne, surface and subsurface targets. The CIC has been designed to be operated efficiently by the minimum number of personnel while the high processing speed and large storage capacity of the computers, together with very fast peripheral equipment and considerable redundancy, permits maintenance and repairs to be carried out without interfering with the primary operational functions. A modular software structure was adopted and four packages were produced, one each for operations, maintenance, support and administration.

Radar video data is transmitted both directly to the display consoles and, via the video extractor, to the central computer and there is partial integration of the IFF system.

The SATIR F 122 system uses the Hughes AN/UYA-4 display system family and has nine OJ-194 consoles with the commanding officer sharing those of the tactical action and anti-air warfare officers. There are consoles for the WM25 gun fire control and the Mk 91 surface-to-air missile systems and two for electronic warfare. The anti-submarine warfare officer has a console together with the track co-ordinator/supervisor and the helicopter controller. There is also a dedicated console for the DSQS-21 sonar system.

Principal air/sea search sensor is the Signaal DA 08 high-power (145 kW peak), coherent F-band search radar with synthesiser-driven TWT transmitter. The horn-fed parabolic reflector antenna rotates at 10/20 rpm and the beamwidth is 1.55 × 40°. The PRF is 500-1,000 and the maximum range is 104 n miles (193 km). The other prime sensor is the Atlas Elektronik DSQS 21BZ hull-mounted, medium-frequency, active search and attack sonar. This has a 1 m (3.3 ft) diameter, hull-mounted transducer array which produces 32 preformed beams.

Manufacturers/Contractors

BWB (prime contractor).
Unisys
STN Atlas Elektronik } (prime subcontractors)

Satcom: Matra Marconi SCOT 1A Satcom (three sets are held in a pool and allocated to ships according to operational requirements)

WEAPONS CONTROL

See SATIR F 122 (above).

SONAR

DSQS-21 hull-mounted sonar systems

DSQS-21 was designed for the Type 122 frigate. It is an active search and attack sonar, operating at medium frequencies. Computer-aided detection techniques are used for classification and tracking and the information is presented on colour CRT displays to permit Doppler coding and the discrimination of data on the integrated displays. The 'Z' in the nomenclature indicates variants equipped with electronic stabilisation to minimise the effects of ship's motion. The transducer array is 1 m (3.3 ft) in diameter and consists of 32 staves.

Shafts: 2 Escher-Wyss, five-bladed
Propellers: cp

FURTHER INFORMATION

PROGRAMME

The German Navy's Type 122 had its genesis in the early 1970s. at the height of the Cold War, when the need arose to replace the 'Fletcher' class destroyers and 'Köln' class frigates. The new ships were required to meet the German Navy's NATO obligations to counter the Soviet Northern Fleet and the Red Banner Baltic Fleet in the North Sea. The North Sea was of great importance at that time as the final stage of the sea route for reinforcements from the USA to Europe which were due to disembark in the north German ports, while a very considerable amount of sea traffic would have taken British reinforcements from the UK to Denmark and Norway. In addition, the North Sea was seen as an operational area for up to ten Soviet SSBNs armed with shorter-range SLBMs targeted against Western European targets.

Considerable discussions took place before the placing of the order. The Germans first considered whether their needs would be met by a small frigate without a flight deck, which would operate in concert with either land-based helicopters or helicopters based on a specialised helicopter carrier. They also examined the possibilities of a force of corvettes operating in conjunction with submarines. The eventual choice, however, was a frigate with its own aviation facilities. Next, seven frigate designs, all foreign, were examined: Wielingen (E-71) (Belgium); C 70ASW (France); Lupo (Italy): Kortenaer (Netherlands); Types 21 and 22 (UK); and Patrol Frigate ('Oliver Hazard Perry') (USA). Of these, the Dutch Kortenaer was judged to be the closest to the German requirements.

The national operational requirement was endorsed in 1974 and, in 1975, a co-operation agreement was signed between the German MoD and the RNethN. Approval was given in early 1976 for the first six of the class. There was a dearth of orders in German shipyards at the time, so the German Cabinet decided that, while Bremer Vulkan should be appointed prime contractor, the order for the first six was to be shared between five yards: AG Weser, Kiel (1); Blohm + Voss, Hamburg (2); Bremer Vulkan, Bremen (1); Howaldtswerke, Kiel (1); and Thyssen-Nordseewerke, Emden (1). The subcontractors were responsible for constructing and partially fitting out the hull, but it was then towed to the Bremer Vulkan yard where weapon systems and electronics were fitted and trials conducted. At the time, this complicated construction programme was estimated to have added some DM150 million (at 1976 prices) to the overall cost.

Some considerable time later an order for a further two was placed (6 December 1985), which were built by Bremer Vulkan and Thyssen Nordseewerke.

DESIGN

The German operational requirement was considerably different from that which the Dutch Kortenaer was designed to meet. The Dutch ship was required to operate as part of a task group in the North Atlantic, and to have a balanced weapon and sensor fit to counter air, surface and underwater threats. The German ship, however, was required to hunt and destroy submarines in the shallow waters of the North Sea, under a somewhat greater air threat. The German operational requirement also specified: area anti-submarine screening; point-defence capability against submarines, aircraft and missiles; and an ability to engage surface targets, particularly amphibious forces.

The result was a ship which differed in many details from the Dutch prototype. Like the Dutch ship, the German ship has two decks running the full length of the ship, but the Germans decided on a double bottom and a full load displacement some 300 tonnes greater. The German requirement for two helicopters also resulted in a rather wider hangar, which is flush with the gunwale.

	Kortenaer	Type 122
Displacement		
standard	3,050 t	2,900 t
full load	3,630 t	3,800 t
Length overall	130.5 m (428 ft)	128 m (420.0 ft)
Beam	14.6 m (47.9 ft)	14.4 m (47.2 ft)
Draught	6.2 m (20.3 ft)	6.0 m (19.7 m)
Helicopters	1	2

The Germans originally intended to install the same COGOG propulsion system as the Dutch, but this was changed before construction. First, the dash engines were changed to General Electric LM-2500s, which had a similar power output to the Rolls-Royce Olympus, but had a higher compression ratio and higher combustion temperatures, which were believed to result in greater efficiency and lower fuel consumption. Thus, the LM-2500s lower operating costs were calculated to more than offset the higher initial cost. Similarly, it was decided to use MTU diesels rather than Tyne gas turbines for cruising, as the diesels had both lower procurement and operating costs.

MODERNISATION

All have been fitted between 1992 and 1996 with the RAM missile system, and a new EW fit is currently being installed.

Consideration is being given to mounting two Rheinmetall Rh-202 20 mm cannon. These would be taken from decommissioned Klasse 520 landing craft, refurbished, and then mounted in the bridge wings, in a similar manner to that in the Type 123 frigates.

An improved search radar is also being considered.

OPERATIONAL

These eight ships form the 2nd and 4th Frigate Squadrons and are based at Wilhelmshaven, which will become the single base for all Bundesmarine frigates in due course. Three containerised SCOT 1A satellite terminals were acquired in 1988 and when fitted are mounted on the hangar roof. Dutch Goalkeeper CIWS was installed on the port side of the hangar roof in F 207, 208 and 212 as a short-term contingency in 1991.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84A/C Block 1C Harpoon

Eight Harpoon anti-ship missile canisters are mounted immediately abaft the forward deckhouse; there are two groups of four launchers, with each group pointing across the ship to the opposite beam. The missiles are the Block 1C version, which has additional options, compared to previous blocks, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)

Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s.
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

Raytheon Sea Sparrow point-defence missile system

The Mk 29 octuple launcher for the Sea Sparrow system is located on the foredeck in 'B' position. Twenty-four RIM-7 Sea Sparrow missiles are carried and the system uses the WM25/STIR fire-control system. The system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg (85.1 lb) blast fragmentation warhead and a dual-purpose proximity impact fuze.

Specifications

RIM-7M
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 226.8 kg (500 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturer/Contractors

Raytheon Company, Equipment Division (prime system contractor).
Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

FIM-43 Redeye close in system

The FIM-43 Redeye system is a man-portable close-range SAM, which although originally developed for army use, is also used by a number of navies. A number of launchers is deployed in the 'Elli' class frigates.

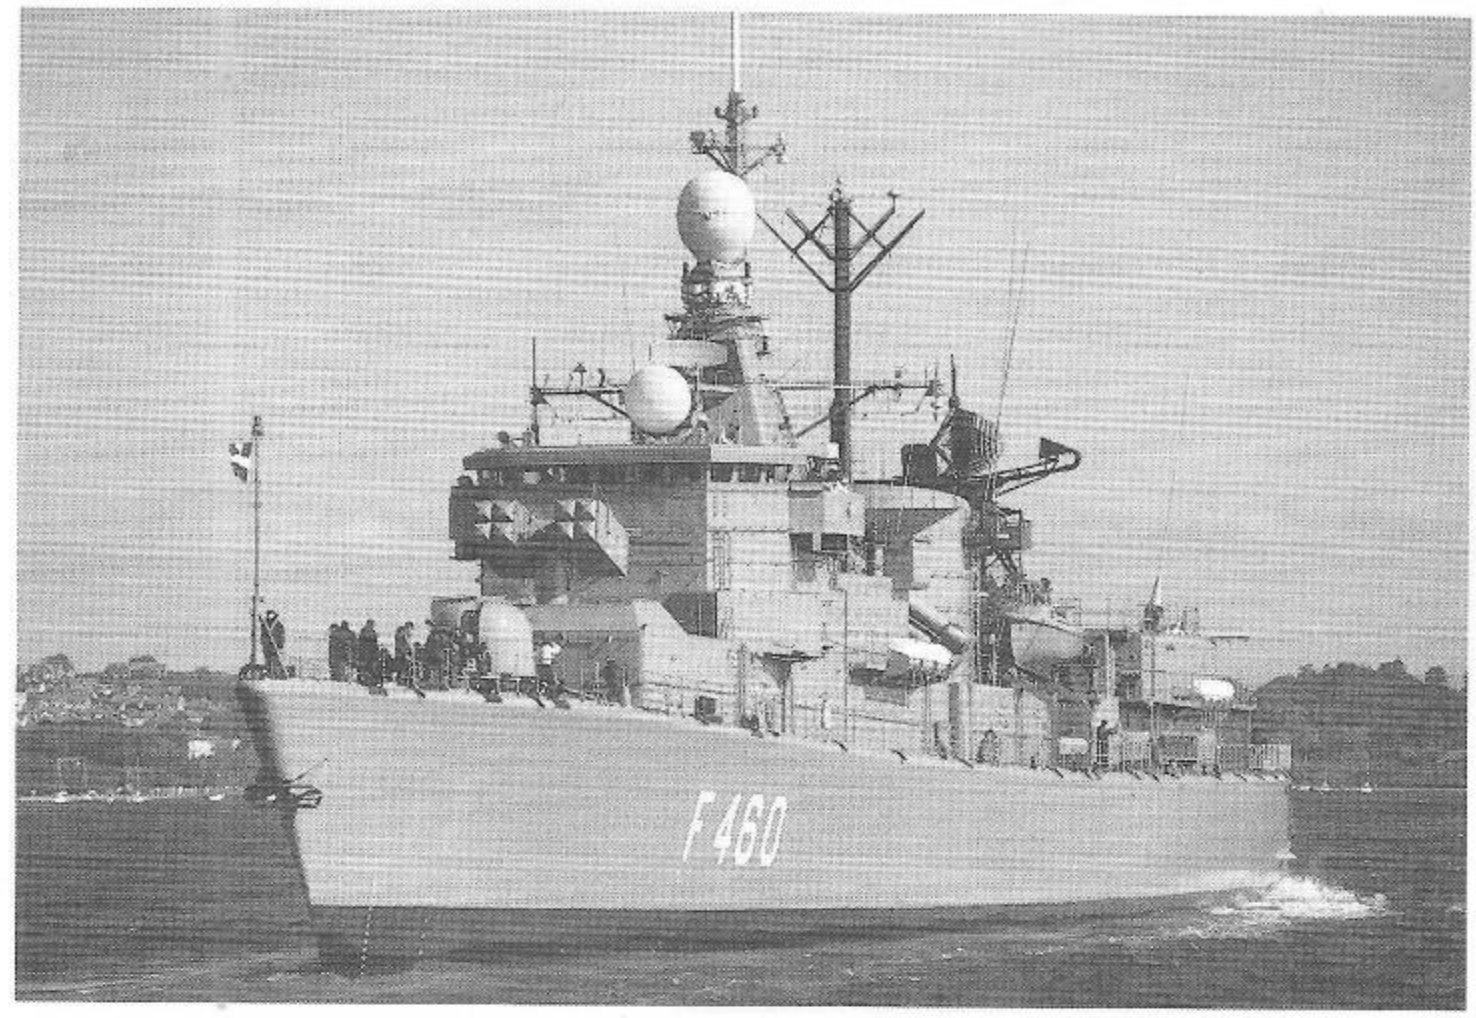
The system consists of an M46A2 launcher assembly with grip-stock, sighting system, an M41 missile in its launcher-container, and a battery coolant device which is fitted to the M46A2. On acquiring a target the operator activates the battery coolant unit and uses the optical sighting system (×7.5 magnification; 25° field of view) to track the target until the missile seeker 'locks on', which generates both audio and visual signals, and the missile is launched. The first stage rocket carries the missile out of the tube and the aerodynamic surfaces deploy, and then, after 1.6 seconds, by which time the missile is 6-7 m (19.6-23 ft) ahead of the operator, the sustainer motor ignites, the warhead is armed, and the seeker constantly measures the difference between the gyro line of sight and the IR source. Throughout the engagement the seeker is continuously repositioned to remain aimed at the target.

Specifications

FIM-43
Length: 1.28 m (4.2 ft)
Diameter: 70 cm (27.5 in)
Weight: 8.2 kg (18.0 lb)
Speed: Mach 1.6
Range: 3,300 m (10,827 ft)
Altitude: 3,000 m (9,843 ft)
Guidance: IR passive homing

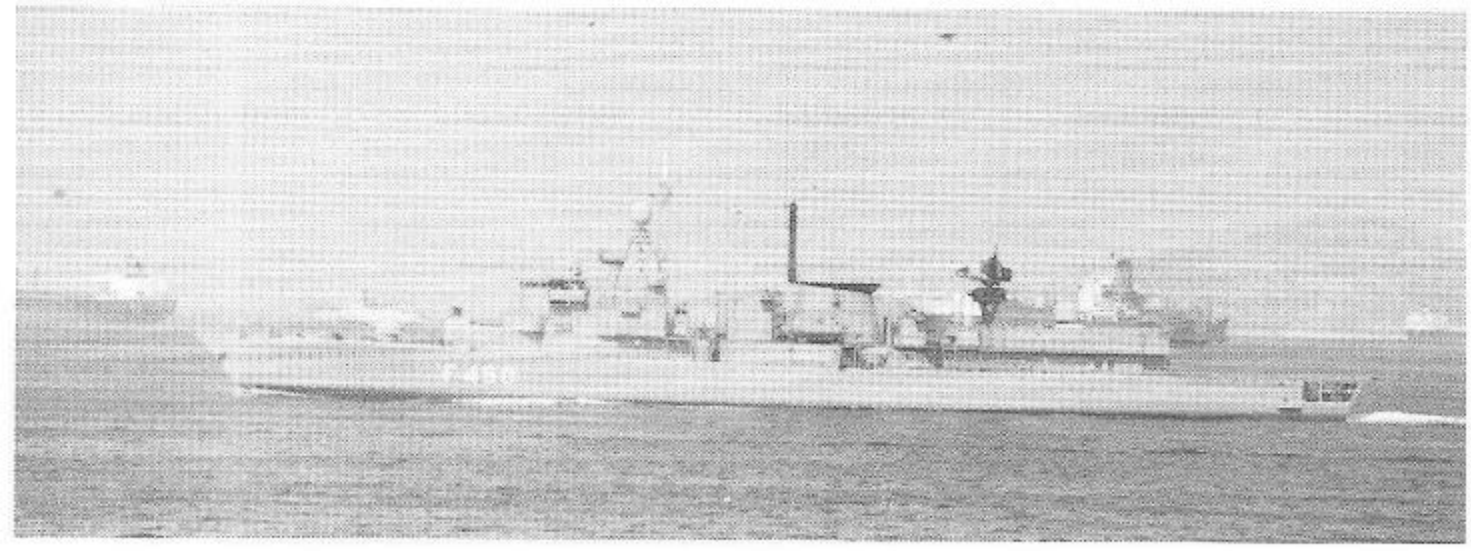
Manufacturers/Contractors

Hughes Missile Systems (prime).
Raytheon Company, Missile Systems Division (second source).
Dornier GmbH (prime European).



Aegeon *(F 460). Weapons include 76 mm gun ('A' position), Mk 29 eight-cell launcher for NATO Sea Sparrow SAM ('B' position) and eight Harpoons (tail end of port-side quad launcher is visible to the left of ship's boat). The 'collar' of DF arrays for the Signaal Sphinx can also be seen below the WM25 Signaal 'egg'* (Jane's/H M Steele)

Navarinon *(F 461) with one 76 mm and two Mk 15 CIWS* (H & L van Ginderen Collection)



Elli *(F 450) the original ship in the Greek Kortenaer class and one of two purchased as new-builds. Note the extended hangar, necessary to accommodate the Greek Navy's AB 212ASW helicopters and the gun armament of two 76 mm and two Mk 15 CIWS* (H & L van Ginderen Collection)

TUBES

Two twin 324 mm US Mk 32 torpedo tubes are mounted at the forward end of the after superstructure. Sixteen Mk 46 Mod 1 torpedoes are carried.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 1/2, 324 mm torpedoes

Specifications

Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts

Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 76 mm (3 in)/62 Compact

The two original Greek ships (*Elli* (F 450) and *Limnos* (F 451)) both have two OTOBREDA 76 mm (3 in) guns. One is sited, as with all other 'Kortenaer' class and Type 122 ships, in the 'A' position on the foredeck. The second gun is sited on the hangar roof. The ex-RNethN ships were transferred with the normal Dutch fit of one 76 mm gun in 'A' position. For future plans see 'Further Information' below.

Specifications

Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/sec
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy

Hughes Mk 15 CIWS Phalanx

There are two Hughes Mk 15 CIWS Phalanx close in weapons systems (CIWS), which are mounted either side of the forward end of the hangar roof. The mounts consist of a 20 mm M61A1, six-barrel, Gatling-principle gun with a cylindrical magazine and feeding mechanism suspended beneath. Firing usually begins at 1 n miles (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 3,000 rds/min (Block 0, Block 1 Baseline 0), 4,500 rds/min (Block 1 Baseline 1)
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor

Hughes Missile Systems, Tucson, Arizona, USA (system).

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Signaal SPHINX

SPHINX (System for Passive Handling of INtercepted Xmissions) is a radar warning system covering the frequencies 1-18 GHz.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

ELECTRONIC COUNTERMEASURES (ECM)

Signaal RAMSES ECM SYSTEM

The Signaal Reprogrammable Advanced Multimode Shipborne ECM System (RAMSES) countermeasures system provides protection against I/J-band radar threats. It is an integrated responsive jammer capable of long-range jamming of search radars and the deception of missiles once launched. In its normal mode of operation, RAMSES is interconnected to and controlled from the ship's ESM systems and a dedicated ECM operator is not required, but in the back-up mode RAMSES can be manually controlled (target designation and jamming) from a remote-control panel located conveniently near the EW operator. RAMSES is capable of high pulse and CW Effective Radiated Power (ERP). Multimode jamming operation is possible with multitarget handling capability. The system is reprogrammable and power management is provided. The antennas are fully trainable (port and starboard, each through 180°) and are stabilised for roll and pitch.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

DECOYS

Loral Hycor SRBOC Mk 6-barrelled Chaff Launcher

The two original Greek ships have two six-barrelled Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units abreast the bridge. (They originally had two British Corvus mounted at the forward end of the hangar, but these were removed when the Mk 15 Phalanx CIWS were installed.) The ex-RNethN ships still have four SRBOC pending installation of the CIWS.

Specifications

Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturers/Contractors

Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

SEWACO II sensor, weapon control and command system

Both the original two ships and the later ships bought from the RNethN are fitted with SEWACO II. Sensors include the Signaal LW-08, and ZW-06 radars, the combined search and tracking radar of the WM25 weapon control system and ESM system, two optical target designation sights and an automatic datalink. Non-Signaal sensors include IFF, a helicopter transponder system and the AN/SQS-505 sonar set. The SEWACO system consists of Signaal's Digital Action Information SYstem (DAISY), WM25 weapon control system, including a Separate Tracking and Illumination Radar (STIR) on which a TV camera is mounted, while the weapons fit comprises the OTO Melara 76/62 dual-purpose gun, Harpoon SSM, NATO Sea Sparrow, ASW torpedoes and a Lynx ASW helicopter. SEWACO II's functions include:

- air, surface and subsurface warning
- compilation and display of tactical air, surface and subsurface situations
- threat evaluation and target engagement in AAW, EW, ASuW, ASW and NGS
- navigation including ASW helicopter direction
- communication including tactical datalink operation
- onboard scenario-driven training
- organisation and system management.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

RADARS

Type	LW-08	ZW-06	STIR	WM25

SONAR

Westinghouse AN/SQS-505 hull-mounted search and attack sonar

AN/SQS-505 is installed in all these ships. The Canadian Westinghouse AN/SQS-505 sonar is a hull-mounted 7 kHz, search and attack sonar. It is a deep water, omnidirectional, surveillance system, but is also able to operate in a directional mode that can maintain search ability while tracking defined targets. Three selectable frequencies are available so that several ships can survey an area in close proximity without cross-talk.

In high sea states leading to excessive roll and pitch of the ship, the AN/SQS-505 utilises transmit beam stabilisation, which delays transmission until near optimum roll and submergence conditions prevail, thereby minimising chances of the target being missed altogether.

Specifications

Coverage: 360° (azimuth)
Range: 183-3,000 m (200-3,200 yd)
Doppler range: ±40 kts (7.2 kHz)
Displays: Range (A Scan); Bearing (B Scan)
Doppler frequencies: 6.4, 7.2 and 8.0 kHz
Source levels: From 224.233 dB/µPa/m (transmission mode dependent)
Initial detection: 12 ping history of returns
Bearing accuracy: 1° RMS
Range accuracy: ±1% range reading
Transmission modes: Omni, TRDT, DT, ASPECT
Power level: High and low (10 dB reduction)

Manufacturers/Contractors

Westinghouse Canada Inc, Burlington, Ontario, Canada

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 24.5 m × 14.6 m (80 × 47.9 ft)
Hangar: Because the AB-212ASW is larger than the Lynx, the hangar in the original two Greek ships was lengthened by 2.2 m (7.22 ft) during construction. This does not apply, as yet, to the ex-RNethN ships
Helicopters: 2 Agusta-Bell AB 212ASW helicopters

Agusta-Bell AB 212ASW

Specifications

Main rotor diameter: 14.63 m (48.0 ft)
Length overall (both rotors turning): 22.15 m (57.08 ft)
Fuselage length: 12.92 m (42.39 ft)
Height to rotor head: 3.91 m (12.82 ft)
Rotor disc area: 168.1 m² (1,809 sq ft)
Max take-off weight: 5,070 kg (11,177 lb)
Max speed (never exceed): 130 kts (240 km/h)
Typical cruising speed: 100 kts (185 km/h)
Hovering ceiling (out of ground effect): 396 m (1,300 ft)
Range with max standard fuel: 332 n miles (615 km)
Engine: 1 Pratt & Whitney Canada PT6T-6 Turbo Twin-Pac rated at 1,398 kW (1,875 shp)
Role equipment: Torpedoes

PROPULSION

Specifications

System: Combined gas turbine or gas turbine (COGOG)
Main machinery: 2 Rolls-Royce Olympus TM3B gas turbines; 39.7 MW (50,880 hp) sustained; 2 Rolls-Royce Tyne RM1C gas-turbines; 7.4 MW (9,900 hp) sustained
Propellers: cp

FURTHER INFORMATION

PROGRAMME

The original contract for the purchase of one of the 'Kortenaer' class then building for the Netherlands' Navy was signed with the Netherlands on 15 September 1980, and included an option on a second ship. This option was taken up on 7 June 1981, but a plan to construct a third ship in Greece was dropped, due to financial problems.

After a gap of some ten years, a second contract was signed on 9 November 1992, under which three ex-RNethN ships were transferred. It is expected that the Greek Navy will also purchase a sixth hull (probably *Kortenaer* (F 807) from the RNethN when it becomes available.

MODERNISATION

In the late 1980s it was planned to replace the after 76 mm gun with a single Mk 15 Phalanx CIWS. When Gulf deployments were undertaken in 1990-91, however, the 76 mm gun was retained and two Mk 15 Phalanx fitted on modified platforms at the forward end of the hangar, which had been previously occupied by Corvus launchers. Two new SRBOC launchers were fitted either side of the bridge.

It had been planned that the three ex-Netherlands ships would be modified to the same standard. This would have involved installing a second 76 mm gun on the hangar roof and two Mk 15 Phalanx to replace the Goalkeeper which was removed before transfer. However, as there is a shortage of funds it is now intended to mount a single Mk 15 Phalanx in the hangar roof, although the hangar will still be lengthened to accommodate the two AB 212ASW.

Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

MISSILE LAUNCHERS

Mk 13 Mod 4 launcher
There is one Mk 13 Mod 4 single-arm launcher located aft, which is used to launch Standard SM-1MR SAMs. There are 40 missiles stored vertically in a below-decks magazine in two concentric rings. Launching rate is one missile every 10 seconds. Mod 4 introduced solid-state technology, replacing the electromechanical relays in Mods 1-3.

Mk 29 launcher
One Mk 29 octuple launcher is located atop a platform deck on the foredeck. The Mk 29 can launch one missile every ten seconds.

TUBES

Two twin 324 mm US Mk 32 torpedo tubes are mounted at the forward end of the after superstructure.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

Signaal/Hughes SGE-30 30mm Goalkeeper close in weapons system
One Signaal/Hughes 30 mm 7-barrelled Gatling Goalkeeper close in weapons system is mounted on the quarterdeck. Goalkeeper is an autonomous, fully automatic system, consisting of a Hughes Sea Vulcan 30 gun, I-band search radar, I/K-band tracking radar, TV camera, and ancillaries. The Sea Vulcan 30 is based upon the electrohydraulically powered GAU-8/A 30 mm seven-barrel, Gatling gun, with each barrel firing once during each revolution of the barrel cluster. The gun is very reliable, with 33,000 mean rounds between stoppages. The mounting has an ammunition capacity of 1,190 rounds carried in a linkless system using a feed and storage drum, which is claimed to be sufficient for several target engagements before reloading is necessary. The warhead kill capability of Goalkeeper against anti-ship missiles is achieved by use of MPDS rounds which have high-density, tungsten-alloy penetrators. For 'soft' targets, HEI and TP types of ammunition can be used.

The I-band search radar uses a 2,050 × 280 mm linear array antenna with an integrated sidelobe suppression antenna. The antenna rotates at 60 rpm and has a horizontal beamwidth of 1.7° and a vertical beamwidth of 60°. The radar is powered by a water-cooled, synthesiser-driven, TWT transmitter with high output power for greater frequency and PRF flexibility in the face of ECM threats.

Specifications
Calibre: 30 mm
Muzzle velocity: 1,020 m/s (TP, HEI); 1,150 m/s (APDS)
Traverse: 360°
Elevation: −25 to +85°
Mounting weight: 6,800 kg (14,994 lb)
Crew: 0
Range: 200 m to 3 km (1.61 n miles)
Rate of fire: 4,200 rds/min
Ammunition: 369 g (TP, HEI, HEISD, API, MPDS)

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands (system/radar).

Oerlikon 20 mm
Two single Oerlikon 20 mm guns are mounted either side of the bridge superstructure abreast the foremast.

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2.740 ft/s)
Range:
anti-surface: 0.93 n miles (1.5 km)
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +55°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Signaal SPHINX

SPHINX (System for Passive Handling of INtercepted Xmissions) is a radar warning system covering the frequencies 1-18 GHz.

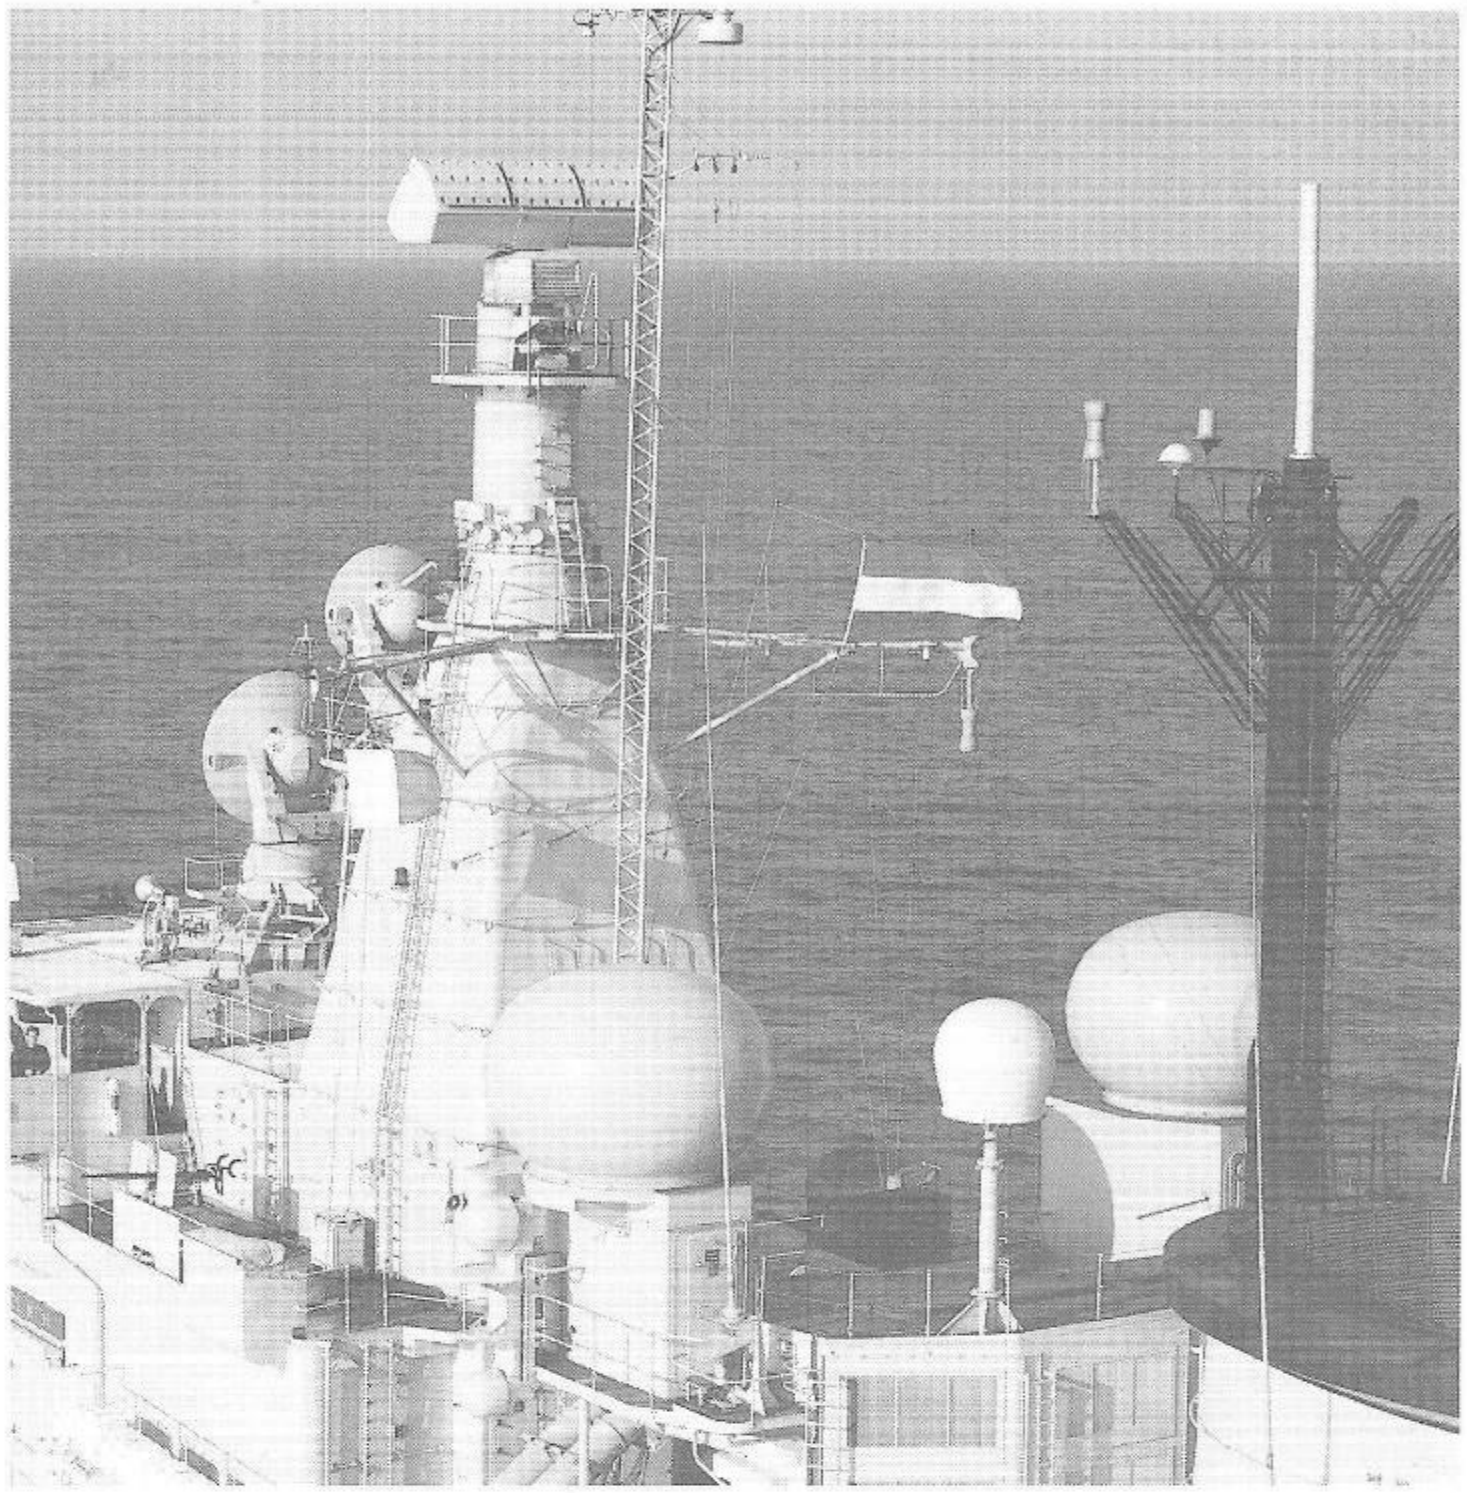
RAMSES jammer system

Signaal's Reprogrammable Advanced Multimode Shipborne ECM System (RAMSES) is a modular naval electronic countermeasures system designed principally to provide protection for ships against radar threats. It is an integrated responsive jammer capable of long-range jamming of search radars and the deception of missiles once launched. In its normal mode of operation, RAMSES is controlled by the Signaal SPHINX, so a dedicated ECM operator is not therefore required. In the back-up mode, RAMSES can be manually controlled (target designation and jamming) from the remote-control panel located conveniently near the EW operator.

RAMSES operates in I/J-band and is capable of high pulse and CW Effective Radiated Power (ERP). Multimode jamming operation is possible with multitarget handling capability. There are two antennas in small 'egg-shaped' radomes on each side of the ship, abaft the foremast and immediately below the Satcom antennas. The two RAMSES antennas are vertically separated with the receive antenna uppermost and a radiation-reflecting plate between them. On receiving orders from SPHINX, the RAMSES receiver trains towards the designated threat, searches for it and then locks onto it, whereupon the system automatically triggers a programmed response. With two separate systems, two targets can be handled simultaneously, but, in addition to this, jamming sequences for the next targets can be set up, so that as soon as one target has been dealt with the next can be tackled.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.



Close-up of Witte de With *(F 813). At the masthead is the Signaal SMART air surface search radar and below it the RAMSES DF array encircles the tower. On the front of the tower is a Signaal STIR 180 and below it on the bridge roof a STIR 240. In the foreground are two 'mushroom' radomes for satellite antennas and below the left one is a RAMSES jammer installation with two small radomes separated by two radiation-reflecting plates. Note also the Oerlikon 20 mm cannon on the bridge wing* (Royal Netherlands Navy via Signaal)

DECOYS

Loral Hycor SRBOC Mk 6-barrelled Chaff Launcher

There are two six-barrelled, fixed, Mk 36 SRBOC launchers immediately below the mainmast.

Specifications

Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturers/Contractors

Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEM

Signaal SEWACO VI action data automation

The four elements in the SEWACO VI system are:

- sensors consisting of primary 2/3D radar systems for long-, medium- and short-range air and surface warning, secondary radar sensors such as IFF and helicopter transponders, hull-mounted sonar systems, and passive sensors such as ESM and IR sensors. Automatic initiation and tracking of air and surface targets is released by built-in track capability or additional primary and secondary video extractors
- the DAISY system comprising operator consoles, plotting table, conference display and the command and control software package
- weapon control system comprising active and/or passive target tracking and/or illumination systems, weapon interface systems for interfacing with hard-kill and soft-kill weapons and close in weapon control systems
- a communications system with internal and external communication equipment and automatic datalink systems.

Functions performed include:

- air, surface and subsurface warning
- compilation and display of tactical air, surface and subsurface situations
- threat evaluation and target engagement in AAW, EW, ASuW, ASW and NGS
- navigation including ASW helicopter direction
- communication including tactical datalink operation
- onboard scenario-driven training
- organisation and system management.

SEWACO VI was specially designed for the RNethN's 'Jacob van Heemskerck' class air defence frigates and comprises: Signaal LW-08 extended range/elevation version, a stabilised DA-05, ZW-06 and Goalkeeper search radar sensors; multiple video extractor systems; a SPHINX ESM system; RAMSES ECM system; two optical target designation sights; the GMCS guided missile control system, consisting of three STIRs (one 1.8 m (5.9 ft) and two 2.4 m (7.9 ft) scanners) with high-power coherent transmitter chains. CW illumination for Standard SM1 MR and for Sea Sparrow missiles is provided by each STIR. The system provides a high level of autonomy by means of automatic threat evaluation and STIR and weapon selection for automatic target engagement.

The DAISY system includes six vertical consoles, two horizontal consoles and a sonar display console, primary and secondary video extractors. In addition to the normal DAISY functions it has extensive air defence software facilities. IFF, VESTA and datalink are also integrated in the SEWACO system. The weapons are the SM1-MR to be launched by a Mk 13 Mod 4 launcher, Sea Sparrow from eight-cell launcher, Harpoon surface-to-surface missiles, RBOC countermeasures, Mk 46 torpedoes and the EX 83 30 mm gun portion of the Goalkeeper CIWS.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 11; JMCIS (may be fitted)
Satcom: The SHF Satcom system is based on the US Navy AN/WSC-6, with twin aerials providing 360° coverage, even at high latitudes

Jacob van Heemskerck *(F 812) (left) and* Witte de With *(F 813) (right). Note that F 812 has a DA 08 at the masthead while F 813 has a SMART radar* (RNethN)

SONAR

AN/SQS-509 hull-mounted search and attack sonar

AN/SQS-509, an improved version of AN/SQS-505, is installed in both these ships.

Specifications

Coverage: 360° (azimuth)
Range: 183-3,000 m (200-3,200 yd)
Doppler range: ±40 kts (7.2 kHz)
Displays: Range (A Scan); Bearing (B Scan)
Doppler frequencies: 4.8, 5.4 and 6.0 kHz
Doppler limits: ±40 kts
Passive frequency: 3.125 kHz
Source levels: From 224.233 dB/µPa/m (transmission mode dependent)
Initial detection: 12 ping history of returns
Bearing accuracy: 1° RMS
Range accuracy: ±1% range reading
Transmission modes: Omni, TRDT, DT, ASPECT
Power level: High and low (12 dB reduction)

PROPULSION

Specifications

System: Combined gas turbine or gas turbine (COGOG)
Main machinery: 2 Rolls-Royce Olympus TM3B gas turbines; 37.9 MW (50,880 hp) sustained; 2 Rolls-Royce Tyne RM1C gas-turbines; 7.4 MW (9,900 hp) sustained
Shafts: 2
Propellers: cp

FURTHER INFORMATION

PROGRAMME

In the 1970s the RNethN undertook a commitment to NATO to provide four ASW task groups in the North Atlantic in war. Each of those task groups required a flagship/air defence ship and the two 'Tromp' class frigates were already available for this role.

Thus, there was a requirement for two further flagship/air defence ships for the remaining two task groups and the sale of two ASW Kortenaers to Greece provided the opportunity to construct the two required ships on a Kortenaer hull.

DESIGN

The 'Jacob van Heemskerck' class is identical in dimensions and propulsion to the ASW Kortenaer, and has a number of the same weapons systems, such as Harpoon, NATO Sea Sparrow, Goalkeeper and Mk 32 torpedo tubes. The major differences lie in the deletion of the 76 mm gun, and the replacement of the hangar and flight deck by a large magazine and launcher for Standard SM-1MR SAMs.

MODERNISATION

In-service upgrading has included fitting twin Satcom terminals: to F 812 in 1993, and to F 813 in 1994/95. Signaal SMART radar replaced DA 05 in F 813 in 1994 and in F 812 in 1995/96.

A 'Capability Upkeep Programme' (CUP) had been planned to take place between 1999 and 2002, but it is now intended to cancel this in order to free the funds to purchase two additional LF frigates (see 'LCF' entry).

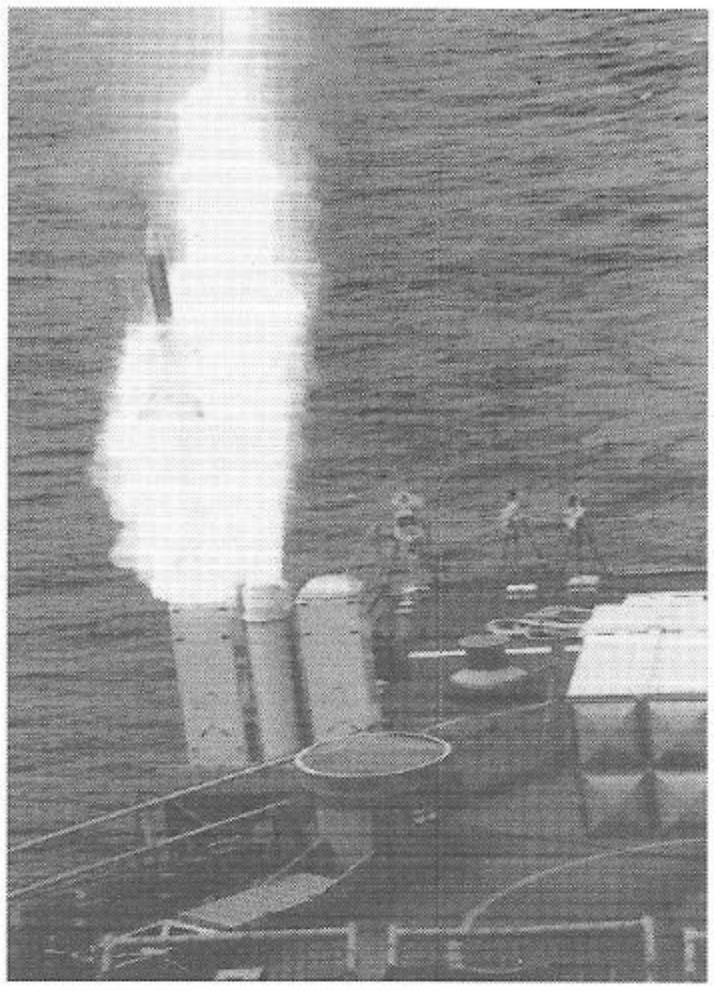
WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84C Block 1C Harpoon

Eight Harpoon anti-ship missile canisters are mounted immediately abaft the stack; there are two groups of four launchers, with each group pointing across the ship to the opposite beam. The missiles are the Block 1C version, which has additional options, compared to previous blocks, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-



NATO Sea Sparrow SAM lifts off from the Mk 48 launcher with the rocket efflux being directed outboard across the ship's rails. At the after end of the row of missile tubes is the drum-like antenna array of the APECS-II ESM/ECM system (Royal Netherlands Navy)

Van Galen *(F 834) in the North Atlantic waters for which the class was designed. The very neat installation for the Sea Sparrow missiles down the port side of the hangar can be seen, as can the two APECS-II arrays — one at the after end of the hangar, the other on the starboard side of the bridge screen*

skimming approach or a low-apogee 'pop-up' trajectory.

Specifications

Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile)
US Naval Weapons Center, China Lake, California, USA (warhead)
Thiokol, Elkton, Maryland, USA (booster)

SURFACE-TO-AIR MISSILES (SAM)

Mk 48 Mod 1 VLS

There is one Mk 48 Mod 1 VLS with eight pairs of twin launch canisters in a single row along the port side of the hangar. The units are made up of pairs of vertical canisters, each with its own efflux system, which turns the gases through 90° to exhaust over the ship's side.

Raytheon Sea Sparrow point-defence missile system

The system uses RIM-7M Sea Sparrow missiles, with two STIR illuminators. The system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg blast fragmentation warhead and a dual-purpose proximity impact fuze.

Specifications

RIM-7M
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 226.8 kg (500 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturer/Contractors

Raytheon Company, Equipment Division (prime system contractor).
Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

TUBES

Two 324 mm US Mk 32 torpedo tubes are mounted at the forward end of the after superstructure.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications

Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 76 mm (3 in)/62 Mk 100 Compact

There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck. This is the latest version with an improved rate of fire.

Specifications

Calibre: 76.2 mm (3.0 in)
Barrel length: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 100 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

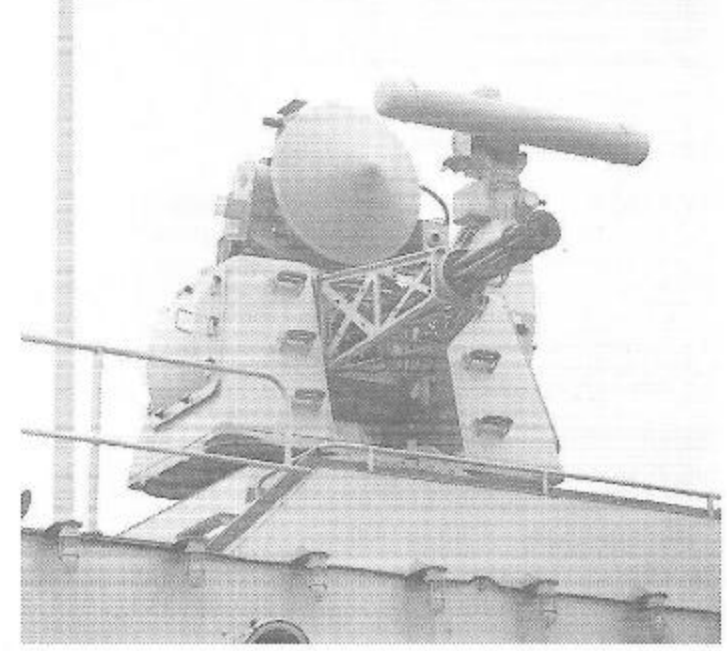
Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.

Signaal/Hughes SGE-30 30 mm Goalkeeper close in weapons system

One Signaal/Hughes 30 mm 7-barrelled Gatling Goalkeeper close in weapons system is mounted in the hangar roof on the port side. Goalkeeper is an autonomous, fully automatic system, consisting of a Hughes Sea Vulcan 30 gun, I-band search radar, I/K-band tracking radar, TV camera, and ancillaries. The Sea Vulcan 30 is based upon the electrohydraulically powered GAU-8/A 30 mm seven-barrel, Gatling gun, with each barrel firing once during each revolution of the barrel cluster. The gun is very reliable, with 33,000 mean rounds between stoppages. The mounting has an ammunition capacity of 1,190 rounds carried in a linkless system using a feed and storage drum, which is claimed to be sufficient for several target engagements before reloading is necessary. The warhead kill capability of Goalkeeper against anti-ship missiles is achieved by use of MPDS rounds which have high-density, tungsten-alloy penetrators. For 'soft' targets, HEI and TP types of ammunition can be used.

The I-band search radar uses a 2,050 × 280 mm linear array antenna with an integrated sidelobe



Signaal SGE-30 Goalkeeper, combines the Hughes Vulcan 30 mm Gatling seven-barrel gun with Signaal radar and control systems. Firing rate is 4,200 rounds per minute (Signaal)

suppression antenna. The antenna rotates at 60 rpm and has a horizontal beamwidth of 1.7° and a vertical beamwidth of 60°. The radar is powered by a water-cooled, synthesiser-driven, TWT transmitter with high output power for greater frequency and PRF flexibility in the face of ECM threats.

Specifications
Calibre: 30 mm
Muzzle velocity: 1,020 m/s (TP, HEI); 1,150 m/s (APDS)
Traverse: 360°
Elevation: −25 to +85°
Mounting weight: 6,800 kg
Crew: 0
Range: 1.61 n miles (200 m to 3 km)
Rate of fire: 4,200 rds/min
Ammunition: 369 g (TP, HEI, HEISD, API, MPDS)

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands (system/radar)

Oerlikon 20 mm
Two single Oerlikon 20 mm guns are mounted either side of the bridge superstructure.

Specifications
Calibre: 20 mm
Barrel length: 70 calibres
Muzzle velocity: 835 m/s (2.740 ft/s)
Range:
surface target: 1.5 km
air target: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +55°

ELECTRONIC WARFARE SYSTEMS

ELECTROMAGNETIC SUPPORT MEASURES/COUNTERMEASURES (ESM/ECM)

APECS II radar detection and jamming system
APECS II is an advanced modular ESM/ECM system covering frequencies from 0.5 to 18 GHz, which is designed to counter most known radar threats. It is a fully automatic system, identifying and jamming threat emitters using a mixture of IFM receivers and microprocessor-controlled jammers, with high-speed switching enabling up to 16 threats to be jammed simultaneously. There are two arrays: one is mounted on a small platform on the starboard side of the bridge screen and the other on the after port corner of the hangar. Both consist of two DF arrays, one omnidirectional unit and two monopulse units; system processing equipment.

Specifications
ESM frequency coverage: 0.5-18 GHz
High sensitivity: up to −67 dBm
Detection range: 200 n miles ships; 50 n miles aircraft
DF accuracy: 4° RMS; 2° RMS fine DF
Automatic tracking: 500 active signals in dense signal environment
Signal identification speed: <1s
ECM azimuth coverage: 360° using a 60-beam jammer (one beam per 6° azimuth sector)
Radiated power: 180 kW nominal mid-band
ECM frequency coverage: 7.5-18 GHz

Manufacturer/Contractor
ARGOSystems Inc, Sunnyvale, California.

DECOYS

Two Loral Hycor SRBOC
There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Rounds
Mark 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

COMMAND AND CONTROL SYSTEMS

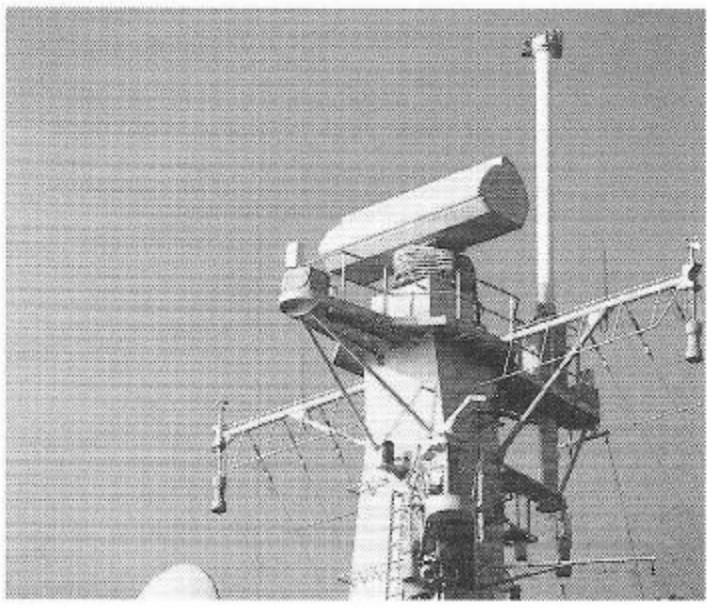
COMBAT DATA SYSTEMS

SEWACO VIIB
SEWACO VIIB is installed in the Royal Netherlands Navy's eight 'Karel Doorman' class frigates (M-frigate) and is the first of a new generation of SEWACO systems with an increased level of integration and automation.

The core system comprises three computer complexes: Data Handling Computer Complex (two SMR-4 and one SMR-MU computers); Communications Complex (two SMR-4 computers); and Mass Memory and Message Handling Complex (two mainframe VAX 4000, two MC-68030 multiprocessor nodes). Each of these complexes has two elements, which are split between the fore and aft ends of the ship to ensure survivability. Connections between the elements are achieved by three separate systems: the system databus (triple Ethernet connection); voice and communications databus (fibre optic ring); video bus (compiled from CCTV components). All buses feature automatic reconfiguration to implement bypasses in the event of damage. In addition, the sensors are connected with the core system, either by interfacing with the bus, or via duplicated direct links.

The sensors are, in general, autonomous subsystems with embedded processing power enabling them to convert detected targets into tracks automatically. Radars are:
- LW-08 — long-range, 2D, D-band radar, with IFF
- SMART-S — medium-range, 3D, F-band radar

Sonars:
- PHS-36 — hull-mounted active/passive system
- TACTAS — long-range, towed array



Main air/surface search radar is the Signaal SMART, located at the masthead. The small arrays on the fore and aft platforms are part of the Argo APECS-II ESM/ECM system, and the antenna on the spiralled platform below is for the navigational Racal-Decca 1226 (Signaal)

ESM:
- APECS II – EW system

Weapons systems are also mainly autonomous subsystems, with their own embedded processors responsible for automatic handling of engagements, the most important elements being:
- MultiPurpose Weapon Control System (MWCS), which controls the vertically launched Sea Sparrow SAM and the 76 mm gun
- The two STIR tracking systems and both weapons systems are scheduled and assigned to the most important targets automatically
- Harpoon surface-to-surface missile system
- Goalkeeper CIWS accepts and engages targets assigned by the core system, but also has the ability to conduct autonomous engagements within set parameters
- The ECM system can conduct noise and deception repeater jamming on orders from the core system.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

COMMUNICATIONS AND DATALINKS

Satellite communications: Electrospace SHF

SONARS

Signaal PHS-36 hull-mounted search and attack sonar

The PHS-36 provides information for the data handling functions of active sonar, passive sonar, acoustic support and track management and other functions such as equipment monitoring. The sound velocity processing and recording system also provides data for acoustic support.

The transducer is based on that of the French TSM 2080 but with Signaal electronics. A colour-coded presentation on a Signaal GOS, high-resolution console gives a graphic picture of sonar information. The dual-processing system performs FM and CW processing

The second element in the air/surface search system is the Signaal LW 08, a D-band radar with an IFF interrogator above the main array (Signaal)

simultaneously to cope with both noise-limited and reverberation-limited conditions, as well as with a variety of submarine running conditions as provided for ASW scenarios. The main functions performed by the sonar processor are auto-detection, auto-track initiation and auto-track processing.

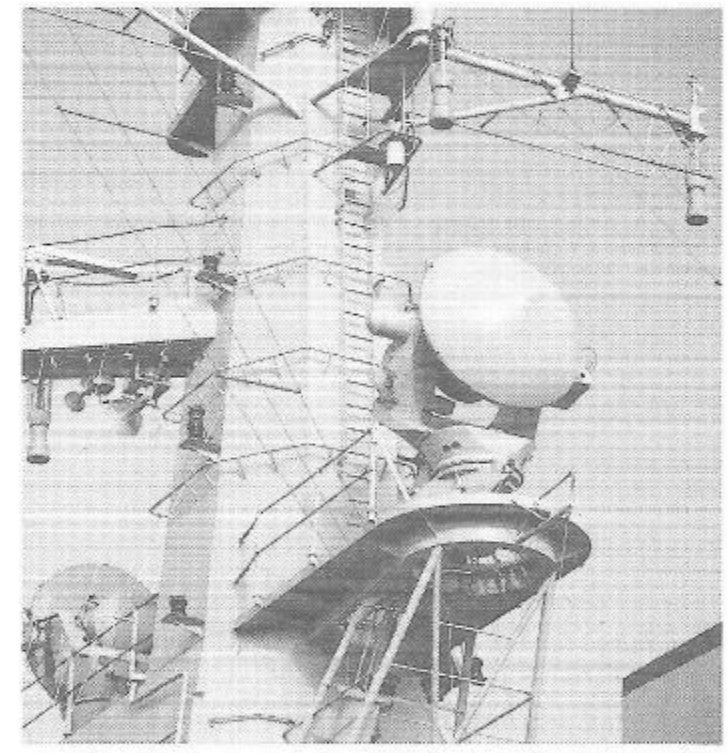
Specifications

Transmission
Frequencies: 5.5 kHz, 6.5 kHz, 7.5 kHz
Pulse type: CW, FM, FM + CW (a sequential transmission per interval)
Pulse length: 75-1,200 ms depending on range-scale/pulse type selections

Reception
Preformed beams: 32
Bandwidth passive mode: Band I low; Band II high
Accuracy:
Range: CW (300 ms) <70 yd; FM <20 yd
Bearing: <2°
Doppler speed: CW (300 ms) <0.2 kts
Vertical beamwidth: 13° (narrow beam); 24° (wide beam)

Manufacturer/Contractor

Hollandse Signaalapparaten, Hengelo, Netherlands.



There are two Signaal STIR (Signaal Target Indication Radars), one forward and one aft of the mast. These provide I- and K-band tracking and target illumination for missile and gunfire control (Signaal)

Anaconda Tactical Towed Array Sonar (TACTAS)

Thomson-CSF Sonar produced an export TACTAS, specifically for the M-type frigates, which was derived from the French Navy's DSBV 61A, with an advanced technology sonar receiver built around the Mustang processor. This latter equipment was developed by Thomson-CSF to increase the performance of all sonars, particularly in automatic detection, narrowband analysis, automatic tracking, adaptive beam-forming and self-noise cancellation. Anaconda is a very low-frequency passive towed array sonar system consisting of a linear array, a towing cable (which is also used for data transmission), a winch for handling and storage of array and cable, and the necessary signal processing and data extraction electronics. The 'dry-end' interfaces with SEWACO VII. The design allows two selectable towing modes: critical angle towing or towing behind a VDS 'fish'.

Manufacturer/Contractor

Thomson-Sintra, France.

AVIATION

AVIATION FACILITIES

Specifications
Flight deck: 24.2 m (79.5 ft) × 14.4 m (47.2 ft)
Hangar: Single hangar

HELICOPTER

One Westland SH-14D Lynx
(Note: all RNethN SH-14B/C Lynxes have now been converted to SH-14D standard.)

Specifications

Dimensions:
main rotor diameter: 12.80 m (42.00 ft)
tail rotor diameter: 2.21 m (7.25 ft)
length overall (rotors turning): 15.165 m (49.75 ft)
Weights
empty: 2,740 kg (6,040 lb)
empty, equipped (ASW): 3,343 kg (7,370 lb)
Performance:
cruising speed: 125 kts (232 km/h)
speed for max endurance: 70 kts (130 km/h)
max rate of climb: 661 m (2,170 ft)/min
time on station (ASW) 50 n miles (93 km) radius: 2 h
max range: 320 n miles (593 km)
max endurance: 2 h 50 min
Power plant: 2 Rolls-Royce Gem 42-1 with max contingency rating of 835 kW (1,120 shp)
Crew: 2 (pilot and co-pilot/observer)
Radar: Ferranti Sea Spray Mk 1 lightweight search and tracking radar
Mission: Alcatel DUAV-4 dipping sonar; FLIR systems 2000HP FLIR
Navigation: Trimble Type 2200; Doppler 91
ESM: Ferranti AWARE-3 ESM
ASW armament: 2 Mk 46 homing torpedoes; depth charges

PROPULSION

Specifications
System: Combined diesel or gas turbine (CODOG)
Main engines: 2 Rolls-Royce Spey SM1C; 25.2 MW (33,800 hp) sustained (early ships of the class will initially only have SM1A gas generators and 23 MW (30,800 hp) sustained available); 2 Stork-Wartsila 12 SW 280 diesels; 7.2 MW (9,790 hp(m)) sustained
Shafts: 2
Propellers: cp
Auxiliary generators: 4 diesel generators; each 650 kW
Emergency generator: 1 diesel generator; 120 kW

FURTHER INFORMATION

PROGRAMME

The M-type frigates were required to be multipurpose ships able to operate as part of a task group in any of the world's oceans, but with particular emphasis on the North Atlantic. The principle tasks are anti-submarine warfare, surface action and local air defence, with an additional requirement of serving in a surveillance role towing a TACTAS array. The M-type was intended to take over from the 'Van Speijk' class and was designed in the early 1980s, which meant that, as with so many other designs of that period, the lessons of the Falklands (Malvinas) War were fresh in the minds of the naval staff and the designers.

The declaration of intent was signed on 29 February 1984, although the actual contract was not signed until 29 June 1985, by which time the design had been completed. A further four were ordered on 10 April 1986. Names have been shuffled to make the new *Van Speijk* the last of the class but she has retained her allocated pennant number.

DESIGN

The hull has been optimised to meet the latest design criteria on rolling and pitching, slamming, shipping green water, flight deck movement and minimising underwater radiated noise. The result is a hull with a flared-out bow, a V-shaped stern cross-section and a prominent, full-length knuckle at the G-deck level. There are two controllable-pitch propellers and an unusual arrangement of twin rudders angled out at 20°, which are controlled by an adaptive autopilot and function as combined rudders and stabilisers.

STEALTH

Great attention has been paid to minimising the ships' signatures. IR radiation has been reduced by insulating hot spots such as diesel generator exhausts and the stack, while areas with a high ambient temperature such as the galley have been sited amidships.

Severe limitations have been placed on permitted sound levels. Rotating machinery is mounted on flexible mountings and piping systems are interconnected with flexible couplings. Gear transmissions are claimed to be among the quietest of their type in any ship, while hydrodynamic design of the propellers has been optimised to avoid cavitation. One of the reasons for developing the rudder roll stabilisation is that this produces less noise than the usual stabilisers.

Radar cross-section has also been minimised. Large surfaces have been avoided and the knuckle extends over the entire length of the hull. In the superstructure, right angles have been avoided, all walls and decks avoid the vertical, and the decks are at slightly different angles to avoid presenting large surfaces when the ship rolls.

Van Amstel *(F 831) with a Belgian Navy Alouette III landing onboard. The Dutch and Belgian navies are now under combined control* (H & L van Ginderen Collection)

DAMAGE CONTROL

Considerable attention has been paid to reducing the vulnerability of the ship and its crew, particularly in the light of the Falklands (Malvinas) War.

Firefighting measures include three pump systems with a capacity of 610 m³/h and fire mains are doubled with numerous cross-connections to minimise risk under damage conditions. A portable fire pump is also available.

The spread of smoke, fire and water is inhibited by subdividing the ship into a number of watertight and smoke-tight compartments, and in vital areas (such as the engine rooms) special heat-resistant materials have been fitted to prevent the spread of fires.

NBC protection includes gastight citadels, filter units, an elaborate prewetting system, cleaning stations and extensive distribution of radiological equipment.

All relevant information on fire, flooding and smoke alarms, watertight doors, hatches and NBC filters is displayed on the ship's integrated monitoring and control system.

Extensive electromagnetic pulse protection (EMPP) measures have been taken.

There is a high degree of built-in redundancy in all systems.

MODERNISATION

There were some delays in installing some items of equipment. Early ships did not have the TACTAS towed array and lacked the full EW suite, and the control system was designated SEWACO VII(A) to indicate this. By mid-1994, however, all had been fitted with APECS II EW system and the Anaconda towed array and the SEWACO system was redesignated VII(B) to indicate this.

The recently installed SHF Satcom is based on the USN WSC-6, with twin antennas under the pancake-shaped domes, providing 360° coverage, even at high latitudes.

SMART-L is replacing SMARTY in a programme starting in 1996 and, under present plans, this will in turn be replaced by APAR (Active Phased-Array Radar), starting in about 2003-2004.

TRIALS

A containerised Signaal IRSCAN infra-red detector was fitted on the hangar roof in *Willem van der Zaan* (F 829) for trials in 1993.

WEAPONS SYSTEMS

ANTI-SHIP MISSILES

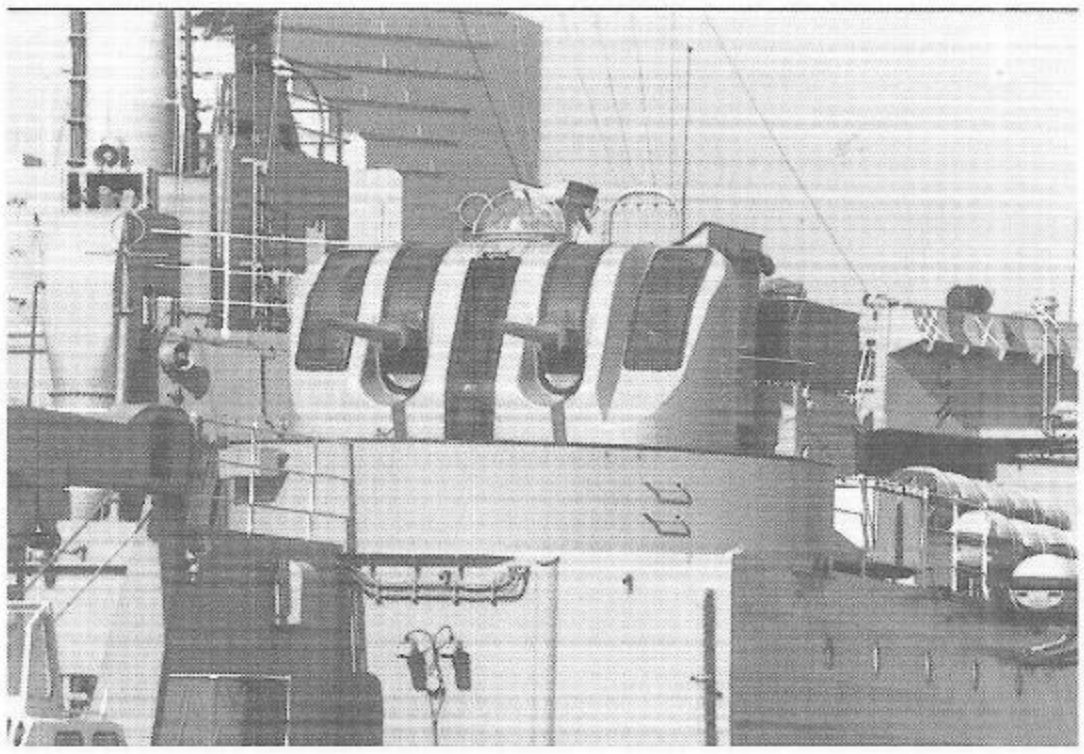
Penguin Mk 2 (RB 12)

Four Penguin Mk 2 missiles are carried in weather-prooof launcher-containers mounted on the quarter-deck. The Penguin is a Norwegian-designed and developed anti-ship missile system consisting of the missile, a launching system and a control cabinet which interfaces with the fire-control system.

The missile is relatively small (3.0 m (9.8 ft) long; 28 cm (11.0 in) in diameter; 1.42 m (4.6 ft) wing span), with a rocket booster/sustainer, a 120 kg (265 lb) semi-armour-piercing warhead (based on the Bullpup missile warhead), and an impact fuze. Compared to the Mk 1, the Mk 2 has an improved IR seeker, a modified inertial navigation unit incorporating angled trajectories and a redesigned actuation system. The shipboard control system consists of a control cabinet based upon a Kongsberg SM-3 computer, an operations panel integrated into the fire-control system and an independent emergency firing panel on the bridge.

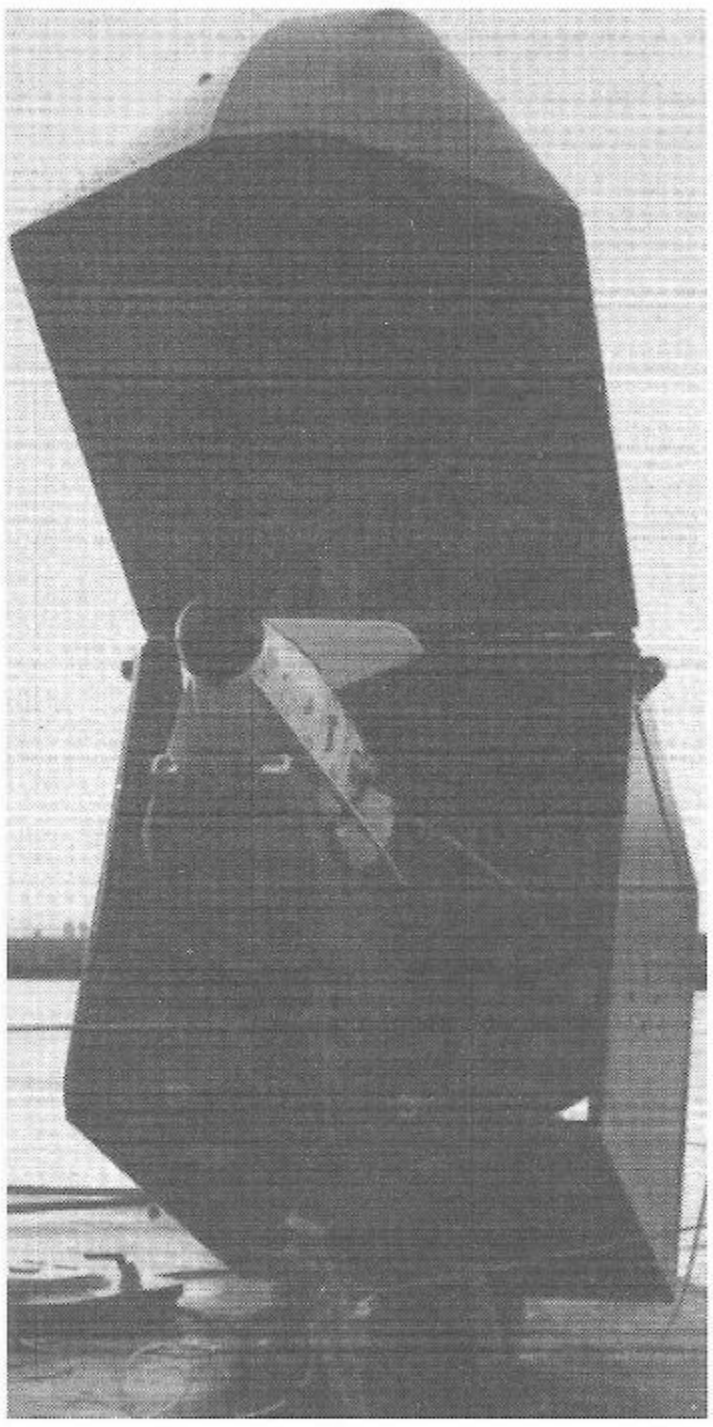
On acquiring the target, the fire-control computer calculates the bearing to the predicted point of impact which is then fed through the missile control system into the missile's inertial navigation system. The operator can select from a set of shapes and sizes of the seeker field and programmes the seeker to ignore some in order to target specific ships. On launch, the booster takes the missile clear of the ship and once at cruising speed the missile follows a programmed course in the target's general direction, the radio altimeter keeping it at a height of 80 m (262 ft). The missile may fly a direct course to the target or it may make one 'dog-leg' to achieve an indirect approach. In the search mode the seeker has two scanning options of varying width. Once the seeker acquires the target it switches to tracking mode for the terminal phase and guides the missile in such a way as to hit the target at a point close to the waterline.

(Note: The Penguin launchers were installed in the late 1970s refit, six launchers being mounted aft. In the late 1980s modernisation, two of those launchers were removed, leaving the present four.)



Twin 76 mm (3 in) guns in Mk 33 mounting of the type in Norway's 'Oslo' class (W Donko)

Narvik *(F 304). For their size, these ships carry a heavy armament. Aft there are four Penguin launchers, one 40 mm Bofors and an eight-cell Sea Sparrow launcher, and forward are twin 76 mm guns and the unusual six-tube Terne III ASW mortar. There are also two sets of triple 324 mm torpedo tubes amidships* (Jane's/HM Steele)



A Norwegian Navy Penguin anti-ship missile in its launch container (NFT)

Specifications
Penguin Mk 2
Length: 3.0 m (9.8 ft)
Diameter: 28 cm (11.0 in)
Span: 1.42 m (4.6 ft)
Launch weight: 340 kg (750 lb)
Speed: Mach 0.8
Range: 1.5-14 n miles (2.5-27 km)
Guidance: Inertial and passive IR

Manufacturer/Contractor
Norsk Forsvarsteknologi (NFT), Kongsberg, Norway.

SURFACE-TO-AIR MISSILES (SAM)

Raytheon Sea Sparrow point-defence missile system
There is a single Mk 29 eight-cell launcher for the NATO Sea Sparrow system which is located aft. The system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg (85.1 lb) blast fragmentation warhead and a dual-purpose proximity impact fuze. The magazine contains 24 missiles.

Specifications
RIM-7M
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 1.02 m (3.35 ft)
Weight: 226.8 kg (500 lb)
Speed: Mach 2.5
Range: 8 n miles (14.5 km)
Warhead (WAU-17/B): 38.6 kg (85.1 lb)
Guidance: Semi-active radar

Manufacturers/Contractors
Raytheon Company, Equipment Division (prime system contractor).
Raytheon Company, Missile Systems Division (prime missile contractor).
Hughes Missile Systems (second missile source).
Naval Weapons Center, Crane, USA (warhead).

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited at the foot of the mainmast.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Sting Ray lightweight anti-submarine weapon
The 'Oslo' class carry British Sting Ray torpedoes.

Specifications
Length: 2.59 m (8.5 ft)
Diameter: 324 mm (12.75 in)
Weight: 267 kg (589 lb) (in air)
Warhead: 35 kg (77 lb)
Speed: 45 kts (estimated)
Range: 6 n miles (11 km) (estimated)
Endurance: Approximately 8 minutes
Depth: 750 m (2,461 ft)

Manufacturer/Contractor
GEC-Marconi Underwater Weapons Systems, Wateroolville, Hampshire, UK.

GUNS

US Navy 76 mm (3 in) L/50 Mk 33 Mod 4 gun mounting
There are two twin 76 mm (3 in) mounts; one is on the foredeck, the other aft. This is a twin gun, power-driven, base-ring mount, with local or remote control, with a gun house (Mod 4). It uses two Mk 22 guns.

Specifications
Mk 22 gun
Calibre: 76.2 mm
Length of barrel: 50 calibres
Muzzle velocity: 823 m/s (2,700 ft/s) (new gun, nominal); 808 m/s (2,651 ft/s) (mid-life)
Range: 7 n miles (13 km)
Altitude: 8,951 m (29,368 ft)
Ammunition: 10.9 kg (24 lb)

Mk 33 mount
Traverse: 360°
Elevation: −14/15 to +85°
Traverse rate: 30°/s
Elevation rate: 24°/s
Rate of fire: 100 rds/min

Bofors 40 mm L/70 twin mounting
In the late 1980s refit the after 76 mm turret was removed and its loss was partially compensated by mounting a single Bofors 40 mm/70 aft.

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −13 to +85° at 60°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

NFT KV-SK 20 20 mm cannon
The KV-SK 20 is produced under licence by Norsk Forsvarsteknologi (NFT) and is a modified version of the Rheinmetall Rh-202, 20 mm cannon. One of the lessons of Gulf deployments is the need for a light, short-range gun and many NATO navies are now mounting 20 mm guns such as these. The 'Oslo' class carries two.

Specifications
KV-SK 20
Calibre: 20 mm
Length of barrel: 85 calibres
Muzzle velocity: 1,050-1,250 m/s (3,445-4,101 ft/s)
Rate of fire: 800-1,000 rds/min
Range: 1 n mile (1.85 km)
Traverse: 360°
Elevation: −10 to +55°
Crew: 1-2

Manufacturer/Contractor
Norsk Forsvarsteknologi (NFT), Oslo, Norway (under licence from Rheinmetall).

ANTI-SUBMARINE MORTARS

NFT Terne ASW rocket launcher system
The 'Oslo' class are the only ships to carry the Norwegian-developed Terne ASW rocket launcher system.

This is a quick reaction short/medium-range ASW system for frigate and corvette-size ships, using rocket-propelled depth charges, which is mounted on the foredeck. Sonar data is received through the ship command system and transmitted to a ballistic computer which receives further inputs from the weapon order panel.

The weapon handling and launching system is forward of the bridge and consists of a six-cell retractable launching rail on a mounting which ensures stability in pitch and roll but can incline the launching rail at angles of 47 to 77°. The launcher system is covered by retractable doors and below it is a loading ring with six salvos of missiles; a trained three-man crew can load the launcher within 30 seconds. The missile carries explosive which is comparable with TNT and variable depth, impact and proximity fuze options are available. The motor consists of a double-base propellant in a steel case.

Specifications

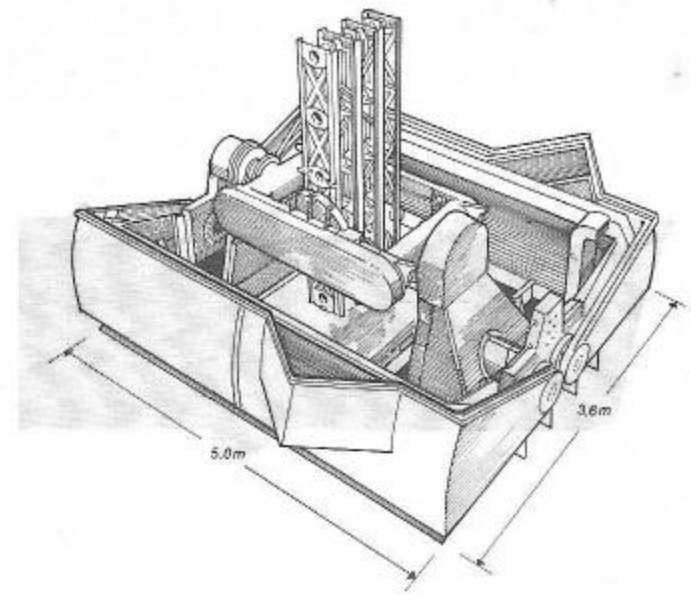
Rocket	Mk 7	Mk 8
Length	1.97 m (6.5 ft)	2.00 m (6.6 ft)
Diameter	20 cm (7.8 in)	20 cm (7.8 in)
Weight	121 kg (267 lb)	121 kg (267 lb)
Warhead	50 kg (110 lb)	70 kg (154 lb)
Range	400-4,000 m (2.15 n miles)	

Manufacturer/Contractor

Norsk Forsvarsteknologi, Kongsberg, Norway.

MINES

These ships have a minelaying capability.



Terne launcher (NFT via Jane's Naval Weapon Systems)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

ARGO Systems AR 700 APECS II

ARGOSystems AR 700 APECS II radar detection and jamming system is an advanced modular ESM/ECM system covering frequencies from 0.5 to 18 GHz, which is designed to counter most known radar threats. It is a fully automatic system, identifying and jamming threat emitters using a mixture of IFM receivers and microprocessor-controlled jammers, with high-speed switching enabling up to 16 threats to be jammed simultaneously. The antenna array consists of a mast-mounted ESM antenna assembly with two DF arrays, one omnidirectional unit and two monopulse units; system processing equipment; operator's console and two ECM transmitters (port and starboard) with their antenna systems located inside the transmitter units.

Specifications

ESM frequency coverage: 0.5-18 GHz
High sensitivity: Up to −67 dBm
Detection range: 200 n miles ships; 50 n miles aircraft
DF accuracy: 4° RMS; 2° RMS fine DF
Automatic tracking: 500 active signals in dense signal environment
Signal identification speed: <1s
ECM azimuth coverage: 360° using a 60-beam jammer (one beam per 6° azimuth sector)
Radiated power: 180 kW nominal mid-band
ECM frequency coverage: 7.5-18 GHz

Manufacturer/Contractor

ARGOSystems Inc, Sunnyvale, California, USA.

DECOYS

There are two chaff launchers; type unknown.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

MSI-3100/WCS tactical picture compilation and weapon designation system

MSI-3100 conducts tactical data handling to permit the ship to meet a variety of simultaneous threats. It has a distributed architecture, using the KS500 and KS800 computers with Mary language software. Functions are carried out automatically, although there are provisions for manual override or support at any stage. The computers control the most important weapons and sensors and this integration reduces decision making and reaction times. The manufacturer claims that the time from target detection to the point when the weapon is ready to engage is less than 10 seconds.

There are two KMC9000 multipurpose consoles each with two operators. One console acts as the weapons control system (KMC9000 WCC) while the other acts as the tactical control system (KMC9000 TCC). Each of the KMC9000 consoles has two KS500 computers; one is for general operating functions, with 256 k of memory, while the other acts in a dedicated role with 128 k of memory. The KS800 computer is used as a scan converter and display controller, and an NFT REX-II radar data extractor is also fitted. In the KMC9000 WCC the dedicated computer is used for fire control for the Terne ASW rocket system while in the KMC9000 TCC the computer acts in an air defence and ASV fire-control role. All elements of the system are linked via the NFT-designed BUDOS bus data transmission system, which operates to NATO STANAG 4156 standards.

The limited memory of the system means that a manual plotting board is kept. A new air-warning system is currently being installed, based upon the Siemens Plessey ASW 9 (2D) radar.

Specifications

Air-sea search radar: AWS-9
Fire-control radar: NobelTech 9LV 218 Mk 2
Navigation radar: Racal-Decca TM 1226
Sonar: AN/SQS 36

Manufacturer/Contractor

Norsk Forsvarsteknologi, Kongsberg, Norway.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 11; Link 14.
Satcom: A Satcom link is fitted.

WEAPONS CONTROL

Mk 91 Mod 1 air defence fire-control system

The Mk 91 fire-control system operates in either automatic or semi-automatic modes from target acquisition to interception. It is a mainframe system using an NFT (Norsk Forsvarsteknologi) Mk 157 digital computer which performs all necessary calculations, stores data and is responsible for data distribution. There are two Mk 91 directors — one is on the bridge roof, the other atop a small tower aft — using the Mk 95 radar.

Because of its I-band frequency the Mk 91 will detect sea-skimming missiles sooner than lower-frequency search radars; the system can thus be fully autonomous, conducting search, detection and engagement automatically. It can also accept outside designations from radar, EW or optic sources. Radar data from the director is passed to the signal data processor to provide range and angle tracking data. This data is passed to the firing officer's console from where prelaunch data and firing commands are relayed to the Mk 29 trainable launcher and missile. The launcher then trains in azimuth to the intercept point and in superelevation to optimum angle to maximise missile kinetic energy. Should the correct azimuth be blocked by the ship's superstructure, the launcher trains to the nearest clear azimuth and commands the missile to 'fly around the corner' to the direct path to the intercept. On launch, the missile flies a proportional navigation path (lead angle intercept) directly to the intercept point in a lofted trajectory which maximises energy and minimises image effects.

Manufacturer/Contractor

Raytheon Company, Equipment Division (prime).

Saab TVT-300 electro-optic director

The Saab TVT-300 director tracks objects automatically, using the optical contrasts of an object against its background as seen by a TV camera. The system consists of a TV camera on a gyrostabilised platform, a monitor, and an electronics unit containing video processing and servo-control circuits. The operator uses a joystick to place an electronic 'window' on the target and then initiates automatic tracking, with the servo-control circuits keeping the 'window' centred on the target contrast and also aligning the target to the centre of the camera field of view. The platform angular positions in bearing and elevation are used for automatic tracking of the guns, which are slaved to the system.

Specifications

Traverse: 360°
Elevation: −30 to +85°
Speed (elevation and traverse): 40°/s

Manufacturer/Contractor

Saab Missiles, Linkoping, Sweden.

SONAR

TSM 2633 hull-mounted sonar

The 'Oslo' class is fitted with the Thomson-CSF TSM 2633 hull-mounted and VDS Spherion system. The hull-mounted element is a long-range active sonar for ASW surface combatants. It comprises a spherical hull-mounted array with an electronic processing system that allows for real-time computation in transmission and reception modes; three-dimensional stabilisation to compensate for pitch, roll and yaw in the parent vessel; and a beam-tilting capability to counter

adverse sound velocity profiles and strong reverberation.

The VDS is a similar diameter spherical array with 160 transducers. This is mounted in a 'fish' and streamed over the stern.

Specifications

Acoustic array: Spherical with 160 individual transducers
Frequency: 7 kHz (approx)
Transmitter: Omnidirectional and sectoral transmissions in CW and FM modes, various modes including TRDT
Receiver: 36 preformed beams stabilised in azimuth and elevation; advanced processing with replica correlator in FM and spectrum analysis (FFT) in CW
Video processing: Data processing in FM and CW modes: automatic detection and tracking; simultaneous multitrack extraction (up to 64); target analysis (apparent length, Doppler measurement)
Display: High-resolution, flicker-free colour TV monitors
Total weight: 4,000 kg (8,820 lb)

Shafts: 1

FURTHER INFORMATION

PROGRAMME

The five ships of the 'Oslo' class were the first (and up till now, the only) major surface units built for the Norwegian Navy since the Second World War. They were constructed under a five-year naval construction programme, which was approved by the Norwegian Storting (Parliament) in late 1960. Fifty per cent of the cost of the ships was provided by the USA under the Mutual Defense Aid Program (MDAP) and the balance by Norway, and all five ships were constructed in the Norwegian Naval Dockyard.

DESIGN

The design of the hull and propulsion system of these ships was based on that of the US Navy's 'Dealey' class destroyer escorts, which have now all been deleted. Certain parts of the design were, however, modified to meet Norwegian requirements, especially those of cold weather and high seas, including, in particular the much greater freeboard forward.

MODERNISATION

The ships were given their first modernisation in the late 1970s, when the Penguin SSMs, Sea Sparrow SAMs and Mk 32 torpedo tubes were fitted, together with many new electronic equipments.

A second substantial modernisation took place in the late 1980s, the ships completing their programme in the order: F 302 — 30 November 1987; F 304 — 21 October 1988; F 303-5 Jun 1989; F 301 — 4 April 1990. The work involved removing the after twin 76 mm mounting and one pair of Penguin SSM launchers so that a Thomson-CSF Spherion VDS could be installed. Decoy rocket launchers were also fitted.

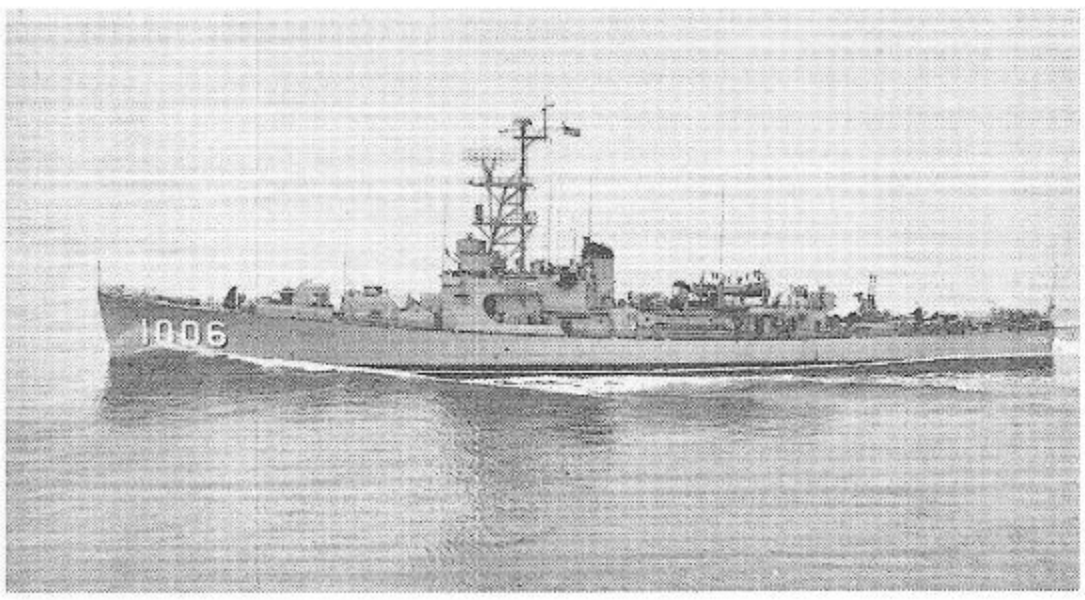
In a further updating, Plessey AWS-9 radar is being fitted in 1996-97 together with Link 11 and GPS.

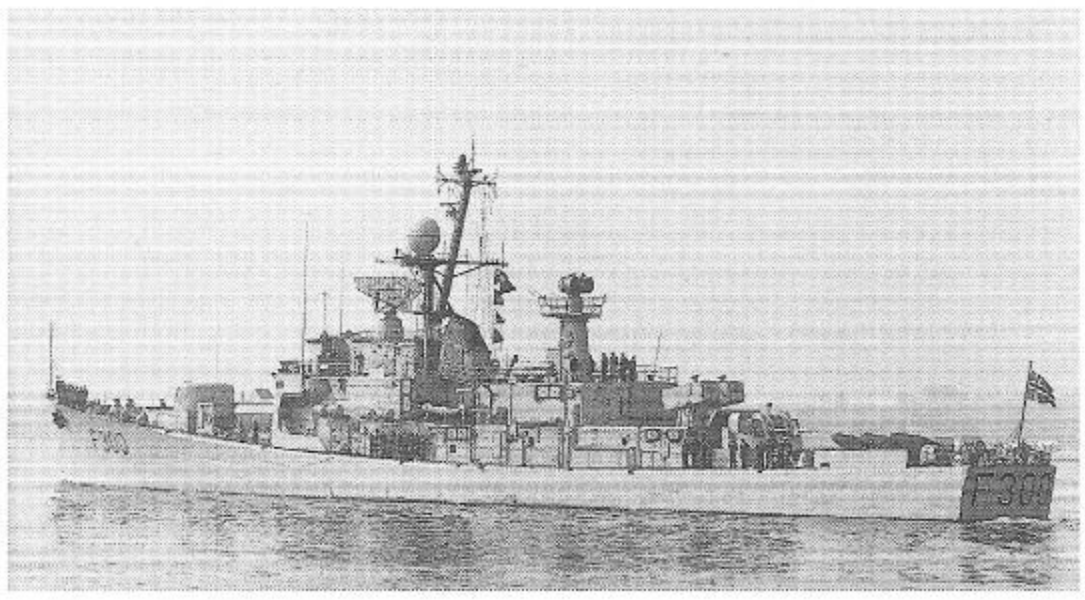
STRUCTURE

The hulls have become stressed as a result of towing the VDS in heavy seas, an activity for which they were not designed.

Then the name-ship of the class, *Oslo* (F 300), was lost in 1994, the ship suffering an engine failure in heavy weather, which resulted in it running aground. The ship was towed back into deep water and then taken under tow, but sank in the continuing bad weather.

As a result, the remaining ships have been restricted in their deep water operations until the hulls have been strengthened and the complements have also been reduced. The strengthening programme started in 1995 with *Narvik* (F 304) and all will be completed by the end of 1996. This will result in an increase in displacement of some 200 tonnes.





The 'Oslo' class design was based on the US Navy's 'Dealey' class destroyer escort (left), but with considerable modification to meet the Norwegian operational requirement and environmental conditions. As can be seen from Oslo *(F 300) (right) the hulls were similar, but otherwise they were very different* (top: US Navy; bottom: Miko)

Laid down	9 Jun 1984	**Commissioned**	15 Mar 1987

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 'Grail' (Strela-2M)

There are two, four-missile launchers for the SA-N-5 short-range SAM system. SA-N-5 is the NATO designation for the Russian Strela-2M (Strela = arrow), which is the naval version of the very widely used Strela-2 (NATO = SA-7 Grail) land-based, shoulder-launched short-range missile system. In the naval version, four missiles are mounted on a metal framework, with the operator standing inside the framework, leaning back into a lumbar pad, with the missiles at shoulder level, as in the land-based system.

When the target is acquired the operator selects a missile and then activates the thermal battery. When the seeker acquires the target the operator receives an audio signal and he partially pulls the trigger to activate the missile gyros, which take some four to six seconds to warm up. The operator uses stadia reference marks in his optical sight to compute the lead angle to the target then fully engages the trigger to launch the missile. The booster burns for 0.05 seconds, ejecting the missile from the launch tube at a speed of 28 m/s (92 ft/s) and spinning it up. Then, at a distance of 6 m (19.7 ft), the sustainer ignites and the trailing fins pop out.

The missile has four small fins of cruciform configuration and two pop-out trailing fins behind the exhaust. The missile homes on the 'hottest' part of the aircraft and probably has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead. In Strela 2M the (SA-7B 'Grail' Mod 1) the seeker has a filter for improved performance and the warhead has improved fragmentation uniformity.

According to a Polish source, the missile installation is designated Fasta 4M while the missiles are designated Strzala-2M and a total of 16 missiles is carried.

Specifications
Strela 2
Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (21.98 lb)
Speed: Mach 1.7
Range: 2.6 n miles (5.5 km)
Altitude: 18-4,500 m (60-15,000 ft)
Guidance: IR homing

Manufacturer/Contractor
Fakel, Russia.

TUBES

There are four 533 mm (21 in) Model DTA-53-620 torpedo tubes mounted two on either side in the waist. The two pairs of tubes are individual units located side by side and are fixed, pointing ahead at about 15° to the centreline.

TORPEDOES

SET-53M

Russian SET-53M active/passive torpedoes are carried. These are homing torpedoes, with a range of 8.1 n miles (15 km) and a speed of 40 knots. They carry a 205 kg (452 lb) warhead.

GUNS

AK-176M 76 mm L/59

There is one AK-176M 76 mm L/59 gun mounted in 'A' position on the foredeck. The AK-176M is a four-man mounting, which is hydraulically operated, with manual reversion in the event of power failure. The AK-176M would normally be controlled by a Bass Tilt or a Kite Screech director, but, in this case, there is no director (although there is space for such a device in the bridge roof). This suggests that the gun is only fired under local control using either the Kondensor sight, which is normally only used as a back-up in the event of the failure of 'Bass Tilt', or the WD-221 optical sight. Alternatively, the Nogat radar may be used in a directing role, although this would not be particularly satisfactory.

Specifications
AK-176
Calibre: 76 mm (3.0 in)
Length of barrel: 59 calibres
Muzzle velocity: n/k
Traverse: 360° at 35°/s
Elevation: −3 to +85° at 30°/s
Ammunition (total): 16 kg (35.3 lb)
Rate of fire: 120 rds/min
Range:
anti-surface: 8 n miles (15 km)
anti-air: 7,000 m (22,967 ft)

Ammunition
UOFB-62
Weight:
complete round: 12.8 kg (28.2 lb)
projectile: 4.6 kg (10.1 lb)
explosive: 400 g (A-IX-2)
Fuze: Point impact fuze (VG-67)

Wrobel-I ZU-23-2M twin 23 mm cannon

There are three twin Wrobel-I ZU-23-2M 23 mm mounts. Two are located close abreast of each other at the rear of the bridge structure and the third is at the after end of the superstructure. The ZU-23-2 was manufactured for

Kaszub *(240). The design is based — somewhat loosely — on the Russian 'Grisha' class. Note the RBU-6000 launcher on the foredeck and the two Wrobel 23 mm guns aft* (Jane's/H M Steele)

some years in Poland and this particular mounting is designated Wrobel-I and consists of twin 23 mm cannon mounted side by side in an open tub-type mounting, but with a clear glass cover of either glass or plastic.

The ZU-23-2 consists of two air-cooled 2A14 cannon of monobloc construction. Each barrel weighs 27.2 kg (60 lb), is 2.01 m (6.6 ft) long including flash suppressor, and they fit into separate cradles. A hot barrel may be replaced by a cool one in 15-20 seconds. The weapon has a vertically moving breech block and is fed from 50-round belts in boxes fitted to each side of the trunnions. A ZAP-23 optical sight is attached to the rear of the weapon which is on a manually operated firing platform.

The mounting has a five-man crew, of whom two are on the mounting and three are ammunition carriers and loaders.

Specifications

Wrobel-I ZU-23-2M
Calibre: 23 mm
Length of barrel: 87 calibres
Traverse: Unlimited
Elevation: −10 to +90°
Traverse speed: n/k
Elevation speed: n/k
Rates of fire: 200 rds/min/barrel
Projectile: 0.19 kg (0.42 lb)
Range:
anti-surface: 1.1 n mile (2 km)
anti-air: 1,500 m (4,922 ft)

Saluting gun

There is one 45 mm saluting gun on the port side of the foredeck.

ANTI-SUBMARINE MORTARS

RBU-6000

Two RBU-6000, 12-tubed trainable anti-submarine rocket launchers are located immediately before the bridge. These are conventional Russian-pattern systems; 98 rockets are carried.

Specifications

RBU-6000
Launch tubes: 12
Tube arrangement: Circular
Calibre: 300 mm
Tube length: 0.6 m (2.0 ft)
Elevation: +50°
Traverse: 360° (theoretical)
Rocket weight: 100 kg (220 lb)
Warhead: 31 kg (68 lb)
Range: 3.25 n miles (6,000 m)

DEPTH CHARGES/MINES

There are two rails at the stern. These can be used for either 24 depth charges or 20 mines.

ELECTRONIC WARFARE SYSTEM

ELECTRONIC SUPPORT MEASURES (ESM)

ORLO

There is one radar intercept and direction-finding equipment, designated ORLO.

DECOYS

There are four 16-tube PK-16 chaff launchers.

COMMAND AND CONTROL SYSTEMS

RADARS

Strut Curve search radar

Kaszub's air search radar is the Russian MR-302 (NATO = Strut Curve) a medium-range, general purpose, F band, air search radar. The elliptical lattice reflector is mounted at the masthead. Range performance against a 2 m² aircraft target at medium altitude is about 60 n miles (110 km) with a likely maximum range of 150 n miles (280 km).

Nogat SRN-7453

The SRN-7453 is the surface search radar. No other details are known.

SRN-441XT

SRN-441XT is the navigational radar.

Square Head Naval IFF System

The antenna of this shipborne system consists of a broadside array of dipoles with a rectangular reflector/support frame measuring about 1.4 m (4.6 ft) high by 2 m (6.6 ft) wide. It was originally thought to be a long wavelength search radar of modest power, but later evidence confirms that its function is that of an IFF interrogator antenna, or directional array for transmission of guidance signals to surface-to-surface missiles. It is most frequently seen on the older types of Russian Federation missile carrying boats, and these

carry two or four such arrays on sponsons fore and aft of the mainmast. Recent information strongly suggests that the system operates in G-band.

SONARS

MG-322T
MG-322T is a bow-mounted, active search, medium-frequency sonar.

MG-329M
MG-329M is a stern-mounted, dipping sonar, mounted in a large cylinder on the transom. which appears to have been developed from a helicopter sonar.

Kaszub (240). *Among the items of Polish equipment aboard are the Nogat SRN 441XT surface search radar below the Strut Curve and the SRN 441X7 navigation radar on the smaller platform below* (H & L van Ginderen Collection)

PROPULSION

Specifications
System: Combined diesel and diesel (CODAD)
Main machinery: 4 Sulzer-Cegielski 16AS-V25/30 diesels; 12.80 MW (17,400 hp(m)) at 1,000 rpm

Shafts: 2
Auxiliary power: 4 Russian diesels, each 200 kW

FURTHER INFORMATION

PROGRAMME

The first warship to have been designed and built in Poland since the 'Jaskolka' class minesweepers in the mid-1930s, *Kaszub* has not proved to be a great success. The ship entered service in 1987 but ten years later it is still not completely equipped.

A class of eight was planned but the second ship was cancelled in 1989 and, despite public statements that more will be built when funds are available, it appears unlikely that this will actually happen.

STRUCTURE

The design is based very loosely on that of the Russian 'Grisha' class but with numerous alterations, including the armament and the use of diesel engines rather than the Russian ships' diesels.

MODERNISATION

There are reports that further changes are to be made, including fitting AK-630 Gatlings in place of the Wrobel I ZU-23-2 23 mm guns and fitting a fire director for the 76 mm gun. The Polish shipbuilding industry is, however, in some disarray and the Gdansk shipyard closed recently, so there may well be greater priorities.

DEPLOYMENT

It took from 1987 to 1990 for the ship to attain operational status and it then spent several months with the coastguard before transferring to the navy in 1991. Since then it has sailed abroad on several occasions and has made at least one visit to the UK.

WEAPONS SYSTEMS

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited on the quarterdeck.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5, 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

100 mm/55 Modéle 1968

There is one single Creusot-Loire 100 mm (3.9 in) Modéle 1968 dual-purpose gun located on the fore-deck, which is normally operated in the fully automatic remote mode with an unmanned turret, although there is a fallback manual mode, requiring two men in the turret.

Specifications
Calibre: 100 mm (3.9 in)
Length of barrel: 55 calibres
Muzzle velocity: 870 m/s (2,854 ft/s)
Traverse: 360° at 40°/s
Elevation: −15 to +80° at 25°/s
Mounting weight: 21 t
Crew: 2 (optional) and 2 loaders
Range:
anti-surface: 9.15 n miles (17 km)
anti-air: 8,000 m (26,000 ft)
Rate of fire: 60-78 rds/min
Ammunition: 13.5 kg (30 lb) (multipurpose projectile); 9.7 kg (21.4 lb) (charge)

Manufacturers/Contractors
Direction des Constructions Navales (DCN) (prime).
Mécanique Creusot-Loire, Marine Products (mountings).
DCN Ruelle (gun).
CSEE Défense (servo equipment).

Bofors 40 mm L/70 twin mounting

There are two single Bofors 40 mm/70 mounted side by side abaft the stack.

Specifications
Traverse: 360° (nominal) at 90°/s

Elevation: −13 to +85° at 60°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,000 m/s (3,280 ft/s)

Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 2.2 n miles (4,000 m)

Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Thomson-CSF Vega Pollux command and weapon control system

The version of the Vega I command and weapon control system in the 'Baptista de Andrade' class is Vega Pollux, which combines the Plessey AWS-2 search radar, Thomson-CSF Diodon sonar and the Thomson-CSF Pollux fire-control director.

Manufacturer/Contractor

Thomson-CSF, Paris, France.

SONAR

Thomson Sintra Diodon hull-mounted depth sonar

Diodon is a panoramic medium-frequency sonar. Embedded facilities include passive listening, sound ray tracer, an acoustic propagation prediction for the day and a recording system that can be used for debriefing and training.

Specifications

Acoustic array: 24 identical staves
Frequencies: 11 kHz, 12 kHz, 13 kHz.
Transmitter: Omnidirectional transmission in CW and FM modes
Receiver: 36 preformed beams; advanced processing with replica correlator in FM and spectrum analysis (FFT) in CW

RADARS

Set	AWS-2	Type RM 316P	Pollux
Company	Plessey	Decca	Thomson-CSF
Role	Air search	Navigation	Fire control

Video processing: Data processing in FM and CW modes: automatic detection and tracking; simultaneous multitrack extraction (up to 64); target analysis (apparent length, Doppler measurement)
Range scales: Max 15,000 m (49,215 ft)
Display: High-resolution flicker-free colour TV monitors
Total weight: 1,500 kg (3,307 lb)

Manufacturer/Contractor

Thomson CSF, Sophia Antipolis Cedex, France.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 12 × 8 m (40 × 26 ft)

HELICOPTERS

The flight deck will accept a Westland Lynx helicopter, but there is no hangar or other aviation facilities

PROPULSION

Specifications

System: Diesel
Main machinery: 2 OEW Pielstick 12 PC2.2 V 400 diesels; 8.82 MW (12,000 hp(m)) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These ships were originally built for South Africa, but, as with the French 'Agosta' class submarines and Type A 69 corvettes, the order was overtaken by the United Nations mandatory embargo in 1977. As a result, the order was taken over by the Portuguese Navy.

DESIGN

The 'Baptista de Andrada' class uses exactly the same hull and propulsion as the 'Joao Coutinho' class but has a different armament and sensor fit, which was presumably originally tailored to the South African requirement. Thus, the 'de Andrade' class has a more powerful main gun, a better fire-control system, and more effective radars and sonars.

MODERNISATION

Communications equipment was updated in 1988-91, but a programme to install Sea Sparrow and an SSM system has been postponed until 1999, even though space and weight allowance is available.

FUTURE

There was a proposal in 1977 to sell these four ships to Colombia, but the deal fell through and, as far as is known, there have been no further attempts to sell them.

WEAPONS SYSTEMS

GUNS

US Navy 76 mm (3 in) L/50 Mk 33 Mod 4 gun mounting

There is one twin 76 mm (3 in) mount in 'A' position. This is a twin gun, power-driven, base-ring mount, with local or remote control, with a gun house (Mod 4). It uses two Mk 22 guns.

Specifications
Mk 22 gun
Calibre: 76.2 mm
Length of barrel: 50 calibres
Muzzle velocity: 823 m/s (2,700 ft/s) (new gun, nominal); 808 m/s (2,651 ft/s) (mid-life)
Range: 7 n miles (13 km)
Altitude: 8,951 m (29,368 ft)
Ammunition: 10.9 kg (24 lb)

Mk 33 mount
Traverse: 360°
Elevation: −14/15° to +85°
Traverse rate: 30°/s
Elevation rate: 24°/s
Rate of fire: 100 rds/min
Elevation: −3 to +85° at 60°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Max range:
anti-surface: 6.5 n miles (12 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

Bofors 40 mm/60 Mk 9

There is one twin Bofors 40 mm/60 Mk 9 mount abaft the stack.

Specifications
Traverse: 360° (nominal) at 90°/s

MINES

There are two mine rails.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Mk 51 Gun Fire Control System (GFCS)

There are two Mk 51 Gun Fire Control Systems (GFCS), one for each Bofors 40 mm mounting. The system is a lead-computing gunsight.

Mk 63 Gun Fire Control System (GFCS)

The Mk 63 GFCS is associated with the 76 mm gun and is a combination of the Mk 51 sight and an SPG-34 radar (see below).

RADARS

Kelvin Hughes

A Kelvin Hughes radar is used for air/surface search. Type is not known.

Racal-Decca RM-1226C

There is one Racal-Decca RM 1226C navigation radar.

Specifications
Role: Surface search
Band: I
Beam: 1.2°

FURTHER INFORMATION

PROGRAMME

Six ships were built between 1968 and 1971, replacing a miscellaneous collection of elderly sloops, corvettes and destroyer escorts.

DESIGN

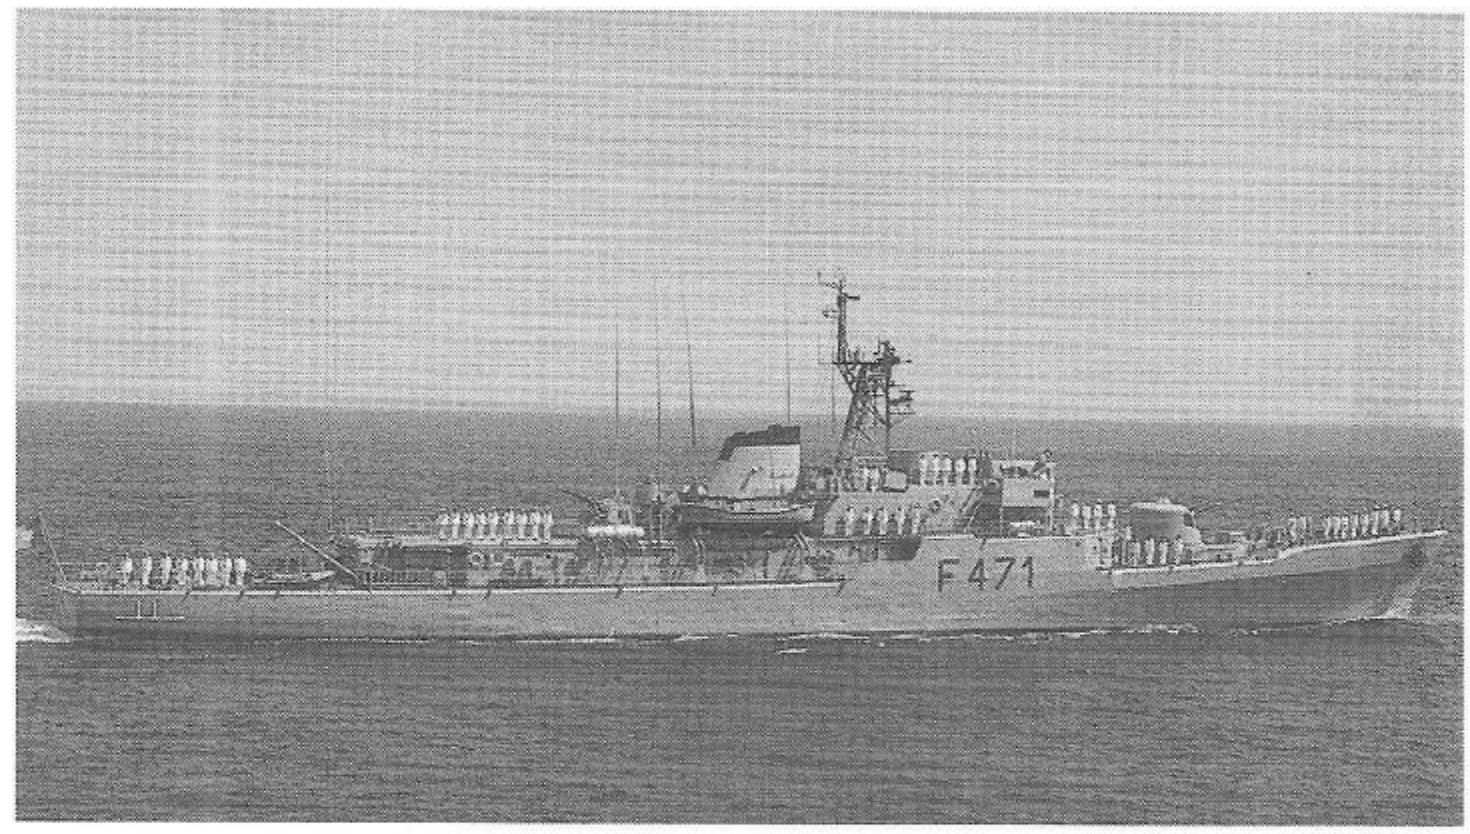
This design was prepared by the German company Blohm + Voss of Hamburg, which then built three in its yard, while the other three were built by Bazan in Spain. They are similar in concept to a number of other European designs for a light frigate for 'colonial' duties, such as the French 'Commandant Riviere' class.

The 'Joao Coutinho' class is small and lightly equipped, and the ships as built, were armed with a twin 76 mm gun, two Bofors 40 mm cannon, six torpedo tubes and a Hedgehog ASW mortar. Despite their small size they have accommodation for a platoon (34 men) of marines, as part of their 'colonial' role.

MODERNISATION

It was planned at one stage to fit this class with SSMs and PDMS, but this was shelved for budgetary reasons. Meanwhile, the ASW equipment, including the Hedgehog mortar and twin torpedo tubes has all been removed.

In 1989-91 the main radar was updated and SIFICAP was installed. This is a data exchange system with satellite links between a main base ashore and ships at sea on fishery protection duties.

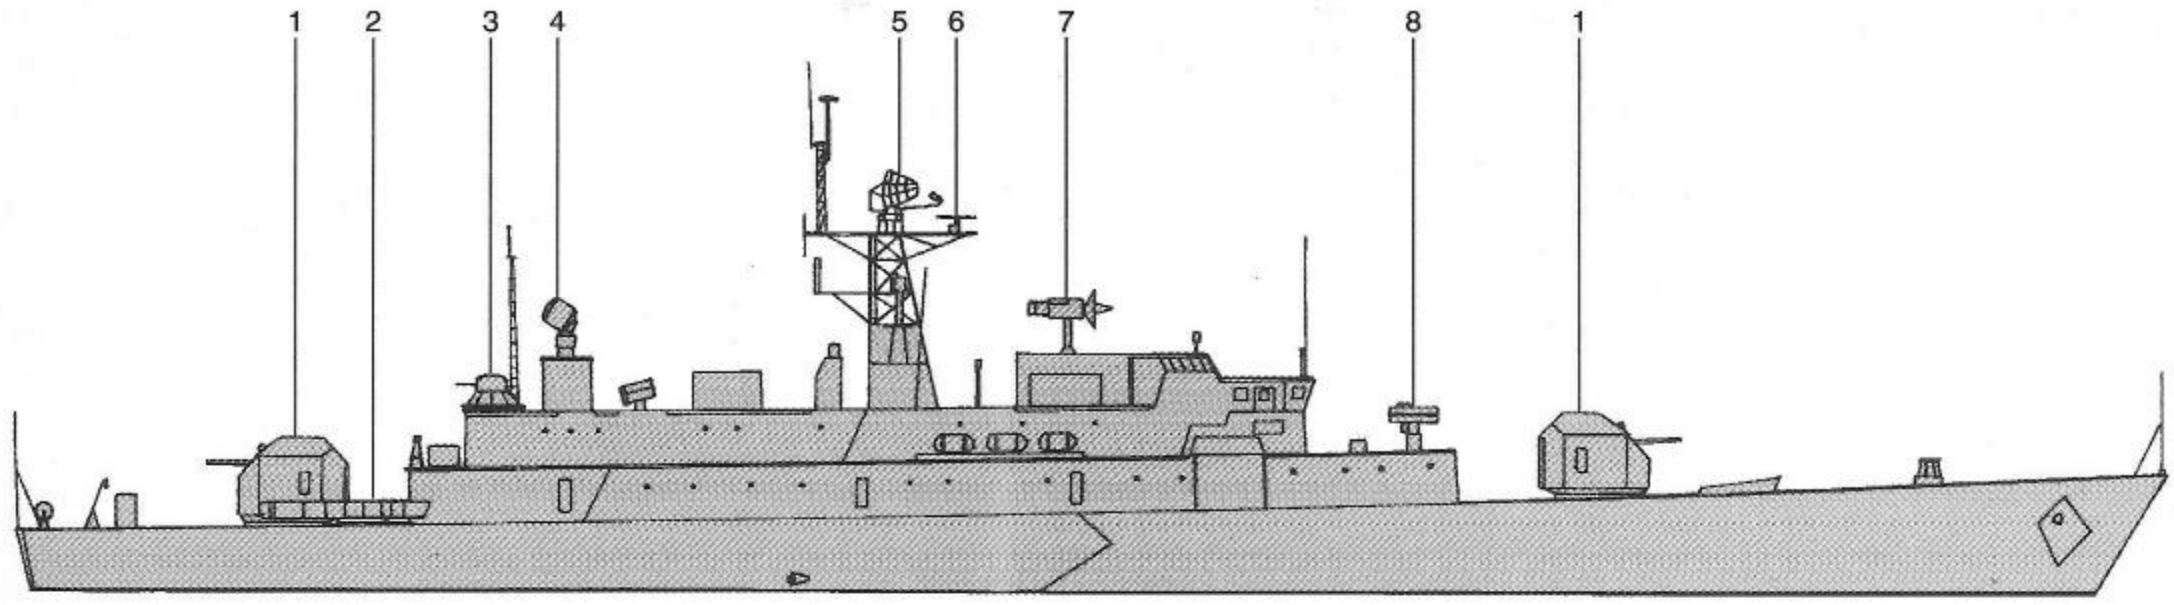


Antonio Enes *(F 471)* (H & L van Ginderen Collection)

DEPLOYMENT

These ships are now employed on Fishery Protection duties and, with their ASW equipment removed, their value as warships is very small.

TETAL



Admiral Petre Barbuneanu (Ian Sturton)

1 Russian twin AK-726 76 mm (3 in)/60 gun 2 Two 533 mm (21 in) torpedo tubes 3 AK-230 twin 30 mm/65 cannon 4 Drum Tilt fire-control radar (for AK-230) 5 Strut Curve air/surface search radar 6 Nayada navigation radar 7 Hawk Screech fire control (for AK-726) 8 RBV-2500 anti-submarine rocket launcher

WEAPONS SYSTEMS

TUBES

There are two fixed 533 mm (21 in) torpedo tubes on either side of the after 76 mm gun turret.

TORPEDOES

Torpedoes used are the Russian 53-65, a passive/wake homing torpedo, with a range of 13.5 n miles (25 km) at 50 knots. It carries a 300 kg (661 lb) warhead.

GUNS

AK-726 twin 76 mm L/59 mount

There are two twin 76 mm/59 mounts, one each in 'A' and 'Y' positions. AK-726 is a multirole weapon system designed for air defence, surface engagement and shore bombardment roles, and consists of two 76 mm guns mounted in a turret with a 5 mm metal shield. Each gun has its own loading system.

There is a five-man crew in the turret: the gun captain, two layers and two loaders. There is a further team of four loaders in the below-decks magazine.

AK-726 is associated with 'Hawk Screech' radar which features a circular dish antenna (2.3 m (7.5 ft) diameter) with central feed on four 'legs'. The transmitter, receiver, turning and stabilisation gears are behind the antenna and the whole director is mounted on a pedestal, approximately 2 m high (6.5 ft).

'Hawk Screech' may also incorporate electro-optic sensors. In addition to radar fire control there is local control through the Prisma optical sighting system, which may be used for engaging targets with speeds of up to 600 m/s (1,969 ft/s, Mach 1.75).

Specifications
AK-726
Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: 980 m/s (3,215 ft/s)
Traverse: 360° at 36°/s
Elevation: −7 to +85° at 32°/s
Rate of fire: 90 rds/min (whole mounting)
Range:
anti-surface: 8 n miles (15 km)
anti-air: 10,000 m (32,810 ft) (max)
anti-air: 7,000 m (22,967 ft)

Ammunition
UOFB-62
Complete round: 12.8 kg (28 lb)
Projectile: 4.6 kg (10 lb)
Explosive: 400 g (A-IX-2)
Fuze: VG-67 point impact fuze

30 mm L/65 AK-230 twin mounting

There are two twin 30 mm/65 AK-630 mounts at either corner of the after superstructure. The AK-230 is a remotely operated, twin barrel, automatic anti-aircraft gun designed to engage air targets at heights of up to 4,000 m (13,124 ft). It is also capable of engaging surface targets at ranges up to 2.2 n miles (4 km). The electrically powered mounting consists of two 64.2 calibre, water-cooled, NN30 guns, each with a liner and a rotating breech with four chambers. The elevating mechanism is on the carriage together with a compressed air tank and associated equipment for the loading system.

The fire-control radar is the I/J-band Rys (NATO = Drum Tilt) fire-control radar, whose maximum acquisition range is approximately 22 n miles (40 km), with each radar director controlling two gun mountings.

Specifications
NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,445 ft/s)
Range:
anti-surface: 2.2 n miles (4 km)
AA: 4,000 m (13,124 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Mounting weight: 1,857-1,905 kg (4,095-4,200 lb)
Crew: 2 (off mount)

Ammunition
BR-83:
type: armour-piercing tracer
weight (complete round): 1.47 kg (3.24 lb)
weight (projectile): 0.35 kg (0.77 lb)
OF-83D:
type: high explosive
weight (complete round): 1.40 kg (3.0 lb)
projectile: 0.27 kg (0.6 lb)
explosive: 30 g (A-XI-2)

14.5 mm KPV heavy machine gun

There are two 14.5 mm KPV heavy machine guns. The KPV (Vladimirov Heavy Machine Gun) was designed during the Second World War but is still an effective short-range weapon. It is short-recoil operated with gas assistance supplied by a muzzle booster. The body is a simple metal cylinder to which various attachments are riveted. The barrel is chromium plated with a flash suppressor. API, API-T and I-T rounds are available.

Specifications
KPV
Weight: 49.1 kg (108 lb)
Length: 2 m (6.5 ft)
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 600 rds/min (cyclical)

ANTI-SUBMARINE MORTARS

RBU 2500
There are two RBU 2500 launchers on the foredeck. RBU 2500 consists of 16 rocket launcher tubes arranged horizontally in two rows with a steel beam across the top above the rear of the upper row. The tubes, which may be elevated to +85°, are fitted to a large yoke fitting which enables the weapon to be traversed through a nominal 360°. Each tube has a diameter of 250 mm (10 in), is 1.6 m (5.25 ft) long and fires manually loaded rockets, each with 21 kg (46.3 lb) warhead, up to 1.5 n miles (2.8 km). This weapon seems to be associated with older, hull-mounted, HF active search and attack sonars such as Wolfs Paw (Herkules) and the similar system which operates at about 24 kHz and has the NATO designation Buck Toe and the Soviet designation Pegas.

Specifications
RBU 2500
Calibre: 250 mm (10 in)
Launcher tubes: 16
Elevation: +85°
Traverse: 360°
Warhead: 21 kg (46.3 lb)
Range: 1.5 n miles (2.8 km)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Watch Dog
There are two Watch Dog arrays. Watch Dog is an intercept and radar warning system which has been in service for over 30 years. It is a wide open system with an array consisting of four tiers of eight microwave horns, covering frequencies from D to H-band and normally has two arrays, one on each side of the ship.

DECOYS

PK-16 chaff launcher
There are two PK-16 chaff launchers.

COMMAND AND CONTROL SYSTEMS

RADARS

Strut Curve search radar
The air search radar is the Russian MR-302 (NATO = Strut Curve) a medium-range, general purpose, F-band, air search radar. The elliptical lattice reflector is mounted at the masthead. Range performance against a 2 m^2 (21.5 sq ft) aircraft target at medium altitude is about 60 n miles (110 km) with a likely maximum range of 150 n miles (280 km).

Drum Tilt
There is one 'Rys' (NATO = Drum Tilt) fire-control system for the AK-230. This is an I/J-band system with a pedestal-mounted director whose antenna is in a weatherproof container and is mounted atop a small tower just forward of the AK-230 mounts. Maximum acquisition range is approximately 22 n miles (40 km).

Hawk Screech
The director for the AK-726 is the 'Hawk Screech' which features a circular dish antenna (2.3 m (7.5 ft) diameter) with central feed on four 'legs'. The transmitter, receiver, turning and stabilisation gears are behind the antenna and the whole director is mounted on a pedestal, approximately 2 m (6.5 ft) high.

'Hawk Screech' may also incorporate electro-optic sensors.

Nayada
Nayada is a standard Russian I-band navigation radar.

IFF
High Pole.

SONAR

These ships are fitted with a hull-mounted, active, search and attack, medium-frequency sonar.

PROPULSION

Specifications
System: Diesel
Main machinery: 4 diesels; 9.9 MW (13,000 hp(m))
Shafts: 4

FURTHER INFORMATION

PROGRAMME

One of President Ceausescu's grandiose ideas was to build a large naval force, constructed to the greatest possible extent from Romanian resources. The navy was to create a task group consisting of the 'battle-cruiser' *Muntenia* and four anti-submarine escorts — the 'Tetal' class frigates.

These four ships were laid down in the late 1970s and commissioned between 1983 and 1987. Construction ended with the fourth hull and building then switched to the 'Improved Tetal' (see next entry).

DESIGN

The 'Tetal' class hull has approximately the same dimensions as the Russian 'Koni' class frigate, but the form is quite different and there may be no relationship between the two. Also, the Russian ship has a CODAG propulsion system, whereas the Romanian employs diesels. The Romanians could not, however, avoid a large dependence on Russian weapons and electronic equipment.

DEPLOYMENT

These four ships operate from the main Romanian naval base at Constanza.

Admiral Petre Barbuneanu *(260) one of four 'Tetal' class frigates, which were designed and built in Romania in the early 1980s.*

WEAPONS SYSTEMS

TORPEDOES

There are two twin 533 mm (21 in) torpedo tubes, which pivot outwards to launch. The weapons are Russian 53-65 torpedoes, which use passive/wake-homing. They have a speed of 50 knots and a range of 13.5 n miles (25 km).

GUNS

AK-176M 76 mm L/59

There is one AK-176M 76 mm L/59 gun mounted in 'A' position on the foredeck. The AK-176M is a four-man mounting, which is hydraulically operated, with manual reversion in the event of power failure. The AK-176M is controlled by the Drum Tilt director. There is also a Kondensor sight, used as a backup in the event of the failure of Drum Tilt, or the WD-221 optical sight.

Specifications
AK-176 m
Calibre: 76 mm (3.0 in)
Length of barrel: 59 calibres
Traverse: 360° at 35°/s
Elevation: −3 to +85° at 30°/s
Ammunition (total): 16 kg (35.3 lb)
Rate of fire: 120 rds/min
Range:
anti-surface: 8 n miles (15 km)
anti-air: 7,000 m (22,967 ft)

Ammunition
UOFB-62
Weight:
complete round: 12.8 kg (28 lb)
projectile: 4.6 kg (10 lb)
explosive: 400 g (A-IX-2)
Fuze: Point impact fuze (VG-67)

30 mm L/65 AK-630 twin mounting

There are two twin 30 mm/65 AK-630 mounts immediately forward of the mast. The AK-230 is a remotely operated, twin barrel, automatic anti-aircraft gun designed to engage air targets at heights of up to 4,000 m (13,124 ft). It is also capable of engaging surface targets at ranges up to 2.2 n miles (4 km). The electrically powered mounting consists of two 64.2 calibre, water-cooled, NN30 guns, each with a liner and a rotating breech with four chambers. The elevating mechanism is on the carriage together with a compressed air tank and associated equipment for the loading system.

The fire-control radar is the I/J-band Rys (NATO = Drum Tilt) fire-control radar, whose maximum acquisition range is approximately 22 n miles (40 km), with each radar director controlling two gun mountings.

Specifications
NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,445 ft/s)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,124 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Mounting weight: 1,857-1,905 kg (4,095-4,200 lb)
Crew: 2 (off mount)

Ammunition
BR-83:
type: Armour-piercing tracer
weight (complete round): 1.47 kg (3.24 lb)
weight (projectile): 0.35 kg (0.77 lb)

OF-83D:
type: High explosive
weight (complete round): 1.40 kg (3.0 lb)
projectile: 0.27 kg (0.6 lb)
explosive: 30 g (A-XI-2)

AK-306 30mm/65 cannon

There are also two 30 mm/65 AK 306. This is also a six-barrelled weapon and is very similar to the AK-630. However, it is a different weapon and according to recent reports is optimised for the anti-surface role, whereas the AK-630 is a CIWS air defence system.

ANTI-SUBMARINE MORTARS

RBU-6000

Two RBU-6000, 12-tubed trainable anti-submarine rockets launchers are located immediately before the bridge. These are conventional Russian-pattern systems; 98 rockets are carried.

Specifications
RBU-6000
Launch tubes: 12
Tube arrangement: Circular
Calibre: 300 mm
Tube length: 0.6 m (2.0 ft)
Elevation: +50°
Traverse: 360° (theoretical)
Rocket weight: 100 kg (220 lb)
Warhead: 31 kg (68 lb)
Range: 3.25 n miles (6,000 m)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Watch Dog
There are two Watch Dog arrays. Watch Dog is an intercept and radar warning system which has been in service for over 30 years. It is a wide open system with an array consisting of four tiers of eight microwave horns, covering frequencies from D to H-band and normally has two arrays, one on each side of the ship.

DECOYS

PK-16
There are two PK-16 16-tube chaff launchers.

COMMAND AND CONTROL SYSTEMS

RADARS

Strut Curve search radar
The air search radar is the Russian MR-302 (NATO = Strut Curve) a medium-range, general purpose, F band, air search radar. The elliptical lattice reflector is mounted at the masthead. Range performance against a 2 m² aircraft target at medium altitude is about 60 n miles (110 km) with a likely maximum range of 150 n miles (280 km).

Drum Tilt
There is one 'Rys' (NATO = Drum Tilt) fire-control system for the AK-230. This is an I/J-band system with a pedestal-mounted director whose antenna is in a weatherproof container and is mounted atop a small tower just forward of the AK-230 mounts. Maximum acquisition range is approximately 22 n miles (40 km).

Spin Trough
Spin Trough is an I-band navigation radar.

IFF
High Pole.

SONAR

These ships are fitted with a hull-mounted, active, search and attack, medium-frequency sonar. This could well be the Russian Herkules.

AVIATION

AVIATION FACILITIES

Specifications
Flight deck: 17 × 11 (55 × 38 ft)
Helicopters: 1 IAR-316 Alouette III

Specifications
Dimensions:
main rotor diameter: 11.02 m (36.15 ft)
length overall (rotor turning): 12.84 m (42.15 ft)
fuselage length: 10.17 m (33.7 ft)
height to rotor head: 3.00 m (9.84 ft)
Weights:
empty: 1,143 kg (2,520 lb)

Shafts: 4

FURTHER INFORMATION

PROGRAMME

This is the follow-on to the original 'Tetal' class, with the first ship launched in 1988, followed by the second in 1992. The first was commissioned in 1989, but the second has suffered a series of delays and there are now serious doubts that it will ever be completed.

STRUCTURE

The hull and propulsion system are the same as in the original 'Tetal' class. There are, however, major changes in the weapons and sensors, primarily in order to enable the ship to accommodate a flight deck and a hangar.

The superstructure is more substantial than in the earlier ships and the bridge is one deck level higher. There is also a recognisable stack, something that is missing in the Tetal design.

DEPLOYMENT

Eustatiu Sebastian is based at Constanta with the four original 'Tetal' class frigates.

Contre Admiral Eustatiu Sebastian *(264), first of the 'Improved Tetal' class. A second was launched in 1992 but has still not been completed*

PETYA

OVERVIEW

Some 54 'Petya' class frigates were built between 1960 and 1982 with production split between Kaliningrad and Khabarovsk. They were small and handy vessels designed specifically for the ASW mission and were designated *'storozhevoy korabl'* (SKR) by the Russian Navy.

Petya I. This was the original version for the Russian Navy with two twin 76 mm guns, two RBU-2500 ASW rocket launchers, five 406 mm torpedo tubes and 22 mines. Six were built, all of which have been scrapped.

Petya I Mod. Production switched to a modified version, which had two extra RBU-2500 rocket launchers. Ten were built, all of which have been scrapped.

Petya II. This was the major production version for the Russian Navy, of which 27 were built. This had two RBU 6000 forward and a second bank of 400 mm torpedo tubes mounted aft in place of the second pair of RBU-2500 in the Petya I Mod. Petya IIs remain in service, of which three are with the Russian Navy. Five were exported at the end of their service with the Russian Navy: two to Ethiopia and three to Vietnam.

Petya II Mod. The two ships transferred to Ethiopia had the after bank of torpedo tubes replaced by a large multibarrelled rocket launcher. Whether this was done before the transfer or was a local modification in Ethiopia is not known.

Petya III. This version was specifically designed for export. 18 were built, which were exported to: Ethiopia — 2; India — 10; Syria — 2; and Vietnam — 2. The remaining two were retained by the Russian Navy for demonstration and crew training for the export customers. This version had the same hull as Petya II, but with one triple bank of 533 mm torpedo tubes in place of the 406 mm tubes in earlier versions. It also had four RBU-2500 as in Petya I Mod.

A Petya II Mod of the now defunct navy of Ethiopia and Eritrea. This ship was a standard Petya II while serving with the Russian Navy, but on transfer it had a multibarrel rocket launcher installed on the after deck (Ethiopian Navy)

Current Position

Ethiopia. With the break-up of Ethiopia and Eritrea the position of the remains of the fleet is unclear. The four Petyas supplied by Russia have all either been scrapped or are lying derelict; they are not, therefore, included in the following entries.

In service

Currently in service are:

Russia — three Petya II
India — four Petya III
Syria — two Petya III
Vietnam — three Petya II, two Petya III

GENERAL SPECIFICATIONS

Operator: Russia
Type: Project 159A

Class: PETYA II

Built: 27
Active: 3

Displacement:
standard: 950 t
full load: 1,180 t

Dimensions
Length: 81.8 m (268.3 ft)
Beam: 9.1 m (29.9 ft)
Draught: 2.9 m (9.5 ft)

Speed: 32 kts
Range: 4,870 n miles at 10 kts; 450 n miles at 29 kts

Complement: 98

WEAPONS SYSTEMS

TORPEDOES

There are two banks, each of five 406 mm (16 in) torpedo tubes. One bank is forward of the after turret, the other immediately abaft it. The torpedo normally used is the SAET-40, an anti-submarine torpedo with active/passive homing to 5.4 n miles (10 km) at a speed of 30 knots.

GUNS

Two AK-726 twin 76 mm (3 in)/59 mountings

There are two twin AK-726 turrets, one forward in 'A' position, the other aft in 'Y' position. The AK-726 is a multirole weapon system designed for air defence, surface engagement and shore bombardment roles and consists of two 76 mm guns mounted in a turret with a 5 mm metal shield. The whole mounting can contain 60 rounds of which two are on the feeder rail and four are on the hoists at any one time. The prime ammunition is the UOFB-62, a fixed round which weighs 12.8 kg (28.2 lb). The projectile weighs 4.6 kg (10.1 lb) and has 400 g of A-IX-2 explosive and a VG-67 point impact fuze.

There is a five-man crew in the turret: the gun captain, two layers and two loaders. There is a further team of four loaders in the below-decks magazine. In this installation AK-726 is associated with Hawk Screech radar, but, in addition to radar fire control there is also local control through the Prisma optical sighting system, which may be used for engaging targets with speeds of up to 600 m/s (Mach 1.75).

Specifications

Calibre: 76 mm
Barrel length: 59 calibres
Muzzle velocity: 980 m/s (3,215 ft/s)
Traverse: 360° at 36°/s
Elevation: −7 to +85° at 32°/s
Ammunition (total): 16 kg (35.2 lb)
Rate of fire: 90 rds/min (whole mounting)
Range:
surface/surface: 8.5 n miles (15.7 km)
AA (max): 10,000 m (32,808 ft)
AA (effective): 7,000 m (22,965 ft)

ANTI-SUBMARINE MORTARS

RBU-6000

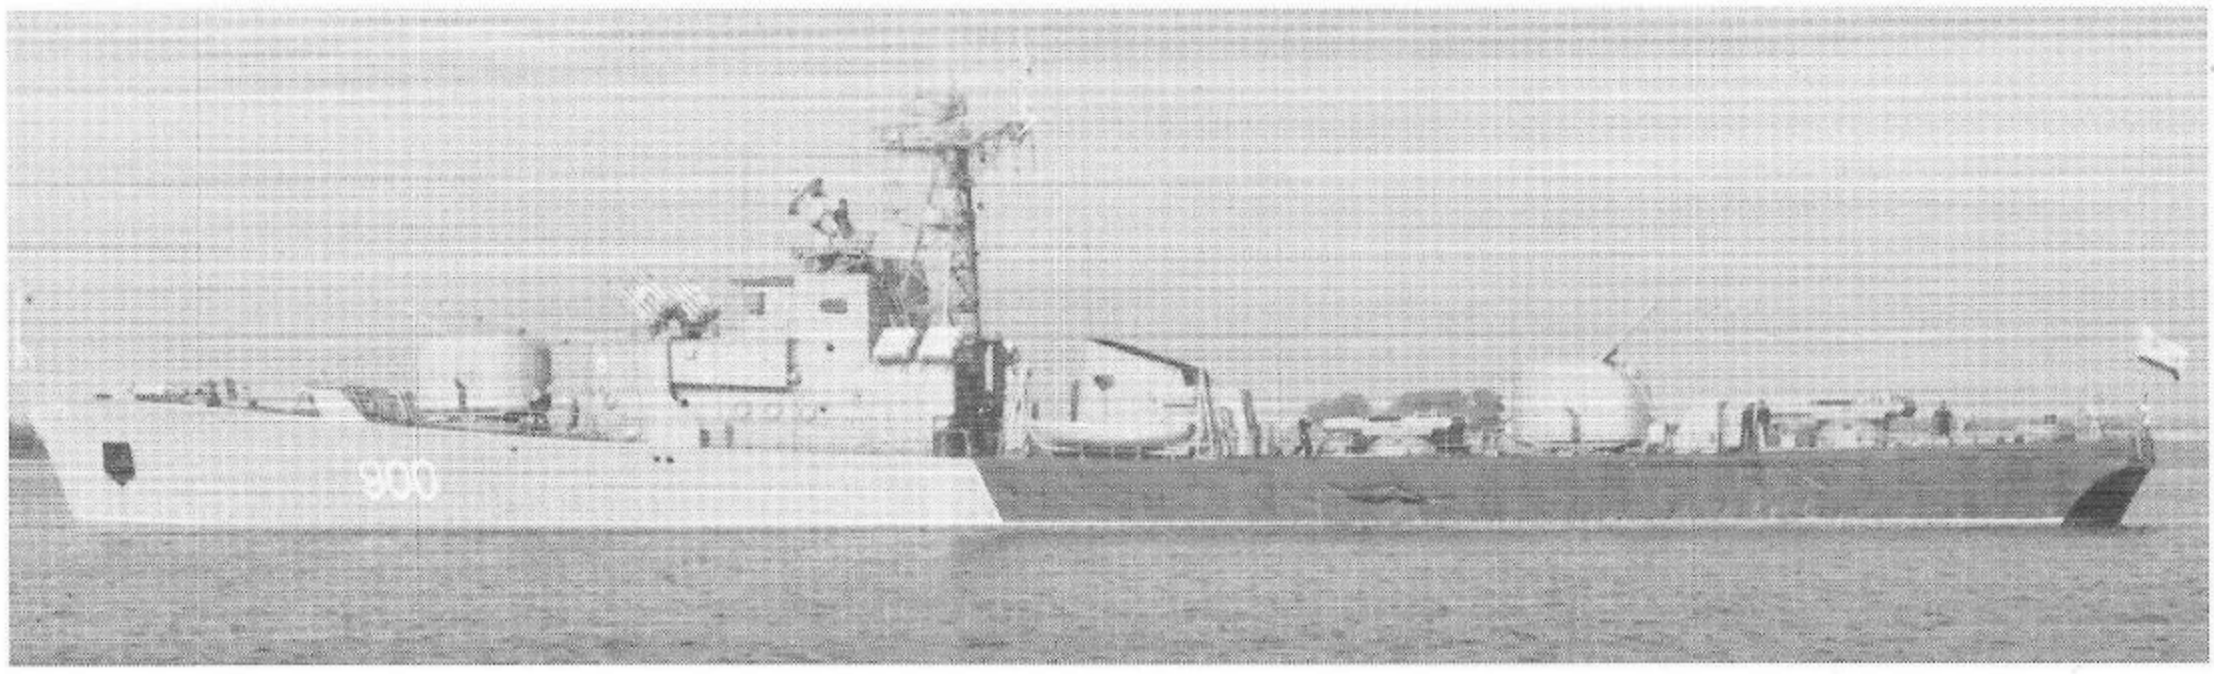
There are two 12-tube RBU-6000 mortars immediately before the bridge. The mounting can traverse through 360° and elevation limits are −15°/+60°. Loading is automatic from a below-deck magazine. It is estimated that the rockets weigh 110 kg, with a 25 kg warhead. Pairs of tubes are fired in sequence. The RGB-60 rocket is fitted with an impact time fuze, which detonates either on hitting a solid object (such as a submarine) or when it reaches a preset depth. Firing is usually conducted in a full salvo of 12 rockets, but it is also possible to fire single rockets, or four- or eight-rocket salvos, if the tactical situation requires it.

DEPTH CHARGES

There are two depth-charge racks.

MINES

22 mines can be carried.



A Petya II of the Russian Navy (H & L van Ginderen Collection)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Watch Dog

There are two Watch Dog arrays. Watch Dog is an intercept and radar warning system which has been in service for over 30 years. It is a wide-open system with an array consisting of four tiers of eight microwave horns, covering frequencies from D to H-band and normally has two arrays, one on each side of the ship.

COMMAND AND CONTROL SYSTEMS

RADARS

Strut Curve search radar

The air search radar is the MR-302 (NATO = Strut Curve) a medium-range, general purpose, F-band, air search radar. The elliptical lattice reflector is mounted at the masthead. Range performance against a 2 m² aircraft target at medium altitude is about 60 n miles (110 km) with a likely maximum range of 150 n miles (280 km).

Don 2

All Grishas have one Don 2, I-band, navigation radar.

Hawk Screech fire-control radar

Hawk Screech fire-control radar has a circular dish scanner, behind which are mounted the transmitter and receiver, as well as turning and stabilisation gear. The 2.3 m (7.5 ft) diameter scanner has a central feed supported by a four-leg structure. Feed arrangements could incorporate a rotating dipole to provide a conical scan search pattern. Dish diameter is approximately 2 m (6.56 ft) and the operating frequency is in the H/I-band for both types. The NATO designation, Hawk Screech, is apparently derived from signal characteristics noted in the course of ELINT monitoring. The principal function is that of gunfire director against aircraft targets, although this type probably also has a certain capability against surface targets, and possibly splash detection. In the Petyas Hawk Screech is associated with the 76 mm guns.

IFF

High Pole B.

SONARS

Herkules

The Petya II is equipped with Herkules (NATO = Wolf Paw) a sonar more usually found in submarines. It is a hull-mounted, active search and attack, medium-frequency system.

VDS

Some Petya IIs are reported to be fitted with a VDS.

PROPULSION

Specifications

System: Combined diesel and gas turbine (CODAG)
Main machinery: 2 gas turbines; 22 MW (30,000 hp(m); 1 Type 61V-3 diesel; 3.97 MW (5,400 hp(m)) sustained (centre shaft)
Shafts: 3

FURTHER INFORMATION

Only three Petya IIs remain in service with the Russian Navy: two in the Northern Fleet and one in the Caspian Sea. All other Russian Petya IIs have either been scrapped, sold abroad (Ethiopia — 2; Vietnam — 3), or defected to the Ukraine (one, which has since been scrapped).

A 'Petya II' class ship of the Russian Navy. Note the two sets of five torpedo tubes (one between the stack and the aft gun; one aft of the gun) and the chutes in the transom for mines and depth charges

WEAPONS SYSTEMS

TORPEDOES

There is one bank of three 533 mm (21 in) torpedo tubes abaft the stack. The torpedo normally used is the SAET-60, an anti-submarine torpedo with active/passive homing to 8.1 n miles (15 km) at a speed of 40 knots. It carries a 400 kg (880 lb) warhead.

GUNS

Two AK-726 twin 76 mm (3 in)/59 mountings

There are two twin AK-726 turrets, one forward in 'A' position, the other aft in 'Y' position. The AK-726 is a multirole weapon system designed for air defence, surface engagement and shore bombardment roles and consists of two 76 mm guns mounted in a turret with a 5 mm metal shield. The whole mounting can contain 60 rounds of which two are on the feeder rail and four are on the hoists at any one time. The prime ammunition is the UOFB-62, a fixed round which weighs 12.8 kg (28.2 lb). The projectile weighs 4.6 kg (10.1 lb) and has 400 g of A-IX-2 explosive and a VG-67 point impact fuze.

There is a five-man crew in the turret: the gun captain, two layers and two loaders. There is a further team of four loaders in the below-decks magazine. In this installation AK-726 is associated with Hawk Screech radar, but, in addition to radar fire control there is also local control through the Prisma optical sighting system, which may be used for engaging targets with speeds of up to 600 m/s (Mach 1.75).

Specifications
Calibre: 76 mm
Barrel length: 59 calibres
Muzzle velocity: 980 m/s (3,215 ft/s)
Traverse: 360° at 36°/s
Elevation: −7 to +85° at 32°/s
Ammunition (total): 16 kg (35.2 lb)
Rate of fire: 90 rds/min (whole mounting)
Range:
surface/surface: 8.5 n miles (15.7 km)
AA (max): 10,000 m (32,808 ft)
AA (effective): 7,000 m (22,965 ft)

ANTI-SUBMARINE MORTARS

RBU-2500

There are four RBU-2500 launchers. RBU-2500 is about 2.5 m (8.2 ft) high and consists of 16 rocket launcher tubes arranged horizontally in two rows with a steel beam across the top above the rear of the upper row. The tubes, which may be elevated to +85°, are fitted to a large yoke fitting which enables the weapon to be traversed through a nominal 360°. Each tube has a diameter of 250 mm (9.8 in), is 1.6 m (5.2 ft) long and fires manually loaded rockets, each with a 21 kg (46.3 lb) warhead, up to 1.5 n miles.

DEPTH CHARGES

There are two depth-charge racks.

MINES

22 mines can be carried.

COMMAND AND CONTROL SYSTEMS

RADARS

Slim Net

Slim Net is a surface warning, high-definition radar of generally conventional naval design, with the typical Russian characteristic of balancing vanes behind the scanner. It also has an air search capability. The scanner is of open lattice construction and approximately 5.5 m (18.0 ft) span and 1.8 m (5.9 ft) maximum depth. The general shape is of a tapered rectangle, and the balance vanes also are rectangular. The horn feed is mounted on a boom overhanging the scanner. Operating frequency is in the E/F-band of the spectrum.

Don 2

All Grishas have one Don 2, I-band, navigation radar.

Hawk Screech fire-control radar

Hawk Screech fire-control radar has a circular dish scanner, behind which are mounted the transmitter and receiver, as well as turning and stabilisation gear. The 2.3 m (7.5 ft) diameter scanner has a central feed supported by a four-leg structure. Feed arrangements could incorporate a rotating dipole to provide a conical scan search pattern. Dish diameter is approximately

2 m (6.56 ft) and the operating frequency is in the H/I-band for both types. The NATO designation, Hawk Screech, is apparently derived from signal characteristics noted in the course of ELINT monitoring. The principal function is that of gunfire director against aircraft targets, although this type probably also has a certain capability against surface targets, and possibly splash detection. In the Petyas, Hawk Screech is associated with the 76 mm guns.

Shafts: 3

FURTHER INFORMATION

The Indian Navy acquired 12 Petya IIIs from the (then) Soviet Union between 1969 and 1974. These were special export versions with three 533 mm torpedo tubes in place of the ten 406 mm tubes in the Soviet Navy version, and with four RBU-2500 instead of two RBU-6000. They also had simpler communications equipment.

Seven have been stricken and one, *Andaman* (P 74) sank in heavy weather in the Bay of Bengal on 22 August 1990 with the loss of 14 lives.

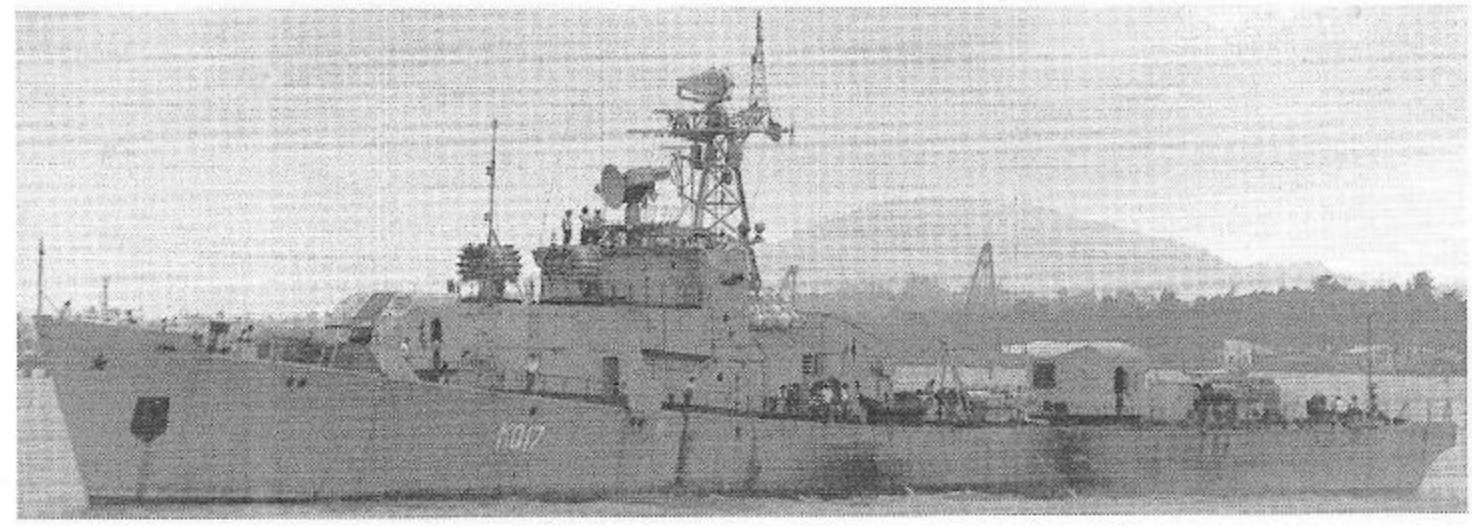
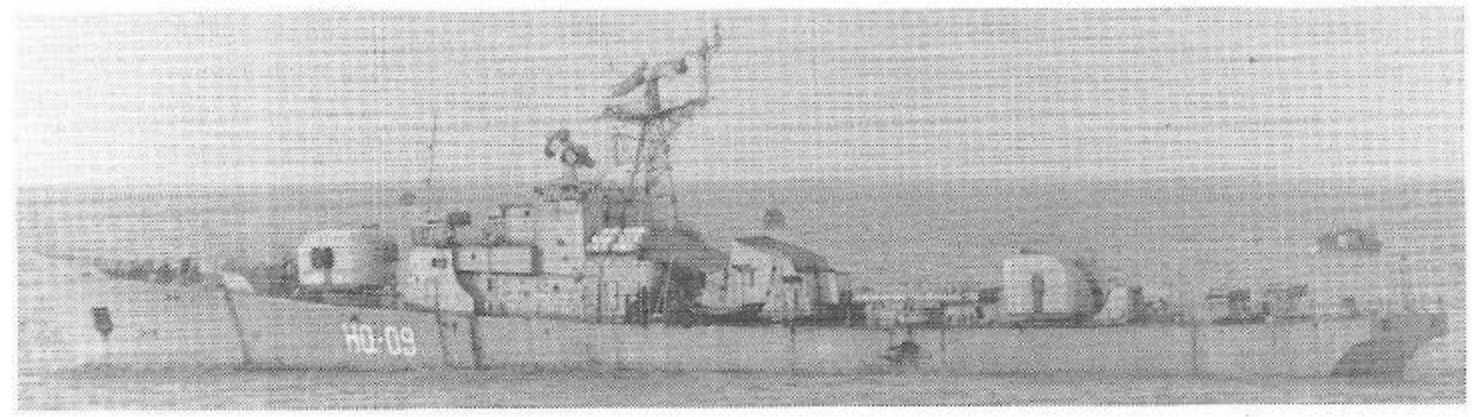
AA (effective): 7,000 m (22,965 ft)



HQ 17, *one of the three former Russian Navy Petya IIs acquired by the Vietnamese Navy in 1983-84. One of the major characteristics of this version is the pair of RBU-6000 12-tube ASW rocket launchers before the bridge* (G Torremans)



HQ 09, *a Vietnamese Navy Petya III. Note that there are no torpedo tubes abaft the after gun mounting, and that there are four RBU-2500 rocket launchers, two forward and two aft*

ANTI-SUBMARINE MORTARS

RBU-6000

Petya II only. There are two 12-tube RBU-6000 mortars, immediately before the bridge. The mounting can traverse through 360° and elevation limits are −15°/+60°. Loading is automatic from a below-deck magazine. It is estimated that the rockets weigh 110 kg (242 lb), with a 25 kg (55 lb) warhead. Pairs of tubes are fired in sequence. The RGB-60 rocket is fitted with an impact-time fuze, which detonates either on hitting a solid object (such as a submarine) or when it reaches a preset depth. Firing is usually conducted in a full salvo of 12 rockets, but it is also possible to fire single rockets, or four- or eight-rocket salvos, if the tactical situation requires it.

RBU-2500

Petya III only. There are four RBU-2500 launchers. RBU-2500 is about 2.5 m (8.2 ft) high and consists of 16 rocket launcher tubes arranged horizontally in two rows with a steel beam across the top above the rear of the upper row. The tubes, which may be elevated to +85°, are fitted to a large yoke fitting which enables the weapon to be traversed through a nominal 360°. Each tube has a diameter of 250 mm (9.8 in), is 1.6 m (5.2 ft) long and fires manually loaded rockets, each with a 21 kg (46.2 lb) warhead, up to 1.5 n miles.

DEPTH CHARGES

There are two depth-charge racks in both Petya II and III.

MINES

Both types can carry up to 22 mines.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Watch Dog

There are two Watch Dog arrays. Watch Dog is an intercept and radar warning system which has been in service for over 30 years. It is a wide-open system with an array consisting of four tiers of eight microwave horns, covering frequencies from D to H-band and normally has two arrays, one on each side of the ship.

COMMAND AND CONTROL SYSTEMS

RADARS

Strut Curve search radar

The air search radar is the MR-302 (NATO = Strut Curve) a medium-range, general purpose, F band, air search radar. The elliptical lattice reflector is mounted at the masthead. Range performance against a 2 m² aircraft target at medium altitude is about 60 n miles (110 km) with a likely maximum range of 150 n miles (280 km).

Don 2

One Don 2, I-band, navigation radar.

Hawk Screech fire-control radar

Hawk Screech fire-control radar has a circular dish scanner, behind which are mounted the transmitter and receiver, as well as turning and stabilisation gear. The 2.3 m diameter scanner has a central feed supported by a four-leg structure. Feed arrangements could incorporate a rotating dipole to provide a conical scan search pattern. Dish diameter is approximately 2 m and the operating frequency is in the H/I-band for both types. The NATO designation, Hawk Screech, is apparently derived from signal characteristics noted in the course of ELINT monitoring. The principal function is that of gunfire director against aircraft targets, although this type probably also has a certain capability against surface targets, and possibly splash detection. In the Petyas, Hawk Screech is associated with the 76 mm guns.

IFF

High Pole B. Two Square Head.

SONARS

Herkules

All ships are equipped with Herkules (NATO = Wolf Paw) a sonar more usually found in submarines. It is a hull-mounted, active search and attack, medium frequency system.

PROPULSION

Specifications
System: Combined diesel and gas turbine (CODAG)
Main machinery: 2 gas-turbines; 22 MW (30,000 hp(m)); 1 Type 61V-3 diesel; 3.97 MW (5,400 hp(m)) sustained (centre shaft)
Shafts: 3

FURTHER INFORMATION

The Vietnamese Navy operates five of these ships. Two were the standard export version — Petya III — and were supplied brand new in December 1978. The other three were standard Russian Navy Petya IIs and were transferred after service in the Russian Navy, two in December 1983 and one in December 1984.

GRISHA

OVERVIEW

The successor to the 'Poti' class, the Grisha is a small anti-submarine ship of which at least 97 have been built. The Grisha has a full load displacement of 1,200 t, making it marginally smaller than the Danish Niels Juel frigate, and is known in the Russian Navy as *maly protivolodochny korabl* (small anti-submarine ship) or MPK, for short.

Propulsion is CODAG, with one gas turbine and two diesels. The main reason for the gas turbine is the sonar, which was developed from a helicopter set and requires the ship to stop to use it, then raise it and move rapidly to another spot — the so-called 'dip-and-dash' technique.

Grisha I. The basic version, this has the SA-N-4 launcher in the foredeck, with a twin 57 mm gun aft, four torpedo tubes, two depth-charge racks, and the inevitable RBU launchers. 16 were built, of which one was diverted to become the sole Grisha IV. Both Grisha I and II have a rectangular screen abaft the stack, which is not present in later types, which do not have the Muff Cob director, either. This suggests that the screen may have been related to the radiation patterns of Muff Cob.

Grisha II. This version was built for the KGB Border Guard units and has a second twin 57 mm mounting forward, displacing the SA-N-4 launcher. 17 were built.

Grisha III. The Grisha III has an AK-630 Gatling on a small tower aft, displacing the Muff Cob fire-control director in Grisha I and II. To make up for this, a Bass Tilt is mounted on the after deckhouse and performs fire control for both the 57 mm and the AK-630. 34 were built, the largest single group in the class, of which six were for the KGB Border Guard. The engines were more powerful, as well.

Zemaitis, one of two Grisha IIIs operated by the Lithuanian Navy. At least 97 have been built (Jane's/Kathleen Bunten)

Grisha IV. This was one of the Grisha I hulls, which was diverted to become a trials ship, but apparently had a 76 mm gun. It was used in the early 1980s as the trials ship for the SA-N-9 missile system and the associated Cross Sword fire-director.

Grisha V. This version has a 76 mm gun aft and a new air search radar, either Strut Pair or Half Plate B. It is also reported to have an improved sonar and two positions for shoulder-launched SAMs. One RBU-6000 was removed. Some units were for the KGB Border Guard, the remainder for the navy.

Lithuania
Two Grisha IIIs have been sold to Lithuania.

Ukraine
One Grisha V was claimed by the Ukraine in 1993 and three (possibly four) more are being built at Leninskaya Kuznitsa shipyard at Kiev.

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

SA-N-4 'Gecko' (OSA-M) point defence system

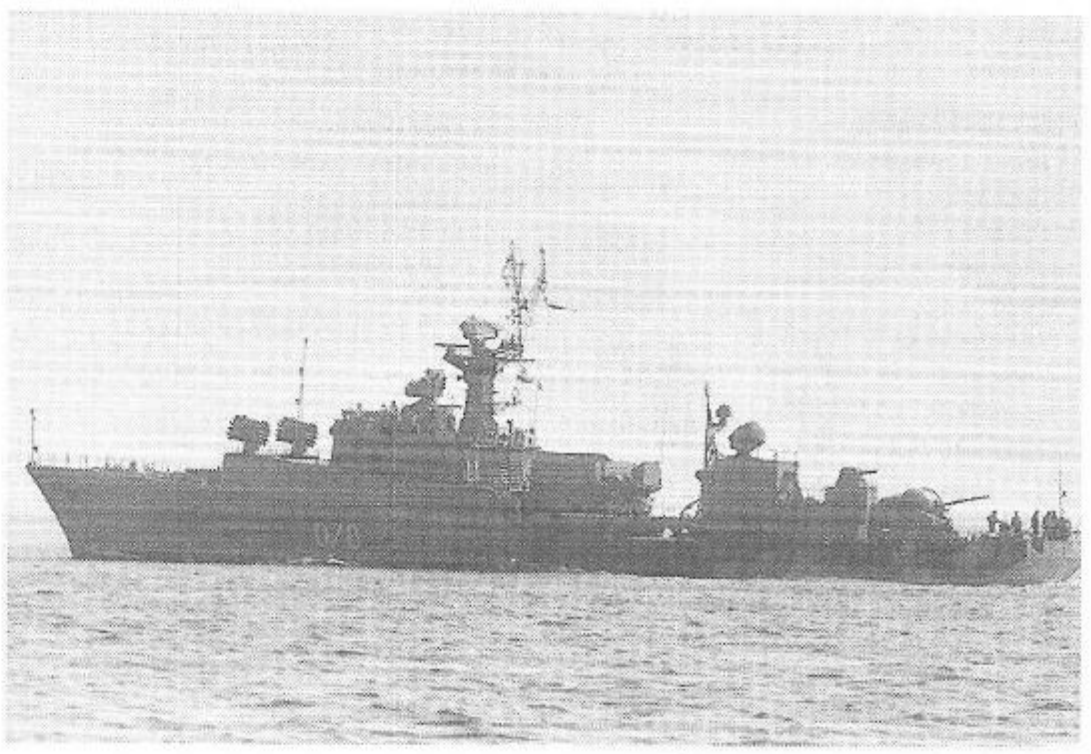
Grisha I, III and V only. There is one SA-N-4 launcher in the foredeck, with 20 missiles in a below-deck magazine. This system is known to NATO as SA-N-4 (reporting name = Gecko) but is known in Russia as the Osa-M system, while the missile itself is designated 9M33. SA-N-4 has a distinctive loading and launching system in which the twin-rail launcher lies beneath a hinged flat cover plate, emerges to launch its missiles, and then retracts in order to reload. This is likely to result in a low rate of fire which must be slowed even further by the need to close the magazine cover before firing. Underneath the launcher are four revolving drums each with five missiles while the electromechanical and hydraulic machinery is below that. On launch, the booster burns for 2 seconds allowing the radar to gather the missile at a range of 0.75 n miles (1.5 km), following which the sustainer burns for 15 seconds.

SA-N-4 is controlled by the Pop Group system. There is a frequency-agile, monopulse radar with a parabolic rotating search antenna operating in H-band (6-8 GHz) and with a typical acquisition range of 16 n miles (30 km). There are two J-band (10-20 GHz) antennas, one of them for a pulse Doppler target-tracking element with a range of 10.75 n miles (20 km) and the smaller parabolic antenna being used to track the missile. Above the prime antennas is a smaller, circular one which emits an I-band (8-10 GHz) uplink capture beam which gathers the missile shortly after launch. The director also has a small, rectangular command uplink emitter.

Specifications

Range: 8 n miles (15 km)
Altitude: 39-3,048 m (130-10,000 ft)
Speed: Mach 2.5
Warhead: 50 kg (110.2 lb)

Grisha I. Weapons include SA-N-4 launcher in foredeck, two RBU-6000s before the bridge, two pairs of fixed 533 mm torpedo tubes and a twin 57 mm mounting aft (partially obscured by the diesel exhaust fumes). Note that the Muff Cob is offset to port, and the small rectangular array at the head of the small mainmast



Grisha II of the (then) KGB Border Guard. This version has two twin 57 mm guns

Grisha III. This version has a 30 mm CIWS and a Bass Tilt fire director offset to port

Grisha V. Note the Half Plate B air/surface search radar and the single 76 mm gun which are the main differences from Grisha III (H & L van Ginderen Collection)

TORPEDOES

All versions have two pairs of fixed torpedo tubes amidships, except for some late production Grisha V which have only one per side.

GUNS

57 mm twin L/75 (ZIF-72/AK 725)

Grisha I, III — one twin mounting. Grisha V — two mountings. Grisha I and III have one twin 57 mm L/75 mounting in 'Y' position; Grisha II has two such mounts in 'A' and 'Y' positions. This Russian weapon has been designed for prolonged air defence engagements, but can also be used against seaborne and land targets. The 4.57 m (15.0 ft) long barrels are water-cooled and the mounting consists of the elevating mass with two automatic weapons and the cradle, the rotating structure for the elevating mass with gun drives, firing system and other elements, all on a slip ring with two arrays of ball-bearings. Below decks are the ammunition handling system and the magazine. The turret is made of aluminium alloy. The 550-round linked belt is initially threaded into the feeder mechanism by hand and is advanced by the cocking mechanism; thereafter, the hydraulic mechanism takes over. The feeder system is capable of operating in bursts or in a sustained form with automatic interruption when only 50 rounds remain in the belt. Each round weighs 6.61 kg (14.6 lb) and the feeder mechanism has 15 per barrel within the turret.

There are two operators in the fire-control station, which is associated with the 'Muff Cob' fire-control system.

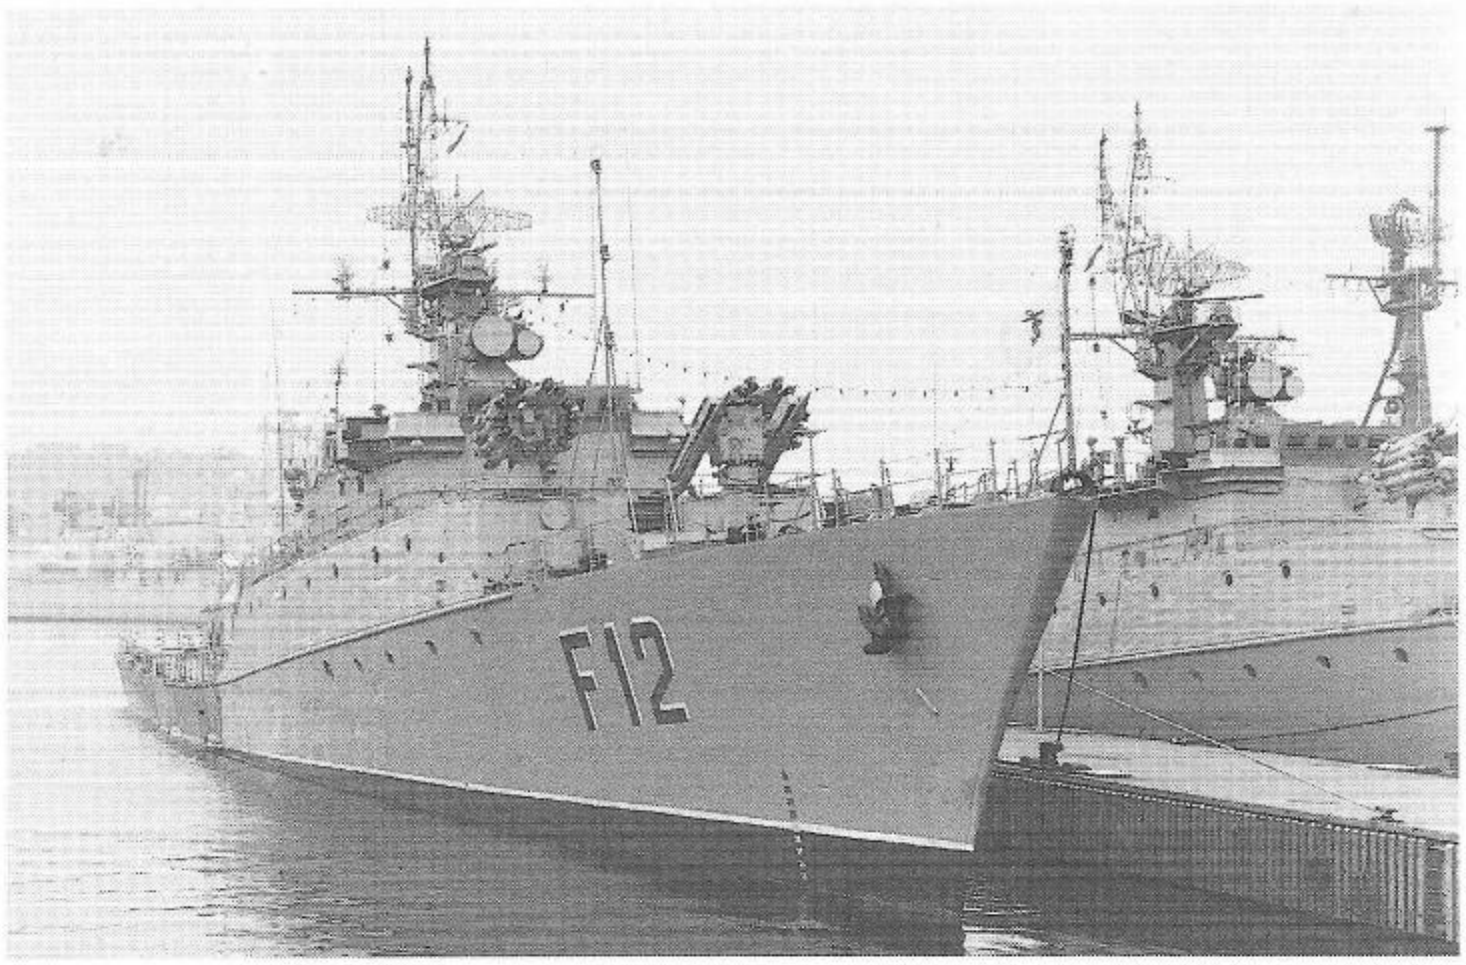
'Muff Cob' has its antenna in a 1 m (3.38 ft) wide, weather-proof mounting suspended from a trunnion-yoke carried on a traversing mounting. The radar is supplemented by an electro-optic sensor. The height of the mounting is about 3 m (9.8 ft) and the H-band radar can probably tilt from −10 to +50° as with the gun mounting. It is likely that control of the mounting is conducted from the compartment which houses the radar display system. Remote laying is controlled through a servo follower drive which ensures smooth slew rate changes at all speeds. Manual operation of the mounting is confined to maintenance and repair functions.

Specifications

Length of barrel: 75 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Traverse: ±200°
Elevation: −10 to +85°
Range:
anti-surface: 3.25 n miles (6 km)
anti-air: 6,000 m
Rate of fire: 120 rds/min/barrel
Projectile weight: 6.61 kg (14.6 lb)
Power requirements: 220 or 380 V, three phase

AK-176M 76 mm L/59

Grisha V only. There is one AK-176M 76 mm L/59 gun mounted in 'Y' position aft. The AK-176M is a four-man mounting, which is hydraulically operated, with manual reversion in the event of power failure. The AK-176M would normally be controlled by a Bass Tilt or a Kite Screech director, but, in this case, there is no director (although there is space for such a device in the bridge roof). This suggests that the gun is only fired under local control using either the Kondensor sight, which is normally only used as a back-up in the event of the failure of 'Bass Tilt', or the WD-221 optical sight. Alternatively, the Nogat radar may be used in a directing role, although this would not be particularly satisfactory.



Aukstaitis *(F 12), a Grisha III of the Lithuanian Navy. This picture shows the SA-N-4 missiles on their launcher with the associated Pop Group radar array on the bridge roof* (Jane's/H M Steele)

Specifications

AK-176
Calibre: 76 mm
Barrel length: 59 calibres
Muzzle velocity: n/k
Traverse: 360° at 35°/s
Elevation: −3 to +85° at 30°/s
Ammunition (total): 16 kg (35.2 lb)
Rate of fire: 120 rds/min
Range:
Surface/surface: 8 n miles (15 km)
AA: 7,000 m (22.965 ft)

Ammunition (UOFB-62)
Weight:
complete round: 12.8 kg (28.2 lb)
projectile: 4.6 kg (10.1 lb)
explosive: 400 g (A-IX-2)
Fuze: Point impact fuze (VG-67)

AK-630 30 mm CIWS

Grisha III and V only. These ships have one 30 mm 65 calibre AK-630 Gatling close in weapon system mounted on a small tower in 'X' position overlooking the after gun.

Specifications

Calibre: 30 mm
Length of barrel: 65 calibres
Number of barrels: 6
Muzzle velocity: 890 m/s (2,920 ft/s)
Cooling: Water
Traverse: 360° at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range: 4,000 m (13,123 ft) (radar fire control), 5,000 m (16,404 ft) (electro-optic fire-control)
Rate of fire: 4,000-5,000 rds/min
Magazine: 2,000 rds
Weight of complete round: 1.224 kg (2.7 lb)
Ammunition types:
UOF-84 HE-I weight: 384 g
UOR-84 HE-T weight: 388 g
Fuze: MG-32 point impact (both rounds)

ANTI-SUBMARINE MORTARS

RBU-6000

Grisha I, II, III — two. Grisha V — 1. The RBU-6000 is a 12-tubed, trainable, anti-submarine rocket launcher, which is located before the bridge. These are conventional Russian-pattern systems; 98 rockets are carried. Grisha V has only one RBU-6000, on the port side.

Specifications

RBU-6000
Launch tubes: 12
Tube arrangement: Circular
Calibre: 300 mm (11.8 in)
Tube length: 0.6 m (1.9 ft)
Elevation: +50°
Traverse: 360° (theoretical)
Rocket weight: 100 kg (220 lb)
Warhead: 31 kg (68 lb)
Range: 3.25 n miles (6,000 m)

DEPTH CHARGES

There are two rails; 12 depth charges are carried.

MINES

18 mines can be carried in lieu of depth charges.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Chaff launchers

All ships have two 10-barrelled chaff launchers.

Watch Dog

There are two Watch Dog arrays. Watch Dog is an intercept and radar warning system which has been in service for over 30 years. It is a wide-open system with an array consisting of four tiers of eight microwave horns, covering frequencies from D to H-band and normally has two arrays, one on each side of the ship.

RADARS

Strut Curve search radar

Grisha I, II, III. The air search radar in the first three groups is the Russian MR-302 (NATO = Strut Curve) a medium-range, general purpose, F band, air search radar. The elliptical lattice reflector is mounted at the masthead. Range performance against a 2 m^2 aircraft target at medium altitude is about 60 n miles (110 km) with a likely maximum range of 150 n miles (280 km).

Strut Pair

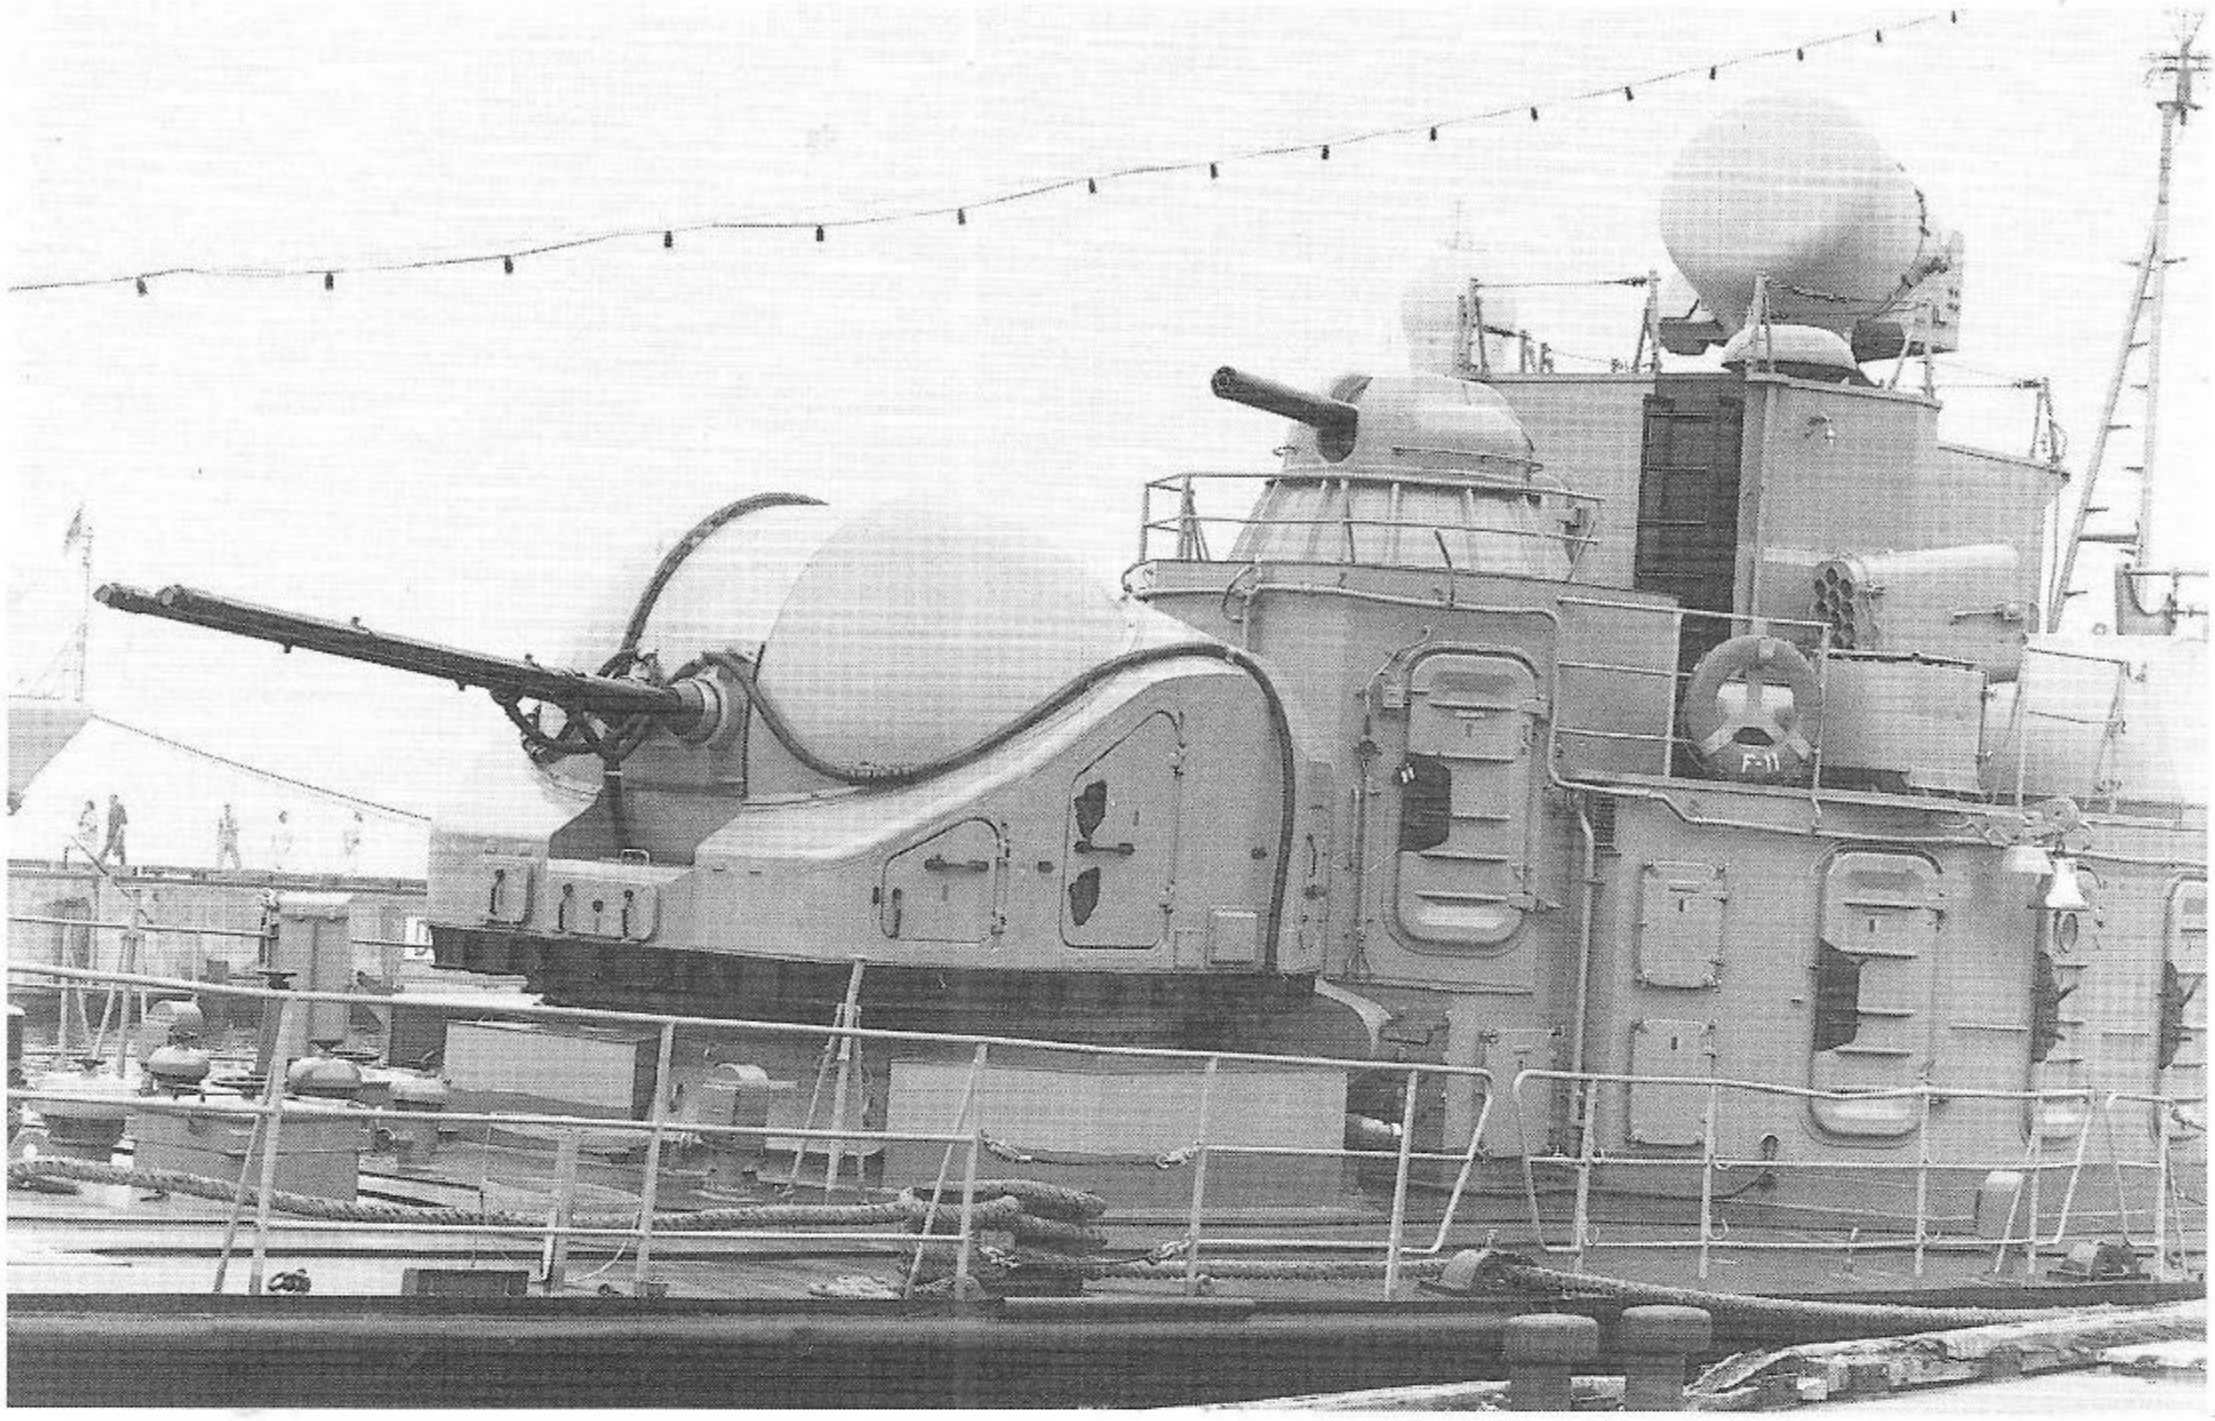
Grisha V. Early ships in the Grisha V group have Strut Pair, which consists of two Strut Curve antennas back to back, which is presumably intended to increase the data rate.

Half Plate Bravo

Grisha V. The later ships have Half Plate Bravo in place of Strut Pair. Half Plate Bravo is an E/F band set formed by taking one of the two planar arrays from the Top Plate back to back array.

Don 2

All Grishas have one Don 2, I-band, navigation radar.



Zemaitis *(F 11) in close-up showing the twin AK-725 57 mm guns, AK-630 CIWS and Bass Tilt fire-control director radar. Note also the PK-2 chaff launcher to the right of the lifebelt* (Jane's/H M Steele)

Pop Group

Grisha I, III, V. The Pop Group director is located on the bridge roof, providing the weapon control system for the SA-N-4 missile system. The director includes an acquisition radar with a long, curved antenna on top of the cab, and two target trackers. The latter two are of different size, but presumably the smaller one performs a similar function to the larger, but at higher frequencies, which would enable them to direct two different missiles against the same target. The system operates in the F/H/I band.

Muff Cob

Grisha I and II. Muff Cob is the director for the 57 mm fire-control system and is the large cylindrical radome atop the small tower overlooking the quarterdeck. The radome is supported by a trunnion yoke in a traversing mounting and is thus capable of both elevation and traverse. There is a device to the left of the radome (from the front), with a remotely controlled cover, which may be a TV camera. The F/G band radar is named Muff Cob by NATO and Bars (Wildcat) by the Russian Navy.

Bass Tilt fire-control radar

Grisha III, V only. Bass Tilt is an H/I-band fire-control radar which entered service in the mid-1970s and in the 'Grisha' class it is the fire-control system for the 76 mm gun and the 30 mm CIWS. The weapon system and director are mounted on a pedestal, with the drum-shaped antenna radome, 1.2 m (3.9 ft) in diameter, inclined at an angle of approximately 45°. The director is 2 m (6.5 ft) high and 1.45 m (4.7 ft) long. The radar is probably linked to a ballistic computer and each director controls one or two gun mountings.

Unidentified antenna. There is a mast at the forward end of the after deckhouse in all versions; in Grisha I, III and V this is a lattice mast, in Grisha II it is plated over. This supports a single rectangular array which has not, as yet, been identified.

IFF

Different IFF equipments can be found, including: High Pole A or B; Square Head; and Salt Pot.

SONARS

Bull Nose

The Grishas all carry the Bull Nose bow-mounted, active search and attack sonar, which operates in the 7-8 kHz frequency band.

Elk Tail

The Elk Tail dipping sonar is derived from the set used in the Hormone helicopter. It is deployed from the stern and the ship must stop to use it and recover it before moving on. It is used, in conjunction with Bull Nose, to trigger the ASW torpedoes and the RBU-6000 ASW rocket launcher.

PROPULSION

Specifications

System: Combined diesel and gas turbine (CODAG)
Main machinery: 1 gas turbine; 11 MW (15,000 hp(m)); 2 diesels; 11.8 MW (16,000 hp(m))
Shafts: 3

FURTHER INFORMATION

Ukrainian Ship

The Ukrainian ship appears to be a standard Russian Navy Grisha V.

Lithuanian Ships

The Lithuanian ships appear to be a standard Grisha III, except that they do not have the mast on the after deckhouse with the unexplained radar (see above).

KRIVAK

OVERVIEW

The 'Krivak' class is one of the major successes of the Russian shipbuilding industry. It is a very neat design, well armed and with a good balance of sensors on a moderate displacement (3,650 tonnes full load). The operational requirement was issued in 1964 and the first of class appeared in 1969, at the height of the Cold War, and was immediately recognised as impressive, capable, and for Western navies — dangerous. There was only one significant tactical deficiency, the lack of an onboard helicopter, and that was overcome in the Krivak-III. A total of 41 Krivaks has been produced which fall into four groups.

The Krivak (Project 1135) was designed at the Northern Design Bureau, headed by N Sobolev, with Chief Supervisor I Satsyura representing the navy department. The requirement was for a small escort ship, displacing no more than 2,100 tonnes, with a predominantly ASW armament and capable of being mass-produced. It was to be armed with RBU launchers, ASW torpedo tubes, an air defence missile system and two twin 76 mm guns. As is normal in all navies, however, the requirement changed, more weapons were needed and the displacement increased, resulting in the Project 1135, displacing well over 3,000 tonnes.

The propulsion units are mounted on rafts, with two-stage anti-vibration mountings and to improve economy at low speed there is a propulsion reduction gear unit, which enables one engine to drive both shafts. There is fully automatic roll and pitch stabilisation system, designated UKA-135, with twin stabilisers located on the lower hull immediately below the mast, which is claimed to reduce roll and pitch by a factor of between 3.5 and four times.

The Krivak was produced at three shipyards, with the lead ship being laid down on 21 July 1968.

Krivak I (Project 1135). The first group, with 21 commissioned between 1970 and 1982. These have four SS-N-14 anti-submarine missile launchers on the foredeck, two SA-N-4 SAM launchers and two twin 76 mm guns, both aft.

TABLE I: KRIVAK CLASS — SUMMARY

		Krivak I	Krivak I Mod	Krivak II	Krivak III

Notes
* The four Krivak I Mod are included in the original 21 Krivak I hulls
** The last two Krivak III hulls have been completed and handed over to the Ukraine

Ukrainian Navy Hetman Sagaidachny, *a Krivak III originally built for the Russian KGB Border Guard* (Jane's/H M Steele)

Krivak I Mod. Three Krivak Is were modernised between 1991 and 1994. This involved deleting the RBU-6000, adding eight SS-N-25 (Harpoonski) launchers and numerous changes to the sensor fit. This programme was ended with the completion of the third hull, purely for financial reasons.

Krivak II (Project 1135M). The second construction group, eleven were commissioned between 1975 and 1982. The major change was in the two gun mountings where two single 100 mm weapons were substituted for the two twin 76s. In addition, the gun mounting in 'X' position is raised slightly and the break to the quarterdeck is several metres further aft than in other versions.

Krivak III. The last to be produced, entering service between 1984 and 1991, this version introduced the long-awaited helicopter flight deck and hangar. This displaced the two gun mountings and the SA-N-4 launcher aft; one gun mounting was moved forward to 'A' position and the other, together with the SA-N-4 launcher, deleted. Moving the gun to the foredeck displaced the four SS-N-14 launchers, but the role of this weapon was taken over by the SS-N-15, which is launched from the torpedo tubes. The forward radar tower is plated over to a much greater extent than in earlier versions and there is a small mast on the hangar roof, which is used to support folded dipole HF communications antennas, the other end of which is suspended from the foremast. When first introduced into service, the Krivak IIIs were operated by the maritime arm of the KGB Border Service in the Far East, although whether the ships were designed for the KGB or the latter simply took them over while under construction is not clear. They have since been returned to the navy.

National designation

The national designations of these ships changed in 1977, indicating an altered perception of their primary mission:

1969-1977. *bolshoy protivolodochny korabl* (large anti-submarine ship.

1977 onwards. *storozhevoy korabl* (escort ship)

Disposals

Disposal of these ships has already started and a number of Krivak Is and Krivak IIs have already been scrapped.

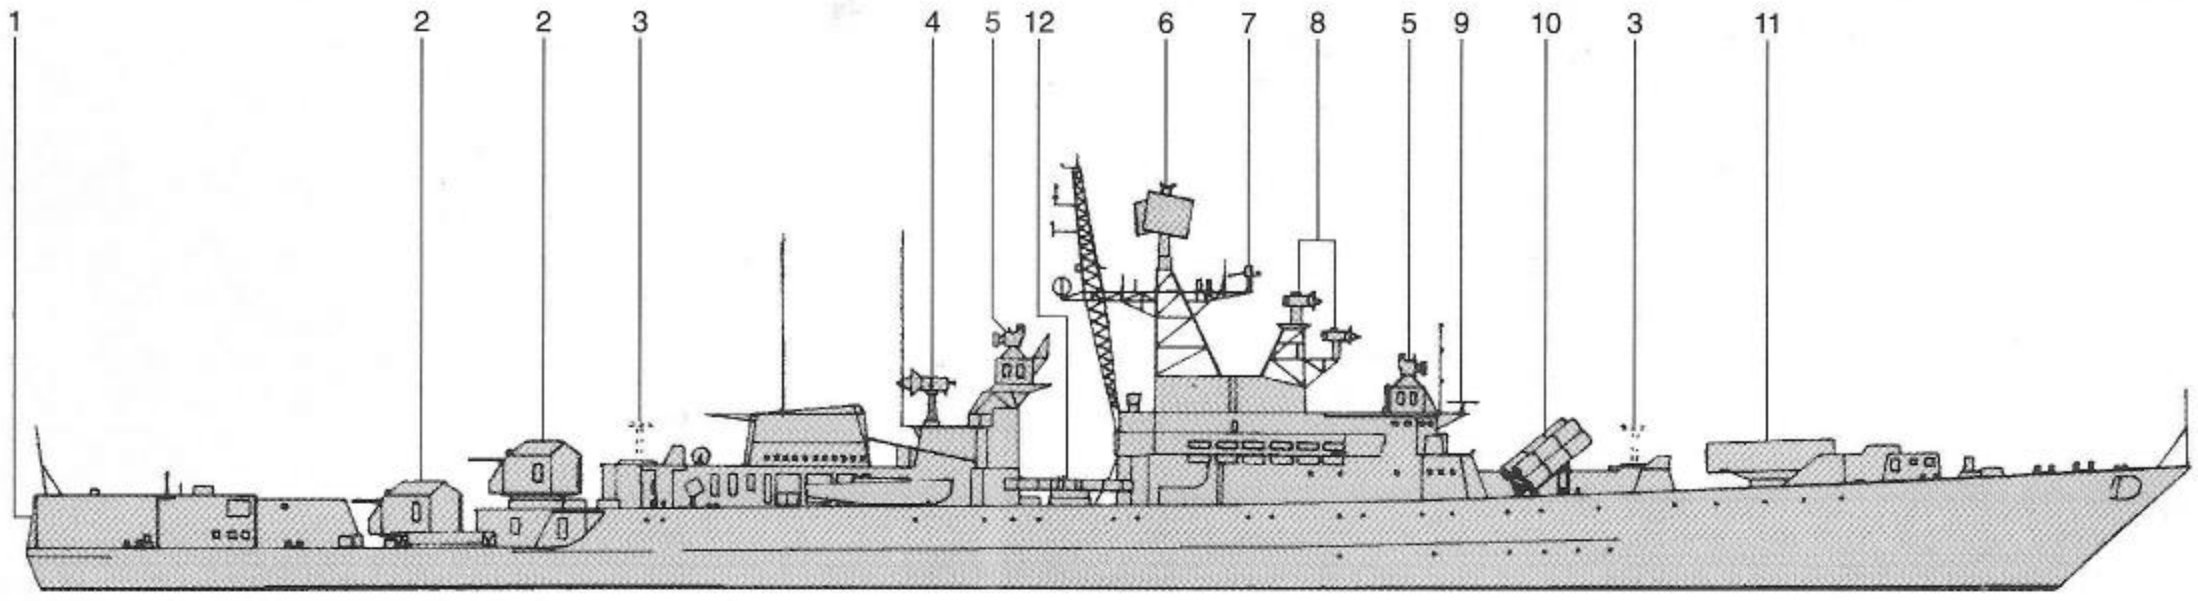
TABLE II. KRIVAK PRODUCTION

	Krivak I	Krivak II	Krivak III
Yantar Shipyard, Kaliningrad	8	11	–
Zaliv Shipyard, Kerch	7	–	7
Severnaya Verf, St Petersburg	6	–	–
TOTAL	21	11	7

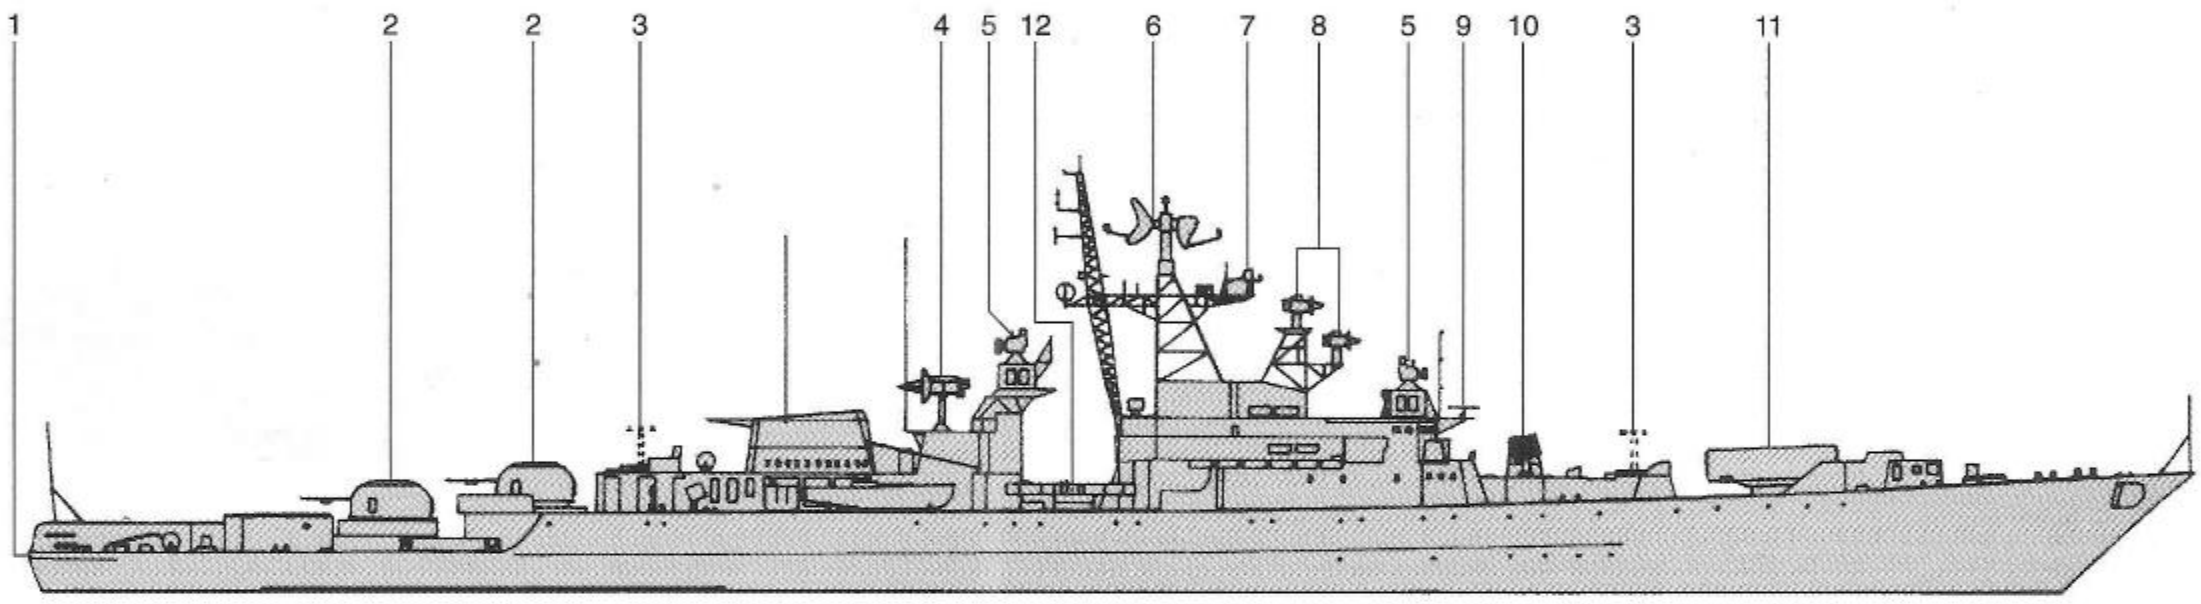
Exports

Despite the respect in which the design is held, no Krivaks have been exported, and ships at the end of their service lives are being scrapped rather than offered to friendly navies as happens with US, British and French ships. However, a new version, designated Project 1135.6 is now being marketed, which appears to be an updated Krivak III.

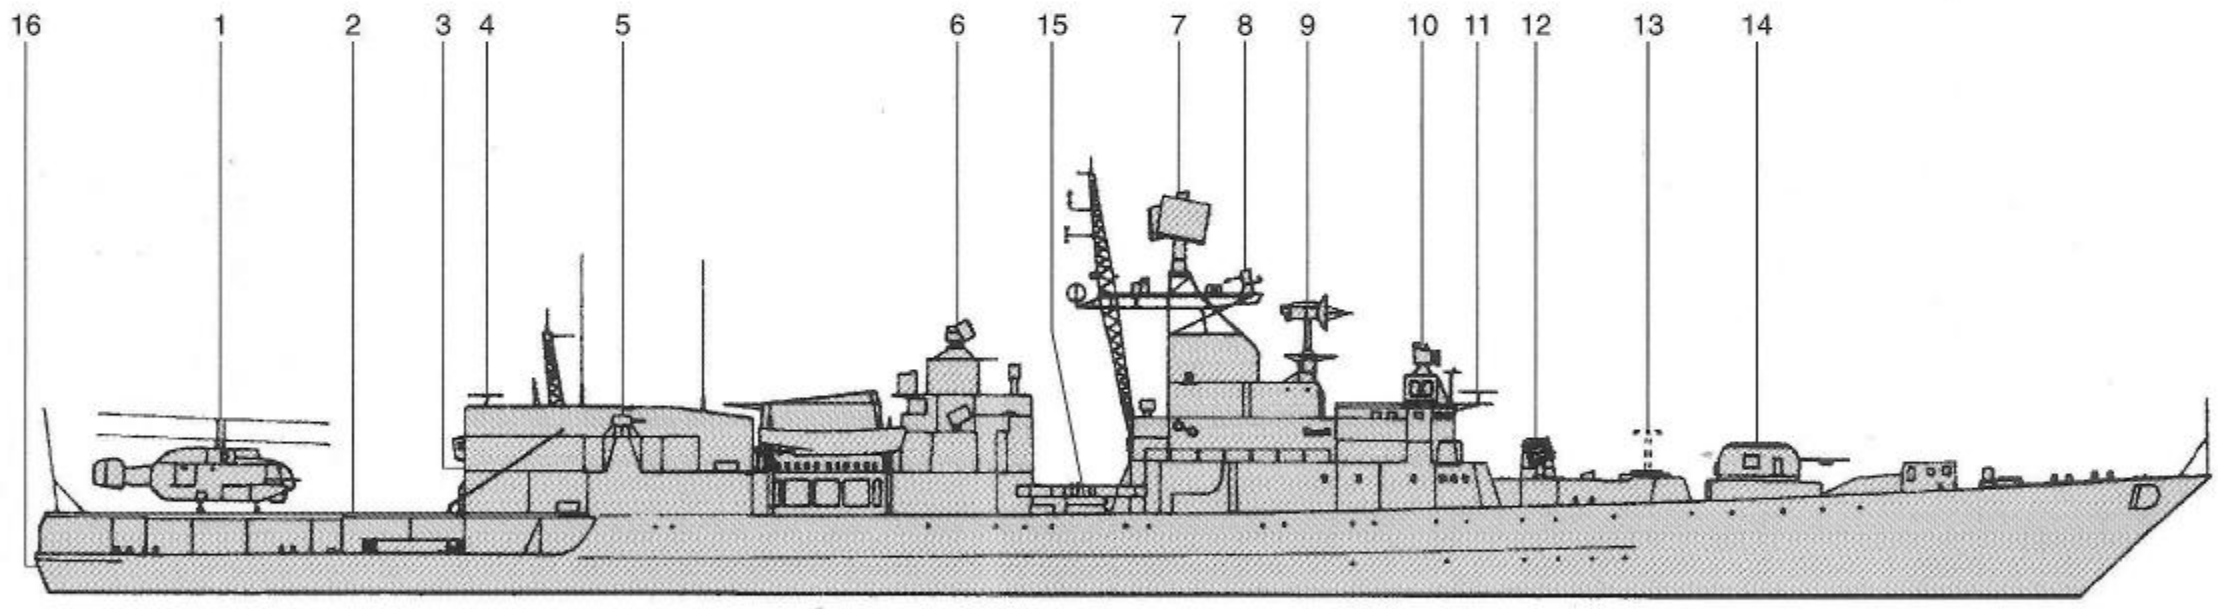
KRIVAK



Krivak I (mod) (Ian Sturton)
1 *Steer Hide variable depth sonar* **2** *Twin AK-726 76 mm (3 in)/59 guns* **3** *SA-N-4 Gecko twin arm launchers* **4** *Owl Screech gunfire control (for 76 mm guns)* **5** *Pop Group fire control (SA-N-4 missiles)* **6** *Top Plate* **7** *Surface search radar: Don Kay, or Don Kay 2, or Palm Frond, or Spin Trough* **8** *Eye Bowl fire control (SS-N-14 missiles)* **9** *Navigation radar: Palm Frond* **10** *SS-N-25 anti-ship missiles (two four-tube launchers)* **11** *SS-N-14 Silex anti-submarine missiles (four launchers)* **12** *Eight 533 mm (21 in) torpedo tubes*



Krivak II (Ian Sturton)
1 *Mare Tail variable depth sonar* **2** *100 mm (3.9 in)/59 single mounts* **3** *SA-N-4 Gecko twin-arm launchers* **4** *Kite Screech fire control (for 100 mm guns)* **5** *Pop Group fire control (for SA-N-4 missiles)* **6** *Head Net C air search radar* **7** *Surface search radar: Don Kay* **8** *Eye Bowl fire control (for SS-N-14 missiles)* **9** *Palm Frond navigation radar* **10** *RBU-6000 anti-submarine/anti-torpedo rocket launcher* **11** *SS-N-14 Silex four-tube anti-submarine missile launcher* **12** *Eight 533 mm (21 in) torpedo tubes*



Krivak III (Ian Sturton)
1 *Ka-27 Helix ASW helicopter* **2** *Flight deck* **3** *Hangar* **4** *Peel Cone carrier control approach (CCA) radar* **5** *ADG-630 30 mm/65* **6** *Bass Tilt fire control (for ADG-630)* **7** *Top Plate air search radar* **8** *Surface search radar: Don Kay, Don Kay 2, Palm Frond or Spin Trough* **9** *Kite Screech fire director (for 100 mm gun)* **10** *Pop Group fire director (for SA-N-4 SAM system)* **11** *Navigation radar: Palm Frond* **12** *RBU-6000 anti-submarine/anti-torpedo rocket launcher* **13** *SA-N-4 twin-arm SAM launcher* **14** *100 mm (3.9 in)/59 single gun* **15** *Eight 533 mm (21 in) torpedo tubes* **16** *Mare Tail variable depth sonar*

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

SS-N-25 (Kh 35 Uran)

Krivak III only. Krivak IIIs are armed with eight SS-N-25 launchers on the foredeck. SS-N-25 is an autonomous anti-ship missile system, which has been dubbed 'Harpoonski' in the West. The system comprises the missile, the launcher-handling system and (probably) a fire-control console. It is compatible with most surface search radars. The clipped-delta wings and slim, trapezoidal control fins are in X configuration and all fold. The missiles are housed in individual, cylindrical launcher-containers, but these are grouped together in a box-like structure, which is noticeably different from the Harpoon-like launchers in the 'Gepard' class frigate. The launchers are raised at a fixed angle of about 35°. Information in Russian sales literature suggests that the missile has a limited capability compared with Harpoon. The sea-skimming altitude is 5-10 m (16.4-32.8 ft).

Specifications

Length: 3.78 m (12.4 ft) (4.62 m (15.1 ft) with booster)
Diameter: 42 cm (16.5 in)
Wing span: 93 cm (36.6 in)
Weights:
missile: 480 kg (1,058 lb) (without booster)
booster: 120 kg (264 lb)
warhead: 145 kg (319 lb)
Guidance: Inertial and active radar
Max speed: Mach 0.9
Range: 2.5-70 n miles (5-130 km)

Manufacturer/Contractor

Zvezda Design Bureau.

Pylky, *a modified Krivak I, with the two RBU-6000 ASW rocket launchers replaced by two four-tube launchers for SS-N-25* (MoD Bonn)

SURFACE-TO-AIR MISSILES (SAM)

SA-N-4 short-range missile system

Krivak I, Krivak I Mod, Krivak II — two launchers: Krivak III — one launcher. All ships are armed with SA-N-4, but Krivak III has one launcher forward, while the others all have two launchers, one at either end of the ship. The twin-rail launcher lies beneath a hinged flat cover plate, emerging to launch its missiles and retracting to reload. This is likely to result in a low rate of fire which must be slowed even further by the need to close the magazine cover before firing. Below the launcher are four revolving drums each with five missiles while the electromechanical and hydraulic machinery is below that. On launch, the booster burns for 2 seconds allowing the radar to gather the missile at a range of 0.75 n miles (1.5 km), following which the sustainer burns for 15 seconds. Command and control is via the Pop Group system (see below). There are 20 weapons to each launcher.

Specifications

Length: 3.1 m (10.17 ft)
Diameter: 21 cm (8.27 in)
Wing span: 64 cm (25.2 in)
Weight: 130 kg (286.6 lb)
Speed: Mach 2.5
Warhead: 50 kg (110 lb) HE
Range: 0.75-8 n miles (1.5-15 km)
Height: 9-3,000 m (30-10,000 ft)
Guidance: Semi-active radar homing

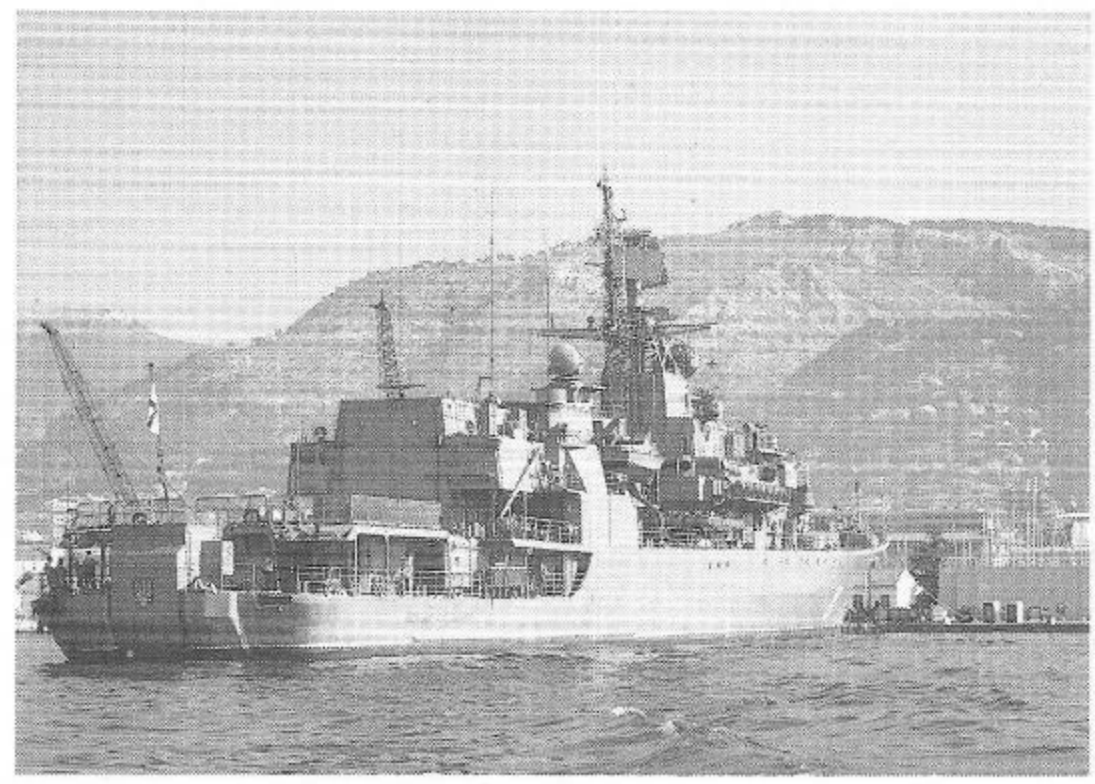
SS-N-14 'Silex' long-range anti-submarine torpedo delivery system

Krivak I, Krivak I Mod, Krivak II. There is one, quadruple SS-N-14 ('Silex') missile launcher on the foredeck. SS-N-14 is a long-range torpedo delivery system capable of operating to beyond the First Convergence Zone. The missile is powered by a solid propellant booster-sustainer and is reported to have an autopilot which can be updated in flight. Payload is either a Type 40 or a Type 53-72 torpedo, which is faired into the underside of the airframe. The ASW version of the weapon requires only 15 seconds warm-up time and cruises at a height of some 750 m (2,460 ft), being guided towards the approximate location of the target by radio command. The torpedo is ejected immediately above the submarine's estimated position and deploys its parachute which slows the descent. On entering the water the parachute is disconnected and the weapon begins a search pattern to acquire the target. The missile body includes a 500 kg (1,102 lb) warhead, enabling the weapon to be used in an anti-ship role against targets up to 19 n miles (35 km) distant. The target is initially located by sonar and the Eye Bowl F-band fire-control radar is used to guide and track the missile during flight.

Specifications

SS-N-14
Length: 7.2 m (23.62 ft)
Diameter: 0.574 m (1.88 ft) (1.35 m (4,43 ft) with torpedo)
Launch weight: 4,000 kg (8,818 lb)
Range (anti-submarine): 30 n miles (55 km)
Speed: Mach 0.95
Guidance: Autopilot and command update

The stern of Krivak II, Neukrotimy. *The two 100 mm (3.9 in) guns are characteristic of this version . The long housing accommodates the Mare Tail variable depth sonar which is deployed through the large door in the transom. The two torpedo-shaped devices resting on chocks on the deck are acoustic decoys. The sailor on the left is standing behind the cable drum for the non-buoyant decoy which is kept at a standard depth by the float strapped to the side of the VDS housing. The recesses at the outer ends of the transom are for minelaying and the minerails can be seen in the deck* (A M Garcia)



Ukrainian Krivak III. Hetman Sagaidachny, *at Toulon in 1994. The Krivak IIIs were originally built for the KGB Border Service and then taken over by the Russian Navy. One already in service was handed over to the Ukraine Navy, while the second in still under construction. There is a large hangar and flight deck, displacing the guns and SA-N-4 launcher, but the Mare Tail VDS and mine rails are still fitted. Note also the Top Plate radar which replaced Head Net C in this version and the Peel Cone carrier-controlled approach (CCA) radar on the hangar roof* (Jane's/H M Steele)

AT-2 (NATO = Type 53-72)
Range: 3,800 m (4,155 yd)
Max depth: 400 m (1,312 ft)
Homing:
Warhead: 100 kg (220 lb)
Speed: 40 kts
Length: 7.2 m (23.5 ft)
Diameter: 533 mm (21 in)

TUBES

There are two sets of quadruple 533 mm (21 in) torpedo tubes in the waist. They are normally aligned with the ship but pivot outwards at an angle of about 30° to fire.

TORPEDOES

The tubes can launch any of the wide variety of Russian 533 mm torpedoes.

GUNS

Two AK-726 twin 76 mm (3 in)/59 mountings

Krivak I only. There are two twin AK-726 turrets, both aft in 'X' and 'Y' positions. The AK-726 is a multirole weapon system designed for air defence, surface engagement and shore bombardment roles and consists of two 76 mm guns mounted in a turret with a 5 mm metal shield. The whole mounting can contain 60 rounds of which two are on the feeder rail and four are on the hoists at any one time. The prime ammunition is the UOFB-62, a fixed round which weighs 12.8 kg (28.2 lb). The projectile weighs 4.6 kg (10.1 lb) and has 400 g of A-IX-2 explosive and a VG-67 point impact fuze.

There is a five-man crew in the turret: the gun captain, two layers and two loaders. There is a further team of four loaders in the below-decks magazine.

AK-726 is associated with 'Owl Screech' radar. In addition to radar fire control there is local control through the Prisma optical sighting system, which may be used for engaging targets with speeds of up to 600 m/s (Mach 1.75).

Specifications

Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: 980 m/s (3,215 ft/s)
Traverse: 360° at 36°/s
Elevation: −7 to +85° at 32°/s
Ammunition (total): 16 kg (35.2 lb)
Rate of fire: 90 rds/min (whole mounting)
Range:
- **surface/surface:** 8.5 n miles (15.7 km)
- **AA (max):** 10,000 m (32,808 ft)
- **AA (effective):** 7,000 m (22,965 ft)

AK-100 100 mm/59 medium-calibre dual-purpose gun

Krivak II — two single mounts. Krivak III — one single mount. Krivak IIs and Krivak IIIs mount the 100 mm gun instead of the 76 mm in the Krivak I and Krivak I Mod. The AK-100 100 mm/59 calibre is a water-cooled weapon in an enclosed turret.

Specifications

Calibre: 100 mm (3.9 in)
Length of barrel: 59 calibres
Muzzle velocity: 880 m/s
Traverse: 200° at 30°/s
Elevation: −10 to +85° at 20°/s
Weight of projectile: 15.6 kg (34.4 lb)
Rate of fire: 60 rds/min
Range, surface/surface: 21.5 km

30 mm AK-630 close in weapon system

Krivak III only. There are two AK-630 close in weapon system (CIWS) turrets either side of the hangar. This multibarrel, high volume-of-fire gun system, has a separate fire-control radar and a below-deck control station with remote optical and/or electro-optical sensor. It fires five types of fire mission: against anti-ship missiles, aircraft, small surface vessels, drifting mines and unprotected shore targets. The weapon consists of six water-cooled barrels, using the Gatling principle with a fixed breech block and revolving barrels. The magazine contains 2,000 rounds of HE-I and HE-T ammunition. The gun fires bursts of up to 400 rounds, during which both the barrel and the breech block are cooled, with used cartridges and links being ejected into a bin below the elevating mass. The mounting is unusual in having an ignition system for burning off gun gases accumulating within it during firing.

Specifications

Calibre: 30 mm
Length of barrel: 65 calibres
Muzzle velocity: 890 m/s (2,920 ft/s)
Traverse: 360° (depending on location of turret) at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range:
- **radar fire control:** 4,000 m (13,123 ft)
- **electro-optic fire control:** 5,000 m (16,404 ft)

Rate of fire: 4,000-5,000 rds/min
Ammunition:
- **round:** 1.224 kg (2.7 lb)
- **projectile weight:** UOF-84: 384 g; UOR-84: 388 g

ANTI-SUBMARINE MORTARS

RBU-6000

Krivak I, II, III. There are two 12-tube RBU-6000 mortars located on the foredeck in all except Krivak I Mod, which thus becomes one of the very few Russian combat ships not to have at least one RBU-type weapon. The mounting can traverse through 360° and elevation limits are −15°/+60°. Loading is automatic from a below-deck magazine. It is estimated that the rockets weigh 110 kg (242 lb), with a 25 kg (55 lb) warhead. Pairs of tubes are fired in sequence. The RGB-60 rocket is fitted with an impact-time fuze, which detonates either on hitting a solid object (such as a submarine) or when it reaches a preset depth. Firing is usually conducted in a full salvo of 12 rockets, but it is also possible to fire single rockets, or four- or eight-rocket salvos, if the tactical situation requires it. The warhead weighs 31 kg (68 lb).

MINES

There are launch rails at the stern, enabling the ship to launch up to 20 mines.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Bell Shroud

There are two Bell Shroud systems. This is basically a Watch Dog B, but with two extra pairs of receiver antennas to cover higher frequencies in the radar spectrum. It is the standard intercept system used in Russian destroyers and frigates and is used in conjunction with Bell Squat as the standard intercept/jamming system.

Bell Squat

There are two Bell Squat jammer systems, which were derived from Top Hat, but with the frequency bands increased to cover K-band. Two types of ECM system are in use, Bell Squat A which uses barrage jamming, and Bell Squat B which employs deception jamming.

Half Cup

Some ships have been seen with a Half Cup laser warning device.

DECOYS

Chaff launchers

All ships carry chaff launchers, which are either four of the 16-tubes type or ten of the 10-tube type.

Torpedo decoy

There is a towed torpedo decoy, designation unknown.

COMMAND AND CONTROL SYSTEMS

RADARS

Head Net C (MR-310) air surveillance radar

Head Net C (Russian designation = MR-310) is used as the main air surveillance radar in Krivak I and II. It is an E-band, 3D radar, consisting of two Head Net A scanners which are positioned back to back, with one tilted at some 30° to the horizontal. This displaces the resulting fan-shaped elevation beam by the same amount from the vertical, which, in combination with the vertical beam produced by the companion scanner, provides the means for heightfinding using the 'V-beam' technique. The two beams are also separated in azimuth by 180°. In practice, the vertical beam fulfils the search function and the operator selects a target for which height data is required, and by placing a marker on this target (or similar technique) he places a range gate in the second (inclined) beam and excludes other targets. Computation to give a height readout can then be performed by analogue or digital methods. Range is some 70 n miles (128 km).

Top Plate

Top Plate (Orel and later and some Krivak I after modernisation).

Surface search/navigation

There is the usual mixture of types to be found in Russian ships, all I-band, including:

Don Kay
Palm Frond
Don 2
Spin Trough

Peel Cone

Krivak III only. One Peel Cone antenna is found on the hangar roof of the Krivak III. This suggests that it is used in a helicopter control and direction-finding role.

Eye Bowl fire-control radar

Krivak I, I Mod, II. There are two Eye Bowl fire-control radars mounted on a small tower above the bridge. Eye Bowl radar is the fire-control director for the SS-N-14 missile system. Its main role is to track and guide the outgoing SS-N-14 missile to ensure that it reaches a previously designated target position determined by another of the ship's sensors and the combat information system. The reflector dish is comparatively small and there appear to be several auxiliary (possibly electro-optical) sensors mounted immediately behind the reflector dish. Command signals to the SS-N-14 missile are probably transmitted as coded information within the radar transmissions, as no separate command antennas can be seen. Eye Bowl operates in the F-band, which tends to confirm the estimated range of the SS-N-14 system of 30 n miles.

Pop Group

Krivak I, I Mod, II — two, Krivak III — one. Pop Group is the weapon control system for the SA-N-4 missile system, with one director per launcher. In Krivak I, I Mod and II there are two launchers: one is on the bridge roof, the other on a small tower abaft the mast. The director includes an acquisition radar with a long, curved antenna on top of the cab, and two target trackers. The latter two are of different size, but presumably the

Neukrotimy, *a Krivak II. Weapons on the foredeck are SS-N-14 ASW missile launcher and two RBU-6000 ASW rocket launchers. Sensors from the bridge roof upwards are: Peel Cone (navigation radar); Pop Group (fire control, SA-N-4); two Eye Bowl (fire control, SS-N-14); Palm Frond (surface search radar); Head Net C (air search radar). Note also the Bell Shroud ESM array below the port-side bridge windows* (Jane's/HM Steele)

smaller one performs a similar function to the larger, but at higher frequencies, which would enable them to direct two different missiles against the same target. The system operates in the F/H/I band.

Owl Screech gunfire-control radar

Krivak I and Krivak I Mod only. Owl Screech is a G-band, fire-control radar distinguished by a circular dish scanner, behind which is mounted a fairly bulky housing containing transmitter and receiver, together with the turning and stabilisation gear. The 2.3 m (7.5 ft) diameter scanner has a central feed supported by a four-leg structure. Feed arrangements could incorporate a rotating dipole to provide a conical scan search pattern. The NATO designation Owl Screech is derived from signal characteristics noted in the course of ELINT monitoring. The principal function is that of gunfire director against aircraft targets, although it probably has an additional capability against surface targets, and possibly splash detection.

Kite Screech

Krivak II and III only. The radar director for the 100 mm mounts is 'Kite Screech'. This is a G/I-band radar which appears to incorporate monopulse tracking. It features a circular dish antenna, with central feed, behind which are transmitter, receiver, turning and stabilisation gear housings. All are mounted upon a pedestal which is about 2 m (6.5 ft) high. It could well be that the radar compartment for this sensor also acts as the fire-control centre.

Bass Tilt

Krivak III only. Bass Tilt is an H/I-band fire-control radar which entered service in the mid-1970s and is part of the fire-control system for the ADG-630 CIWS. The weapon system and director are mounted on a pedestal, with the drum-shaped antenna radome, 1.2 m in diameter, inclined at an angle of approximately 45°. The director is 2 m (6.5 ft) high and 1.45 m (4.75 ft) long. The radar is probably linked to a ballistic computer and each director controls one or two gun mountings.

IFF

IFFs are High Pole B in all ships, plus Salt Pot in Krivak III.

SONARS

Bull Nose

All ships are fitted with the Bull Nose bow-mounted, active search and attack sonar, which operates in the 7-8 kHz frequency band. This sonar is also found in *Neustrashimmy* and its Russian designation is MGK 335MS.

VDS

Krivak I Mod only. Part of the conversion work in the Krivak I Mod is the installation of a variable-depth sonar (VDS) in an enlarged compartment on the quarterdeck. This may be either Mare Tail or Steer Hide, both of which are medium-frequency, active search systems.

AVIATION

AVIATION FACILITIES

Specifications

Krivak III only.
Flight deck: 23 × 14 m (75 × 46 ft)

HELICOPTERS

One Ka-27PL (NATO = Helix A)

Specifications

Dimensions:
rotor diameter: 15.90 m (52.16 ft)
rotor disc area: 397 m² (4,275 sq ft)
fuselage length: 11.30 m (37.07 ft)
height to rotor head: 5.40 m (17.72 ft)
Weights:
operating weight, empty: 6,500 kg (14,330 lb)
max take-off weight: 12,600 kg (27,778 lb)
max payload: 5,000 kg (11,023 lb)
Performance:
max level speed at optimum altitude: 135 kts (250 km/h)
endurance: 4.5 h
Engines: 2 Klimov (Isotov) TV3-117V turboshafts, each 1,645 kW (2,205 shp)
Accommodation: 3 (pilot plus 2)
Sensors: Surface-search radar, sonobuoys, dipping sonar
Weapons: 2 APR-2 torpedoes, or 4 conventional depth bombs or mines

PROPULSION

Specifications

System: Combined gas turbine and gas turbine (COGAG)
Main machinery: 2 gas turbines; 40.8 MW (55,500 hp (m)); 2 gas turbines; 10 MW (13,600 hp(m))
Shafts: 2

FURTHER INFORMATION

Ukrainian ships

The Ukrainian Navy has taken over the last two Krivak IIIs, which originally had been intended for the Border Guard of the former Soviet Union. The first was commissioned in 1993 and *Dorosenko* should have completed in 1995, but was held up by the refusal of the Russian authorities to release equipment. This problem has now been overcome.

Sagaidachny deployed to the Mediterranean in 1994 and to the Indian Ocean in early 1995, indicating that the Ukrainian Navy fosters 'blue water' ambitions.

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

Klinok integrated air defence system

Neustrashimy has a Klinok fully integrated air defence system consisting of a group of four vertical short-range SAM launchers and a pair of CADS-N-1 combined gun and short-range missile launchers. In addition, each Klinok includes an 8-round magazine; a command and control system; and a Cross Sword fire-control radar. The VLS complex is situated on the forecastle, with two pairs of tubes side by side. Klinok is intended for all-weather use against aircraft, missiles and small craft and is a modular system based on the 9M330 'Kynshal' missile (NATO = SA-N-9 Gauntlet).

Specifications

Klinok system
Max target speed: 700 m/s (2,297 ft/s)
Max number of simultaneous targets: 4
Max number of missiles guided simultaneously: 8
Guidance: Command guidance
Target detection range: 45 km
Target killing range:
missiles: 1.5-12 km
guns: 0.2-12 km
Response time: 0-24 s
Fuze: Pulse radio

SA-N-9 Gauntlet

The missile in the system is the SA-N-9. For launching, the allocated container is rotated into position below the hatch, whereupon the gas-ejection system forces the missile out of the cylinder, simultaneously deflecting the missile in the direction of the target. Once the missile has reached a safe height of some 18-20 m (59-66 ft) above the deck the booster-sustainer comes into operation, accelerating the missile rapidly to its maximum speed. The computer-controlled fire-control system is highly automated and apparently uses one computer for the 'Cross Sword' radar system and two to control the remainder of the Klinok system and to interface with other sensors.

The manufacturers state that up to four targets travelling at Mach 2 may be engaged simultaneously and that the system can operate up to eight missiles simultaneously. The system can be available in 15 seconds when on alert or 3 minutes from 'cold start' and the response time is 8-24 seconds depending upon the search radar's mode of operation.

Specifications

SA-N-9
Length: 3.5 m (11.5 ft)
Diameter: 23.5 cm (9.25 in)
Wing span: 75 cm (25 in)
Weight: 165 kg (364 lb)
Warhead: 15 kg (33 lb)
Speed: Mach 2.5
Range: 0.5-6.5 n miles (1.5-12 km)
Altitude: 10-6,000 m (33-19,686 ft)

Manufacturers/Contractors

Altair Research and Development Corporation, Russia (system).
Fakel Experimental Design Bureau, Kaliningrad, Russia (missile).

CADS-N-1 (Kashtan/Kortika) close in weapon system

The very short-range gun/missile element of the system is the CADS-N-1 Kashtan/Kortika combined missile/gun system, which is designed for point defence against anti-ship missiles and guided bombs at ranges up to 2 n miles (4 km). It consists of an above-deck combat module and a below-deck command module. The combat module is on a deck mounting on which it can turn 360° in azimuth. On either side of the module is a 2A38M 30 mm calibre water-cooled gun, capable of elevation only, and above it are four launcher-containers for 9M311 (NATO = SA-N-11) surface-to-air missiles. These are two-stage, solid propellant missiles with a 'fragmentation/multiple rod type' warhead and a proximity fuze, activated when the missile is within 5 m of the target.

The sensor is the 'Hot Flash' radar which features two paraboloid antennas with front horn feeds. The central one is probably a search radar, to detect and track sea-skimming missiles, while the one mounted to the right of it is probably the missile guidance radar. The transmitter and receiver electronics are mounted behind the antennas. To the left of the central radar antenna are two electro-optic sensors which are probably a laser rangefinder and a remotely operated TV camera.

Targets are designated through the ship's prime air search radar and the target is acquired through the search radar and at ranges of 1,500 to 8,000 m (4,921-26,248 ft) it will be engaged with missiles using radar or TV tracking, with the missiles probably launched in pairs for increased kill probability. Guns will engage targets at closer ranges down to 500 m (1,640 ft). According to Russian publicity material, the highly automated system can engage up to six targets per minute.

Russian sources state the 2S6M can engage targets flying at a maximum speed of 500 m/s (1,640 ft/s) with the complete system having a reaction time of 8 seconds and a similar performance may be expected from the Kashtan.

Specifications

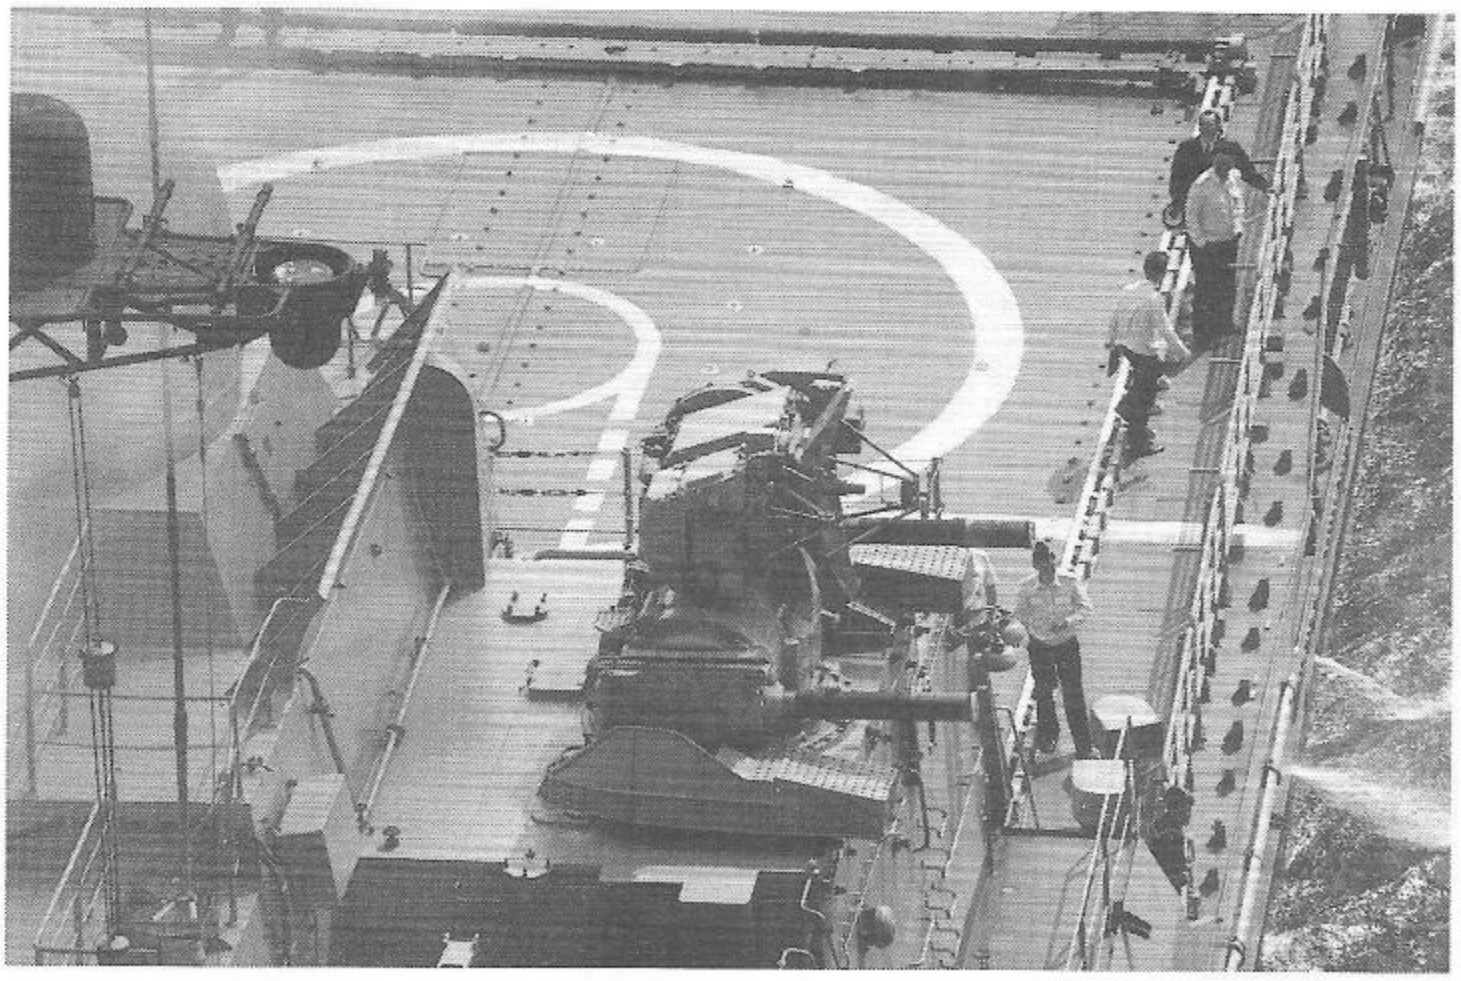
SA-N-11
Length: 2.56 m (5.8 ft)
Diameter: 17 cm (6.7 in)
Wing span: n/k
Weight: 57 kg (125.6 lb)
Speed: Mach 2.6
Range: 4.5 n miles (8 km)
Guidance: Radar to command line of sight

Specifications

2A38M gun
Calibre: 30 mm (12 in)
Number of guns: 2
Length: 3.48 m (11.4 ft)
Weight: 223 kg (491 lb)
Cyclic rate of fire: 1,950-2,500 rds/min
Muzzle velocity: 960 m/s (3,150 ft/s)
Effective range: 2 n miles (4 km)
Effective altitude: 200-2,000 m (656-6,562 ft)
Magazines: 1,900 rounds each

Manufacturers/Contractors

Ministry of Radio Industry, Moscow, Russia.
Scientific Production Corporation Phasotran, Russia.



CADS-N-1 with its two 30 mm cannon, but without the four containers for SA-N-11 SAM (H & L van Ginderen Collection)

ANTI-SUBMARINE MISSILES

Launcher

There are three 533 mm (21 in) horizontal launchers at main deck level on each side of the ship, which are angled outwards at 18° from the centreline. These tubes can launch either SS-N-15 or SS-N-16 anti-submarine missiles which dive into the water, before resurfacing and starting the usual flight profile. Normal torpedoes are also launched. These launchers are similar to those which appeared in the last three 'Kirov' class battlecruisers.

SS-N-15 (NATO = Starfish)

SS-N-15 (Starfish) long-range anti-submarine weapon system is similar in shape to SUBROC, having a long, slim cylinder with small, retractable fins and a booster rocket at the end. The weapon is loaded into a standard 533 mm (21 in) torpedo tube and is then launched in the same way as a torpedo, with the weapon travelling horizontally until it has cleared the ship's side when the rocket motor ignites and propels it upwards, where it flies to the target area and ejects the payload which descends to the sea retarded by a parachute. On entering the water, the weapon is automatically activated and begins carrying out a search and track pattern. The SS-N-15 payload is either a 200 kT nuclear depth charge or a Type 40 lightweight torpedo although it should be noted that, under current international agreements, nuclear warheads would not be carried at sea; the capability, however, remains.

Specifications

Length: 6.5 m (21.33 ft)
Diameter: 533 mm (21 in)
Wing span: n/k
Weight: 1,800 kg (3,968 lb)
Range: 24-27 n miles (45-50 km)
Speed: n/k
Guidance: Inertial

SS-N-16 (NATO = Stallion)

SS-N-16 is a long-range anti-submarine weapon system and is believed to be similar in shape to SUBROC, having a long, slim cylinder with small, retractable fins and a booster rocket at the end. It is associated with a Shark Gill bow-mounted sonar, which is integrated with a passive, towed-array sonar. The weapon is loaded into a standard 650 mm torpedo tube and is then launched in the same way as a torpedo, with the weapon travelling horizontally until it has cleared the submarine when the rocket motor ignites and drives it to the surface and on into the atmosphere where the wings deploy and it flies to the target area where it ejects the payload which descends to the sea retarded by a parachute. On entering the water, the weapon is automatically activated and begins carrying out a search and track pattern.

Payload is usually an E45-75A lightweight torpedo with a range of 8.1 n miles (15 km) at 30 knots. The torpedo has both passive and active sonar sensors and a warhead of either 100 kg (220.5 lb) high explosives (SS-N-16A Veder) or a nuclear warhead of undetermined power (SS-N-16B Vodopod). Note that under current international agreements, nuclear warheads would not be carried at sea, although the capability, of course, remains.

Specifications

Length: 6.7 m (22 ft)
Diameter: 533 mm (21 in)
Span: n/k
Weight: 1,850 kg (4,079 lb)
Range: 50 n miles (92 km)
Speed: n/k
Guidance: Inertial

GUNS

AK-100,100 mm/59 medium-calibre dual-purpose gun

There is one single AK-100,100 mm/59 calibre water-cooled mounting in an enclosed turret on the foredeck in 'A' position.

Specifications

Calibre: 100 mm (3.9 in)
Length of barrel: 59 calibres
Muzzle velocity: 880 m/s (2,887 ft/s)
Traverse: 200° at 30°/s
Elevation: −10 to +85° at 20°/s
Weight of projectile: 15.6 kg (34.4 lb)
Rate of fire: 60 rds/min
Range: anti-surface: 21.5 km

ANTI-SUBMARINE MORTARS

RBU-12000

Few details of this mounting have been published, but it has 10 launcher tubes either side of a box which presumably contains the elevation gears and is itself mounted on a steel pintle. The automatic reloading system is likely to work in the same manner as the RBU 1000/RBU 6000. It is presumably triggered by the Ox Yoke sonar.

Specifications

RBU-12000
Launch tubes: 10
Tube arrangement: Horseshoe
Calibre: 250 mm (9.8 in)
Tube length: 1.4 m (4.6 ft)
Rocket weight: 70 kg (154.3 lb)
Warhead: 80 kg (176.4 lb)
Range: 1,200 m (3,940 ft)

MINES

As in virtually every Russian surface combatant, there are two mine rails.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES ESM/ECM

Three EW systems have been identified so far:

Cage Flask. Cage series sensors are normally communications intercept systems. There are three.

Wine Glass. Wine Glass (formerly designated Foot Ball) is a jammer. It is also found on 'Sovremenny' class destroyers.

Half Hat. There are two Half Hats; Hat group devices are normally jammers.

DECOYS

Chaff launchers

There are two 10-barrelled chaff launchers.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Bell Crown

There are two Bell Crown datalinks.

Salt Pot

There are two Salt Pot IFF devices.

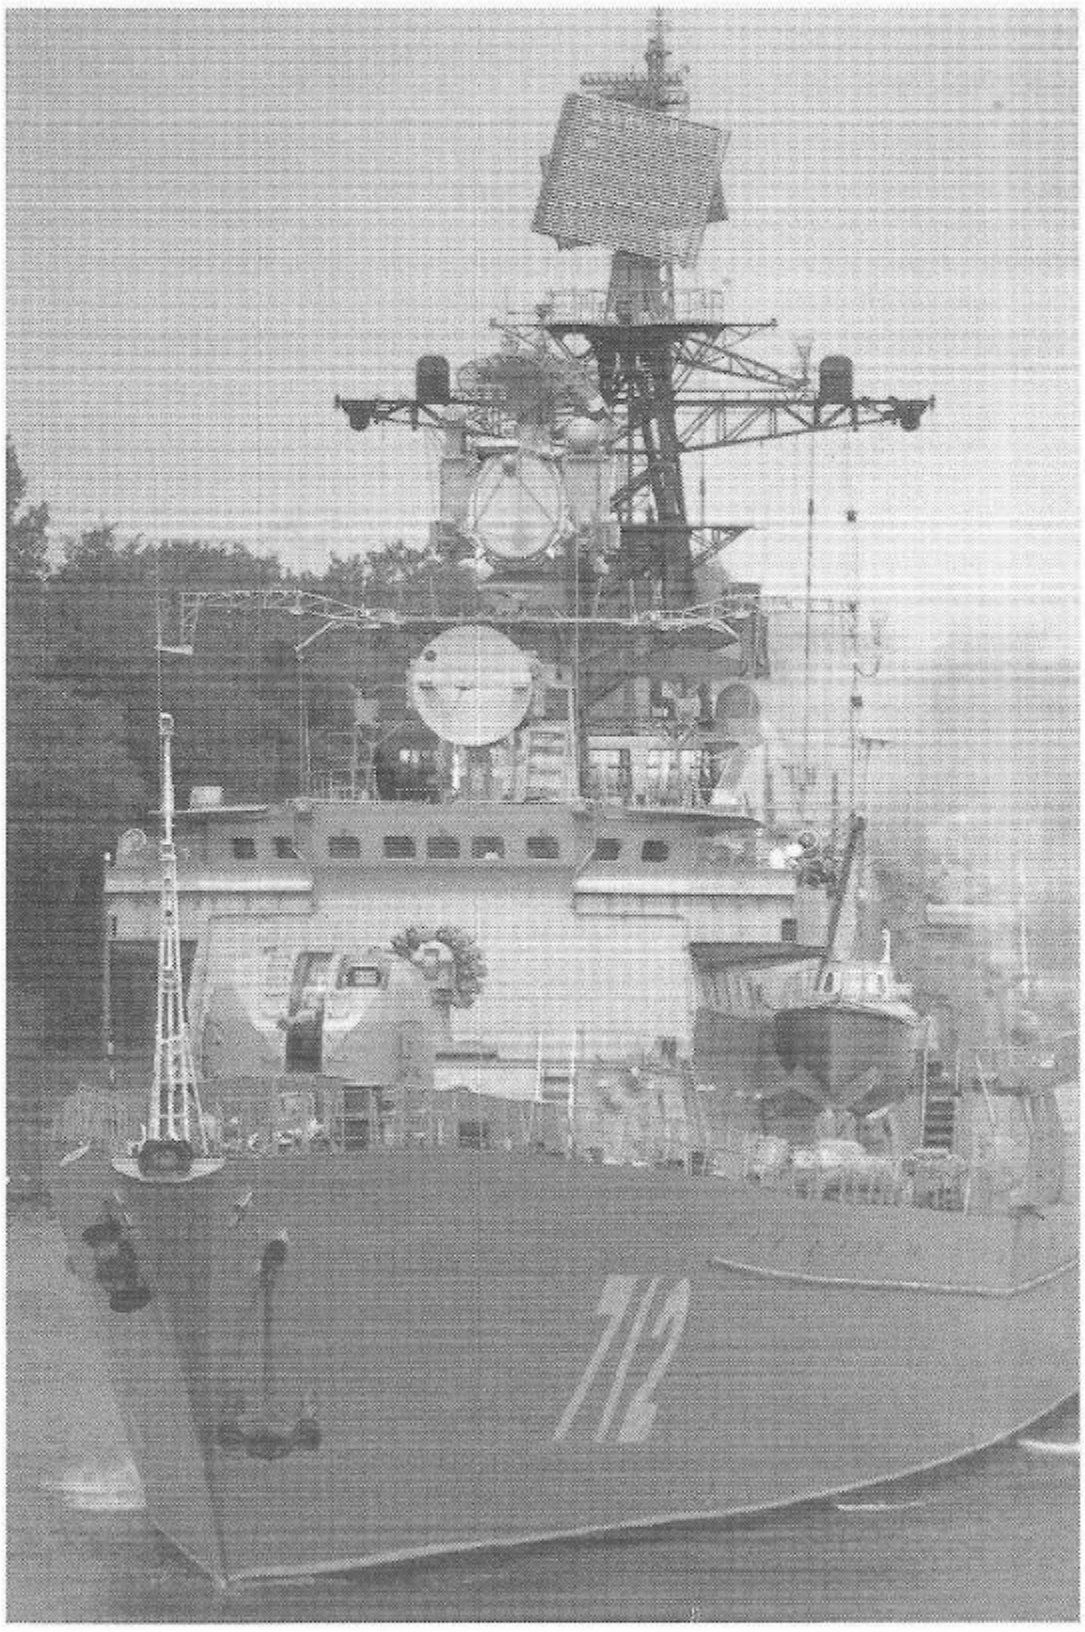
RADARS

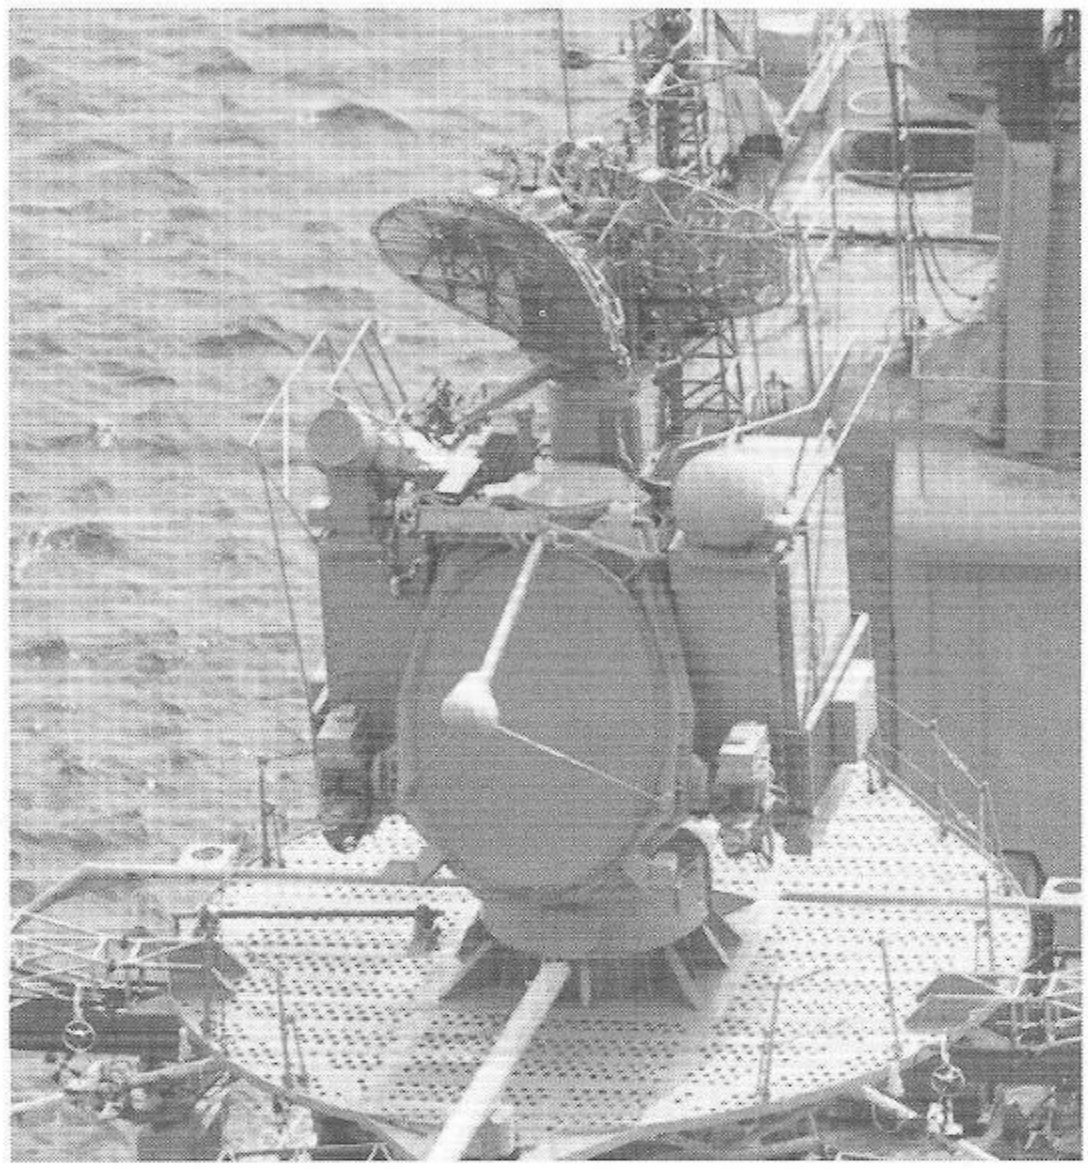
Top Plate air/surface surveillance radar

Top Plate is an air and surface surveillance 3D radar with two back to back planar arrays, operating in the D/E-bands. A version of Top Plate on offer for export as 'Fregat-Mae' has a maximum range and altitude of 150 km and 30,000 m respectively, and is accurate to 120 m (394 ft) in range. It can detect a 7 m² target flying at 5,000 m (16,405 ft) out to a range of 130 km, and a 0.05 m² missile at 30 km.

Palm Frond

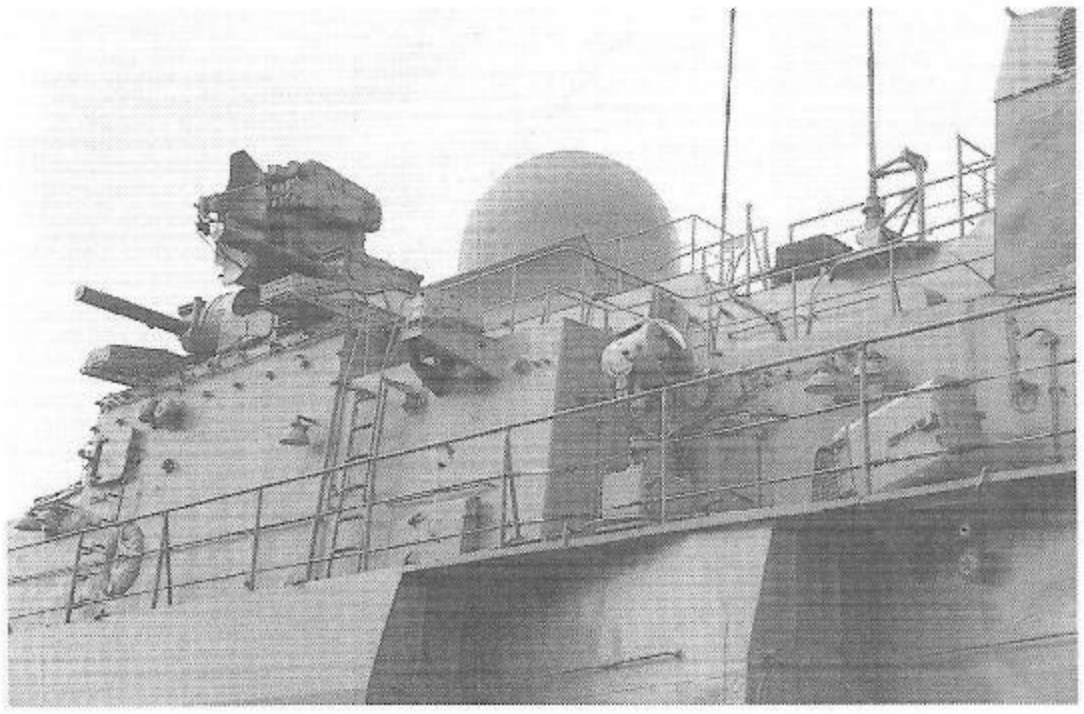
There are two Palm Frond navigational radar antennas.



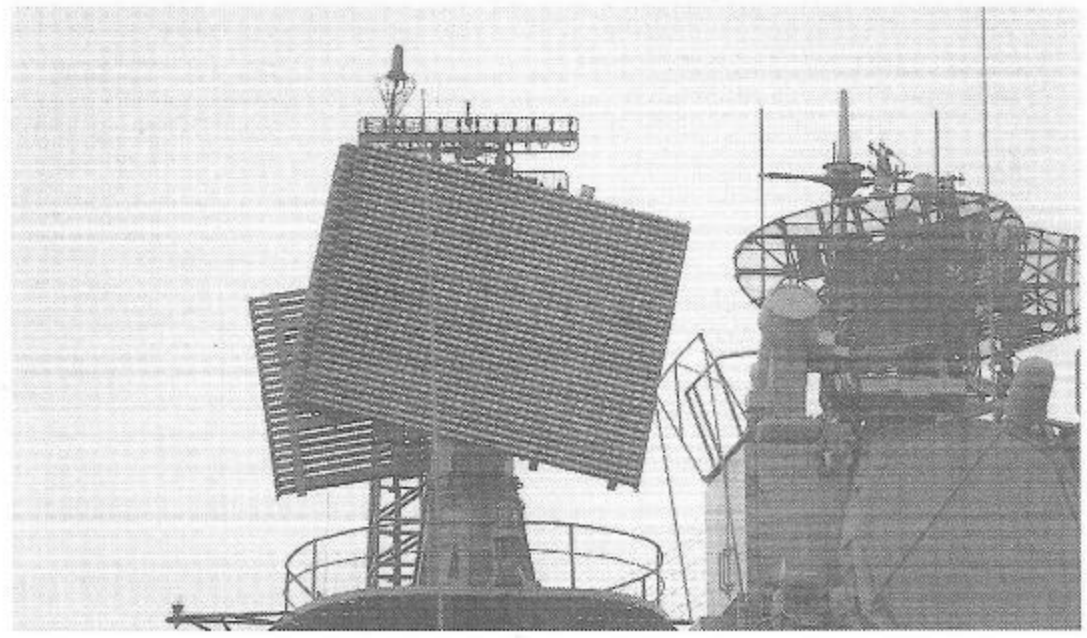


Cross Sword has four basic elements. The back to back parabolic surveillance antennas on top, the elliptical target/missile tracker below, the command transmitter (above left) and a second tracker (above right) (H & L van Ginderen Collection)

Left: Neustrashimy, *showing the usual profusion of electronic devices. On the bridge roof is Kite Screech B, with, behind it, two Palm Frond navigation radars, and behind the post Palm Frond, a Wine Glass jammer. At the next level is a Cross Sword, the fire-control director for SA-N-9; the two back to back parabolic antennas are part of Cross Sword. On the yard-arm are two Bell Crown datalinks, and at the head of the mainmast Top Plate with an IFF interrogator* (Jane's/H M Steele)



Another view of CADS-N-1 with, to its right, the top of the associated Cross Dome target acquisition radar (H & L van Ginderen Collection)



Top Plate antenna array consists of two back to back planar arrays canted at equal but opposite angles to the horizontal. One plate (the front in this picture) is wider and deeper than the other. The horizontal antenna across the top is an IFF interrogator (H & L van Ginderen Collection)

Palm Frond is one of the standard Russian navigation radars and operates in the I-band at between 9,400 and 9,600 MHz.

Cross Sword fire-control radar

Cross Sword consists of two large boxes of electronics with an oval-shaped phased-array antenna installed on the front of one at an angle of 22.5°. This is a front-feed K-band (20-40 GHz) tracking radar and above it are two drum-shaped antennas, the larger one on the right probably tracking the missile while the smaller one on the left is the uplink transmitter. On a separate pedestal on top of the boxes are two parabolic lattice antennas, mounted back to back, for the C-band (0.5-1 GHz) monopulse search radar. Two electro-optic sensors are *at the base of the tracking antenna for operating the* system in severe electronic environments.

Kite Screech gunfire control radar

Kite Screech is an I/J-band fire-control radar for the 100 mm gun. It has a range of approximately 10-12 n miles (18-22 km). It is found in 'Kirov', 'Slava', 'Sovremenny', 'Udaloy', 'Krivak II/III' and 'Neustrashimy'. It appears to use monopulse tracking instead of the conical scan tracking of earlier fire-control radars. It features a circular dish antenna with central feed, behind which are transmitter, receiver and stabilisation gear mountings. All are mounted on a pedestal about 2 m (6.56 ft) high. One such radar controls one or two guns and it is likely that the radar *compartment for this sensor also acts as the fire-control* centre.

SONARS

Bull Nose

Neustrashimy is fitted with Bull Nose bow-mounted, active search and attack sonar, which operates in the 7-8 kHz frequency band.

Ox Tail

Ox Tail VDS is installed in a bulge at the after end of the flight deck and deploys through a large stern door.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 20 × 15 m (67 × 50 ft)

HELICOPTER

1 Kamov Ka-27PL (NATO = Helix A)

Specifications

Dimensions:

rotor diameter: 15.90 m (52.16 ft)
rotor disc area: 397 m² (4,275 sq ft)
fuselage length: 11.30 m (37.07 ft)
height to rotor head: 5.40 m (17.72 ft)

Weights:

operating weight, empty: 6,500 kg (14,330 lb)
max take-off weight: 12,600 kg (27,778 lb)
max payload: 5,000 kg (11,023 lb)

Performance:

max level speed at optimum altitude: 135 kts (250 km/h)
endurance: 4.5 h

Engines: 2 Klimov (Isotov) TV3-117V turboshafts, each 1,645 kW (2,205 shp)

Accommodation: 3, (pilot plus 2)
Sensors: Surface search radar, sonobuoys, dipping sonar
Weapons: 2 APR-2 torpedoes, or 4 conventional depth bombs or mines

PROPULSION

Specifications

System: Combined gas turbine and gas turbine (COGAG)

Main machinery: 2 gas turbines; 35.72 MW (48,600 hp (m)); 2 gas turbines; 17.79 MW (24,200 hp(m))
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The first of class started sea trials in the Baltic in December 1990. Second of class is still fitting out and the third was launched in 1993 with only the hull completed but was back on the slips again by mid-1994. Little work was done on either during 1995.

DESIGN

The latest Russian frigate is slightly larger than the Krivak and has full helicopter facilities, with the helicopter flight deck extending across the full width of the ship. The after funnel is unusually flush decked but both funnels have been slightly extended after initial sea trials.

Separate SSM launchers have not been fitted so it is probable that SSM missiles can also be fired from the midships combined torpedo launchers.

Attempts have been made to incorporate stealth features and there is some form of IR suppression in the engine uptakes. Seen from above there are two rows of four pipes in the forward stack and six, of a slightly larger diameter in the after stack. Despite these, the ship, like many Russian surface ships emits dense clouds of exhaust fumes, probably due to either poor quality fuel or incomplete combustion, or a combination of the two.

The main propulsion plant is the same as in the 'Udaloy II' class.

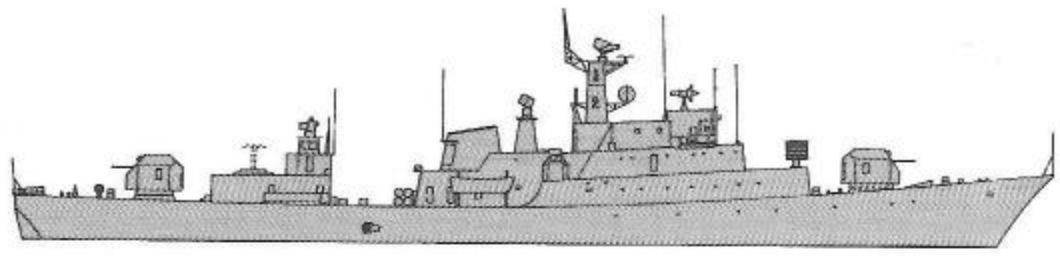
DEPLOYMENT

Neustrashimy is based in the Baltic. It has already made several visits to Western Europe, one of which was for the celebrations commemorating the 100th anniversary of the opening of the Kiel Canal.

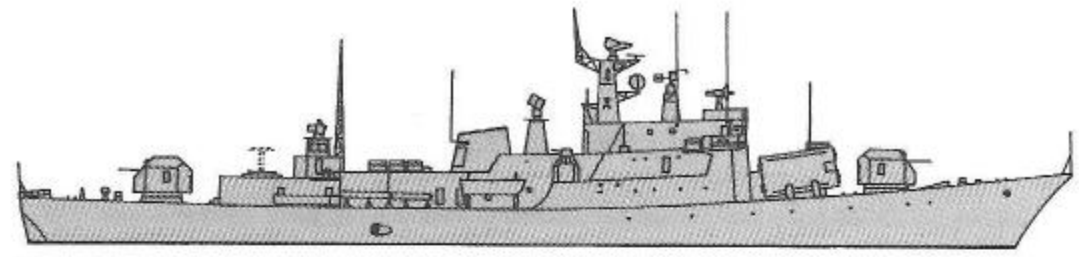
Neustrashimy (H & L van Ginderen Collection)

KONI

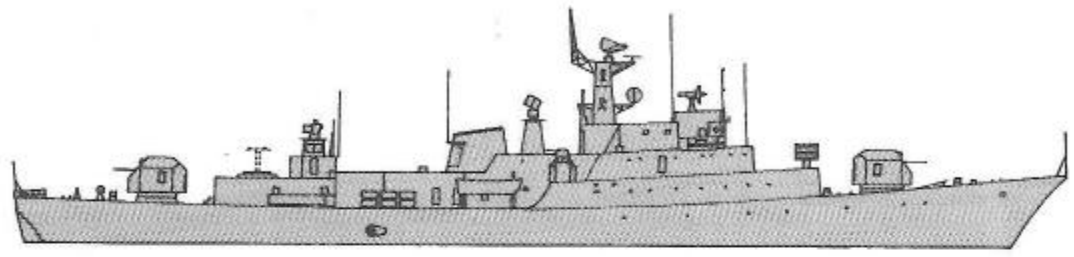
OVERVIEW



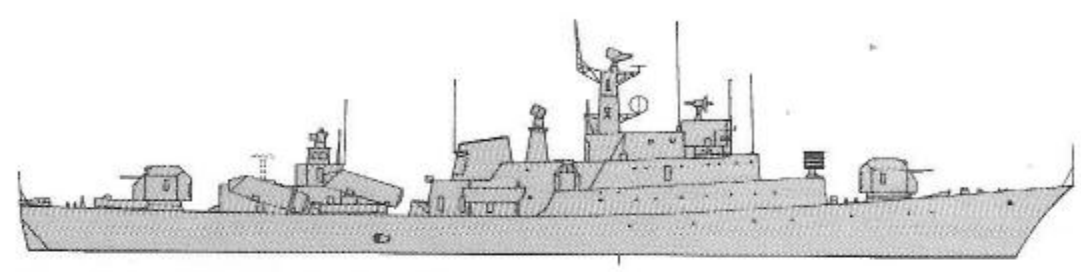
Koni Class (Algeria) (Ian Sturton)



Koni Class (Libya) (Ian Sturton)



Koni Class (Cuba) (Ian Sturton)



Koni Class (Yugoslavia) (Ian Sturton)

The 'Koni' class is relatively unusual in that it was designed and built in Russia specifically for export, with only one of the type being operated by the Russian Navy, and then only for demonstrations and crew training — and even that was sold to Bulgaria in 1990.

The Koni was in essence an enlarged version of the Grisha and was designated *'storozhevoy korabl'* (patrol ship) by the Russian Navy. Fourteen ships were built at the Zelenodolsk Shipyard on the Black Sea and a further two were built to a modified design in Yugoslavia. Another four ships — the 'Tetal' class — were built in Romania, which may (or may not) have been copies of the design (as discussed below).

There are four variations on the designs, which are generally known by their NATO designations of Koni I, II, III and IV:

- **Koni I.** This is the original version and has a distinct break in the superstructure between the stack and the after deckhouse (Bulgaria—1; East Germany—3).
- **Koni II.** This is a 'hot weather version' with a continuous deckhouse to house the air conditioning equipment. (Algeria—3; Cuba—3).
- **Koni III.** Supplied only to Libya, this has the continuous deckhouse of the Koni II, but with changes to the armament and sensors. (Libya—2).
- **Koni IV.** Supplied only to Yugoslavia this is essentially a Koni I but with SS-N-2C missiles (Yugoslavia—2)

Algeria
Algeria took delivery of its three Koni IIs between 1980 and 1985 and may be presumed to be satisfied with them as the country tried to buy the three former East German Konis in 1990 (the offer was refused by the German Government).

Bulgaria
Bulgaria operates one Koni I, which was the ship formerly used by the Russian Navy as a demonstrator and crew trainer.

Cuba
Cuba took delivery of three Koni IIs: the first in 1981, the second in 1984, and the third a considerable time later in 1988.

East Germany
Although now stricken, the three ships of the former DDR are mentioned for completeness. The Volksmarine purchased three ships from Russia, of which the first two were delivered in 1978 and 1979, which were, in fact, the first two to be exported. There was then a long gap before the third was delivered in 1986.

A fourth was ordered but the order was cancelled before delivery. On reunification in 1990 two ships spent six months in the Bundesmarine, following which they were stricken. As far as is known all three have been scrapped.

Libya
Libya took delivery of two Koni IIIs: the first in 1986 and the second in 1987. They are the most sophisticated and powerful of the Russian-made ships, with four SS-N-2C launchers

Romania
Romania built four 'Tetal' class ships between 1983 and 1987. These have certain superficial similarities with the 'Koni' class but their measurements differ, the hull form is not the same, nor is the armament, and while the Konis have a CODAG power plant, the Tetals have an all-diesel propulsion system. It appears, therefore, that even if the Romanian designers started their design work with the 'Koni', the end result is so different as to constitute a separate class altogether and they are not considered further under the 'Koni' class.

Yugoslavia
Yugoslavia took delivery of two Russian-built 'Koni I' class frigates in 1980 and 1982, and these were followed by two much-modified ships, with changes in the armament and sensor fits.

Summary
The Koni programme is summarised in the following two tables:

TABLE 1: RUSSIAN-BUILT 'KONI' CLASS FRIGATES

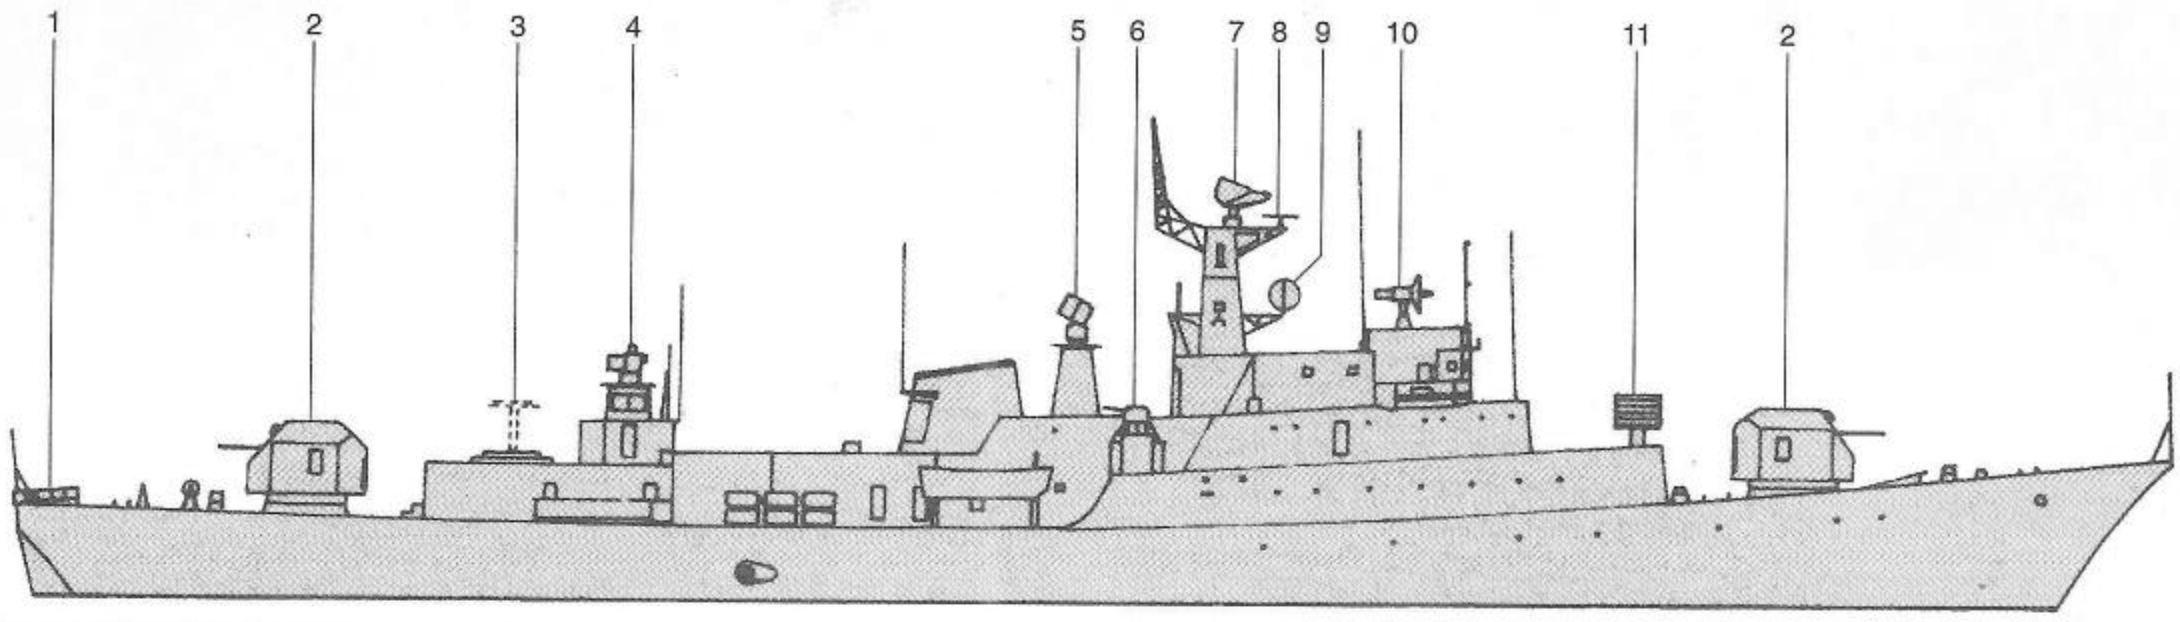
Hull Number	Commissioned	Koni Type	Name	Customer	Remarks
1	1976	I	—	Russia	1. Used for demonstrations/ training 2. Transferred to Bulgaria — see 14A below
2	Jul 1978	I	*Rostock* (141)	East Germany	Stricken 1991
3	May 1979	I	*Berlin* (142)	East Germany	Deleted 1991
4	Mar 1980	IV	*Beograd* (VPB 31)	Yugoslavia	1. Formerly named *Split* 2. In service
5	Dec 1980	II	*Murat Reis* (901)	Algeria	In Service
6	Sep 1981	II	350	Cuba	1. No name 2. In service
7	Apr 1982	II	*Rais Kellich* (902)	Algeria	In service
8	Dec 1982	IV	*Kopar* (VPB 32)	Yugoslavia	In service
9	Feb 1984	II	353	Cuba	1. No name. Now renumbered as 383 2. In service
10	Jan 1985	II	*Rais Korfou* (903)	Algeria	In service
11	Jun 1986	III	*Al Hani* (212)	Libya	In service
12	Jan 1986	I	*Halle* (143)	East Germany	Deleted 1991
13	Oct 1987	III	*Al Qirdabiyah* (213)	Libya	In service
14	Apr 1988	II	356	Cuba	1. No name 2. In service
14A	Feb 1990	I	*Smeli*	Bulgaria	1. Ex-Russian demonstrator 2. In service

TABLE II — YUGOSLAV-BUILT 'KONI' CLASS FRIGATES

Hull Number	Commissioned	Name	Customer	Remarks
15	1988	*Kotor* (VPB 33)	Yugoslavia	In service
16	1988	*Novi Sad* (VPB 34)	Yugoslavia	i. In service ii. Formerly *Pula*

Rostock *(141) was one of three 'Koni' class frigates built in Russia and exported to the (then) East Germany*

MOURAD RAIS (KONI)



Mourad Rais (Ian Sturton)
1 *Depth charge racks* **2** *AK-726 twin 76 mm/60 guns* **3** *SA-N-4 Gecko twin-arm launcher* **4** *Pop Group missile control radar (for SA-N-4)* **5** *Drum Tilt fire-control radar (for 30 mm)* **6** *Twin AK-230 30 mm cannon* **7** *Strut Curve air search radar* **8** *Don 2 surface search/navigation radar* **9** *Cross Loop DF antenna* **10** *Hawk Screech fire control (for 76 mm guns)* **11** *RBU-6000 anti-submarine rocket launchers*

GENERAL SPECIFICATIONS

Country of origin: Russia
Operator: Algeria
Type: Koni (Type 1159.2)

Class: MOURAD RAIS

Purchased: 3
Active: 3

Displacement:
standard: 1,440 t
full load: 1,900 t

Dimensions
Length: 96.4 m (316.3 ft)
Beam: 12.6 m (41.3 ft)
Draught: 3.5 m (11.5 ft)

Speed: 27 kts (gas turbine); 22 kts (diesel)
Range: 1,800 n miles at 14 kts

Complement: 130

Commissioned Jan 1985

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

SA-N-4 short-range missile system

There is one SA-N-4 launcher aft, in the 'X' position. The twin-rail launcher lies beneath a hinged flat cover plate, emerging to launch its missiles and retracting to reload. This is likely to result in a low rate of fire which must be slowed even further by the need to close the magazine cover before firing. Below the launcher are four revolving drums each with five missiles while the electro-mechanical and hydraulic machinery is below that. On launch, the booster burns for 2 seconds allowing the radar to gather the missile at a range of 0.75 n miles (1.5 km), following which the sustainer burns for 15 seconds. Command and control is via the Pop Group system (see below). There are 20 weapons in the magazine.

Specifications
Length: 3.1 m (10.17 ft)
Diameter: 21 cm (8.27 in)
Wing span: 64 cm (25.2 in)
Weight: 130 kg (286.6 lb)
Speed: Mach 2.5
Warhead: 50 kg (110 lb) HE
Range: 0.75-8 n miles (1.5-15 km)
Height: 9-3,000 m (30-10,000 ft)
Guidance: Semi-active radar homing

GUNS

Two AK-726 twin 76 mm (3 in)/59 mountings

There are two twin AK-726 turrets, in 'A' and 'Y' positions, respectively. The AK-726 is a multirole weapon system designed for air defence, surface engagement and shore bombardment roles and consists of two 76 mm guns mounted in a turret with a 5 mm metal shield. The whole mounting can contain 60 rounds of which two are on the feeder rail and four are on the hoists at any one time. The prime ammunition is the UOFB-62, a fixed round which weighs 12.8 kg (28.2 lb). The projectile weighs 4.6 kg (10.1 lb) and has 400 g of A-IX-2 explosive and a VG-67 point impact fuze. There is a five-man crew in the turret: the gun captain, two layers and two loaders. There is a further team of four loaders in the below-decks magazine.

In the 'Koni' class, AK-726 is associated with Hawk Screech radar. In addition to radar fire control there is local control through the Prisma optical sighting system, which may be used for engaging targets with speeds of up to 600 m/s (Mach 1.75).

Specifications
Calibre: 76 mm
Barrel length: 59 calibres
Muzzle velocity: 980 m/s (3,215 ft/s)
Traverse: 360° at 36°/s
Elevation: −7 to +85° at 32°/s
Ammunition (total): 16 kg (35.2 lb)
Rate of fire: 90 rds/min (whole mounting)
Range:
surface/surface: 8.5 n miles (15.7 km)
AA (max): 10,000 m (32,808 ft)
AA (effective): 7,000 m (22,965 ft)

30 mm AK-630 close in weapon system

There are two AK-630 close in weapon system (CIWS) turrets amidships. This multibarrel, high volume-of-fire gun system, has a separate fire-control radar and a below-deck control station with remote optical and/or electro-optical sensor. It fires five types of fire mission: against anti-ship missiles, aircraft, small surface vessels, drifting mines, and unprotected shore targets. The weapon consists of six water-cooled barrels, using the Gatling principle with a fixed breech block and revolving barrels. The magazine contains 2,000 rounds of HE-I and HE-T ammunition. The gun fires bursts of up to 400 rounds, during which both the barrel and the breech block are cooled, with used cartridges and links being ejected into a bin below the elevating mass. The mounting is unusual in having an ignition system for burning off gun gases accumulating within it during firing.

Specifications
Calibre: 30 mm
Length of barrel: 65 calibres
Muzzle velocity: 890 m/s (2,920 ft/s)
Traverse: 360° (depending on location of turret) at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range:
radar fire control: 4,000 m (13,123 ft)
electro-optic fire control: 5,000 m (16,404 ft)
Rate of fire: 4,000-5,000 rds/min
Ammunition:
round: 1.224 kg (2.7 lb)
projectile weight:
UOF-84: 384 g
UOR-84: 388 g

ANTI-SUBMARINE MORTARS

RBU-6000

There are two 12-tube RBU-6000 mortars located on the foredeck. The mounting can traverse through 360° and elevation limits are −15°/+60°. Loading is

automatic from a below-deck magazine. It is estimated that the rockets weigh 110 kg (242 lb), with a 25 kg (55 lb) warhead. Pairs of tubes are fired in sequence. The RGB-60 rocket is fitted with an impact-time fuze, which detonates either on hitting a solid object (such as a submarine) or when it reaches a preset depth. Firing is usually conducted in a full salvo of 12 rockets, but it is also possible to fire single rockets, or four- or eight-rocket salvos, if the tactical situation requires it. The warhead weighs 31 kg (68 lb).

MINES

There are launch rails at the stern, enabling the ship to launch up to 22 mines.

DEPTH CHARGES

There are two depth-charge racks.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC COUNTERMEASURES (ECM)

Cross Loop

Cross Loop is a simple communications direction-finding system.

COMMAND AND CONTROL SYSTEMS

RADARS

Strut Curve search radar

The air search radar is the Russian MR-302 (NATO = Strut Curve) a medium-range, general purpose, F-band, air search radar. The elliptical lattice reflector is mounted at the masthead. Range performance against a 2 m² aircraft target at medium altitude is about 60 n miles (110 km) with a likely maximum range of 150 n miles (280 km).

Don 2

All Konis have one Don 2, I-band, navigation radar.

Hawk Screech fire-control radar

Hawk Screech is the fire-control radar for the 76 mm guns. It has a circular dish scanner, behind which are mounted the transmitter and receiver, as well as turning and stabilisation gear. The complete radar is pedestal-mounted. The 2.3 m (7.5 ft) diameter scanner has a central feed supported by a four-leg structure. Feed arrangements could incorporate a rotating dipole to provide a conical scan search pattern. Dish diameter is approximately 2 m (6.5 ft) and the operating frequency is in the H/I-band for both types. The NATO designation, Hawk Screech, is apparently derived from signal characteristics noted in the course of ELINT monitoring. The principal function is that of gunfire director against aircraft targets, although this type probably also has a certain capability against surface targets, and possibly splash detection.

Drum Tilt

There is a single 'Rys' (NATO = Drum Tilt) fire-control system for the AK-230s. This is an I/J-band system with a pedestal-mounted director whose antenna is in a weatherproof container attached to the scanner assembly and tilted at an angle of about 22°. The maximum acquisition range is approximately 22 n miles (40 km). The single radar director controls both gun mountings.

Pop Group

The Pop Group director is located aft atop a small tower. It provides the weapon control system for the SA-N-4 missile system. The director includes an acquisition radar with a long, curved antenna on top of the cab, and two target trackers. The latter two are of different size, but presumably the smaller one performs a similar function to the larger, but at higher frequencies, which would enable them to direct two different missiles against the same target. The system operates in the F/H/I band.

IFF

The ships carry one High Pole B and two Square Head.

SONAR

Herkules

Herkules (NATO = Wolf Paw) is a sonar more usually found in submarines. It is a hull-mounted, active search and attack, medium-frequency system.

PROPULSION

Specifications

System: Combined diesel and gas turbine (CODAG)
Main machinery: 1 SGW, Nikolayev, M8B gas turbine (centre shaft); 13.25 MW (18,000 hp(m)) sustained; 2 Russki B-68 diesels; 11.63 MW (15,820 hp(m)) sustained
Shafts: 3

FURTHER INFORMATION

The Algerian Government expressed some interest in 1991 in purchasing the three 'Koni' class frigates formerly operated by the defunct East German Navy. The sale was, however, rejected by the German Government and the ships have since been stricken and scrapped.

The Algerian Konis do not have torpedo tubes.

These Algerian ships were fitted with new generators in 1992-94.

All the Algerian ships are currently active.

AA (effective): 7,000 m (22,965 ft)

30 mm L/65 AK-230 twin mounting

This ship has two twin AK-230, remotely operated, twin barrel, automatic anti-aircraft guns, which are designed to engage air targets at heights of up to 4,000 m (13,123 ft). It is also capable of engaging surface targets at ranges up to 2.2 n miles (4 km). The electrically powered mounting is 1.46 m (4.8 ft) high, 3.11 m (10.2 ft) long and 2.1 m (6.8 ft) wide, and consists of two 64.2 calibre, water-cooled, NN30 guns, each with a liner and a rotating breech with four chambers. The elevating mechanism is on the carriage together with a compressed air tank and associated equipment for the loading system. Russian ammunition for this weapon consists of two rounds; BR-83 and OF-83D (see Specifications).

The fire-control radar is the I/J-band Rys (NATO = Drum Tilt) fire-control radar, whose maximum acquisition range is approximately 22 n miles (40 km).

Specifications

NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,445 ft/s)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,123 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Mounting weight: 1,857-1,905 kg (4,094-4,200 lb)
Crew: 2 (off mount)

Ammunition
BR-83:
type: Armour-piercing tracer
weight (complete round): 1.47 kg (3.2 lb)
weight (projectile): 0.35 kg (0.77 lb)
OF-83D:
type: High explosive
weight (complete round): 1.40 kg (3.08 lb)
projectile: 0.27 kg (0.6 lb)
explosive: 30 g (A-XI-2)

ANTI-SUBMARINE MORTARS

RBU-6000

There are two 12-tube RBU-6000 mortars located on the foredeck. The mounting can traverse through 360° and elevation limits are −15°/+60°. Loading is automatic from a below-deck magazine. It is estimated that the rockets weigh 110 kg (242 lb), with a 25 kg (55 lb) warhead. Pairs of tubes are fired in sequence. The RGB-60 rocket is fitted with an impact-time fuze, which detonates either on hitting a solid object (such as a submarine) or when it reaches a preset depth. Firing is usually conducted in a full salvo of 12 rockets, but it is also possible to fire single rockets, or four- or eight-rocket salvos, if the tactical situation requires it. The warhead weighs 31 kg (68 lb).

MINES

There are launch rails at the stern, enabling the ship to launch up to 22 mines.

DEPTH CHARGES

There are two depth-charge racks.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Watch Dog

There is a single Watch Dog array. This is an intercept and radar warning system which has been in service for over 30 years. It is a wide-open system with an array consisting of four tiers of eight microwave horns, covering frequencies from D to H-band.

Cross Loop

Cross Loop is a simple communications direction-finding system. The antenna is on a small platform on the mast.

DECOYS

There are two PK-16 16-barrelled chaff launchers.

COMMAND AND CONTROL SYSTEMS

RADARS

Strut Curve search radar

The air search radar is the Russian MR-302 (NATO = Strut Curve) a medium-range, general purpose, F band, air search radar. The elliptical lattice reflector is mounted at the masthead. Range performance against a 2 m² aircraft target at medium altitude is about 60 n miles (110 km) with a likely maximum range of 150 n miles (280 km).

Don 2

All Konis have one Don 2, I-band, navigation radar.

Hawk Screech fire-control radar

Hawk Screech is the fire-control radar for the 76 mm guns. It has a circular dish scanner, behind which are mounted the transmitter and receiver, as well as turning and stabilisation gear. The complete radar is pedestal-mounted. The 2.3 m (7.5 ft) diameter scanner has a central feed supported by a four-leg structure. Feed arrangements could incorporate a rotating dipole to provide a conical scan search pattern. Dish diameter is approximately 2 m (6.5 ft) and the operating frequency is in the H/I-band for both types. The NATO designation, Hawk Screech, is apparently derived from signal characteristics noted in the course of ELINT monitoring. The principal function is that of gunfire director against aircraft targets, although this type probably also has a certain capability against surface targets, and possibly splash detection.

Drum Tilt

There is a single 'Rys' (NATO = Drum Tilt) fire-control system for the AK-230s. This is an I/J-band system with a pedestal-mounted director whose antenna is in a weatherproof container attached to the scanner assembly and tilted at an angle of about 22°. The maximum acquisition range is approximately 22 n miles (40 km). The single radar director controls both gun mountings.

Pop Group

The Pop Group director is located aft atop a small tower. It provides the weapon control system for the SA-N-4 missile system. The director includes an acquisition radar with a long, curved antenna on top of the cab, and two target trackers. The latter two are of different size, but presumably the smaller one performs a similar function to the larger, but at higher frequencies, which would enable them to direct two different missiles against the same target. The system operates in the F/H/I band.

IFF

The ship carries one High Pole B, but does not appear to have the two Square Heads carried by some other Konis.

SONAR

Herkules

Herkules (NATO = Wolf Paw) is a sonar more usually found in submarines. It is a hull-mounted, active search and attack, medium-frequency system.

PROPULSION

Specifications

System: Combined diesel and gas turbine (CODAG)
Main machinery: 1 SGW, Nikolayev, M8B gas turbine (centre shaft); 13.25 MW (18,000 hp(m)) sustained; 2 Russki B-68 diesels; 11.63 MW (15,820 hp(m)) sustained
Shafts: 3

FURTHER INFORMATION

This particular ship was operated by the Russian Navy as a demonstrator and crew trainer for foreign customers. When these tasks were completed the ship was sold to Bulgaria in February 1990. *Smeli* is based at Varna.

Smeli *(11). Weapons include twin 76 mm guns ('A' position) and two RBU 6000 ASW rocket launchers ('B' position)*

350 (KONI)

GENERAL SPECIFICATIONS

Country of origin: Russia
Operator: Cuba
Type: Koni II (Type 1159.2)

Class: 350

Acquired: 3
Active: 3

Displacement:
standard: 1,440 t
full load: 1,900 t

Dimensions
Length: 96.4 m (316.3 ft)
Beam: 12.6 m (41.3 ft)
Draught: 3.5 m (11.5 ft)

Speed: 27 kts (gas turbine); 22 kts (diesel)
Range: 1,800 n miles at 14 kts

Complement: 110

383 (ex-*353*)

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

SA-N-4 short-range missile system

There is one SA-N-4 launcher aft, in the 'X' position. The twin-rail launcher lies beneath a hinged flat cover plate, emerging to launch its missiles and retracting to reload. This is likely to result in a low rate of fire which must be slowed even further by the need to close the magazine cover before firing. Below the launcher are four revolving drums each with five missiles while the electromechanical and hydraulic machinery is below that. On launch, the booster burns for 2 seconds allowing the radar to gather the missile at a range of 0.75 n miles (1.5 km), following which the sustainer burns for 15 seconds. Command and control is via the Pop Group system (see below). There are 20 weapons in the magazine.

Specifications
Length: 3.1 m (10.17 ft)
Diameter: 21 cm (8.27 in)
Wing span: 64 cm (25.2 in)
Weight: 130 kg (286.6 lb)
Speed: Mach 2.5
Warhead: 50 kg (110 lb) HE
Range: 0.75-8 n miles (1.5-15 km)
Height: 9-3,000 m (30-10,000 ft)
Guidance: Semi-active radar homing

GUNS

Two AK-726 twin 76 mm (3 in)/59 mountings

All. There are two twin AK-726 turrets, in 'A' and 'Y' positions, respectively. The AK-726 is a multirole weapon system designed for air defence, surface engagement and shore bombardment roles and consists of two 76 mm guns mounted in a turret with a 5 mm metal shield. The whole mounting can contain 60 rounds of which two are on the feeder rail and four are on the hoists at any one time. The prime ammunition is the UOFB-62, a fixed round which weighs 12.8 kg (28.2 lb). The projectile weighs 4.6 kg (10.1 lb) and has 400 g of A-IX-2 explosive and a VG-67 point impact fuze. There is a five-man crew in the turret: the gun captain, two layers and two loaders. There is a further team of four loaders in the below-decks magazine.

In the 'Koni' class, AK-726 is associated with 'Hawk Screech' radar. In addition to radar fire control there is local control through the Prisma optical sighting system, which may be used for engaging targets with speeds of up to 600 m/s (Mach 1.75).

Specifications
Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: 980 m/s (3,215 ft/s)
Traverse: 360° at 36°/s
Elevation: −7 to +85° at 32°/s
Ammunition (total): 16 kg (35.28 lb)
Rate of fire: 90 rds/min (whole mounting)
Range:
anti-surface: 8.5 n miles (15.7 km)
anti-air (max): 10,000 m (32,808 ft)
anit-air (effective): 7,000 m (22,965 ft)

30 mm L/65 AK-230 twin mounting

356 and 380 only. These two ships have two twin AK-630, remotely operated, twin barrel, automatic anti-aircraft guns, which are designed to engage air targets at heights of up to 4,000 m (13,124 ft). It is also capable of engaging surface targets at ranges up to 2.2 n miles (4 km). The electrically powered mounting is 1.46 m (4.8 ft) high, 3.11 m (10.2 ft) long and 2.1 m (6.9 ft) wide, and consists of two 64.2 calibre, water-cooled, NN30 guns, each with a liner and a rotating breech with four chambers. The elevating mechanism is on the carriage together with a compressed air tank and associated equipment for the loading system. Russian ammunition for this weapon consists of two rounds; BR-83 and OF-83D (see Specifications).

The fire-control radar is the I/J-band Rys (NATO = Drum Tilt), whose maximum acquisition range is approximately 22 n miles (40 km).

Specifications
NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,123 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Mounting weight: 1,857-1,905 kg (4,094-4,200 lb)
Crew: 2 (off mount)

Ammunition
BR-83:
type: Armour-piercing tracer
weight (complete round): 1.47 kg (3.24 lb)
weight (projectile): 0.35 kg (0.77 lb)
OF-83D:

projectile: 0.27 kg (0.59 lb)
explosive: 30 g (A-XI-2)

30 mm AK-630 close in weapon system

350 only. This ship has four AK-630 close in weapon system (CIWS) turrets amidships. This multibarrel, high volume-of-fire gun system, has a separate fire-control radar and a below-deck control station with remote optical and/or electro-optical sensor. It fires five types of fire mission: against anti-ship missiles, aircraft, small surface vessels, drifting mines, and unprotected shore targets. The weapon consists of six water-cooled barrels, using the Gatling principle with a fixed breech block and revolving barrels. The magazine contains 2,000 rounds of HE-I and HE-T ammunition. The gun fires bursts of up to 400 rounds, during which both the barrel and the breech block are cooled, with used cartridges and links being ejected into a bin below the elevating mass. The mounting is unusual in having an ignition system for burning off gun gases accumulating within it during firing.

Specifications
Calibre: 30 mm
Length of barrel: 65 calibres
Muzzle velocity: 890 m/s (2,920 ft/s)
Traverse: 360° (depending on location of turret) at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range:
radar fire control: 4,000 m (13,123 ft)
electro-optic fire control: 5,000 m (16,404 ft)
Rate of fire: 4,000-5,000 rds/min
Ammunition:
round: 1.224 kg (2.7 lb)
projectile weight:
UOF-84: 384 g
UOR-84: 388 g

ANTI-SUBMARINE MORTARS

RBU-6000

There are two 12-tube RBU-6000 mortars located on the foredeck. The mounting can traverse through 360° and elevation limits are −15°/+60°. Loading is automatic from a below-deck magazine. It is estimated that the rockets weigh 110 kg (242 lb), with a 25 kg warhead. Pairs of tubes are fired in sequence. The RGB-60 rocket is fitted with an impact-time fuze, which detonates either on hitting a solid object (such as a submarine) or when it reaches a preset depth. Firing is usually conducted in a full salvo of 12 rockets, but it is also possible to fire single rockets, or four- or eight-rocket salvos, if the tactical situation requires it. The warhead weighs 31 kg (68.3 lb).

MINES

There are launch rails at the stern, enabling the ship to launch up to 22 mines.

DEPTH CHARGES

There are two depth-charge racks.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Watch Dog
There is a single Watch Dog array. This is an intercept and radar warning system which has been in service for over 30 years. It is a wide-open system with an array consisting of four tiers of eight microwave horns, covering frequencies from D to H-band.

Cross Loop
Cross Loop is a simple communications direction-finding system. The antenna is on a small platform on the mast.

There are two PK-16 16-barrelled chaff launchers.

COMMAND AND CONTROL SYSTEMS

RADARS

Strut Curve search radar
The air search radar is the Russian MR-302 (NATO = Strut Curve) a medium-range, general purpose, F band, air search radar. The elliptical lattice reflector is mounted at the masthead. Range performance against a 2 m² aircraft target at medium altitude is about 60 n miles (110 km) with a likely maximum range of 150 n miles (280 km).

Don 2
All Konis have one Don 2, I-band, navigation radar.

Hawk Screech fire-control radar
Hawk Screech is the fire-control radar for the 76 mm guns. It has a circular dish scanner, behind which are mounted the transmitter and receiver, as well as turning and stabilisation gear. The complete radar is pedestal-mounted. The 2.3 m (7.5 ft) diameter scanner has a central feed supported by a four-leg structure. Feed arrangements could incorporate a rotating dipole to provide a conical scan search pattern. Dish diameter is approximately 2 m (6.5 ft) and the operating frequency is in the H/I-band for both types. The NATO designation, Hawk Screech, is apparently derived from signal characteristics noted in the course of ELINT monitoring. The principal function is that of gunfire director against aircraft targets, although this type probably also has a certain capability against surface targets, and possibly splash detection.

Drum Tilt
There is a single 'Rys' (NATO = Drum Tilt) fire-control system for the AK-230s. This is an I/J-band system with a pedestal-mounted director whose antenna is in a weatherproof container attached to the scanner assembly and tilted at an angle of about 22°. The maximum acquisition range is approximately 22 n miles (40 km). The single radar director controls both gun mountings.

Pop Group
The Pop Group director is located aft atop a small tower. It provides the weapon control system for the SA-N-4 missile system. The director includes an acquisition radar with a long, curved antenna on top of the cab, and two target trackers. The latter two are of different size, but presumably the smaller one performs a similar function to the larger, but at higher frequencies, which would enable them to direct two different missiles against the same target. The system operates in the F/H/I band.

IFF
The ship carries one High Pole A, and two Square Heads.

SONARS

Herkules
Herkules (NATO = Wolf Paw) is a sonar more usually found in submarines. It is a hull-mounted, active search and attack, medium-frequency system.

PROPULSION

Specifications
System: Combined diesel and gas turbine (CODAG)
Main machinery: 1 SGW, Nikolayev, M8B gas turbine (centre shaft); 13.25 MW (18,000 hp(m)) sustained; 2 Russki B-68 diesels; 11.63 MW (15,820 hp(m)) sustained
Shafts: 3

FURTHER INFORMATION

Names/Pennant numbers
The ships have no names and the Cuban Navy follows the Russian practice of allocating pennant numbers according to tactical missions. Thus, the ship that was designated 353 was redesignated 383 in October 1988.

Transfers
Because of the changing pennant numbers and the fact that the ships are not named it is difficult to trace the history of each. The transfers of the three ships took place:

First ship — 24 September 1981
Second ship — 8 February 1984
Third ship — 10 April 1988

Deployment
All three ships are based at Cienfuegos.

Cuban 'Koni' class frigate. The Cubans change pennant numbers frequently, making it difficult to keep track of individual ships (Van Boeijin)

WEAPONS SYSTEMS

ANTI-SHIP MISSILES

P-21 Rubezh (SS-N-2c 'Styx') medium-range anti-ship missile

The Libyan Konis are armed with four P-21 (NATO = SS-N-2c 'Styx') missiles, with two twin launch bins located either side of a large deckhouse on the foredeck. There are no reloads. This relatively large anti-ship missile is powered by a liquid-fuelled rocket motor, with a solid fuel booster attached.

Once the target is detected the ship must close with the aim of being within the optimum engagement distance, some 15-20 n miles (28-37 km). Then the ship must maintain a speed of 15 knots or less and hold its course for 20-30 seconds before launching the first salvo of two missiles. These may be followed, a minute later, by the other two.

Upon launch the missile climbs at an angle of 45° to one of five preset altitudes (100, 150, 200, 250 or 350 m), where the onboard radar searches for a target and the receiver is switched on for very short periods to receive signals from a designated range, the range gate being 1 km on either side of the target. The radar locks on only after eight returns have been received, at distances of 3.5-12 n miles (6.5-22 km), whereupon the seeker guidance system switches off the autopilot. A throw-off gyroscope takes the missile on target a few seconds before impact as it becomes too close for radar-generated homing signals. Russian Navy tacticians calculate that seven to eight missiles are required to destroy a cruiser-size target and four for a destroyer, making salvo firing a major feature of any tactical engagement scenario with SS-N-2c missiles to ensure destruction of the target.

Specifications

SS-N-2c
Length: 6.55 m (21.5 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.9 ft)
Speed: Mach 0.9
Weight (without booster): 2,500 kg (5,512 lb)
Warhead: 454 kg (1,001 lb) hollow-charge
Fuzes: Impact, proximity
Range: 3-46 n miles (5.5-85 km)
Guidance: Autopilot with active radar (supplemented in some with IR)

MS-2 seeker
Frequency: I-band (8-12 GHz) (five presets)
PRF: 300-500 pps (adjustable)
Altitude control: Barometric pressure device

Manufacturer/Contractor

Raduga, Moscow, Russia.

SA-N-4 short-range missile system

There is one SA-N-4 launcher aft, in the 'X' position. The twin-rail launcher lies beneath a hinged flat cover plate, emerging to launch its missiles and retracting to reload. This is likely to result in a low rate of fire which must be slowed even further by the need to close the magazine cover before firing. Below the launcher are four revolving drums each with five missiles while the electro-mechanical and hydraulic machinery is below that. On launch, the booster burns for 2 seconds allowing the radar to gather the missile at a range of 0.75 n miles (1.5 km), following which the sustainer burns for 15 seconds. Command and control is via the Pop Group system (see below). There are 20 weapons in the magazine.

Specifications

Length: 3.1 m (10.17 ft)
Diameter: 21 cm (8.27 in)
Wing span: 64 cm (25.2 in)
Weight: 130 kg (286.6 lb)
Speed: Mach 2.5
Warhead: 50 kg (110 lb) HE
Range: 0.75-8 n miles (1.5-15 km)
Height: 9-3,000 m (30-10,000 ft)
Guidance: Semi-active radar homing

TUBES

Unlike other Konis, the Libyan version has four single 406 mm torpedo tubes, which are located aft beneath the Pop Group radar tower. There are two tubes on each side mounted at a fixed angle of some 30° to the centreline.

TORPEDOES

The torpedoes used are USET-95, 406 mm, which use active/passive homing to 5.5 n miles (10 km) at 30 knots. They have a 100 kg (220 lb) warhead.

GUNS

Two AK-726 twin 76 mm (3 in)/59 mountings

There are two twin AK-726 turrets, in 'A' and 'Y' positions, respectively, but it should be noted that the 'A' gun has a restricted arc of fire compared to other Konis, due to the SS-N-2c launch bins. The AK-726 is a multi-role weapon system designed for air defence, surface engagement and shore bombardment roles and consists of two 76 mm guns mounted in a turret with a 5 mm metal shield. The whole mounting can contain 60 rounds of which two are on the feeder rail and four are on the hoists at any one time. The prime ammunition is the UOFB-62, a fixed round which weighs 12.8 kg (28.2 lb). The projectile weighs 4.6 kg (10.1 lb) and has 400 g of A-IX-2 explosive and a VG-67 point impact fuze.

There is a five-man crew in the turret: the gun captain, two layers and two loaders. There is a further team of four loaders in the below-decks magazine.

In the 'Koni' class, AK-726 is associated with 'Hawk Screech' radar. In addition to radar fire control there is local control through the Prisma optical sighting system, which may be used for engaging targets with speeds of up to 600 m/s (Mach 1.75).

Specifications

Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: 980 m/s (3,215 ft/s)
Traverse: 360° at 36°/s
Elevation: −7 to +85° at 32°/s
Ammunition (total): 16 kg (35.28 lb)
Rate of fire: 90 rds/min (whole mounting)
Range:
anti-surface: 8.5 n miles (15.7 km)
anti-air (max): 10,000 m (32,808 ft)
anti-air (effective): 7,000 m (22,965 ft)

30 mm L/65 AK-230 twin mounting

These two ships have two twin AK-230, remotely operated, twin barrel, automatic anti-aircraft guns, which are designed to engage air targets at heights of up to 4,000 m (13,124 ft). It is also capable of engaging surface targets at ranges up to 2.2 n miles (4 km). The electrically powered mounting is 1.46 m (4.8 ft) high, 3.11 m (10.2 ft) long and 2.1 m (6.9 ft) wide, and consists of two 64.2 calibre, water-cooled, NN30 guns, each with a liner and a rotating breech with four chambers. The elevating mechanism is on the carriage together with a compressed air tank and associated equipment for the loading system. Russian ammunition for this weapon consists of two rounds; BR-83 and OF-83D (see Specifications).

The fire-control radar is the I/J-band Rys (NATO = Drum Tilt), whose maximum acquisition range is approximately 22 n miles (40 km).

Specifications

NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,445 ft/s)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,123 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s

Al Hani *(F 212) in Grand Harbour, Malta. The foredeck in this version is very crowded, with a 76 mm gun, two twin SS-N-2c launchers and an RBU-6000 ASW rocket launcher* (H & L van Ginderen Collection)

Mounting weight: 1,857-1,905 kg (4,094-4,200 lb)
Crew: 2 (off mount)

Ammunition
BR-83:
type: Armour-piercing tracer
weight (complete round): 1.47 kg (3.24 lb)
weight (projectile): 0.35 kg (0.77 lb)
OF-83D:
type: High explosive
weight (complete round): 1.40 kg (3.08 lb)
projectile: 0.27 kg (0.59 lb)
explosive: 30 g (A-XI-2)

ANTI-SUBMARINE MORTARS

RBU-6000

There is only one 12-tube RBU-6000 mortar, which is located centrally on the roof of the small forecastle deckhouse between the two SS-N-2C launch boxes. The mounting can traverse through 360° and elevation limits are −15°/+60°. Loading is automatic from a below-deck magazine. It is estimated that the rockets weigh 110 kg (242.5 lb), with a 25 kg (55.12 lb) warhead. Pairs of tubes are fired in sequence. The RGB-60 rocket is fitted with an impact-time fuze, which detonates either on hitting a solid object (such as a submarine) or when it reaches a preset depth. Firing is usually conducted in a full salvo of 12 rockets, but it is also possible to fire single rockets, or four- or eight-rocket salvos, if the tactical situation requires it. The warhead weighs 31 kg (68.3 lb).

MINES

There are launch rails at the stern, enabling the ship to launch up to 22 mines.

DEPTH CHARGES

There are two depth-charge racks.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Watch Dog

There are two Watch Dog arrays. This is an intercept and radar warning system which has been in service for over 30 years. It is a wide-open system with an array consisting of four tiers of eight microwave horns, covering frequencies from D to H-band.

Cross Loop

Cross Loop is a simple communications direction-finding system. The antenna is on a small platform on the mast.

DECOYS

PK-17

There are two 16-barrelled PK-17 chaff launchers.

Torpedo decoys

Unlike other Konis, the Libyan ships are equipped with Russian towed torpedo decoys.

COMMAND AND CONTROL SYSTEMS

RADARS

Strut Curve search radar

The air search radar is the Russian MR-302 (NATO = Strut Curve) a medium-range, general purpose, F-band, air search radar. The elliptical lattice reflector is mounted at the masthead. Range performance against a 2 m² aircraft target at medium altitude is about 60 n miles (110 km) with a likely maximum range of 150 n miles (280 km).

Plank Shave

The Libyan Konis are fitted with Plank Shave atop a small tower on the bridge roof. This is an I-band set used for surface search and targeting the SS-N-2c missiles.

Don 2

All Konis have one Don 2, I-band, navigation radar.

Drum Tilt

There is a single 'Rys' (NATO = Drum Tilt) fire-control system for the AK-230s. This is an I/J-band system with a pedestal-mounted director whose antenna is in a weatherproof container attached to the scanner assembly and tilted at an angle of about 22°. The maximum acquisition range is approximately 22 n miles (40 km). The single radar director controls both gun mountings.

Hawk Screech fire-control radar

Hawk Screech fire-control radar has a circular dish scanner, behind which are mounted the transmitter and receiver, as well as turning and stabilisation gear. The complete radar is pedestal-mounted. The 2.3 m (7.5 ft) diameter scanner has a central feed supported by a four-leg structure. Feed arrangements could incorporate a rotating dipole to provide a conical scan search pattern. Dish diameter is approximately 2 m (6.5 ft) and the operating frequency is in the H/I-band for both types. The NATO designation, Hawk Screech, is apparently derived from signal characteristics noted in the course of ELINT monitoring. The principal function is that of gunfire director against aircraft targets, although this type probably also has a certain capability against surface targets, and possibly splash detection. There is one Hawk Screech to control both 76 mm guns.

Pop Group
The Pop Group director is located aft atop a small tower. It provides the weapon control system for the SA-N-4 missile system. The director includes an acquisition radar with a long, curved antenna on top of the cab, and two target trackers. The latter two are of different size, but presumably the smaller one performs a similar function to the larger, but at higher frequencies, which would enable them to direct two different missiles against the same target. The system operates in the F/H/I band.

IFF
The ship carries one High Pole B, and one Square Head.

SONAR

Herkules
Herkules (NATO = Wolf Paw) is a sonar more usually found in submarines. It is a hull-mounted, active search and attack, medium-frequency system.

PROPULSION

Specifications
System: Combined diesel and gas turbine (CODAG)
Main machinery: 1 SGW, Nikolayev, M8B gas turbine (centre shaft); 13.25 MW (18,000 hp(m)) sustained; 2 Russki B-68 diesels; 11.63 MW (15,820 hp(m)) sustained
Shafts: 3

FURTHER INFORMATION

These are Type III Konis which differ substantially from earlier versions. The most important difference is that they are armed with four SS-N-2c anti-ship missiles, which are mounted on the foredeck. The forward gun is retained, but the number of RBU-6000s is reduced from two to one. This is also the only version of the Koni to have torpedo tubes: two, fixed 400 mm tubes on either beam in the waist. It also has a new small tower on the bridge roof to mount a Plank Shave surface search/target indication radar. The striped camouflage paint was applied in 1991. Both ships are reported to have been active in 1995.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

P-21 Rubezh (SS-N-2c 'Styx') medium-range anti-ship missile

The Yugoslav ships are all armed with four SS-N-2c anti-ship missiles, but the fits vary. In the two Russian-built ships the missiles are in single launcher-containers which are abaft the stack and facing towards the stern. In the two Yugoslav-built ships, however, the launcher-containers are located foward and face the bows.

Once the target is detected the ship must close with the aim of being within the optimum engagement distance, some 15-20 n miles (28-37 km). Then the ship must maintain a speed of 15 knots or less and hold its course for 20-30 seconds before launching the first salvo of two missiles. These may be followed, a minute later, by the other two.

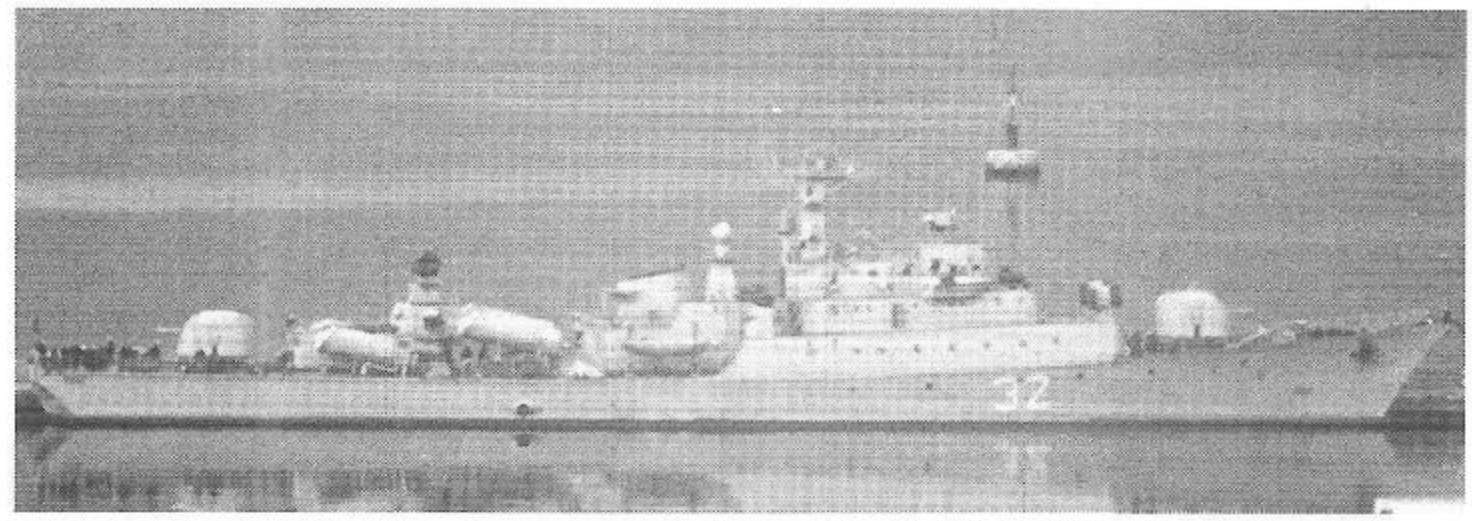
Upon launch, the missile climbs at an angle of 45° to one of five preset altitudes (100, 150, 200, 250 or 350 m), where the onboard radar searches for a target and the receiver is switched on for very short periods to receive signals from a designated range, the range gate being 1 km on either side of the target. The radar locks on only after eight returns have been received, at distances of 3.5-12 n miles (6.5-22 km), whereupon the seeker guidance system switches off the autopilot. A throw-off gyroscope takes the missile on target a few seconds before impact as it becomes too close for radar-generated homing signals. Russian Navy tacticians calculate that seven to eight missiles are required to destroy a cruiser-size target and four for a destroyer, making salvo firing a major feature of any

tactical engagement scenario with SS-N-2c missiles to ensure destruction of the target.

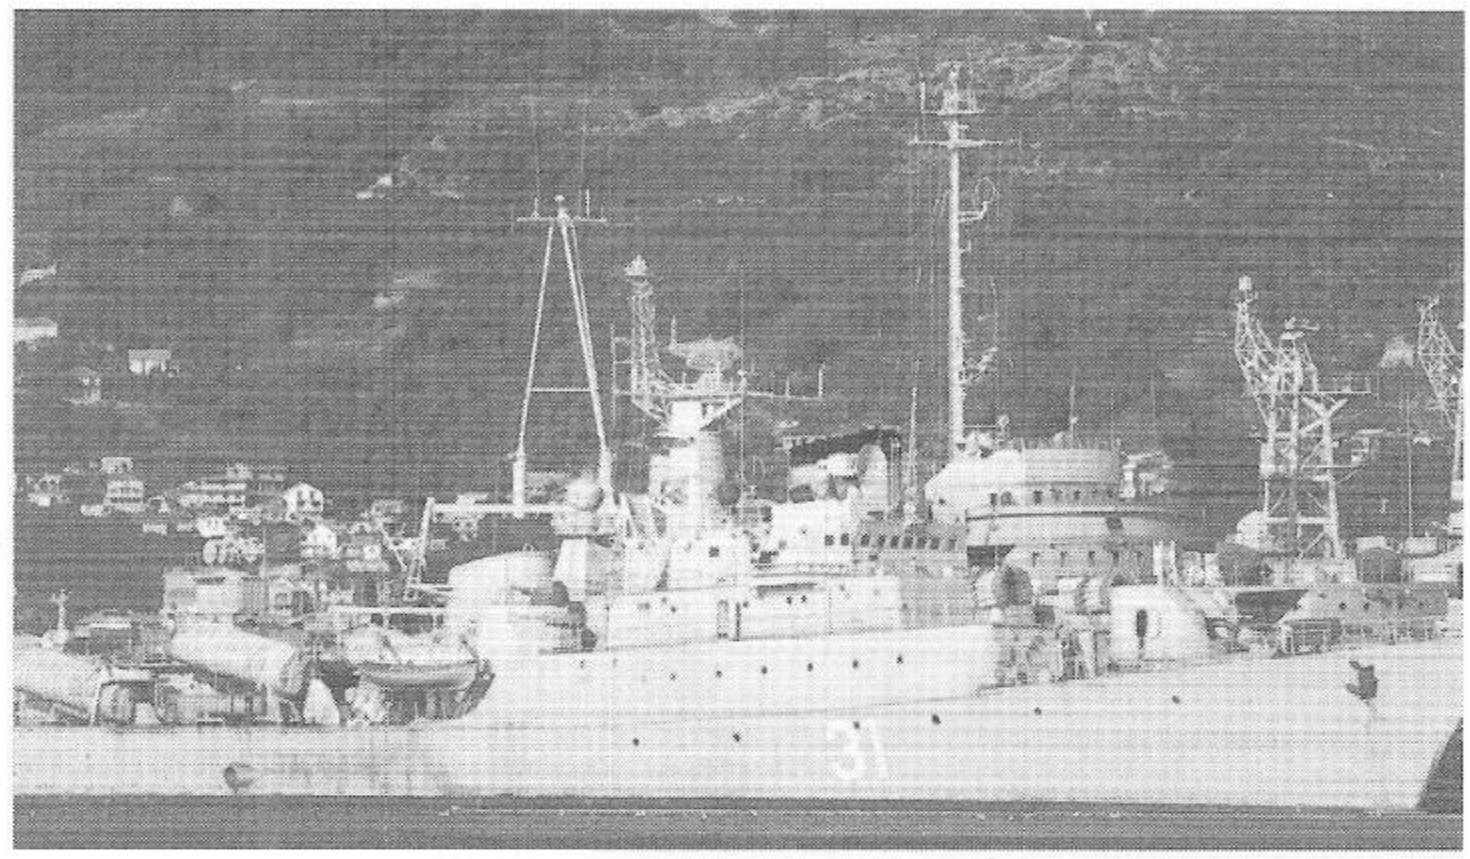
Specifications
SS-N-2c
Length: 6.55 m (21.5 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.9 ft)
Speed: Mach 0.9
Weight (without booster): 2,500 kg (5.512 lb)
Warhead: 454 kg hollow-charge
Fuzes: Impact, proximity
Range: 3-46 n miles (5.5-85 km)
Guidance: Autopilot with active radar (supplemented in some with IR)

MS-2 seeker
Frequency: I-band (8-12 GHz) (four presets)
PRF: 300-500 pps (adjustable)
Altitude control: Barometric pressure device

Manufacturer/Contractor
Raduga, Moscow, Russia



Kopar *(32) the second of the two Koni IVs built in Russia for the Yugoslav Navy. They have the gap in the superstructure of the Koni II, but with four SS-N-2c anti-ship missiles which are fired over the ship's stern*



Beograd, *first of the Russian Koni IV, with SS-N-2cs pointing over the stern*

SURFACE-TO-AIR MISSILES (SAM)

SA-N-4 short-range missile system
There is one SA-N-4 launcher aft. The launcher is atop the deckhouse in the 'X' position in the two Russian-built ships, but on the quarterdeck, displacing the 76 mm mounting in the Yugoslav-built ships. In both cases, the twin-rail launcher lies beneath a hinged flat cover plate, emerging to launch its missiles and retracting to reload. This is likely to result in a low rate of fire which must be slowed even further by the need to close the magazine cover before firing. Below the launcher are four revolving drums each with five missiles while the electromechanical and hydraulic machinery is below that. On launch, the booster burns for 2 seconds allowing the radar to gather the missile at a range of 0.75 n miles (1.5 km), following which the sustainer burns for 15 seconds. Command and control is via the Pop Group system (see below). There are 20 weapons in the magazine.

Specifications
Length: 3.1 m (10.17 ft)
Diameter: 21 cm (8.27 in)
Wing span: 64 cm (25.2 in)
Weight: 130 kg (286.6 lb)
Speed: Mach 2.5
Warhead: 50 kg (110 lb) HE
Range: 0.75-8 n miles (1.5-15 km)
Height: 9-3,000 m (30-10,000 ft)
Guidance: Semi-active radar homing

TORPEDOES

Kotor (VPB 33) and *Novi Sad* (VPB 34) only. These two Yugoslav-built ships have two triple 324 mm tubes on the quarterdeck, displacing the aft twin 76 mm mounting. They are used to launch Whitehead A 244 anti-submarine torpedoes, which use active/passive homing to a range of 3,3 n miles (6 km) at 30 knots. There is, however, some doubt as to whether these tubes are still fitted.

GUNS

Two AK-726 twin 76 mm (3 in)/59 mountings
In *Beograd* and *Kopar* there are two twin AK-726 turrets, in 'A' and 'Y' positions, respectively, but in *Kotor* and *Novi Sad* there is only one gun, in 'A' position. The AK-726 is a multirole weapon system designed for air defence, surface engagement and shore bombardment roles and consists of two 76 mm guns mounted in a turret with a 5 mm metal shield. The whole mounting can contain 60 rounds of which two are on the feeder rail and four are on the hoists at any one time. The prime ammunition is the UOFB-62, a fixed round which weighs 12.8 kg (28.2 lb). The projectile weighs 4.6 kg (10.1 lb) and has 400 g of A-IX-2 explosive and a VG-67 point impact fuze. There is a five-man crew in the turret: the gun captain, two layers and two loaders. There is a further team of four loaders in the below-decks magazine.

In the 'Koni' class, AK-726 is associated with 'Hawk Screech' radar. In addition to radar fire control there is local control through the Prisma optical sighting system, which may be used for engaging targets with speeds of up to 600 m/s (Mach 1.75).

Specifications
Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: 980 m/s (3,215 ft/s)
Traverse: 360° at 36°/s
Elevation: −7 to +85° at 32°/s
Ammunition (total): 16 kg (35.28 lb)
Rate of fire: 90 rds/min (whole mounting)
Range:
anti-surface: 8.5 n miles (15.7 km)
anti-air (max): 10,000 m (32,808 ft)
anti-air (effective): 7,000 m (22,965 ft)

30 mm L/65 AK-230 twin mounting
All four ships have two twin AK-230, remotely operated, twin barrel, automatic anti-aircraft guns, which are designed to engage air targets at heights of up to 4,000 m (13,123 ft). It is also capable of engaging surface targets at ranges up to 2.2 n miles (4 km). The electrically powered mounting is 1.46 m (4.8 ft) high, 3.11 m (10.2 ft) long and 2.1 m (6.9 ft) wide, and consists of two 64.2 calibre, water-cooled, NN30 guns, each with a liner and a rotating breech with four chambers. The elevating mechanism is on the carriage together with a compressed air tank and associated equipment for the loading system. Russian ammunition for this weapon consists of two rounds; BR-83 and OF-83D (see Specifications).

The fire-control radar is the I/J-band Rys (NATO = Drum Tilt), whose maximum acquisition range is approximately 22 n miles (40 km).

Specifications
NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,445 ft/s)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,123 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Mounting weight: 1,857-1,905 kg (4,094-4,200 lb)
Crew: 2 (off mount)

Ammunition
BR-83:
type: Armour-piercing tracer
weight (complete round): 1.47 kg (3.24 lb)
weight (projectile): 0.35 kg (0.77 lb)
OF-83D:
type: High explosive
weight (complete round): 1.40 kg (3.08 lb)
projectile: 0.27 kg (0.59 lb)
explosive: 30 g (A-XI-2)

ANTI-SUBMARINE MORTARS

RBU-6000
There are two 12-tube RBU-6000 mortars located on the foredeck. The mounting can traverse through 360° and elevation limits are −15°/+60°. Loading is automatic from a below-deck magazine. It is estimated that the rockets weigh 110 kg (242.5 lb), with a 25 kg (55.12 lb) warhead. Pairs of tubes are fired in sequence. The RGB-60 rocket is fitted with an impact-time fuze, which detonates either on hitting a solid object (such as a submarine) or when it reaches a pre-set depth. Firing is usually conducted in a full salvo of 12 rockets, but it is also possible to fire single rockets, or four- or eight-rocket salvos, if the tactical situation requires it. The warhead weighs 31 kg (68.3 lb).

MINES

There are launch rails at the stern, enabling the ship to launch up to 22 mines. (As far as is known, none of these ships is fitted with depth-charge rails or carries depth charges.)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

The fitting of specific ESM equipment cannot be confirmed, although it seems very unlikely that these ships should not be fitted with any ESM devices at all. At the very least the Russian Watch Dog and Cross Loop are probably fitted, although it is also possible that Western equipment could be installed.

DECOYS

ML Aviation Barricade countermeasures system

All four ships are fitted with two Barricade decoy launchers. Barricade (British Navy designation = Outfit DLK) provides ships with means of deploying chaff and infra-red (IR) decoys to counter missile attacks, using a layered defence against the various types of anti-ship missile. The system uses a 57 mm rocket with a 900 rpm spin, which combines stabilisation with rapid chaff blooming. There are two types of rocket: Stockade — long range; and Pallisade — short range. The system is integrated into the tactical data handling and command/weapon control system's electronic warfare suite.

Each launcher consists of six sets of triple cells, the outer three sets being angled 60° from the next in bearing so that the launchers provide all-round coverage. The inner three sets are preset to point to the same bearing, as required, but in different elevations. The inner three sets fire short-range Pallisade rockets in centroid mode, while the outer barrels fire medium- and long-range Stockade rockets in dump, distraction and confusion modes.

There are four decoy modes: confusion, distraction, dump and centroid.

Specifications

Stockade
Dimensions: 375 × 57 mm
Weight: 1.89 kg (4.2 lb) (chaff); 1.77 kg (3.9 lb) (IR)
Payload: 0.4 kg (0.88 lb)
Range: 400-2,000 m (1,312-6,561 ft) at 30°
Rocket burn: 0.6 s
Recommended range:
confusion mode: 2,000 m (6,561 ft)
dilution mode: 800 m (2,624 ft)
Chaff frequency range: 2-20 GHz
IR payload: 550 W/steradian in 8-13 µm band

Pallisade
Dimensions: 360 × 57 mm
Weight: 2.1 kg (4.6 lb)
Payload: 0.6 kg (1.3 lb)
Rocket burn: 0.6 s
Chaff frequency coverage: 8-35 GHz
IR payload: 3-14 µm band for 20 s

Manufacturer/Contractor

ML Wallop Defence Systems, Andover, Hampshire, UK.

COMMAND AND CONTROL SYSTEMS

RADARS

Strut Curve search radar

The air search radar is the Russian MR-302 (NATO = Strut Curve) a medium-range, general purpose, F band, air search radar. The elliptical lattice reflector is mounted at the masthead. Range performance against a 2 m² aircraft target at medium altitude is about 60 n miles (110 km) with a likely maximum range of 150 n miles (280 km).

Don 2

VPB 31 and VPB 32 only. One Don 2, I-band, navigation radar.

Palm Frond

VPB 33 and VPB 34 only. One Palm Frond, I-band, navigation radar.

Owl Screech gunfire-control radar

VPB 31 and 32 only. Owl Screech is a fire-control radar of conventional design, widely used in many classes of vessels, distinguished by a circular dish scanner, behind which is mounted a fairly bulky housing which is assumed to contain transmitter and receiver, and probably turning and stabilisation gear. The complete radar is pedestal-mounted. The 2.3 m (7.5 ft) diameter scanner has a central feed supported by a four-leg structure. Feed arrangements could incorporate a rotating dipole to provide a conical scan search pattern. Dish diameter is approximately 2 m (6.5 ft) and the operating frequency is in the H/I-band.

The NATO designation Owl Screech is derived from signal characteristics noted in the course of ELINT monitoring.

The principal function is that of gunfire director against aircraft targets, although this type probably also has a certain capability against surface targets, and possibly splash detection.

CelsiusTech 9LV200 Mk 2 fire-control radar

VPB 33 and 34 only. 9LV200 Mk 2 is a J-band, frequency-agile naval fire-control radar which in these ships acts as a stand-alone fire controller for the 76 mm guns and SS-N-2c missiles. The radar is a monopulse equipment with stabilised antenna and a cassegrain scanner system. The radar mounting can also carry TV, IR camera and laser rangefinder for autonomous electro-optical tracking. A feature of the mounting is a new type of direct drive hydraulic motor capable of a slewing speed of 85°/s, and an initial acceleration of 500°/s².

Specifications

Type: J-band frequency-agile MTI monopulse
Frequency range: Random pulse-to-pulse in J-band
Transmitter: CelsiusTech Electronics YJ1321 magnetron (Mk 2); helix TWT (Mk 3)
Peak power: 65 kW (Mk 2); 1.5 kW (Mk 3)
Receiver noise: 11 dB (Mk 2); 10 dB (Mk 3)

Antenna
Diameter: 1 m (3.28 ft)
Beamwidth (at 3 dB): 1.3°
Gain: 40 dB (Mk 2); 41 dB (Mk 3)

Manufacturer/Contractor

CelsiusTech Electronics, Järfälla, Sweden.

Drum Tilt

There is a single *'Rys'* (NATO = Drum Tilt) fire-control system for the AK-230s. This is mounted on a small tower forward of the stack in *Beograd* and *Kopar*, and at the after end of the forward superstructure in *Kotor* and *Novi Sad*. It is an I/J-band system with a pedestal-mounted director whose antenna is in a weatherproof container attached to the scanner assembly and tilted at an angle of about 22°. The maximum acquisition range is approximately 22 n miles (40 km). The single radar director controls both gun mountings.

Pop Group

The Pop Group director is located aft atop a small tower. It provides the weapon control system for the SA-N-4 missile system. The director includes an acquisition radar with a long, curved antenna on top of the cab, and two target trackers. The latter two are of different size, but presumably the smaller one performs a similar function to the larger, but at higher frequencies, which would enable them to direct two different missiles against the same target. The system operates in the F/H/I band.

IFF

The ships carry one High Pole and two Square Heads.

SONARS

Herkules

VPB 31 and VPB 32.

Bull Nose

VPB 33 and VPB 34. Hull-mounted; active search and attack; medium frequency.

PROPULSION

Specifications

System: Combined diesel and gas turbine (CODAG)
Main machinery VPB 31, VPB 32: 2 Russki B-68 diesels; 11.63 MW (15,820 hp(m)) sustained; 1 SGW Nikolayev gas turbine; 13.2 MW (18,000 hp(m))
Main machinery VPB 33, VPB 34: 2 SEMT-Pielstick 12 PA6 V 280 diesels; 7.1 MW (9,600 hp(m)) sustained; 1 SGW Nikolayev gas turbine; 13.2 MW (18,000 hp(m))
Shafts: 3

FURTHER INFORMATION

PROGRAMME

The first two, Koni IV, were purchased from the (then) Soviet Union in 1978 and 1981, respectively, while the second two, Koni Mod, were built in Yugoslavia under licence.

DESIGN

Although the hulls are identical to the 'Koni' class there are some equipment, and considerable structural differences between the Russian- and Yugoslav-built ships. The two Russian-built ships, for example, have the SS-N-2c missiles aft of midships and facing aft, while the Yugoslav-built ships have the same missiles and launchers, but level with the forward end of the bridge and facing forward. In addition, two triple torpedo tubes replace the after 76 mm gun mounting. The Yugoslav-built ships probably have the same gas-turbine engines as the other pair but there are different diesels.

There is also a different arrangement of the bridge superstructure and stack.

DEPLOYMENT

Three of the four are operational. One of the class was damaged by fire in 1991, and this may have been *Beograd* (VPB 31) which is now being cannibalised for spares. All are based at Tivat.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84B Harpoon

There are eight Harpoon launcher-containers at the 01 deck level, between the bridge structure and the stacks (only four are normally carried in peacetime). This missile can either fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses or it can approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. It can also use selectable seeker search expansion patterns, and for the terminal phase can use either a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

Alenia Elsag Albatros Mk 2 Mod 9 point air defence system

The Albatros Mk 2 Mod 9 system comprises two elements:
Riva-Calzoni launcher
Aspide missile

Riva-Calzoni Albatros launcher

The single, eight-cell Albatros launcher is located on the quarterdeck. Produced by Riva-Calzoni, it has eight launch cells, four on each side of the mounting, each with a frangible front and rear cover. Each cell contains a loading guide to which the launching rail of the missile is electrically and mechanically connected. Sixteen reload missiles are stored horizontally in a hydraulically operated store and reload system in the deckhouse forward of the launcher; they are in four rows of four missiles each, their location corresponding to that of the launcher cells, and each storage cell has an autonomous missile travel device.

Selenia Aspide missile

The system uses the Selenia (now Alenia) Aspide SAM, a missile developed by Selenia from the US Sparrow. Targets are detected by the ship's primary search radar and then allocated to the fire-control system. The target is acquired by the fire-control system radar and the CW transmitter group injects signals into the fire-control system tracker as the launcher slews in the target's direction. The missile control system selects the missile or missiles which the power supply units then prepare for launch. Total system reaction time is 8 seconds. When the decision is made to engage the target with missiles the reversible prelaunch commands are

issued. The firing command itself can be issued automatically or manually, the operator also having the options of a single shot or salvo mode. In the latter, two missiles are launched sequentially against the same target, the maximum firing rate of the system being one missile every 2.5 seconds. Upon launch, the missile is gathered into the tracker-illuminator's beam through a direct signal to the rear receiver and homes on the reflected energy from the target. Up to three missiles at once may be controlled by the tracker, according to the manufacturer who also claims the system can engage horizontal targets at up to 8 n miles (15 km), vertical ones at 2.73 n miles (5 km) and lateral ones at 4.4 n miles (8 km). A short reaction time gives the system the ability to destroy anti-ship missiles even when detection is late.

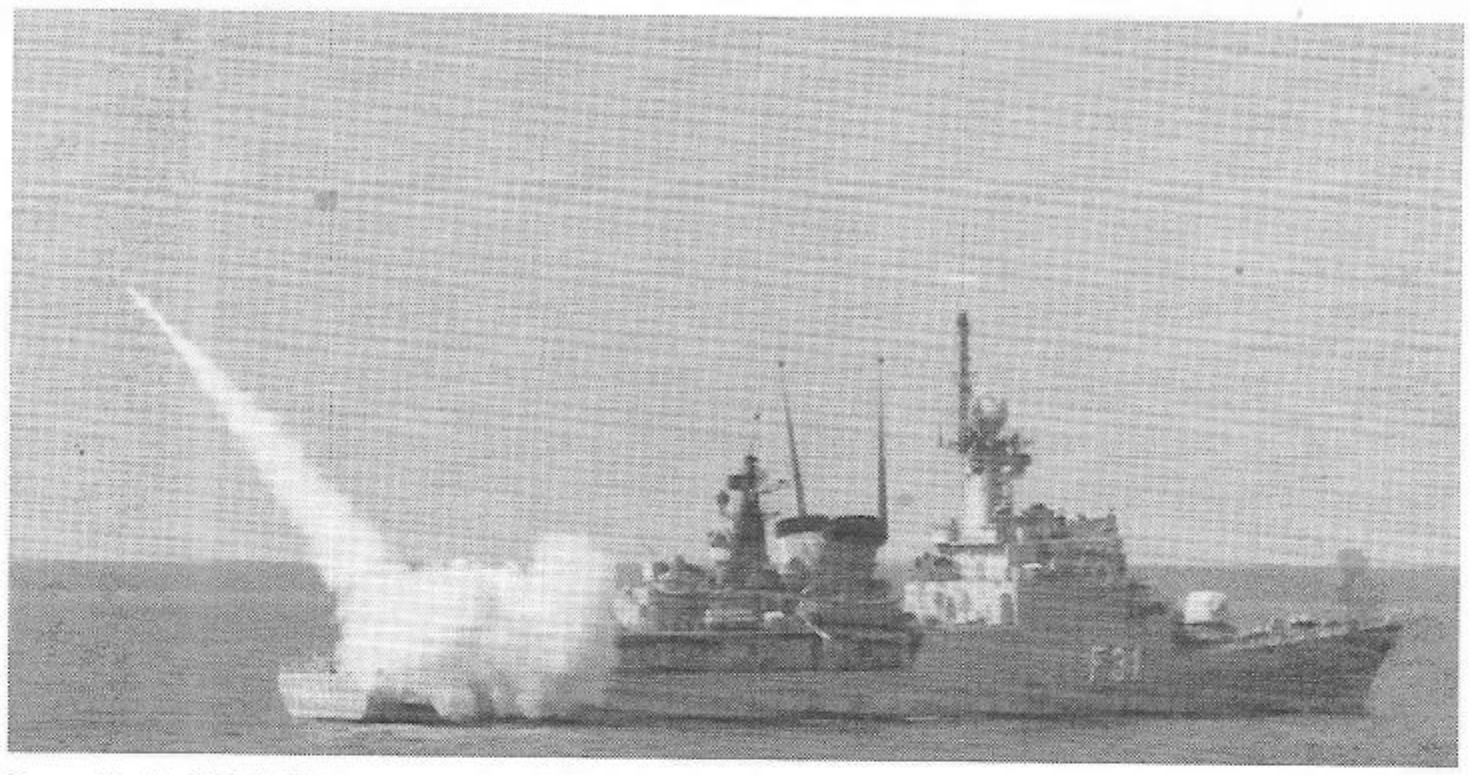
Specifications

Albatros launcher
Height: 2.98 m (9.77 ft)
Width: 3.82 m (12.53 ft)
Length: 3.82 m (12.53 ft)
Weight (loaded): 8.5 t
Traverse: 360° at 45°/s
Elevation: −5 to +80° at 25°/s

Aspide missile
Length: 3.7 m (12.14 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 80 cm (31.5 in)
Weight: 220 kg (485 lb)
Speed: Mach 2.5
Range:
anti-surface: 7 n miles (13 km)
anti-air: 15-5,000 m (50-16,000 ft)
Warhead: 33 kg (72.75 lb)
Guidance: Semi-active radar

Manufacturers/Contractors

Alenia Elsag Sistemi Navali, Rome, Italy (system/missile).
Riva-Calzoni, Bologna, Italy (launcher).



Descubierta *(F 31) firing an Aspide SAM* (Bazan)

Diana *(F 32). Note the Albatros launcher on the quarterdeck and the two Bofors 40 mm. Only one Harpoon missile launcher can been seen, but the satellite radome is fitted* (Diego Quevedo)

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited in the waist.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications

Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

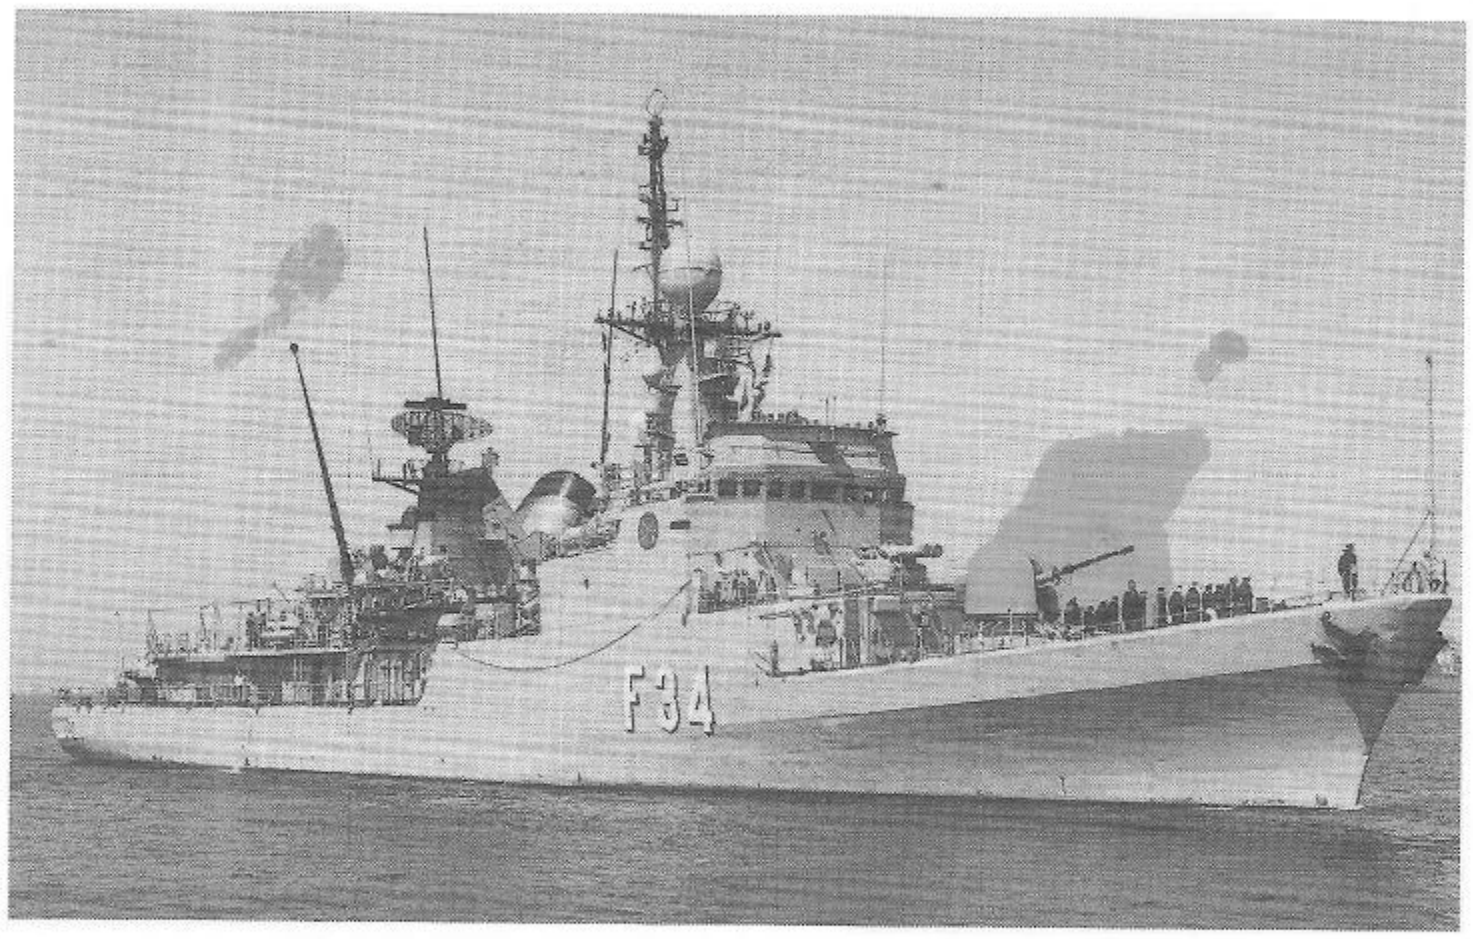
GUNS

OTOBREDA 76 mm (3 in)/62 Compact

There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck for use in either air defence or anti-surface roles. If the weapon is designated to the air defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission.

Specifications

Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s



Infanta Christina *(F 34). The Armament on the foredeck comprises an OTOBREDA 76 mm/62 Compact and a twin-barrel Bofors 375 mm ASW mortar* (Robert Pabst)

Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.

Bofors 40 mm/60

There are two single Bofors 40 mm mounts located on the after superstructure.

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −3 to +85° at 60°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Max range:
anti-surface: 6.5 n miles (12 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

Manufacturer/Contractor
Bofors, Sweden.

ANTI-SUBMARINE MORTARS

Bofors 375 mm ASW rocket system
There is a single, Bofors twin-tube, 375 mm ASW rocket launcher located in the 'B' gun position. The system consists of a rocket launcher, a handling system, the ship sonar and a fire-control system. The two launch tubes are mounted on trunnions with an automatic contact device to connect the rockets with the fire-control system. The hydraulic laying machinery is in the front of the mounting and a flame deflector in the rear; there is also an automatic electrohydraulic handling system. 48 rounds are stored vertically beneath the mounting and selected by an operator. The rate of fire is one round a second and rockets may be fired singly or in a salvo. There are two types of rocket, both with Hexotonal filling. The Type E (Erika) rocket has Stidar time and impact fuzes, while the Type N (Nelli) uses the Zambo proximity and impact fuzes.

Specifications
Launcher
Tubes: 4
Traverse: 260° at 18°/s
Elevation: −15 to +90° at 18°/s
Crew: 4

Rockets

	Type E	Type N
Weight	250 kg (551 lb)	230 kg (507 lb)
Muzzle velocity	130 m/s (427 ft/s)	205 m/s (673 ft/s)
Explosive weight	107 kg (236 lb)	80 kg (176 lb)
Range	0.35-0.87 n miles (0.65-1.63 km)	0.85-2.11 n miles (1.58-3.62 km)
Sinking speed	10.7 m/s (35.1 ft/s)	9.2 m/s (30.2 ft/s)

Manufacturer/Contractor
Bofors, Sweden.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

ENSA Deneb
ENSA Deneb is the ESM part of the new EW package for the 'Descubierta' class, replacing the previous radar intercept and warning elements (ELT/114 and ELT/116). It covers the frequencies 2-18 GHz.

Manufacturer/Contractor
ENSA, Spain.

Ceselsa Canopus
Canopus is the upgraded jammer suite for the 'Descubierta' class, where it has replaced both the manually operated Elettronica ELT/311 noise jammer and the ELT/511 deception jammer.

Manufacturer/Contractor
Ceselsa, Spain.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher
There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)

Rounds
Diameter: 130 mm (5.1 in)
Length, weight:
Mk 182: 1,209 mm; 22.7 kg
Super Chaffstar: 1,209 mm; 20.9 kg
Super Gemini: 451 mm; 5.5 kg
Super Hiram III: 1,220 mm; 13.6 kg
Super Hiram IV: 467 mm; 3.8 kg
Super Loroc: 734 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

Prairie noise suppression systems
The ships are fitted with the Prairie radiated noise suppression system in which air is passed down the propeller shaft and ejected from a groove in the leading edge of the blade, thus delaying the onset of cavitation.

AN/SLQ-25 Nixie noisemaker
One AN/SLQ-25 Nixie (Phase 1), solid-state, modular design electroacoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed through the transom or in a partially or totally enclosed location on the main deck. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm (3.10 ft) long, 15.24 cm (6 in) in diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body at a time is deployed.

Manufacturer/Contractor
Aerojet ElectroSystems, Sacramento, California, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

SEWACO data handling and weapon control system
The sensor, weapon and command system in these ships is the Signaal SEWACO (SEWACO = SEnsoren WApens und COmmandosystem), at the heart of which is the DAISY-1 (DAISY = Digital Action Information SYstem), consisting of a computer and a display system. The system has been designed to fulfil the functions of anti-submarine warfare, self-defence against air attack and anti-surface warfare. The sensors contributing to the system are:

Signaal DA-05 air and surface warning radar
Signaal WM22/41 or WM25/41 combined air and surface warning and fire control, track-while-scan radar.
Signaal ZW-06 navigation and surface search radar
Ceselsa Deneb EW system
Raytheon DE-1160B sonar
External inputs received via Link 11.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 11.
Satcom: Saturn

WEAPONS CONTROL

Signaal WM25 fire-control system
The Spanish ships currently have WM25 fire-control systems.

This system was designed for frigates and destroyers and requires a crew of four or five. It is capable of controlling up to two light or medium calibre guns and the Aspide point defence, semi-active homing, surface-to-air missile system. It can track simultaneously either one air and two surface targets or alternatively an air, a surface and a shore target. The configuration differs substantially from other members of the M20/WM20 family. The radar includes MTI and circular polarisation facilities for searches and pulse Doppler tracking. Peripherals include an SF-6 gas container unit for fires and a radar test set. The weapon control console is supplemented by a missile status and control panel, a bombardment corrector unit and a television console. The system receives inputs from the radar, a television director and two target designation sights. The system uses a mainframe architecture, with the prefix 'W' denoting that the SMR-S1 computer is reprogrammable. Programming is done using the Assembler software language

The prime sensor is the search and target tracking radar which shares the designation of the fire-control system. The radar features helical or horizontal scanning modes for search, monopulse tracking for air targets and track-while-scan for surface targets. The radar antennas are housed in a distinctive, egg-shaped radome, with a stabilisation system which enables them to operate at roll angles of ±30° and pitch angles of ±10°. The upper cassegrain antenna is used for searching as well as for automatic tracking of surface targets for weapon control, while the lower parabolic antenna is used for tracking air targets and for controlling air defence weapons. The antennas are fed from a common I/J-band transmitter but during surveillance all the transmitter output is channelled to the search antenna.

The search radar has a range of approximately 30-32 km against surface targets and 7,600 m against air targets, while the tracker has a range of about 29 km.

The tracker is capable of monitoring the movement of aircraft with a 1 m² cross-section at velocities up to

Cazadora *(F 35). Under the yard-arm are two spherical and two cylindrical radomes, which are part of the Elettronica Beta ESM/ECM system. The cylinders house rotating DF antennas, while the spheres are probably the jammers. These are in the process of being replaced by Spanish EW equipment* (Jane's/H M Steele)

900 m/s (2,952 m/s) and similar size objects moving at or near the surface at maximum velocities of between 34 (111 ft/s) and 55 m/s (180 ft/s).

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

SONAR

Raytheon DE-1160B (AN/SQS-53B) sonar

DE-1160B is the export version of the Raytheon AN/SQS-53B.

This is an active/passive sonar with a cylindrical array 1.6 m (5.25 ft) high and 4.8 m (15.75 ft) in diameter with 576 transducers. The sonar has a power requirement of about 65 kW, a reported active transmitting frequency of about 3 kHz and a peak frequency of 192 kHz. It operates in three active modes; surface duct, bottom bounce and convergence zone, and ranges are believed to be about 10 n miles (18.5 km) in surface duct mode and up to 34.5 n miles (64 km) in convergence zone mode. There are 37 cabinets of signal processing, transmitting and display equipment, the latter having digital display subsystems, and the system includes an AN/UYK-44 Military Reconfigurable Processor (MRP).

Manufacturer/Contractor

Raytheon, USA.

Specifications

System: Diesel

Main machinery: 4 Bazan-MTU 16V 956 TB91 turbocharged diesels; 11 MW (15,000 hp(m)) sustained

Shafts: 2

Propellers: 2 Escher-Wyss, cp, 3 m (9.84 ft) diameter; 250 rpm (nominal).

FURTHER INFORMATION

PROGRAMME

The first batch of four ships was ordered on 7 December 1973, followed by the order for the second batch of four on 25 May 1976. The last ships of the second batch (F 37 and F 38) were, however, sold to Egypt before completion, and were not replaced. These ships are rated as corvettes in the Spanish Navy, although they carry 'F' pennant numbers.

DESIGN

The design of these ships originates with a Spanish Navy staff requirement issued in late 1971 for a new class of frigates:

- A high degree of national participation (83 per cent was eventually achieved).
- Cruising speed of 18 knots.
- Endurance of 4,000 n miles.
- Maximum continuous speed in excess of 25 knots.
- An integrated weapons system to include: medium-calibre guns; four light-calibre guns; SSMs; ASW torpedoes.
- Good habitability.
- Accommodation for 30 troops.

The main design was prepared by Bazan under contract to the Spanish Navy, but an outside subcontractor, expert in the ASW field (believed to be Blohm + Voss), evaluated the design as an ASW platform and a number of its recommendations (but not all) were implemented:

- Adoption of the Prairie system.
- Move the sonar dome.
- Damping numerous items of equipment, particularly near the sonar dome.
- Installation of a gas turbine high in the ship to be used during passive sonar operations.

The eventual design was based on the Portuguese 'João Coutinho' by Comodoro de Oliveira of the Portuguese Navy and final modifications by Bazan prior to construction. The Descubierta design packs a great deal into a relatively small hull (1,482 t full load displacement). Below the main deck there are two levels extending the full length of the ship, with the second deck inevitably interrupted by the machinery spaces. There is a double-bottom deck and below it most of the ship's tanks (fuel oil, lubricating oil, ballast and fresh water). The transverse bulkheads have been arranged so that the flooding of two adjacent compartments will not result in the loss of the ship.

The main longitudinal structure of the shell and decks is of HT steel, which was chosen for its combination of strength and light weight, with all transverse structures, frames, bulkheads and the secondary structure made of mild steel to Lloyd's Register Class A standards. All superstructure, deckhouses and masts, except in certain parts of the hull and weapon carrying areas are of aluminium alloy. A Y-shaped stack was adopted to minimise corrosion and obscuration effects.

Propulsion is provided by four high-speed, non-reversible diesels, two on each shaft, with the engines split between two engine rooms to enhance survivability. Manoeuvrability is enhanced by the use of two rudders abaft the propellers but slightly inboard to avoid corrosion and to permit the shaft to be removed without having first to remove the rudder.

The weapons system comprises one 76 mm gun, two 40 mm cannon, as well as eight Harpoon anti-ship missiles and an eight-cell launcher for NATO Sea Sparrow SAM, with 16 reloads. ASW capability is rather more limited, with one 375 mm mortar and two triple 324 mm torpedo tubes.

Fully stabilised. Automatic computerised engine and alternator control; two independent engine rooms; normal running on two diesels.

NAMES

Infanta Elena and *Infanta Cristina* are the daughters of King Juan Carlos. The frigate *Diana* is the tenth Spanish warship to hold that name, the line extending back to the galley *Diana* of 1570.

MODERNISATION

The original design included space and weight allowances for a VDS, but this has never been fitted, and it seems that the plan has been dropped. Similarly, it was planned at one time to replace the 40 mm gun immediately aft of the mainmast with a Meroka with associated fire-control radars but this update may also be shelved. In-service updates which have taken place include fitting two SRBOC chaff launchers and complete replacement of the Italian EW suite by a Spanish system. Link 11 has also been installed.

The WM25 fire-control system may be updated in four of the class in due course.

DEPLOYMENT

All are based at Cartagena, where they form the 21st Squadron.

SALES

Two were sold to Egypt in 1982 and one to Morocco in 1983.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84B Harpoon

There are eight Harpoon launcher-containers at the 01 deck level, between the bridge structure and the stacks (only four are normally carried in peacetime). This missile can either fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses or it can approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. It can also use selectable seeker search expansion patterns and, for the terminal phase, can use either a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

Abu Qir *(F 946). Unlike the Spanish and Moroccan ships, the Egyptian Descubiertas are equipped with the Raytheon 1167 variable depth sonar (VDS) which can be seen on the stern. The 324 mm Mk 32 torpedo tubes can be seen abaft the ship's boat and the full complement of eight Harpoons is embarked*

SURFACE-TO-AIR MISSILES (SAM)

Alenia Elsag Albatros Mk 2 Mod 9 point air defence system

The Albatros Mk 2 Mod 9 system comprises two elements:
Riva-Calzoni launcher
Aspide missile

Riva-Calzoni Albatros launcher

The single, eight-cell Albatros launcher is located on the quarterdeck. Produced by Riva-Calzoni, it has eight launch cells, four on each side of the mounting, each with a frangible front and rear cover. Each cell contains a loading guide to which the launching rail of the missile is electrically and mechanically connected. Sixteen reload missiles are stored horizontally in a hydraulically operated store and reload system in the deckhouse forward of the launcher; they are in four rows of four missiles each, their location corresponding to that of the launcher cells, and each storage cell has an autonomous missile travel device.

Selenia Aspide missile

The system uses the Selenia (now Alenia) Aspide SAM, a missile developed by Selenia from the US Sparrow. Targets are detected by the ship's primary search radar and then allocated to the fire-control system. The target is acquired by the fire-control system radar and the CW transmitter group injects signals into the fire-control system tracker as the launcher slews in the target's direction. The missile control system selects the missile or missiles which the power supply units then prepare for launch. Total system reaction time is 8 seconds. When the decision is made to engage the target with missiles the reversible prelaunch commands are issued. The firing command itself can be issued automatically or manually, the operator also having the options of a single shot or salvo mode. In the latter, two missiles are launched sequentially against the same target, the maximum firing rate of the system being one missile every 2.5 seconds. Upon launch, the missile is gathered into the tracker-illuminator's beam through a direct signal to the rear receiver and homes on the reflected energy from the target. Up to three missiles at once may be controlled by the tracker, according to the manufacturer who also claims the system can engage horizontal targets at up to 8 n miles (15 km), vertical ones at 2.73 n miles (5 km) and lateral ones at 4.4 n miles (8 km). A short reaction time gives the system the ability to destroy anti-ship missiles even when detection is late.

Specifications

Albatros launcher
Height: 2.98 m (9.77 ft)
Width: 3.82 m (12.53 ft)
Length: 3.82 m (12.53 ft)
Weight (loaded): 8.5 t
Traverse: 360° at 45°/s
Elevation: -5 to +80° at 25°/s

Aspide missile
Length: 3.7 m (12.14 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 80 cm (31.5 in)
Weight: 220 kg (485 lb)
Speed: Mach 2.5
Range:
anti-surface: 7 n miles (13 km)
anti-air: 15-5,000 m (50-16,000 ft)
Warhead: 33 kg (72.75 lb)
Guidance: Semi-active radar

Manufacturers/Contractors

Alenia Elsag Sistemi Navali, Rome, Italy (system/missile).
Riva-Calzoni, Bologna, Italy (launcher).

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited in the waist.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Sting Ray lightweight anti-submarine weapon

Unlike the Spanish ships, the Egyptian Descubiertas use British Sting Ray lightweight ASW torpedo. This torpedo can be employed in deep or shallow waters, using its multiband, multibeam sonar. The narrowband capability gives good Doppler discrimination against slow or quiet targets, while the broadband capability provides target discrimination, range and bearing resolution. The acoustic beam sweeps the whole volume of the water from the surface to the maximum operating depth. The computer can be reprogrammed 'through the skin' whenever updated software is required, with the programs adapting themselves to the tactical and environmental conditions in which the torpedo operates. The computer also controls the signals, beam form, speed and trajectory of the weapon.

On entering the water the torpedo sets up a programmed search pattern designed to maximise the chances of target detection. On acquiring the target, the computer and active sonar sensors make it almost impossible for the target to evade attack. The software of the guidance/homing system enables it to filter out background noise and decoys, and to intercept the target rather than perform a conventional tailchase attack. Maximum speed is about 45 knots with an estimated endurance of some 8 minutes at that speed.

Specifications

Length: 2.59 m (8.5 ft)
Diameter: 324 mm (12.75 in)
Weight: 267 kg (in air) (589 lb)
Warhead: 35 kg (77 lb)
Speed: 45 knots (estimated)
Range: 6 n miles (11 km) (estimated)
Endurance: Approximately 8 minutes
Depth: 750 m (246 ft)

Manufacturer/Contractor

GEC-Marconi Underwater Weapons Systems Ltd.

GUNS

OTOBREDA 76 mm (3 in)/62 Compact

There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck for use in either air defence or anti-surface roles. If the weapon is designated to the air defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission.

Specifications

Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s
Elevation: -15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.

Bofors 40 mm/60

There are two single Bofors 40 mm mounts located on the after superstructure.

Specifications

Traverse: 360° (nominal) at 90°/s
Elevation: -3 to +85° at 60°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Max range:
anti-surface: 6.5 n miles (12 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

ANTI-SUBMARINE MORTARS

Bofors 375 mm ASW rocket system

There is a single, Bofors twin-tube, 375 mm ASW rocket launcher located in the 'B' gun position. The system consists of a rocket launcher, a handling system, the ship sonar and a fire-control system. The two launch tubes are mounted on trunnions with an automatic contact device to connect the rockets with the fire-control system. The hydraulic laying machinery is in the front of the mounting and a flame deflector in the rear; there is also an automatic electrohydraulic handling system. 48 rounds are stored vertically beneath the mounting and selected by an operator. The rate of fire is one round a second and rockets may be fired singly or in a salvo. There are two types of rocket, both with Hexotonal filling. The Type E (Erika) rocket has Stidar time and impact fuzes, while the Type N (Nelli) uses the Zambo proximity and impact fuzes.

Specifications

Launcher
Tubes: 4
Traverse: 260° at 18°/s
Elevation: -15 to +90° at 18°/s
Crew: 4

Weight	250 kg (551 lb)	230 kg (507 lb)
Muzzle velocity	130 m/s (427 ft/s)	205 m/s (673 ft/s)
Explosive weight	107 kg (236 lb)	80 kg (176 lb)
Range	0.35-0.87 n miles (0.65-1.63 km)	0.85-2.11 n miles (1.58-3.62 km)
Sinking speed	10.7 m/s (35.1 ft/s)	9.2 m/s (30.2 ft/s)

Manufacturer/Contractor

Bofors, Sweden.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Elettronica BETA ESM/ECM suite

The Egyptian ships are fitted with the same Elettronica EW suite as was fitted in the Spanish ships before their modernisation. The antennas are located in two sets of radomes below the yard-arm on either side of the foremast; the upper pair are globes, the lower pair a flat-topped cylinder, similar in appearance to the Russian Top Hat. The BETA suite comprises:

ELT/114 and ELT/116. Radar intercept and warning sets covering the frequencies 2-18 GHz.
ELT/311 and ELT/511. These are manually operated noise and deception jammers, respectively.

El Suez *(F 941). The EW radomes of the Elettronica BETA system show up prominently on the side of the mast*

Telegon

A Telegon communications electronics support measures (CESM) direction-finding set is installed in both ships.

Prairie noise suppression systems

The ships are fitted with the Prairie radiated noise suppression system in which air is passed down the propeller shaft and ejected from a groove in the leading edge of the blade, thus delaying the onset of cavitation. (As these two ships were originally constructed for the Spanish Navy, whose ships have only the Prairie and not the Masker system, as well, it seems unlikely that the Egyptian ships have Masker.)

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

SEWACO data handling and weapon control system

The sensor, weapon and command system in these ships is the same Signaal SEWACO (SEWACO = SEnsoren WApens und COmmandosystem) as that fitted originally in the Spanish ships. At the heart of this system is the DAISY-1 (DAISY = Digital Action Information SYstem), consisting of a computer and a display system. The system has been designed to fulfil the functions of anti-submarine warfare, self-defence against air attack and anti-surface warfare. The sensors contributing to the system are:

- Signaal DA05 air and surface warning radar.
- Signaal WM25 combined air and surface warning and fire-control, track-while-scan radar.
- Signaal ZW-06 navigation and surface search radar.
- Raytheon DE-1160B sonar.
- External inputs received via Link Y (see below).

(Note that the Elettronica BETA EW suite is a stand-alone system and cannot be interfaced with an automated system such as SEWACO.)

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

RADARS

Type	DA 05	ZW 06	WM25
Maker	Signaal	Signaal	Signaal
Role	Air/surface search	Navigation	Fire control
Band	E/F	I	I/J

Peak Power	1,200 kW	60 kW	200 kW
Gain	32.2 dB	32 dB	33.5 dB
Pulsewidth	1.3/2.6 µs	0.06/0.6 µs	0.22/4.5 µs
PRF	1,000/500 pps	4,000/2,000 pps	3,600/1,800 pps
Scan rate	10.20 rpm	24 rpm	60 rpm
Typical range	75 n miles (137 km) for 2 m² target	14 n miles (7.6 km) for 10 m² target	25 n miles (46 km)

COMMUNICATIONS AND DATALINKS

Link YE

The Egyptian Navy purchased the Signaal version of Link Y, which was developed in the UK by Ferranti as a digital link suitable for sale to non-NATO countries for naval and aircraft use. Different users have versions tailored to their own needs; Link YE, for example, is exclusive to the Egyptian Navy.

Link Y, generally, uses a standard message format of two 24-bit words and a transmission speed of 300-1,200 bits/s.

SONAR

Raytheon DE1167LF/VDS sonar

The Egyptian ships have been retrofitted with the DE 1167, which includes both a hull-mounted 7.5 kHz hull-mounted 36-stave transducer array and a 12 kHz VDS. This system uses digital electronics and an advanced control and display system. Outboard units consist of a transducer array and a 4.17 m (13.7 ft) long dome and the VDS winch, overboarding assembly, control station, hydraulic power supply, 200 m faired cable and towed body for the 12 kHz variable depth subsystem.

The basic hull-mounted DE1167 is an active/passive, preformed beam, omni and directional transmission sonar which uses three non-interfering 600 Hz wide FM transmission bands centred at 7.5 kHz and has a spatial Polarity Coincidence Correlation (PCC) receiver. The passive mode, which is selected automatically when transmissions are stopped, is primarily useful for torpedo detection. Optional items in production include a performance prediction subsystem, an auxiliary half-frequency passive receiver, an auxiliary display, a remote display and a training/test target remote-control unit. Signal reception and beamforming are accomplished by broadband analogue circuitry followed by clipper amplifiers for perfect data normalisation.

Specifications

Centre frequency: VDS—12 kHz; hull-mounted—7.5 kHz

Source level: TRDT 227 dB (HM), omni 217 dB

Pulse type: 600, 2,000 Hz FM sweep; 100, 200, 50, 6 ms pulse lengths
Receiver type: Spatial polarity coincidence correlator (PCC) between 36 pairs of half-beams
Beam characteristics: 36 sets of right and left half-beams for active and passive detection. Selectable 10°H × 13°V sum beam for audio listening. 1.25° bearing interpolation for fine search display

Track displays: Sector scan indicator (1,000 yd × 10°) and target Doppler indicator (1,000 yd × ±60 knots)
Target data: Range: 6.1 m (24 ft) resolution. Bearing 1.25° resolution plus active search display −0.1° and 3 m (9.84 ft) on SSI display. ±60 kts of Doppler at 1 kt steps on the TDI
Data format: Standard: NTDS ANEW (digital). Optional: NTDS slow, Fast Serial D/S synchro converters

Manufacturer/Contractor

Raytheon Company Submarine Signal Division, Portsmouth, Rhode Island, USA.

PROPULSION

Specifications

System: Diesel
Main machinery: 4 Bazan-MTU 16V 956 TB91 turbocharged diesels; 11 MW (15,000 hp(m)) sustained

Shafts: 2
Propellers: 2 Escher-Wyss, cp, 3 m (9.84 ft) diameter; 250 rpm (nominal).

FURTHER INFORMATION

PROGRAMME

These two ships were ordered from Bazan, Spain in September 1982 and were allocated from the batch already under construction for the Spanish Navy. The two ships concerned were *Centinela* (F 37) and *Serviola* (F 38) and they were completed at Ferrol as *El Abu Qir* and *El Suez,* respectively and then moved to Cartagena for modification before transfer.

MODERNISATION

The combat data system and air search radar were updated in 1995.

El Suez *(F 941). The two ships for Egypt were taken from the Spanish production order, but were not replaced* (Bazan)

Commissioned	28 Mar 1983

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 38 medium-range anti-ship missile

Unlike the Spanish and Egyptian ships which have eight Harpoon SSMs, the Moroccan Descubierta is armed with four MM 38 Exocets, although these are mounted in the same place between the bridge superstructure and the twin stacks. The missiles are carried in two twin launcher-containers pointing across the centreline at the opposite beam. These launcher-containers are inclined at an angle of 12° to the horizontal. In addition to the launcher installations there is a control console and there is a co-ordinate converter to interface the missile with the ship's sensors.

Targets are acquired by the ship's search radar and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence. This involves turning on the thermal battery, releasing the mechanical safety locks, igniting the booster, and, finally, breaking the umbilical cord; the total process takes some 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change of course during its flight.

The attack consists of two phases:

Cruise phase. The cruise phase starts as the missile clears the container and the missile, powered by the sustainer motor, flies towards the general location of the target at a height of about 100 m (328 ft) which is low enough to reduce the chance of detection but adequate for target acquisition. This phase can be as long as 22 km and ends when the seeker acquires the target. This seeker is a Dassault Electronique ADAC (Auto Directeur Anti-Clutter) active monopulse radar, working in the I-band (8-10 GHz), which has a typical range of 13 n miles (24 km) against FACs.

Approach phase. On detecting the target the missile descends to 9-15 m (30-50 ft) in the approach phase.

Terminal phase. During this final phase the missile descends to 8 m (2-5 m in a calm sea) (26 ft (6.5-16.4 ft)) for a sea-skimming run in to the target.

A salvo may be fired in 12-20 seconds.

Specifications

MM 38
Length: 5.21 m (17.1 ft)
Diameter: 35 cm (13.8 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 2-22.5 n miles (4-42 km)
Guidance: Inertial and active radar
Sustainer motor: SNPE Eole alloy-cased CDB; weight 151 kg (333 lb); max burn time 93 s
Booster: SNPE Epervier boost motor; burn time of 2.4 s
Warhead: Luchaire 165 kg (364 lb) fragmentation warhead
Fuzes: Delayed impact fuze and autopilot-controlled proximity fuze.

Manufacturer/Contractor

Aerospatiale Missiles, Paris, France.

SURFACE-TO-AIR MISSILES (SAM)

Alenia Elsag Albatros Mk 2 Mod 9 point air defence system

The Albatros Mk 2 Mod 9 system comprises two elements:

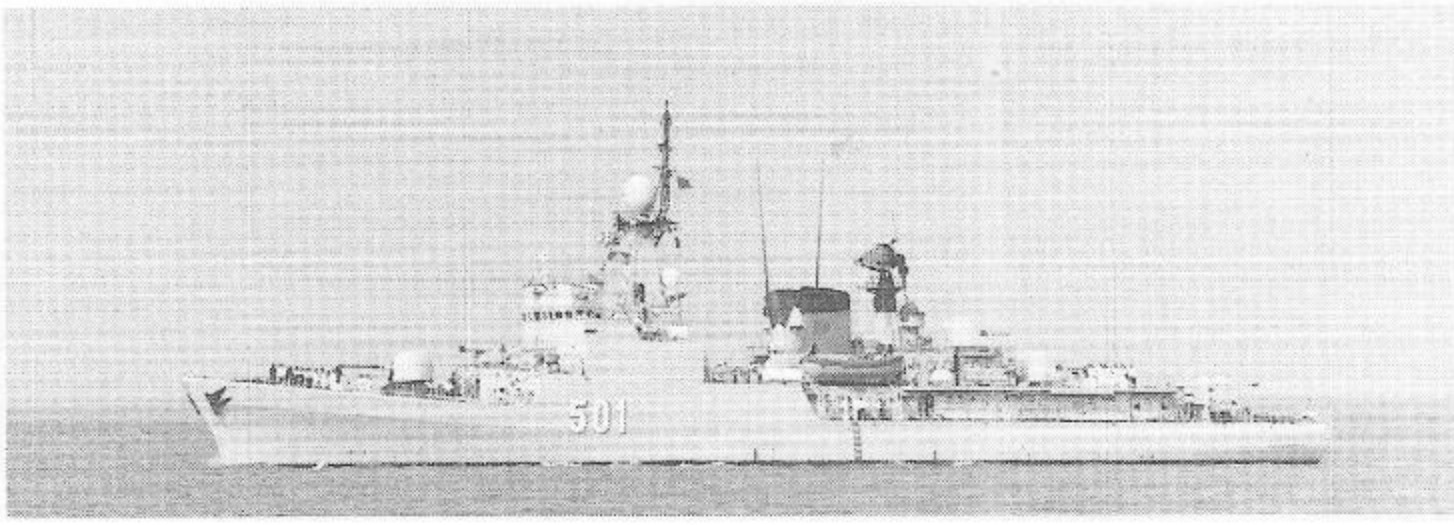
Riva-Calzoni launcher
Aspide missile

Riva-Calzoni Albatros launcher

The single, eight-cell Albatros launcher is located on the quarterdeck. Produced by Riva-Calzoni, it has eight launch cells, four on each side of the mounting, each with a frangible front and rear cover. Each cell contains a loading guide to which the launching rail of the missile is electrically and mechanically connected. Sixteen reload missiles are stored horizontally in a hydraulically operated store and reload system in the deckhouse forward of the launcher; they are in four rows of four missiles each, their location corresponding to that of the launcher cells, and each storage cell has an autonomous missile travel device.

Selenia Aspide missile

The system uses the Selenia (now Alenia) Aspide SAM, a missile developed by Selenia from the US Sparrow. Targets are detected by the ship's primary search radar and then allocated to the Signaal WM25 fire-control system. The target is acquired by the fire-control system radar and the CW transmitter group injects signals into the fire-control system tracker as the launcher slews in the target's direction. The missile control system sel-



Lieutenant Colonel Errhamani *(F 501), flagship of the Moroccan Navy. Note that the Moroccan ship has turret-mounted OTOBREDA 40 mm, whereas all other 'Descubierta' class have simple, open mounts. It is also the only Descubierta to be armed with Exocet anti-ship missiles, although it is rarely seen with the launch tubes actually mounted* (Jane's/H M Steele)

ects the missile or missiles which the power supply units then prepare for launch. Total system reaction time is 8 seconds. When the decision is made to engage the target with missiles the reversible pre-launch commands are issued. The firing command itself can be issued automatically or manually, the operator also having the options of a single shot or salvo mode. In the latter, two missiles are launched sequentially against the same target, the maximum firing rate of the system being one missile every 2.5 seconds. Upon launch the missile is gathered into the tracker-illuminator's beam through a direct signal to the rear receiver and homes on the reflected energy from the target. Up to three missiles at once may be controlled by the tracker, according to the manufacturer who also claims the system can engage horizontal targets at up to 8 n miles (15 km), vertical ones at 2.73 n miles (5 km) and lateral ones at 4.4 n miles (8 km). A short reaction time gives the system the ability to destroy anti-ship missiles even when detection is late.

Specifications
Albatros launcher
Height: 2.98 m (9.77 ft)
Width: 3.82 m (12.53 ft)
Length: 3.82 m (12.53 ft)
Weight (loaded): 8.5 t
Traverse: 360° at 45°/s
Elevation: -5 to +80° at 25°/s

Aspide missile
Length: 3.7 m (12.14 ft)
Diameter: 20.3 cm (8.0 in)
Wing span: 80 cm (31.5 in)
Weight: 220 kg (485 lb)
Speed: Mach 2.5
Range:
anti-surface: 7 n miles (13 km)
anti-air: 15-5,000 m (50-16,000 ft)
Warhead: 33 kg (72.75 lb)
Guidance: Semi-active radar

Manufacturers/Contractors
Alenia Elsag Sistemi Navali, Rome, Italy (system/missile).
Riva-Calzoni, Bologna, Italy (launcher).

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited in the waist.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 1 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 76 mm (3 in)/62 Compact
There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck for use in either air defence or anti-surface roles. If the weapon is designated to the air defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission.

Specifications
Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s
Elevation: -15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

OTOBREDA 40 mm/70 Type 564
There are two single OTOBREDA Type 564 40 mm/70 mounts located on the after superstructure. These have a glass-reinforced plastic (GRP) gunshield, an electrically powered automatic feed device, and a digital servo system.

Specifications
Traverse: 360° (nominal) at 85°/s
Elevation: -9 to +83° at 45°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,000 m/s (3,297 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

ANTI-SUBMARINE MORTARS

Bofors 375 mm ASW rocket system
There is a single, Bofors twin-tube, 375 mm ASW rocket launcher located in the 'B' gun position. The system consists of a rocket launcher, a handling system, the ship sonar and a fire-control system. The two launch tubes are mounted on trunnions with an automatic contact device to connect the rockets with the fire-control system. The hydraulic laying machinery is in the front of the mounting and a flame deflector in the rear; there is also an automatic electrohydraulic handling system. 48 rounds are stored vertically beneath the mounting and selected by an operator. The rate of fire is one round a second and rockets may be fired singly or in a salvo. There are two types of rocket, both with Hexotonal filling. The Type E (Erika) rocket has Stidar time and impact fuzes, while the Type N (Nelli) uses the Zambo proximity and impact fuzes.

Specifications
Launcher
Tubes: 4
Traverse: 260° at 18°/s
Elevation: -15 to +90° at 18°/s
Crew: 4

Rockets

	Type E	Type N
Weight	250 kg (551 lb)	230 kg (507 lb)
Muzzle velocity	130 m/s (427 ft/s)	205 m/s (673 ft/s)
Explosive weight	107 kg (236 lb)	80 kg (176 lb)
Range	0.35-0.87 n miles (0.65-1.63 km)	0.85-2.11 n miles (1.58-3.62 km)
Sinking speed	10.7 m/s (35.1 ft/s)	9.2 m/s (30.2 ft/s)

Manufacturer/Contractor
Bofors, Sweden.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Elettronica ELT 715
This ship is fitted with the Elettronica ELT 715 intercept and jamming system, which appears to have been specially developed for this application.

DECOYS

DAGAIE countermeasures system
There are two DAGAIE ten-barrelled, trainable launchers mounted on top of the bridge structure, just forward of the DRBC-32E director, which can be loaded with either IR or chaff rockets. The firing sequence runs automatically, once triggered by a missile alarm from a variety of sources, such as radar, ESM systems, or optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, windspeed and direction, ship heading and speed data.

The launching of radar and IR decoys is so arranged that advanced mixed-guidance missile systems cannot discriminate between them and thus collocation of

both decoys is achieved. The installation is a double mounting and comprises two trainable mountings carrying 10 replaceable containers (suitcases), each of which is loaded with either 3-5 and 8-14 µm IR or I/J-band chaff projectiles.

A wide range of ammunition is provided by Etienne Lacroix Défense providing seduction, distraction and seduction/dissimulation modes. The electromagnetic decoys are normally based upon aluminised glass fibre chaff with rapid bloom time and they cover the I and J frequency bands. The infra-red decoys cover both the 3-5 and the 8-14 µm bands.

Specifications

Traverse: 330° at 21°/s
Average reaction time: Within 4 s
REM rocket dimensions: 850 × 127 mm (33.5 × 5 in)
Rocket weight: 13 kg (28.66 lb)
Container dimensions: 900 × 130 mm (35.4 × 5.1 in)
Container weight: 20 kg (44.1 lb)
LIR/LEM container dimensions: 780 × 630 × 134 mm (30 × 24.8 × 5.3 in)

Manufacturer/Contractor

CSEE Défense, Paris, France.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

SEWACO-MR data handling and weapon control system

The sensor, weapon and command system in these ships is designated Signaal SEWACO-MR (SEWACO = SEnsoren WApens und COmmandosystem) (MR = Morocco) and is similar to that fitted originally in the Spanish ships. At the heart of this system is the DAISY-1 (DAISY = Digital Action Information SYstem), consisting of a computer and a display system. The system has been designed to fulfil the functions of anti-submarine warfare, self-defence against air attack and anti-surface warfare. The senors contributing to the system are:

- Signaal DA05 air and surface warning radar.
- Signaal WM25/41 combined air and surface warning and fire control, track-while-scan radar.
- Signaal ZW-06 navigation and surface search radar.
- Raytheon DE-1160B sonar.

(Note that the Elettronica ELT 715 EW suite is a stand-alone system and cannot be interfaced with an automated system such as SEWACO).

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

Lieutenant Colonel Errhamani *(F 501). This ship does not have the same EW fit as the Spanish and Egyptian ships and thus has no small radomes on the side of the mast* (Jane's/H M Steele)

SONAR

Raytheon DE-1160B (AN/SQS-53B) sonar

DE-1160B is the export version of the Raytheon AN/SQS-53B.

This is an active/passive sonar with a cylindrical array 1.6 m (5.2 ft) high and 4.8 m (15.7 ft) in diameter with 576 transducers. The sonar has a power requirement of about 65 kW, a reported active transmitting frequency of about 3 kHz and a peak frequency of 192 kHz. It operates in three active modes; surface duct, bottom bounce and convergence zone, and ranges are believed to be about 10 n miles (18.5 km) in surface duct mode and up to 34.5 n miles (64 km) in convergence zone mode. There are 37 cabinets of signal processing, transmitting and display equipment, the latter having digital display subsystems, and the system includes an AN/UYK-44 Military Reconfigurable Processor (MRP).

Manufacturer/Contractor

Raytheon, USA.

System: Diesel
Main machinery: 4 Bazan-MTU 16V 956 TB91 turbocharged diesels; 11 MW (15,000 hp(m)) sustained
Shafts: 2
Propellers: 2 Escher-Wyss, cp, 3 m (9.84 ft) diameter; 250 rpm (nominal).

FURTHER INFORMATION

PROGRAMME

This ship was ordered on 7 June 1977 and delivered, after delays due to a strike, in March 1983.

DESIGN

This ship has a number of differences from the original Spanish ships, of which the most noticeable is that it is armed with Exocet SSMs instead of Harpoons. These missiles are, however, rarely mounted in the ships.

MODERNISATION

The new OTOBREDA 40 mm mounts were fitted in 1995, replacing two manual 40 mm mounts.

THE FUTURE

This is the largest unit in the Moroccan Navy and efforts to find the funds for another ship of similar size have not been successful. Morocco was one of the countries offered a 'Knox' class frigate on lease in 1994, but declined the offer, although the concurrent offer of the grant transfer of a 'Newport' class LST was accepted.

ANTI-SUBMARINE MORTARS

Projector Mk 11 (Hedgehog)

Despite their age, two Hedgehog Mk 11 anti-submarine spigot mortars are retained. The bombs are fired into a circular pattern with a 41 m (134.5 ft) radius at a range of 230-250 m (755-820 ft).

Specifications
Projectile
Diameter: 177.8 mm (7 in)
Weight: 29.5 kg (65 lb)
Fuze: Impact
Explosive weight: 13.6 kg (30 lb)
Sinking speed: 7.6 m/s (25 ft/s)

DEPTH CHARGES

One rack.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

AN/WLR-1
AN/WLR-1 is a US-manufactured, manually operated, radar warning system covering frequencies from 50 MHz to 10.75 GHz, employing a number of separate antennas.

WEAPONS CONTROL

Mk 63 GFCS
There are two Mk 63 GFCS associated with the two 76 mm gun mounts, which are a combination of the Mk 51 sight and an SPG-34 radar (see below).

SONAR

AN/SQS 29
The sonar is one of the AN/SQS-29/-31 series. All are similar, being hull-mounted, active search and attack sonars, operating at high frequency. The design was based on the SQS-4 Mod 1, but with a passive search capability.

Specifications
Frequency: 8 kHz
Pulse length: 2, 7, 30, or 120 ms
Nominal range: 6,900 m (7,500 yd)

RADARS

Set	AN/SPS-40	AN/SPS-10	TM 1226	AN/SPG-34 (two)
Company	Lockheed	Raytheon	Racal-Decca	Western Electric
Role	Surface search	Surface search	Navigation	Mk 63 GFCS (guns)
Band	E/F	G	I	I
Beam	11 × 19°	1.5 × 16°	1.2°	2.5°
Peak power	200 kW	500 kW	25 kW	50 kW
Gain	21 dB	30 dB	30dB	36 dB
Pulsewidth	60 µs	0.25/1.3 µs	0.05/0.25/1 µs	0.3 µs pps
PRF	300 pps	625-650 pps		1,800 pps
Scan rate	7.5/15 rpm	15 rpm	28 rpm	28 rpm
Range	175 n miles (320 km)			

AVIATION

AVIATION FACILITIES

There is no hangar. The flight deck will accommodate an Agusta-Bell AB 212ASW

Specifications
Flight deck: 13.6 × 11.8 m (44 × 38 ft)
Helicopter: There are landing/take-off facilities only.

PROPULSION

Specifications
System: Diesel
Main machinery: 4 Fiat-Tosi Type 3-016-RSS diesels; 17.7 MW (24000 hp(m))
Shaft: 1

FURTHER INFORMATION

PROGRAMME

These were the first major warships to be designed and built in Turkey. Two were ordered and built between 1967 and 1975.

DESIGN

The design was based on that of the US Navy's 'Claud Jones' (now the Indonesian 'Samadikun' class). However, the hull design was altered slightly and the Turkish ships have a more powerful and better balanced armament.

The Turkish ships are powered by four Fiat-Tosi diesels driving a single screw, compared to the American ships' four Fairbanks-Morse diesels driving two propellers. As a result, the Turkish ships have a top speed of 25 knots, compared to 21.5 knots for the 'Claud Jones' class.

The Turkish ships also have a flight deck which will accept an Agusta-Bell AB 212ASW, although there is no hangar.

Berk *(D 358) was the first major warship to be built in Turkey. The design was based on that of the US Navy's 'Claud Jones' but with modifications to overcome the deficiencies of that unpopular class* (Selim San)

NAMES

Both ships are named after famous ships of the former Ottoman Navy.

VOSPER THORNYCROFT FAST FRIGATES

OVERVIEW

The British company Vosper (later Vosper Thornycroft) has marketed a series of 'fast frigate' designs and corvettes, which, while not identical, have followed the same general pattern of appearance, design philosophy and weapons systems. Of 25 built, 15 remain in service. They are summarised below:

TABLE I: VOSPER THORNYCROFT FAST FRIGATE DESIGNS

Designation	Customer	Number built	Displacement	Propulsion	Launched	Main weapons	Current status
Mk 1	Ghana	2	500 t	2 × diesel	1963-65	1 × 4 in 1 × 40 mm 1 × Squid	Stricken — 2
Mk 3	Nigeria	2	650 t	2 × diesel	1970-71	2 × 4 in/45 2 × 40 mm 2 × 20 mm	Stricken — 2
Mk 5	Iran	4	1,540 t	2 × GT 2 × diesel	1968-69	1 × SSM 1 × SAM 1 × 114 mm 2 × 35 mm 2 × 30 mm 1 × Limbo	Sunk — 1 Active — 3
Mk 7	Libya	1	1,625 t	2 × GT 2 × diesel	1969	2 × SAM 1 × 114 mm 2 × 40 mm 2 × 35 mm 1 × Limbo	Stricken — 2

Commissioned	1 Mar 1971

SABALAN (73)

Builder	Vickers, Newcastle-upon-Tyne and Barrow-in-Furness, UK
Laid down	10 Dec 1967
Launched	4 Mar 1969
Commissioned	Jun 1972

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

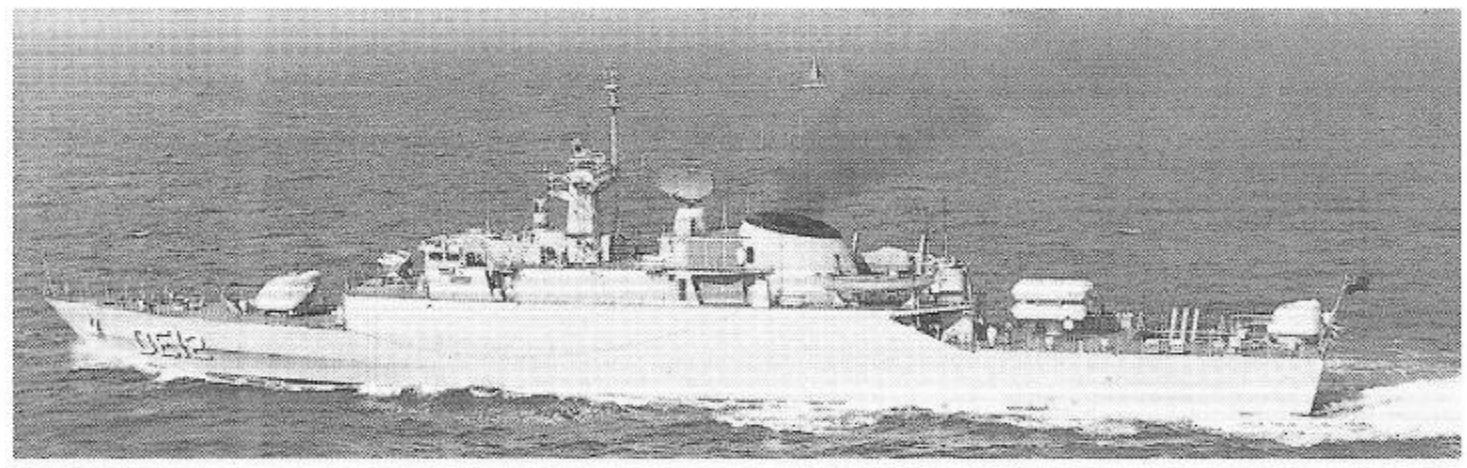
SISTEL Sea Killer Mk 2 missile system

There is one SISTEL Sea Killer Mk 2 SAM/SSM launcher on the afterdeck. This system, which predated Exocet and Harpoon was, for its time, an extremely advanced concept. It comprises three elements:

Sea Killer Mk 2 missile
Mariner launcher system
Sea Hunter 4 fire-control system

The Sea Killer Mk 2 missile is a two-stage Mach 1.9 missile with a rocket booster and rocket sustainer. The launcher system consists of a pedestal and five launcher-containers each with a frangible cover. It weighs approximately 5 tonnes, can traverse 360° at a speed of 30°/s and has an elevation of −15 to +30° at a speed of 20°/s. When a target is acquired and designated by the Sea Hunter 4 system the control console is used to assign weapons by means of an MMI using dedicated push-buttons on the weapon assignment panel. The panel also indicates weapon status and provides an override weapon control facility. For surface engagements the target is assigned to the dedicated console which uses the director search radar to acquire it. The launcher system is slaved to the director and data is provided either from track radar data or from the automatic track-while-scan prediction system.

When the predicted impact point is within the missile's fire range a lamp is illuminated and the missile may then be launched. It is carried clear of the ship by the booster which burns for approximately 1.7 seconds and is then jettisoned. The sustainer is then ignited and at this point the missile is gathered into the search radar beam which provides azimuth control, the tracker monitoring the flight and providing data to the fire-control system. If the missile deviates from the beam, guidance commands can be generated through the command transmitter. Vertical control is provided by the radio altimeter which is controlled from the ship to adjust missile height. In severe radar jamming conditions the missile is tracked by the television camera and it is guided by radio commands.



Vosper Mk 5 frigate as built for Iran as Saam *(DE 12). Following the overthrow of the Shah it became* Alvand *(71). Note the two rows of missile tubes on the Sea Killer missile launcher. The top row has since been removed and replaced by a launcher for BM-21 rockets* (Vosper Thornycroft)

Approximately 120 Sea Killer missiles and four launchers were sold to Iran for the Vosper Mk 5 frigates, the only navy to purchase the system. The system remains in service but is no longer produced and the stock of missiles may have been reduced by 50 per cent through operational use.

Specifications

Length: 4.7 m (15.4 lb)
Diameter: 20.6 cm (8.1 in)
Span: 97.8 cm (38.5 in)
Launch weight: 300 kg (661 lb)
Speed: Mach 0.9
Range: 13.5 n miles (25 km)
Guidance: Inertial and active radar beam riding
Fuze: Impact fuze
Warhead: 70 kg (154 lb) (semi-armour-piercing)

Manufacturer/Contractor

Sistel SpA, Italy.
(This consortium has been dissolved.)

BM-21 rocket launcher

It is reported that the Mariner launcher of the Sea Killer missile system may have been modified to enable it to fire BM-21 rockets in addition to the Sea Killer missiles. The BM-21 is a Russian-designed, free-flight artillery rocket normally used in land battles. It is reasonably accurate (although possibly less so when fired from a naval platform) and has a variety of warheads including chemical.

Specifications

Length: 2.74 m (8.99 ft)
Diameter: 122 mm (4.8 in)
Weight: 45.9 kg (101 lb)
Range: 8.1 n miles (15,000 m)

GUNS

Vickers 114 mm (4.5 in) Mk 8 multipurpose gun

There is one 114 mm (4.5 in) Mk 8 gun in 'A' position. The gun provides quick reaction short-range air defence, engages surface targets including fast attack craft, and provides gunfire support to ground forces. The barrel is 6.22 m (20.40 ft) long, is fitted with a muzzle brake and fume extractor, and has a life of 3,300 rounds EFC. The mounting is completely enclosed in a glass fibre shield which protects it against the environment, blast and shrapnel. The loading system is hydraulically operated, with an autoloader which is manually fed by two loaders and has a capacity of six rounds. The hoist transfers them in two stages to the turret from where they are raised by a pivoting loading arm to the breech where they are inserted by a power rammer. After the shell is fired the case is extracted automatically and ejected through a chute in the front of the mounting.

Alvand *(71) in Gulf waters in 1994. The Seacat SAM launchers have been replaced by Oerlikon 20 mm cannon*

Specifications

Calibre: 113 mm
Length of barrel: 55 calibres
Traverse: 340° at 40°/s
Elevation: −10 to +55° at 40°/s
Muzzle velocity: 868.7 m/s (2,850 ft/s)
Weight of projectile: 21 kg (46.3 lb)
Rate of fire: 25 rds/min
Range:
anti-surface: 11.9 n miles (22 km)
Crew: 4 (gun captain (CIC), loading supervisor, 2 loaders)

Manufacturer/Contractor

Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

Oerlikon 35 mm/90

There is one turret-mounted, twin Oerlikon 35 mm/90 mounting on the stern.

Specifications

Gun
Calibre: 35 mm
Length of barrel: 90 calibres
Muzzle velocity: 1,175 m/s (3,855 ft/s)
Rate of fire: 550 rds/min/barrel
Ammunition: 1.56 kg (3.4 lb)
Range:
anti-surface: 5 km (2.7 n miles)
anti-air: 4,500 m (14,764 ft)

Mounting (GDM-C)
Traverse: 360°
Elevation: −15 to +85°
Training speed: 120°/s
Elevation speed: 100°/s
Crew: 3 (1 gunner; 2 loaders)

Oerlikon GAM-BO1 20 mm/85

Three GAM-BO1 mountings are located one before the bridge and two either side of the after end of the stack. GAM-BO1 uses a swivel fork with the sidewalls having the trunnion bearings. The cradle is made of light alloy and the weapon's working parts are enclosed in a protective case whose top opens to ease maintenance and installation. The sight, shoulder rests and back support strap are all attached to the sight bracket which is adjustable for height. Usually these mountings have an optical ring sight but they can also be fitted with a lead computing sight. The ammunition box with 200 rounds is attached to the front of the mounting and the belt is fed from the right side of the gun, with spent cartridge cases being ejected between the sidewalls of the cradle into a separate compartment, while the links are collected in a bag on the other side of the mounting.

Specifications

KAA gun
Calibre: 85 mm
Muzzle velocity: 1,050-1,150 m/s (3,445-3,773 ft/s)
Effective range:
anti-surface: 1.3 n miles (2.5 km)
fast jets: 1,200 m (3,937 ft)
helicopters: 2,000 m (6,562 ft)
Rate of fire: 900 rds/min
Round weight: 320-345 g
Projectile: 110-125 g

Manufacturer/Contractor

Royal Ordnance, Medium Calibre Gun Division (mounting).
Oerlikon Contraves AG, Defence (cannon).

M2HB 12.7 mm (0.50 in) machine guns

Two M2HB 12.7 mm machine guns are carried and can be mounted on flexible mounts.

Specifications

Calibre: 12.7 mm (0.50 in)
Rate of fire: 450-550 rds/min
Muzzle velocity: 883 m/s (2,900 ft/s)
Max effective range:
anti-surface: 6,700 m (7,400 yd)
anti-air: 1,380 m (4,500 ft)

ANTI-SUBMARINE MORTARS

Anti-Submarine Mortar Mk 10 Limbo

There is one Mk 10 Limbo mortar set in a well in the after deck. It has been suggested that this has been removed but there is photographic evidence that it was still there in 1994. This weapon has three 304.8 mm barrels installed in line on a massive metal mounting with a metadyne system for stabilising it in pitch and roll. The projectiles are loaded automatically from magazines alongside the mounting, the mortar tubes being laid horizontally with a pneumatic system moving rounds down the barrel. Fuze settings are set automatically through relays and uniselectors. The magazine has a capacity of 51 rounds. Training of the mortar is carried out automatically from the combat information centre using data from the ship's sonar system. The Limbo system fires its projectiles in a three-dimensional pattern. The projectiles can be set to explode at various depths using hydrostatic or impact fuzes and are identical to those used in Squid. Limbo has a crew of seven.

Limbo is controlled by the MCS (Mortar Control System) Mk 10. The original system used vacuum-tube technology and during the 1960s systems in British service were updated with new solid-state electronics in the computer and sonar display system. The sonar is the Type 170 with square transducer and a frequency of 15 kHz.

Specifications

Calibre: 304.8 mm (12 in)
Weight: 35 t
Range: 900 m (2,953 ft)
Projectile: 177 kg (390 lb)
Explosive: 94 kg (207 lb)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Decca RDL-2AC

The Decca RDL-2AC is fitted. This is an ESM system designed to detect hostile radar systems and covers the frequency band 1-18 GHz.

Manufacturer/Contractor

Racal-Decca, London, UK.

Racal FH 5-HF/DF

The FH-5 is a communications direction-finding system, recognisable by the masthead cage antenna array.

Manufacturer/Contractor

Racal-Decca, London, UK.

DECOYS

Mk 5 rocket flare launchers

There are two launchers for the British Mk 5 chaff system.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Contraves Sea Hunter 4

The Sea Hunter 4 fire-control system conducts surface and air defence engagements using both missiles and guns. It consists of two I/J-band radars with separate antennas sharing the same four-axis stabilised director, which is mounted at the mastheead. The fire-control system consists of a simple console linked to the Sea Hunter system, where radar data acquired from the directors is combined with data from the AWS 1 air/surface search radar and the Racal-Decca 1226 surface search radar. There is also an optical tracker on the bridge.

Manufacturer/Contractor

Contraves, Switzerland.

SONARS

Graseby Type 174 sonar

The Type 174 is a hull-mounted, medium-frequency, active search sonar, which operates in conjunction with the Type 170 attack sonar.

Manufacturer/Contractor

Graseby Marine (Graseby Dynamics), Luton, UK.

Type 170 sonar

Type 170 is the sonar used to control the Squid ASW mortar. The transducer operates at high frequency (15-25 kHz) and operating limits are about 1,800 m (6,000 ft) in range and about 400 m (1,300 ft) in depth. Accuracy is about 0.5° in bearing and about 5 m (16 ft) in range.

RADARS

Set	AWS-1	Type 1226	Model 629	Sea Hunter 4
Company	Plessey	Racal-Decca	Racal-Decca	Contraves
Role	Air search	Surface search	Navigaion	Fire control
Band	E/F	I	I	H/I
Range	60 n miles (110 km)	48 n miles (81 km)		Search: 24 n miles (45 km) Track: 21.6 n miles (40 km)

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 Rolls-Royce Olympus TM2A gas turbines; 29.8 MW (40,000 hp) sustained; 2 Paxman 16YJCM diesels; 2.83 MW (3,800 hp) sustained

Shafts: 2
Propellers: KaMeWa, five-bladed, cp

FURTHER INFORMATION

PROGRAMME

It was announced on 25 August 1966 that Vosper Ltd, Portsmouth, had received an order for four Mk 5 frigates for the Iranian Navy, two of which were to be built by Vickers. *Sabalan* was towed to Barrow for completion.

DESIGN

The Iranian requirement called for a ship with a primary ASW mission, armed with modern weapons systems and sensors, but with a strong emphasis on speed; indeed, a maximum of 40 knots was demanded — a very high speed for a ship of this size. Vosper's designers were able to work without the constraints imposed by Western governmental departments and produced a ship on time and well within budget.

The hull is constructed of all-welded steel, with transverse frames and longitudinal stiffening to achieve the required strength, while the superstructure is of aluminium, a material whose strengths and weaknesses were very well understood. There is a high freeboard and a knuckle in the bow to keep the foredeck dry. Roll dampers are fitted to ensure that the ship provides a stable firing platform. The sonar dome retracts at high speed. The ships are air conditioned throughout.

The propulsion system is a twin CODOG system, with each of the controllable-pitch propellers being driven by either the gas turbine or the diesel. The propellers are quite small and fast-turning in order to keep the gearbox light in weight and relatively simple. The first of class actually achieved 40.34 knots during trials.

Faramaz *(DE 18) in dry-dock showing the Vosper Thornycroft roll damping fin. This ship became* Sahand *(74) and was later sunk by US Navy forces in the Gulf on 18 April 1988*

NAMES

The ships were delivered with names which subsequently proved unacceptable to the new Iranian Government and the names were changed in 1985:

Original Name	New name
Saam (DE 12)	*Alvand* (71)
Zaal (DE 14)	*Alborz* (72)
Rostam (DE 16)	*Sabalan* (73)
Faramarz (DE 18)	*Sahand* (74)

MODERNISATION

When the ships were being built the Vickers Mk 8 gun was not ready in time to be installed in the first two ships, which were given a 114 mm Mk 5 as a stopgap. This was put right when *Saam* and *Zaal* went to the British naval dockyard at Devonport in 1975 and had a major refit, which included having their Mk 5 guns replaced by Mk 8s. The refit was completed in 1977.

The ships were all modified in 1988, the work including replacing the Seacat SAM launcher with a Russian 23 mm gun. By mid-1991 the 23 mm on both boats had been replaced by GAM-BO1 20 mm guns and the Sea Killer launcher had been modified to launch BM-21 rockets.

DEPLOYMENT

During the Iran-Iraq war there were numerous naval engagements both between the protagonists and the international forces engaged in keeping the sea lanes open. USS *Stark* (FFG) was severely damaged by Iraqi missiles on 17 May 1987 and *Sahand* was sunk by USN on 18 April 1988. *Sabalan* had her back broken by a laser-guided bomb in the same skirmish but was out of dock by the end of 1990 and operational again in late 1991.

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

Short Seacat GWS.22

There are two Short Seacat GWS.22 triple launchers mounted on the hangar roof, with a total of 60 missiles carried. (See 'Modernisation' below).

Specifications
Missile
Length: 1.48 m (4.85 ft)
Diameter: 19 cm (7.4 in)
Wing span: 65 cm (25.5 in)
Weight: 68 kg (150 lb)
Speed: Mach 0.8
Range: 2.7 n miles (5 km)
Radar: Type 904 (see radar table below)

Manufacturer/Contractor
MSI-Defence Systems (formerly Short Brothers plc), Belfast, UK.

ANTI-SHIP MISSILES

Exocet MM 40

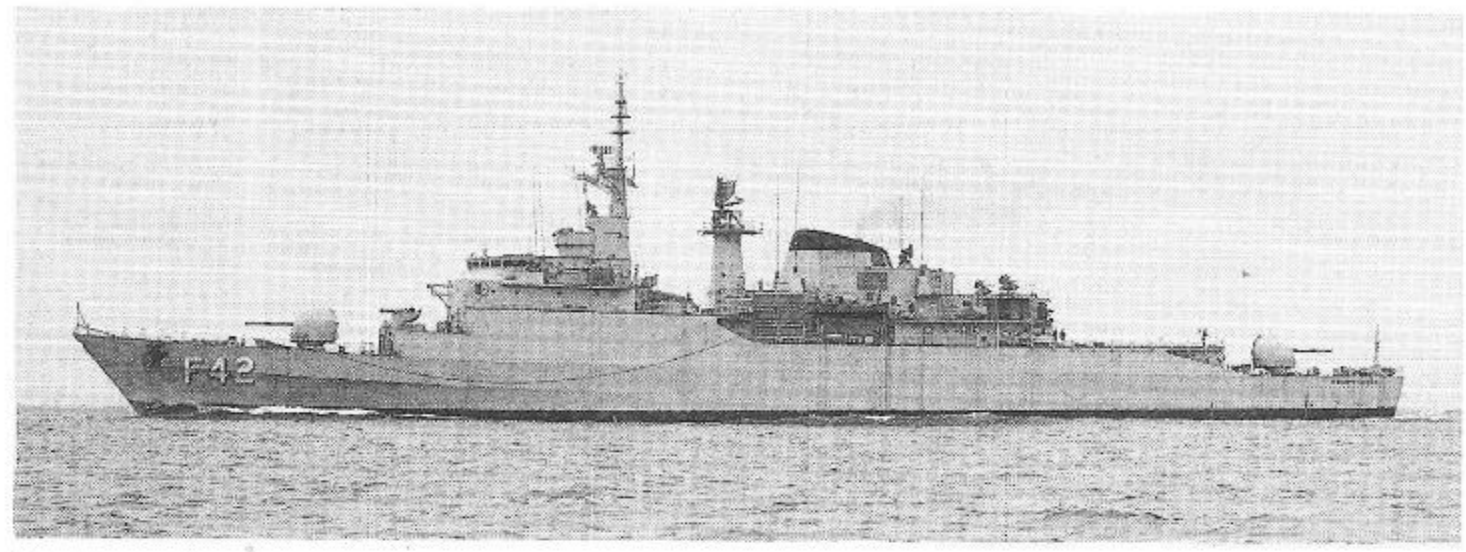
Four MM 40 Exocet anti-ship missile launchers are located immediately abaft the foremast. The launch canisters are mounted in two groups of two facing across the ship at an angle of about 60° to the centreline and at +12° to the horizontal.

There are two versions of MM 40, designated Blocks 1 and 2. Block 2 missiles feature a new J-band (10-20 GHz) seeker with improved ECCM performance, associated electronics and a new guidance computer, although no further details are currently available. The new electronics permit the missile to optimise its sea-skimming height, allowing it to operate in conditions to Sea State 7 even in severe ECM conditions. The fire-control system has also been adapted with the development of the Cat-Visac console which can operate with two types of the Exocet missile simultaneously. The new fire-control system allows improved target selectivity, attacks upon multiple targets by diverging and converging salvos.

Targets for the missiles are acquired by the ship's sensors, and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence which can take up to 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change in the course of its flight. Once the missile has cleared the launcher-container, the sustainer carries it into the cruise phase and it then travels towards the general location of the target at a height of about 100 m (330 ft) which is low enough to reduce the chance of detection but adequate for target acquisition. Once the target is detected the missile descends to 9-15 m (30-50 ft) in the approach phase before descending to 8 m (26.2 ft) (2-5 m (6.5-16.4 ft) in a calm sea) for a sea-skimming terminal phase. A salvo may be fired in 12-20 seconds.

Specifications

	MM 40 Block 1	MM 40 Block 2
Length	5.78 m (19.0 ft)	5.80 m (19.02 ft)
Diameter	35 cm (13.8 in)	35 cm (13.8 in)
Wing span	1.13 m (3.7 ft)	1.13 m (3.7 ft)
Weight	855 kg (1,885 lb)	870 kg (1,918 lb)
Speed	Mach 0.9	Mach 0.9
Range	2-38 n miles (4-70 km)	2-40.5 n miles (4-75 km)
Warhead	165 kg (364 lb) HE frag	155 kg (341 lb) HE frag
Fuze	delay impact/ proximity	impact/proximity
Guidance	Intertial and active radar	



The 'as built' appearance of Constituicos *(F 42), one of the two general purpose variants of the design. There is a single Vickers 114 mm (4.5 in/55 in 'A' and 'Y' positions), and a Bofors 375 mm ASW rocket system in 'B' position. Note also the large flight deck and the Short Seacat launchers on the hangar roof* (Vosper Thornycroft)

Manufacturers/Contractors
Aerospatiale Missiles, Paris Cedex, France (Prime).
Luchaire Défense, Versailles Cedex, France (Warhead).

ANTI-SUBMARINE MISSILES

Branik (Ikara M4 modified) ASW weapon system

Ikara is an unmanned miniature aircraft with a fixed tail, stubby wings and a torpedo payload faired into the underside.

It is powered by a solid propellant, boost/sustainer rocket motor and the guidance system is designed to interface with a full tactical data handling system. Missiles and torpedoes are stored in a magazine and when required are automatically guided along an electrically powered rail system to an assembly room where the wings are fitted and the Ikara is hydraulically lifted onto the trainable launcher which is fixed at a 55° angle.

Ikara is capable of attacking enemy submarines out to the maximum range of the ship's sonar in all weather conditions. Target information from the ship's long-range sonar is fed into a computer which calculates the dropping position, taking into account such factors as ship's own course and speed, wind effect and target movement during time of flight. The outputs from the computer are passed to the missile via the guidance system, a ship-mounted radio/radar system enabling the missile to be tracked and guided accurately to the drop zone where command signals initiate the torpedo release sequence.

The Branik (Brazilian Ikara) is a modified version of the M4 with a revised launcher-computer interface in which the dedicated missile tracking and guidance system is fully integrated with one of the ship's Ferranti FM 1600 B computers. A lightweight, semi-automated missile handling system is also incorporated. Ten Branik missiles are carried. (See 'Modernisation' below).

Specifications
Length: 3.42 m (11.2 ft)
Wing span: 1.52 m (5.0 ft)
Range: 12.93 n miles (24 km)
Speed: Mach 0.8
Guidance: Radio/radar
Payload: 1 Mk 46 torpedo

GUNS

Vickers 114 mm (4.5 in)/55 Mk 8 multipurpose gun

Constituicao (F 42) and *Liberal* (F 43) both have two Vickers 114 mm mountings; one is in 'A' position, the other in 'Y' position. The other four ships have only one 114 mm gun, which is in 'A' position. The 114 mm gun provides quick-reaction short-range air defence, engages surface targets including fast attack craft, and provides gunfire support to ground forces. The weapon system consists of the gun mounting, the ammunition feed system, the remote power control system, and the captain-of-turret panel.

The barrel is 6.22 m (20.4 ft) long, is fitted with a muzzle brake and fume extractor, and has a life of 3,300 rounds EFC. The mounting is completely enclosed in a glass fibre shield which protects it against the environment, blast and shrapnel. The loading system is hydraulically operated, with an autoloader which is manually fed by two loaders and has a capacity of six rounds. The hoist transfers them in two stages to the turret from where they are raised by a pivoting loading arm to the breech where they are inserted by a power rammer. After the shell is fired the case is extracted automatically and ejected through a chute in the front of the mounting.

Specifications
Calibre: 113 mm
Length of barrel: 55 calibres
Traverse: 340° at 40°/s
Elevation: −10 to +55° at 40°/s
Muzzle velocity: 868.7 m/s (2,850 lb)
Weight of projectile: 21 kg (46.3 ft/s)
Rate of fire: 25 rds/min
Range:
anti-surface: 11.9 n miles (22 km)
anti-air: 6,000 m (20,000 ft)
Crew: 4 (gun captain (CIC), loading supervisor, 2 loaders)

Manufacturer/Contractor
Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

Bofors 40 mm L/70

Two single Bofors 40 mm AA guns in open mounts are located either side of the foremast.

Specifications
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000-1,025 m/s (3,280-3,363 ft/s)
Range:
anti-surface: 6.75 n miles (12.5 km)
anti-air (nominal): 6,900 m (22,638 ft)
Rate of fire: 300 rds/min (practical)
Ammunition: 2.21 kg (4.8 lb)

GEC-Marconi STWS-1

There are two STWS-1 324 mm triple launchers, one set on either side of the hangar. STWS-1 (Ship's Torpedo

Defensora (F41)

Weapon System-1) was developed from the US Navy's Mk 32 Mod 5/7 torpedo launcher and is designed to operate with the Mk 44 and Mk 46 lightweight torpedoes and also transistor logic in the presetter/launch controller.

Specifications
Length: 3.65 m (12 ft)
Height: 1.4 m (4.5 ft)
Width: 1.23 m (4.0 ft)
Weight: 1,560 kg (3,439 lb) (unloaded)
Power requirements: 440 V, three phase, 60 Hz; 115 V, single phase, 60 Hz; 28 V DC, 24 V DC ship maintenance supply

Manufacturer/Contractor:
GEC-Marconi Underwater Systems Ltd.

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

ANTI-SUBMARINE MORTARS

Bofors 375 mm Model B2 ASW rocket system

There is a single, twin-tubed ASW rocket launcher in 'B' position, immediately ahead of the bridge. The system consists of a rocket launcher, handling system, the ship sonar and a fire-control system. The launch tubes are mounted on trunnions with an automatic contact device to connect the rockets with the fire-control system. The hydraulic laying machinery is in the front of the mounting and a flame deflector in the rear. Each system features an automatic electrohydraulic handling system. The rounds are stored vertically beneath the mounting and selected by an operator. A grab on a roof-mounted rail picks up the round by the nose and transfers it to the loading table. A hoist brings this through the deck hatch to where the launch tubes have been elevated to their loading position. The rounds are then inserted through the rear of the launch tube. Reload time is approximately 1 minute, each tube being loaded separately. Rockets may be fired singly or in salvo. There are two types of rocket, both with Hexotonal filling. The Type E (Erika) rocket has Stidar time and impact fuzes, while the Type N (Nelli) uses the Zambo proximity and impact fuzes.

Specifications
Launcher
Tubes: 4
Weight: 7,500 kg (16, 534 lb)
Traverse: 260°
Elevation: −15 to +90°
Traverse speed: 18°/s
Elevation speed: 18°/s
Crew: 4

Rockets

	Type E	Type N
Weight	250 kg (551 lb)	230 kg (507 lb)
Muzzle velocity	130 m/s (426 ft/s)	205 m/s (676 ft/s)
Explosive weight	107 kg (236 lb)	80 kg (176 lb)
Range	0.35/0.87 n miles (0.65/1.63 km)	0.85/2.11 n miles (1.58/3.62 km)
Final sinking speed	10.7 m/s (35 ft/s)	9.2 m/s (30 ft/s)
Automatic loading range	1,600 m (5,249 ft)	

Manufacturer/Contractor
Bofors Ordnance, Sweden.

DEPTH CHARGES

Constituicao (F 42) and *Liberal* (F 43) only. One depth-charge rail can be fitted, if required. The rail can carry five charges at a time.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

(The EW suite is in the process of change in advance of the modernisation programme — see 'Modernisation' below. Ships may, therefore, have a combination of the following.)

Cutlass B1 ESM system

Cutlass B1 is designed for operation in very dense signal environments, receiving signals in the 1 to 18 GHz frequency range, measuring their parameters, comparing these with those in the radar library which contains the parameters of 2,000 radars, and displaying the information — all within one second. The EW operator is presented with a tabular display for threat identity and threat evaluation, and a tactical display giving a pictorial representation of the RF environment. Selected digital outputs can be sent to other local systems, and hard copy printout of the intercepted radar is also available. The tabular display can indicate 150 intercepts, in the order of priority. Cutlass is wide open in both bearing and frequency: that is, it does not employ sweep techniques, giving a very high intercept probability (nearly 100 per cent). Cutlass B1 uses the Cutlass processor and an Instantaneous Frequency Measurement (IFM) receiver. It has a 32-element array antenna to provide bearing measurement by phase analysis techniques. This antenna also provides RF for the IFM. In both systems the processor is provided with fast and accurate information on incoming pulses.

Specifications
Frequency coverage: 2-18 GHz
Accuracy: 2° RMS in bearing
Coverage: 360° azimuth; +40 to −10° elevation
Pulse density capability: 500,000/s
Radar store capability: 2,000 modes

Manufacturer/Contractor
Racal Radar Defence Systems Ltd, Chessington, Surrey, UK.

Racal Cygnus B1 jammer

The Cygnus radar jammer operates in the I- or J-bands and was designed for integration with Cutlass ESM equipment. Cygnus uses both responsive noise and deception jamming to provide an effective jamming capability against all types of radar including early warning, target acquisition and missile guidance. It has a narrow beamwidth giving high effective radiated power (300 kW) and is kept on target by a built-in, interferometer type, passive tracking system in both azimuth and elevation. The tracking system may also be used to relay accurate position data to systems of other ships. RF received by the tracking antennas is also used as the basis of transmitted RF and modulation and power management is under the control of a processor which also controls the tracking procedure. Types of modulation sequence available include range gate pull off and false target generation.

Manufacturer/Contractor
Racal Radar Defence Systems Ltd, Chessington, Surrey, UK.

IPqM EW suite

The aim appears to be to outfit all ships in due course with EW equipment that has been designed by the Brazilian Instituto de Pesquisas da Marinas (IPqM) and built in Brazil. Information on this equipment is sparse but it appears to include equipment designated SDR-2 and SDR-7.

DECOYS

Plessey Shield Tactical Decoy System

There are two launchers, each with six parallel barrels, for the Plessey Shield system, sited on either beam, just forward of the mast. Shield is a microprocessor-controlled, fully automatic missile decoy system, which is designed to provide effective protection for various sizes of ship, including fast attack craft, corvettes, frigates and destroyers. On detecting a threat, Shield selects the most appropriate response from up to six million scenarios held in its EPROM memory, using data obtained from onboard sensors such as radar and ESM and then automatically deploys the pattern of decoys that will give the highest probability of success. GEC-Marconi chaff rockets are fitted with a variable fuze which allows the chaff to be dispersed at optimum positions along the trajectory. To counter threats with a dual-mode capability, both chaff and infra-red decoys can be deployed automatically. Shield offers four protection modes — confusion; distraction; seduction/breaklock; and seduction dump — and uses two types of decoy, chaff and infra-red, which may be used on their own, or in combination with each other. (See also 'Modernisation' below.)

Manufacturer/Contractor
GEC-Marconi Naval Systems, Addlestone, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

CAAIS 400 tactical picture compilation system

CAAIS 400 (Computer Assisted Action Information System) is a British system which evolved in the 1960s during development of ADAWS and is in service in a variety of RN ships as Outfit DBA. The first export customer was Brazil which bought CAAIS 400 for the 'Niteroi' class frigates.

CAAIS 400 is a mainframe system using the FM1600B computer and Coral 66 software language. The hardware includes a three-cabinet digital suite which houses a 24-bit computer, operating at 200 Kips and with a 780 k memory, as well as a datalink terminal. In addition there are peripheral control units which include radar extraction units, encoder/decoders, display drive unit and the MMI control units. The last two elements support the display system which, in the CAAIS 400 series, can include up to six CA 1600 horizontal displays.

The search radars have two methods of tracking, LAX (Limited Area automatic eXtraction) and LFX (Limited output Full area automatic eXtraction), either of which involves tracking up to 20 air and surface targets. LAX exploits the capabilities of E/F- and I/J-band radars to produce a combined tracking capability but it is normally used in conjunction with surface search radars. Tracks are initiated manually and the area around the target is highlighted. Where several targets overlap this limits the data rate of position extraction. LFX is similar but is usually used with air search radars and initially merely indicates the presence of such targets. Location data is not automatically provided to the computer until the operator requests it to form a track.

Manual rate-aided tracking is also available in severe clutter or ECM conditions. Automatic tracking may also be transferred by manual order from one radar to another as well as between manual and LAX. The displays may also accept inputs from ESM and optical/electro-optical systems.

Data from up to three sonars may be accepted by a CAAIS system with data fed to the computer semi-automatically by means of synchro-resolvers at the sonar operator's controls. Initially they are displayed as unassociated points which are 'rippled' in time sequence to assess the tactical position. When a submarine is believed to be in the area an automatic investigation is initiated by the operator around its suspected location. The computer then checks records to see if a track can be initiated and monitored by the sonars. There is provision for the 'rippled' display of up to 16 unassociated points, 32 associated detections shared by up to four tracks.

The datalink in the Brazilian CAAIS 400 system is Link YB (see below).

Manufacturer/contractor

Ferranti Naval Systems, UK.

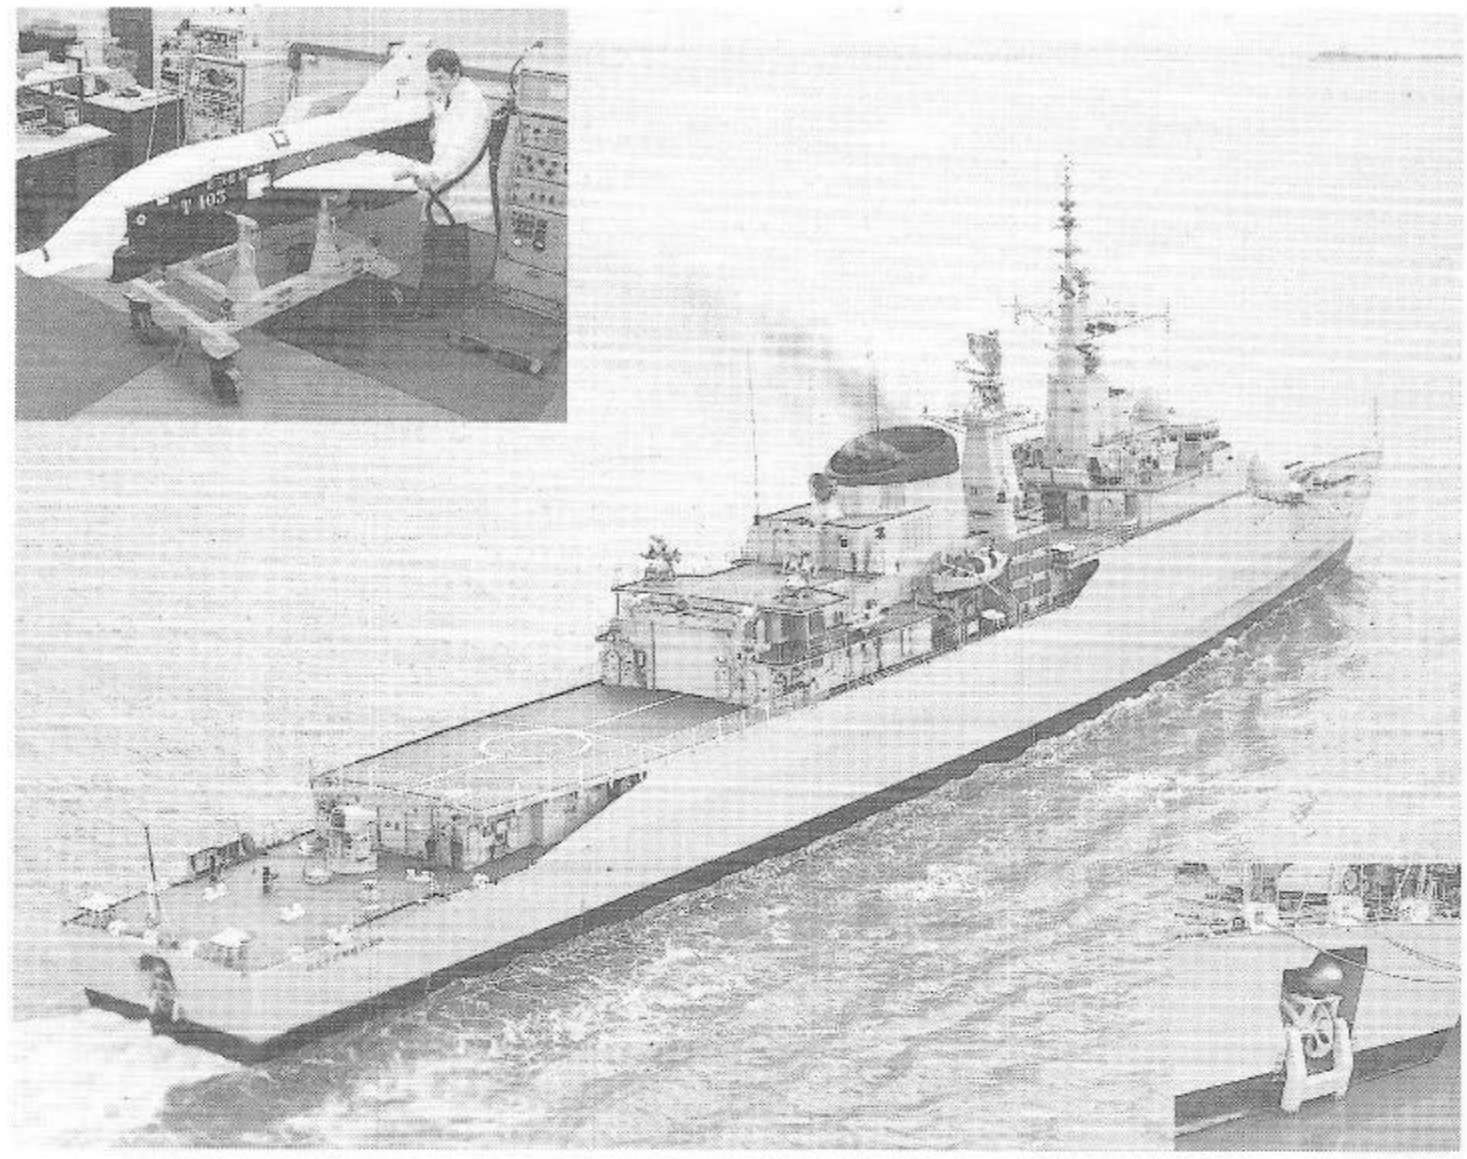
Link YB

Link Y is a datalink for non-NATO navies, originally developed by Ferranti, but with equipment now being marketed also by Signaal. It uses the same equipment as NATO Link 10, but with different programming of the message structure. Link Y enables track data, management data, status reports and commands to be exchanged between a maximum of 31 shipborne, airborne and land-based participating units (PUs). Transmissions are made using a Time Division Multiple Access (TDMA) protocol in which the Net Control Station automatically allocates slots to each PU, depending on the amount of data to be transmitted.

Link Y operates in a serial mode, in which each PU uses its allocated time slot for transmission, receiving in all other slots. PUs can also operate in a receive only mode. Link Y Mk 1 operates at a transmission speed of 300-1200 bits/s, while Signaal's Link Y Mk 2 works at 4,800 bps. The link occupies about 3 kHz of bandwidth and uses either HF ground wave or UHF line of sight, including satellite links.

Different versions have been developed for specific customers, the versions being identified by a single letter suffix. Egyptian vessels, for example, are known to use Link YE, while the Brazilian Navy uses Link YB.

IFF: Mk 10



Defensora *(F 41), an ASW variant, in 'as built' condition, with an inset close-up (bottom right) of the EDO 700E variable depth sonar. The Branik launcher is on the quarterdeck and a close-up of the missile is at the top left* (Vosper Thornycroft)

SONARS

EDO Model CWE-610E hull-mounted active sonar system

The CWE-610E low-frequency (LF) sonar is installed in all six ships. CWE-610E is designed for the long-range detection of submarines in deep and shallow water. There is a 36 stave transducer in a dome under the hull and two active consoles, enabling it to perform a search-while-track function. Facilities offered include a search capability in three 120° sectors, passive correlation, and reverberation processing. Transmissions are at 6, 7 and 8 kHz and use 10° preformed receiver beams. Range of the active system is approximately 30,000 m and there is a passive display for greater ranges. The sonar system outputs data automatically into SEWACO-V. All mode changes and range scale changes are controlled by console push-buttons, and displays include a Doppler display on each of the active consoles and a passive sonar bearing time recorder display.

Manufacturers/Contractors

EDO Corporation, Government Systems Division, College Point, New York, USA.

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

EDO Model 701E variable depth sonar

The Model 701E VDS is installed in *Constituicao* (F 42) and *Liberal* (F 43) only. The 701E is a VDS designed specifically to work with the CWE-610E. There 'fish' contains a 24 stave transducer 4.95 m (16.2 ft) in diameter and 7.87 m (25.8 ft) high, and operating at a frequency of approximately 13 kHz.

Manufacturers/Contractors

EDO Corporation, Government Systems Division, College Point, New York.

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

AVIATION

AVIATION FACILITIES

Specifications
Flight deck: 24.0 × 13.5 m (79 × 44 ft)

HELICOPTERS

One Westland SuperLynx SAH-11

Specifications
Dimensions:
main rotor diameter: 12.80 m (42.00 ft)
tail rotor diameter: 2.21 m (7.25 ft)
length overall (rotors turning): 15.165 m (49.75 ft)
Weights:
empty: 2,740 kg (6,040 lb)
empty, equipped (ASW): 3,343 kg (7,370 lb)
Performance:
cruising speed: 125 kts (232 km/h; 144 mph)
speed for max endurance: 70 kts (130 km/h)
max rate of climb: 661 m (2,170 ft)/min
time on station (ASW): 50 n miles (93 km) radius: 2 h
max range: 320 n miles (593 km)
max endurance: 2 hour 50 minutes
Power plant: 2 Rolls-Royce Gem 41-1 with max contingency rating of 835 kW (1,120 shp)
Crew: 2 (pilot and co-pilot/observer)
Radar: GEC-Marconi ARI5979 Seaspray Mk 3 lightweight search and tracking radar
Mission: CAE Electronics AN/ASQ-504(V) internal MAD
EW: Racal Kestrel EW suite; Racal MIR 2 ESM
ASW role: 2 Mk 44 or Mk 46 torpedoes, or depth bombs
Anti-ship: 4 BAe Sea Skua missiles

PROPULSION

Specifications
System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 Rolls-Royce Olympus TM3B gas turbines; 37.9 MW (50,880 hp) sustained; 4 MTU 16V 956 TB91 diesels; 11 MW (15,000 hp(m)) sustained
Shafts: 2
Propellers: cp
Auxiliary power: 3 MTU 956TB61 diesel alternator sets

FURTHER INFORMATION

PROGRAMME

The Brazilian naval staff drew up a requirement in the late 1960s for an ocean escort ship with a long range, sustained high speed for convoy duties and a higher boost speed for attacks, broad ASW and anti-surface capabilities, and a close in air defence system. Specifications were drawn up with the assistance of US consultants Gibbs & Cox, following which an international design competition was run. The winner was British company Vosper Thornycroft with a modified version of its Mk 10 frigate and the contract for detailed design and construction of six frigates was signed on 29 September 1970 between the Brazilian Government and the company. The contract called for four ships to be built in the UK, with the last two ships being built in Brazil, where materials, equipment and lead-yard services would be provided by Vosper Thornycroft.

It was originally intended that there should be six identical ships, but the development of ASW helicopters led to a decision to complete two as 'general purpose' designs and the other four as ASW ships.

A seventh ship, to a considerably modified design, was constructed in Brazil. *Brasil* (U 27) was commissioned in 1986 and is a purpose-built training ship, serving both the naval and merchant marine academies. The heaviest weapons are two Bofors 40 mm and the ship has no known combat role.

DESIGN

The Mk 10 has the general appearance of the Vosper Thornycroft frigates of the 1960s and 1970s, with a sharply raked stem (which did not indicate the presence of a bow-mounted sonar below), a knuckle forward, and flare carried right aft to the broad transom. Following the practice of the time the superstructure was fabricated from aluminium primarily in order to reduce stability problems resulting from the combination of increased topweight and reduced machinery weights. Seaworthiness and steadiness is enhanced by twin non-retractable fin stabilisers.

The weapons fit required by the Brazilian Navy was heavy for the time and for the size of hull and included:

One Vickers 114 mm (4.5 in) gun in the ASW version and two in the GP version (at a time when the UK Royal Navy was ceasing to fit such guns at all)
Four Exocet anti-ship missile launchers
Two Short Seacat SAM launchers
Bofors twin 375 mm ASW rocket launcher
A Branik ASW missile launcher (a version of the Australian Ikara, developed specifically for the Brazilian Navy)
Two triple ASW torpedo launchers
One Westland Super Lynx ASW helicopter

MODERNISATION

In the late 1980s the Brazilian Navy decided on a major update for the 'Niteroi' class, which are generally in good condition, especially the hulls and CODOG propulsion system, but need more modern weapons and sensors. The requirement was issued in 1991 and in 1993 it was announced that Italian company AESN (Alenia Elsag Sistemi Navali) had won the competition, with Brazilian company ESCA responsible for modernising and integrating the command system. The contract was eventually finalised in March 1995 and the work will take place between October 1997 and December 2000.

In essence, the modernisation programme will enhance the AAW capabilities of the ships, update the command, ESM and other electronic systems, and greatly reduce the current differences between the 'GP' and 'ASW' versions of the class. It will also increase commonality with the navy's 'Inhauma' class. In more detail:

A new SAM system will be installed, consisting of Aspide missiles and an Albatros launcher. This will be located on the afterdeck and will involve deleting the Branik ASW launcher in the current ASW version and the after 114 mm gun in the GP version. The two Seacat launchers on the hangar roof will be deleted in all ships.

The new SAM will require a new fire-control system, which will be provided by the RTN-30X, which will replace the RTN-10X in its present position immediately aft of the stack.

The new Alenia RAN-20S 2D, E-band (2-3 GHz) radar will replace the Plessey AWS-2. RAN-20S has a roll-and-pitch-stabilised 4.5 m planar array and a solid-state transmitter, and is reported to be capable of detecting a fighter-sized target at more than 60 n miles with a range accuracy of 20 m and an angular accuracy of 0.3°.

The Kelvin Hughes Type 1007 navigation radar will replace the Signaal ZW-06.

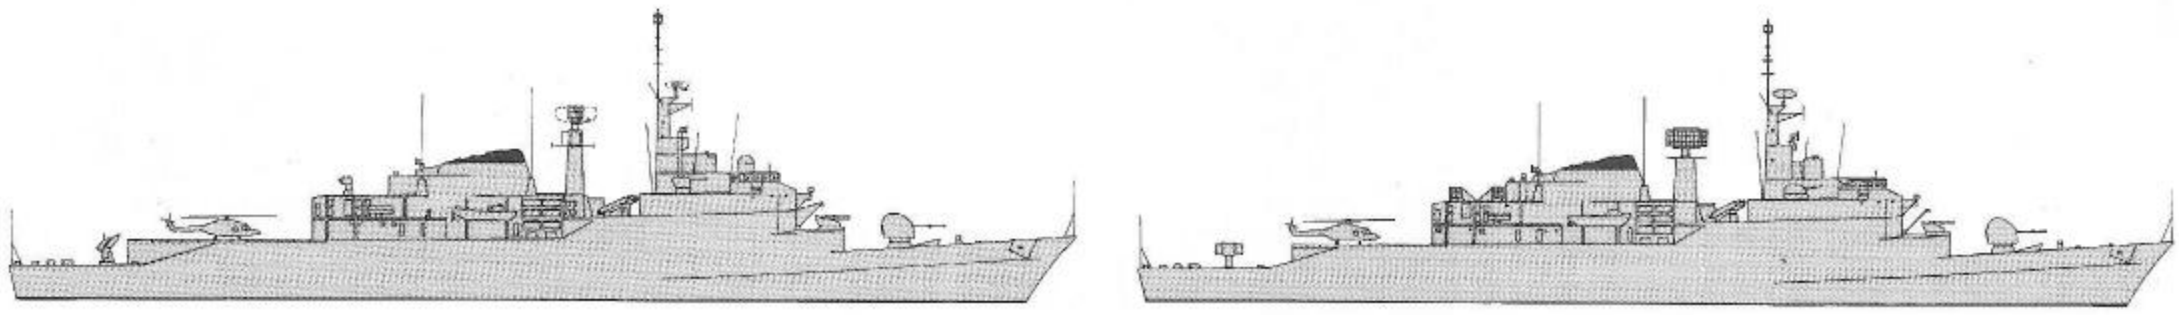
The two 40 mm guns will be upgraded to Bofors 40 mm L/70 standard, with a 10 per cent increase in the rate of fire, an improved ammunition feed system and substantial improvements in elevation and training.

ESM improvements include Plessey Shield countermeasures and Racal Cutlass ESM equipment (as fitted in the 'Inhauma' class), but may also include some equipment currently under development by the Brazilian Instituto de Pesquisas da Marinas (IPqM).

A new command system will be installed. This is being developed by IPqM and will almost certainly be either the same as (or very similar to) the SICONTA-2 (SICONTA = Sistema Controle Tactico) recently installed in the aircraft carrier *Minas Gerais*.

Although officially part of the Niteroi upgrade, the navy's SAH-11 Lynx helicopters are currently undergoing an upgrade to Super Lynx standard, which will, again, enhance the capabilities of these ships.

Reports that new engines and sonars might be fitted have been denied.



Niteroi class as built (left) and as it will appear after modification (right)

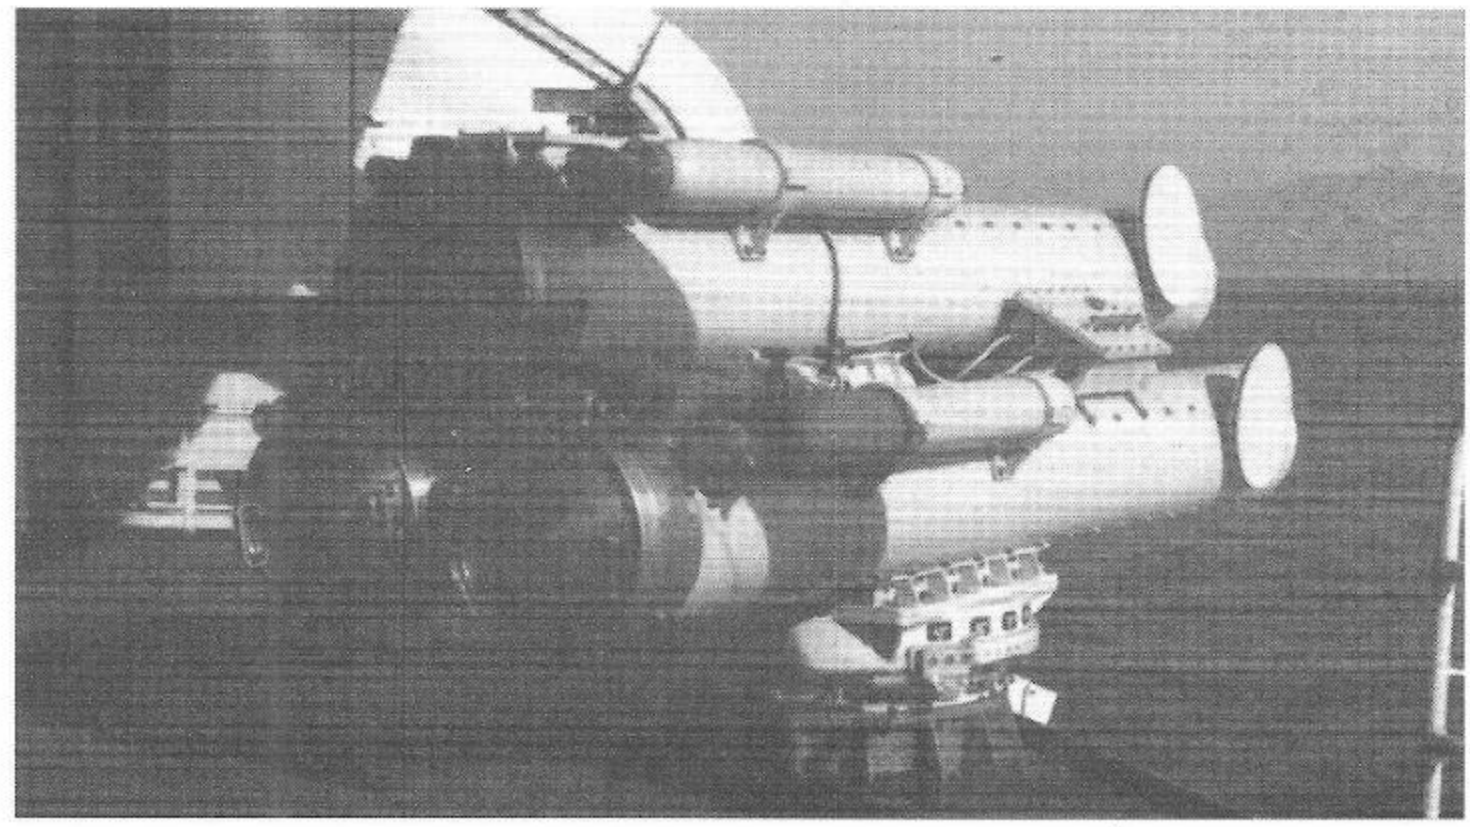
WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 40 medium-range anti-ship missile

Eight MM 40 Exocet launchers in two groups of four are mounted immediately abaft the foremast, firing across the ship.

Specifications
MM 40 Block 2
Length: 5.80 m (19.0 ft)
Diameter: 35 cm (14 in)
Wing span: 1.13 m (3.7 ft)
Weight: 870 kg (1,918 lb)
Speed: Mach 0.9
Range: 2-40.5 n miles (4-75 km)
Warhead: 155 kg (342 lb)HE frag
Fuze: Impact/proximity
Guidance: Inertial and active radar



Whitehead B515 anti-submarine torpedo system consisting of three 324 mm tubes, with one set on each beam (Whitehead)

SURFACE-TO-AIR MISSILES (SAM)

Seawolf (GWS.26) close area defence and anti-missile system

There are 16 launch tubes for Seawolf GWS.26 Mod 1 immediately before the bridge. The GWS.26 system consists of an air/search radar, two trackers, the missile subsystem and the command subsystem, which uses a Ferranti FM1600E processor. The Seawolf VL missile is identical internally to earlier models and is 3.3 m (10.8 ft) long, 60 cm (23.6 in) diameter in a sealed launcher-container. The canister, which has its own efflux management system, is then loaded into a missile silo. The canisters are grouped into eight-cell modules with a missile firing unit and efflux ducting system.

Specifications
Seawolf VL
Length: 3 m (9.84 ft)
Diameter: 18 cm (7.0 in)
Wing span: 70 cm (27.5 in)
Weight: 140 kg (309 lb) (Seawolf VL)
Speed: Mach 2.5
Range: 3.2 n miles (6 km) (Seawolf VL)
Guidance: CLOS
Warhead: Royal Ordnance 14 kg (31 lb) fragmentation high explosive
Fuze: Thorn EMI impact-proximity

Manufacturer/Contractor
BAe Defence Ltd, Dynamics Division.

TORPEDOES

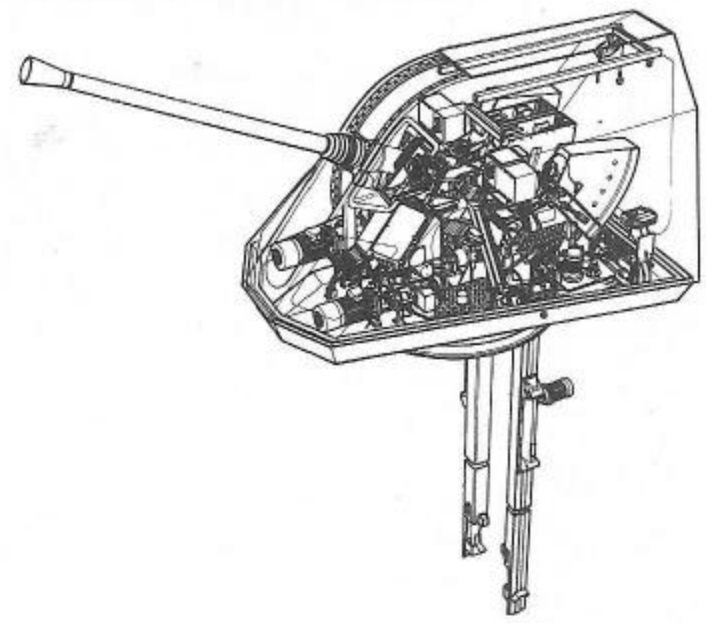
Whitehead B515 anti-submarine torpedo launching system
The B515 system consists of two triple 324 mm diameter torpedo tubes mounted on the open deck, with one installation on each side of the ship. The tubes are manually loaded and trained but remotely operated from the combat information centre, although emergency local operation is possible.

Specifications
Length: 3.4 m (11.0 ft)
Height: 1.2 m (3.9 ft)
Width: 1.285 m (4.2 ft)
Weight: 1,050 kg (2,315 lb) (unloaded)

Manufacturer/Contractor
Whitehead, Salviano, Italy.

A244/S lightweight anti-submarine weapon
The torpedo used by the 'Lekiu' class frigates is the Whitehead A244/S with an Alenia CIACIO-S seeker, which is capable of active, passive or mixed modes for closing on to its target. It can also discriminate between decoys and real targets in the presence of heavy reverberations by specially emitted pulses and signal processing. The seeker also discriminates between target noise and reverberations, as well as having a series preset of programmable search patterns and tactical manoeuvres (including re-attack procedures). The seeker has a large search volume covered by multiple preformed beams following a number of self-adaptive search patterns and is reported capable of target detection at −5 dB in good acoustic conditions. The computerised homing system also provides for presettable combinations of signal processing, spatial filtering and tactical torpedo manoeuvring. The software may be reprogrammed by the customer to meet new tactical conditions. Upon launching, the A244/S initially steers a straight course and, if the target is not detected, it then begins a search pattern which may be either a spiral between preselected depths or a helix pattern.

Specifications
Length: 2.7 m (8.9 ft)
Diameter: 324 mm (12.75 in)
Weight: 215 kg (474 lb) (warshot version)
Warhead: 34 kg (75 lb) shaped charge HBX-3 HE
Propulsion: Electric; silver/zinc batteries
Range: 3.5 n miles (6 km)
Speed: 30 kts



Cutaway of the Bofors SAK 57 Mk 2 system (Bofors)

Guidance: Active/passive sonar, self-adaptive programmed patterns

Manufacturer/Contractor
Whitehead, Salviano, Italy.

GUNS

Bofors SAK 57 L/70 Mk 2
There is a single Bofors SAK 57 L/70 Mk 2 in 'A' position. This is intended to engage air and surface targets and to provide gunfire in support of troops ashore. It is housed inside a 'stealthy' shield.

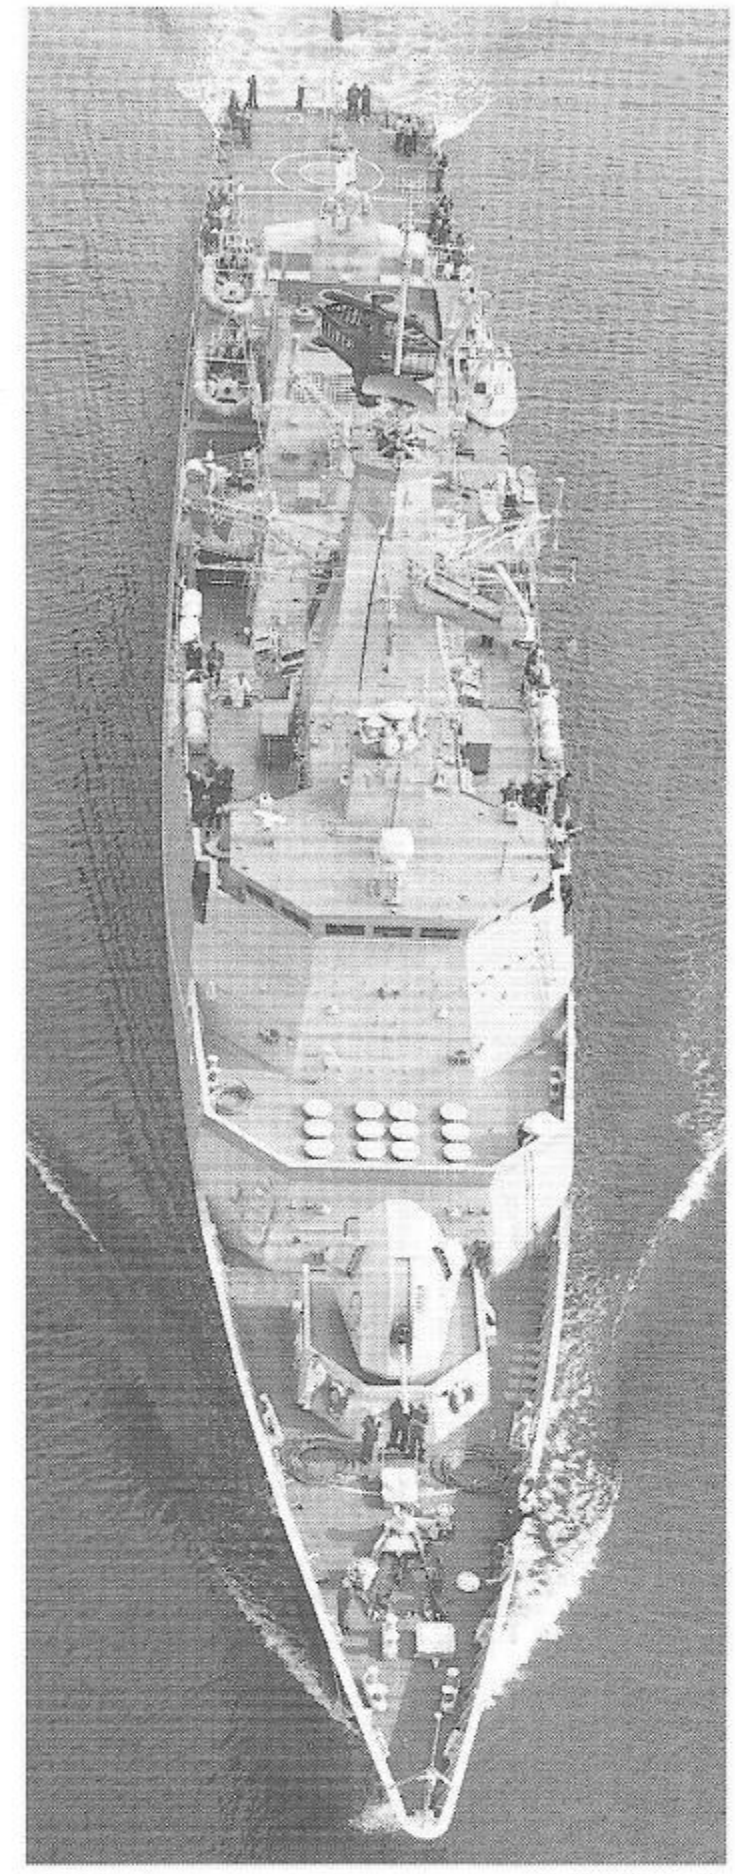
Specifications
Calibre: 57 mm (2.2 in)
Length of barrel: 70 calibres
Traverse: 360° at 55°/s
Elevation: −10 to +77° at 40°/s
Crew: 3
Range: 9 n miles (17 km)
Rate of fire: 220 rds/min
Projectile weight: 2.4 kg (5.3 lb)

Manufacturer/Contractor
Bofors, Karlskroga, Sweden.

MSI DS 30B 30 mm gun mounting
There are two single 30 mm gun mountings either side of the radar tower immediately before the stack. The weapon itself is an Oerlikon KCB 30 mm cannon, which is positively locked and gas operated, with a belt-feed mechanism fixed to the cradle. The left-hand feed KCB-B02 is used in the DS 30B mounting.

The weapon includes a muzzle brake, axial recoil buffer and mechanical ignition system. The KCB normally fires in automatic mode only but in the DS 30B a single shot capability has been included.

The mounting is a locally controlled, power-driven and line of sight stabilised unit designed to allow a variety of sensor and weapon packages to be fitted. The pedestal contains the stabilisation and training machinery and the open gunner's position is on the right of the mounting with the 160-round magazine on the left. The mounting incorporates alloys to reduce magnetic signature and has clean lines to meet NBC washdown requirements. An integral battery pack provides up to 10 minutes of operation in the event of ship power failure.



Lekiu *(30). On the foredeck is the Bofors SAK 57, a gun that is becoming widely used. In 'B' position are 16 vertical launch tubes for VL Seawolf, giving the ship a good self-defence capability* (Yarrow)

Specifications
Mounting (DS 30B)
Traverse: 230° (operational)
Elevation: −25 to +70°
Traverse speed: 55°/s
Elevation speed: 55°/s
Crew: 1

Gun (KCB)
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Rate of fire: 650 rds/min
Ammunition weight: 870 g

Manufacturer/Contractor
MSI Defence Systems, Norwich, Norfolk, UK.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

GEC-Marconi Mentor 2
Mentor systems are designed around a 32-bit signal processor with software written in Ada and can operate in either automatic or manual modes. The displays show raw and synthetic formats on a dynamic cartesian display, using colour coding to differentiate between friendly, neutral, unknown or hostile emitters. Details of new emitters are shown in tabular form, while areas of particular interest can be expanded for detailed viewing. The simultaneous tracking capability is 200 emitters. Mentor 2 provides immediate warning of missile attacks, with radars being detected, analysed and full information displayed in less than 1 second, with both audible and visual warnings given. Mentor 2 also triggers the deployment of offboard countermeasures.

Specifications
Mentor 2
Frequency range: D-J
Bearing accuracy: 3-6°
Channels: 6
Sensitivity: −60 dBm
Dynamic range: 60 dB
Emitter library: 3,000
Response time: 1 s
Scan types: Circular, sector, steady, conscan, raster, complex
Track file: >200
Pulsewidth range: <100 ns to 100 µs/CW
PRF range: 100-130 kHz
Elevation coverage: −10 to +50°
Azimuth coverage: 360°

Loading a Sea Siren launcher

Super Barricade system

Manufacturer/Contractor
GEC-Marconi Defence Systems, Stanmore, Middlesex, UK.

Thorn EMI Scimitar ECM system
Scimitar is a descendant of a system developed by MEL; others are Signaal's Reprogrammable Advanced Multimode Shipborne ECM System (RAMSES) and the Canadian SLQ-503. Scimitar is a modular naval electronic countermeasures system designed to provide protection against radar threats. It is an integrated responsive jammer capable of long-range jamming of search radars and the deception of missiles once launched. In its normal mode of operation, Scimitar is controlled by the Mentor 2 system, so that a dedicated ECM operator is not therefore required. In the back-up mode, Scimitar can be manually controlled (target designation and jamming) from the remote-control panel located near the EW operator.

Scimitar operates in I/J-band and is capable of high pulse and CW Effective Radiated Power (ERP). Multimode jamming operation is possible with multitarget handling capability. There are two antennas in small 'egg-shaped' radomes on each side of the ship, at the end of the yard-arms. The two Scimitar antennas are vertically separated with the receive antenna uppermost. On receiving orders from Mentor, the Scimitar receiver trains towards the designated threat, searches for it and then locks onto it, whereupon the system automatically triggers a programmed response. With two separate systems, two targets can be handled simultaneously but, in addition to this, jamming sequences for the next targets can be set up, so that as soon as one target has been dealt with the next can be tackled.

Manufacturer/Contractor
Thorn EMI, UK.

DECOYS

ML Aviation Super Barricade countermeasures system
There are two Super Barricade launchers either side of the hangar. Super Barricade is an improved version of the widely used Barricade system and provides ships with means of deploying chaff and infra-red (IR) decoys to counter missile attacks, using a layered defence against the various types of anti-ship missile. The system uses a 102 mm rocket and a redesigned launcher with four sets of triple-cell launchers. The system has a similar control unit to Barricade Mk III and the same tactical computer. The ammunition lockers each contain 24 rockets. There are four decoy modes:

- Confusion, in which long-range (Stockade) rockets are fired to confuse enemy search radar and make target selection difficult
- Distraction, in which medium-range chaff and/or infra-red rockets are fired in a pattern of six around the ship to present alternative targets to missiles during their search phase, affording defence against multiple missiles coming from different directions
- Dump is used where a missile has locked on to the ship. The ship uses a jammer to remove the missile's range gate and then fires a single rocket to produce a chaff cloud on which the gate may be 'dumped', thus allowing the jammer to be redeployed.
- Centroid is a close-range, final defence mode, used against single missiles. If the incoming missile is locked on to the ship, a pattern of short-range chaff and/or IR rockets is fired to create a large alternative target close to the ship, which manoeuvres away, leaving the missile to home on to the decoy.

Månufacturer/Contractor
ML Wallop Defence Systems, Andover, Hampshire, UK.

Sea Siren decoy system
Sea Siren is a towed torpedo decoy system developed from the G 738, which produces a realistic noise signature of the ship to decoy passive homing torpedoes, and generates sonar-like echoes to confuse active-homing torpedoes. User-programmable parameters are employed to ensure total confidentiality and the decoy can be updated easily to counter the latest threats. Easy deployment and handling is ensured using a davit or gantry system. One or two decoys can be used and can be controlled remotely from any position in the ship over a serial datalink.

Specifications
Acoustic/operational data
Active decoy signal (CW)
Sweep frequency bands: Up to five programmable sweep frequency bands are provided to cover a wide range of torpedo sonar frequencies
Sweep rate: User-programmable
Chopped CW: On/off chopping periods programmable by the user
Output modes: CW only; noise only; CW and noise simultaneously; CW and noise alternately
Passive decoy signal
Noise bandwidth: Pseudo-random noise spectrum band to cover a wide range of passive torpedo sonar frequencies
Modulation: Choice of modulation envelope shape and programmable modulation depth
Modulation frequency: Dependent on rpm and number of propeller blades
Chopped noise: On/off chopping period programmable by the user

Manufacturer/Contractor
Graseby Marine (Graseby Dynamics Ltd), Watford, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

NAUTIS-F command and weapon control system

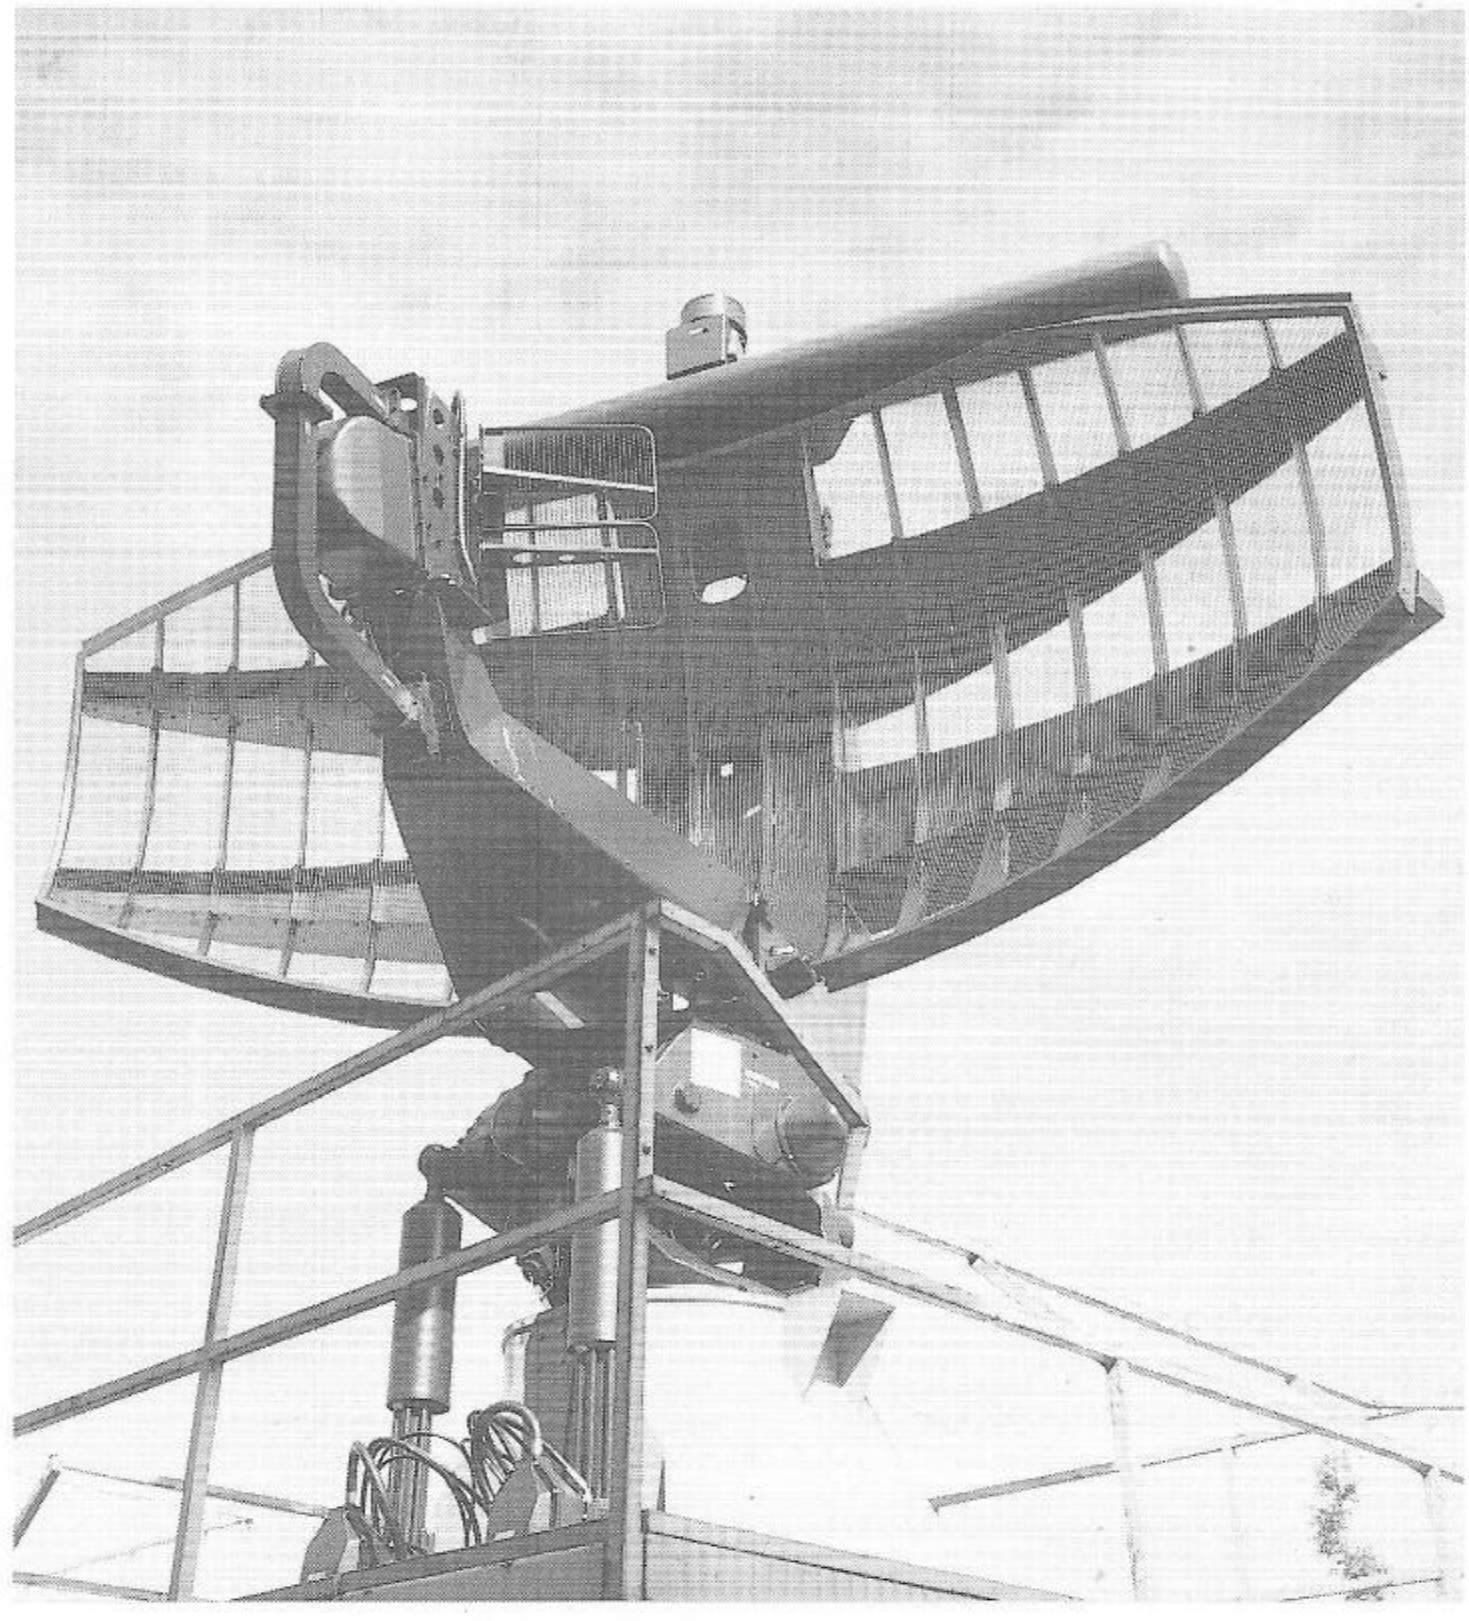
NAUTIS-F (Naval AUTonomous Information System - Frigate) is a command and weapon control system, which, as installed in the Malaysian ships, uses five NAUTIC (Naval AUTonomous Intelligent Console) multifunction intelligent workstations. NAUTICs are based upon Intel iAPX-86 processors with 3 Mbyte RAM together with 2 Mbyte non-volatile magnetic bubble memory. Dual iAPX-286 microprocessors are used in Multibus configurates, while iAPX-186 microprocessors are used for intelligent interfaces. Each NAUTIC uses 150,000 lines of Ada-language software code. NAUTIC consoles are linked by a dual-redundant MIL-STD-1553B data highway.

An extensive system database is replicated in each console, and typically covers an area 2,000 × 2,000 n miles square (3,704 × 3,704 km). It includes radar and sonar tracks, route/search plans, user-designated tactical maps and synthetic charts. System capacity is 200 air, surface and submarine tracks and reference points with integral radar auto-tracking for up to 80 air and surface targets. The database can also include up to six user-designated tactical maps, 15 synthetic charts, 200 labelled reference points, 5,000 fully detailed underwater contacts and 32 labelled bearing lines. Manually initiated automatic radar tracking is possible for a minimum of 20 tracks.

Workstations accept various combinations of digital, synchro and analogue input/output for the whole range of sensors and weapons and interface options, including point-to-point, the data highway or a general purpose combat system highway. They also interface with optional elements, such as chart tables, plotter/printers and magnetic tape units, through point-to-point interfaces or the data highway. The NAUTICs are networked into a system designed to meet customer requirements with the workstations configured to meet specific tasks such as radar displays, automatic target tracking, tactical picture compilation, weapon direction and navigation.

Manufacturer/Contractor

GEC-Marconi Naval Systems, Combat Systems Division.



Signaal DA-08 air search radar (Signaal)

RADARS

Type	DA-08	Sea Giraffe 150 HC	1802 (two)	—

COMMUNICATIONS AND DATALINKS

Link YM

The Malaysian Navy purchased Link YM, which was developed in the UK by Ferranti as a digital link suitable for sale to non-NATO countries for naval and aircraft use. Different users have versions tailored to their own needs; Link YB, for example, is exclusive to the Brazilian Navy and Link YM to the Malaysian Navy. Link Y, generally, uses a standard message format of two 24-bit words and a transmission speed of 300-1,200 bits/s.

WEAPONS CONTROL

Radamec Series 2000 electro-optic director

There is a Radamec Series 2000 electro-optic director on the bridge roof. This is an electro-optical surveillance system with a stabilised, remotely operated, director. It has a full sector auto-scan facility and is used for target identification. It may be integrated with display systems of the customer's choice. Sensors include the HK 203 low-light TV cameras and a thermal imager. The HK 203 can detect a 10 m² target at 4 km, while the thermal imager can detect such a target at 13-18 km.

Manufacturer/Contractor

Radamec Defence Systems, Chertsey, Surrey, UK.

SONAR

TSM 2633 hull-mounted sonar

TSM 2633 is the hull-mounted version of the Spherion VDS and is a long-range active sonar for ASW surface combatants. It comprises a spherical hull-mounted array with an electronic processing system that allows for real-time computation in transmission and reception modes; three-dimensional stabilisation to compensate for pitch, roll and yaw in the parent vessel; and a beam-tilting capability to counter adverse sound velocity profiles and strong reverberation.

Specifications

Acoustic array: Spherical with 160 individual transducers
Frequency: 7 kHz (approx)
Transmitter: Omnidirectional and sectoral transmissions in CW and FM modes, various modes including TRDT
Receiver: 36 preformed beams stabilised in azimuth and elevation; advanced processing with replica correlator in FM and spectrum analysis (FFT) in CW
Video processing: Data processing in FM and CW modes: automatic detection and tracking; simultaneous multitrack extraction (up to 64); target analysis (apparent length, Doppler measurement)
Display: High-resolution, flicker-free colour TV monitors
Total weight: 4,000 kg (8,820 lb)

Manufacturer/Contractor

Thomson Sintra Activités Sous-Marines, Sophia Antipolis Cedex, France.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 22.8 × 12.8 m (75 × 42 ft)

HELICOPTERS

The Malaysian Navy's current shipboard helicopter is the Westland Wasp HAS. Mk 1, but it is actively seeking a replacement.

Wasp HAS. Mk 1

Specifications

Dimensions
Main rotor
diameter: 9.83 m (32.25 ft)
Tail rotor
diameter: 2.29 m (7.5 ft)
Fuselage length: 9.24 m (30.33 ft)
Height to top of rotor hub: 2.72 m (8.92 ft)
Weights:
empty: 1,566 kg (3,452 lb)
max take-off: 2,495 kg (5,500 lb)

Performance:
max level speed (sea level): 104 kts (193 km/h)
economic cruising speed: 96 kts (177 km/h)
max range: 263 n miles (488 km)
Power plant: 1—710 ehp (derated) Rolls-Royce/Bristol Nimbus 503 turboshaft
Avionics: PTR 170 and PV 141 UHF and UHF homing radio, and standby UHF
Weapons: 2 Mk 44 or 1 Mk 46 torpedoes, or 2 AS.12 anti-ship missiles

PROPULSION

Specifications

System: Combined diesel and diesel (CODAD)
Main machinery: 4 MTU 20V 1163 TB93 diesels; 24.5 MW (33,300 hp(m)) sustained

Shafts: 2
Propellers: KaMeWa cp

FURTHER INFORMATION

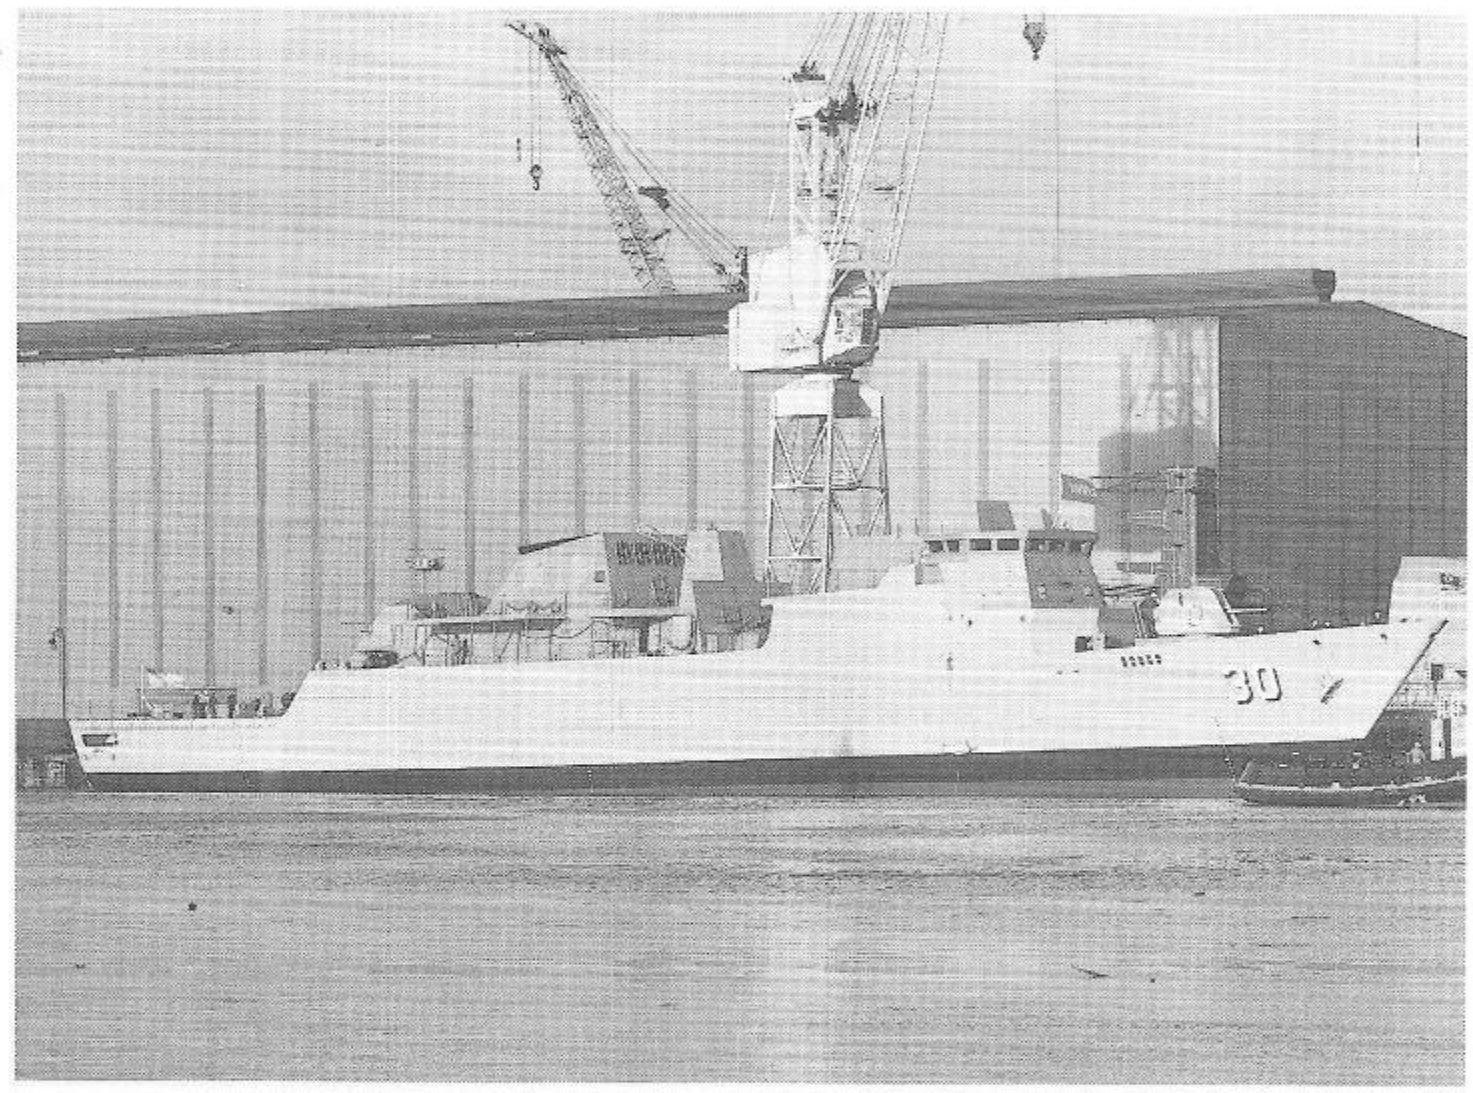
PROGRAMME

The Malaysian Navy originally sought an 80 m (262.5 ft) corvette and started negotiations with Yarrow in the late 1980s for two such ships. The ship design eventually expanded into a frigate-size vessel and a contract was announced on 31 March 1992 for two ships to the Yarrow 'Frigate 2000' design at a cost of £400 million. First steel was cut in March 1993 and the ships were launched on 3 December 1994 *(Lekiu)* and May 1995 *(Jabat)*.

Pennant numbers
The first to be launched and into service was *Lekiu,* which should, therefore, have had the lower pennant number. However, for naval reasons it was desired that *Jabat* should be the 'senior' ship and, therefore, given the lower pennant number (29). Despite that, the class name remains the 'Lekiu' class.

DESIGN

The ship is the GEC Naval Systems Frigate 2000 design with minor alterations to meet Malaysian requirements. Despite its relatively modest size, it has a substantial armament, including Seawolf missiles, a 57 mm gun, eight Exocet MM 40 missiles, two 30 mm cannon and an ASW helicopter. It also has a modern combat data system and automated machinery control.



Lekiu *(30) fitting out* (Yarrow)

Lekiu *(30) at sea on builder's trials* (Yarrow)

Laid down Feb 1966
Launched 18 Dec 1967
Commissioned 31 Aug 1971

WEAPONS SYSTEMS

ANTI-SUBMARINE MORTARS

Anti-Submarine Mortar Mk 10 Limbo

There is one Mk 10 Limbo mortar set in a well in the after deck. This weapon has three 304.8 mm (12 in) barrels installed in line on a massive metal mounting with a metadyne system for stabilising it in pitch and roll. The projectiles are loaded automatically from magazines alongside the mounting, the mortar tubes being laid horizontally with a pneumatic system moving rounds down the barrel. Fuze settings are set automatically through relays and uniselectors. The magazine has a capacity of 51 rounds. Training of the mortar is carried out automatically from the combat information centre using data from the ship's sonar system. The Limbo system fires its projectiles in a three-dimensional pattern. The projectiles can be set to explode at various depths using hydrostatic or impact fuzes and are identical to those used in Squid. Limbo has a crew of seven.

Limbo is controlled by the MCS (Mortar Control System) Mk 10. The original system used vacuum-tube technology and, during the 1960s, systems in British service were updated with new solid-state electronics in the computer and sonar display system. The sonar is the Type 170 with square transducer and a frequency of 15 kHz.

Specifications

Calibre: 304.8 mm (12 in)
Weight: 35 t
Range: 900 m (2,953 ft)
Projectile: 177 kg (390 lb)
Explosive: 94 kg (207 lb)

GUNS

Vickers 114 mm (4.5 in) Mk 5 semi-automatic gun

Rahmat has a single Vickers 114 mm (4.5 in) QF Mk V gun forward in 'A' position. The barrel has neither muzzle brake nor fume extractor and is 45 calibres long with 32 grooves (1 in 25 twist) and a life of approximately 750 EFC (Equivalent Full Charges). There is a hydraulically operated vertical sliding breech block and the gun fires separate ammunition. The recoil and run-out cylinders are incorporated in the breech ring so that the total weight of the weapon is 3,368 kg (7,426 lb). The turret is manually operated. There are 103 mm rocket launchers for illuminants on each side of the mounting.

Specifications

Mk V gun
Calibre: 114 mm
Length of barrel: 45 calibres
Muzzle velocity: 746 m/s (2,448 ft/s)
Weight of round: 25.5 kg (56 lb) (projectile only)
Range:
anti-surface: 9.3 n miles (17 km)
anti-air: 12,500 m (41,000 ft)
Rate of fire: 14 rds/min (Mk V gun)
Max elevation: 50°

Manufacturer/Contractor

Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

Bofors 40 mm/60 Mk 9

There are three single Bofors 40 mm/60 Mk 9 mounts: two are in the waist just forward of the stack, the third on the roof of the after deckhouse.

Specifications

Traverse: 360° (nominal) at 90°/s
Elevation: −3 to +85° at 60°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Max range:
anti-surface: 6.5 n miles (12 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

UA-3 radar warning

A UA-3 radar warning receiver is fitted, covering 2.5 to 11.5 GHz.

FH-4 HF D/F

FH-4 is a 1960s-vintage British communications direction-finding equipment. It employs the 'birdcage' antenna at the head of the mast.

DECOYS

Mk I rail chaff launchers

There are two British Mk 1 chaff launchers.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Signaal SEWACO-MA

Rahmat has a Signaal DAISY (Digital Action Information SYstem) C^2 system which is integrated with the various radars and fire-control systems to form the SEWACO-MA (SEnsor Weapon control And COmmand - Malaysia) system. The DAISY system is designed to present raw and/or processed sensor data from search and fire-control radars together with IFF, sonar, electronic warfare and electro-optic systems to create a picture of the tactical situation. The onboard data is supplemented by data from offboard sensors which are brought to the ship via the Link Y tactical datalink. The data may also be used to designate targets to weapon systems and to assist in operations with auxiliary functions such as ASW helicopter direction and tactical navigation.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

COMMUNICATION AND DATALINKS

Link YM

The Malaysian Navy purchased Link YM, which was developed in the UK by Ferranti as a digital link suitable for sale to non-NATO countries for naval and aircraft use. Different users have versions tailored to their own needs; Link YB, for example, is exclusive to the Brazilian Navy and Link YM to the Malaysian Navy. Link Y, generally, uses a standard message format of two 24-bit words and a transmission speed of 300-1,200 bits/s.

RADARS

Set	LW-02	626	MS 32	M 22
Company	HSA	Decca	Kelvin Hughes	Signaal
Role	Air search	Surface search	Navigation	Fire control
Band	D	I	I	I/J
Beam	2.2 × csc² to 40°			Search: 1.5 × 7° Track: 2.4°
Peak power	500 kW			180 kW
Gain	31 dB			33.5 dB
Pulsewidth	2/5 µs			0.22/0.45 µs
PRF	500/250 pps			3,600/1,800 pps

Typical ranges	100 n miles (185 km) for 2 m² target at 18,000 m (59,000 ft)			

SONARS

Type 170B sonar

Type 170B is the sonar used to control the Squid ASW mortar. Operating frequency is 15-25 kHz and the system has a maximum operating range of about 1,800 m (2,000 yd) and a maximum depth of about 350 m (1,200 ft)

Type 174

The hull-mounted Type 174 is a 1950s-vintage active search sonar operating at 14-22 kHz, which operates in conjunction with the Type 170B (see above).

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 14 × 10 m (48 × 34 ft). The Limbo Mk 10 mortar is in the centre of the flight deck and is covered over, using a special hatch, prior to flying operations

Hangar: There is no hangar or other aviation facility

HELICOPTERS

If used for flying, *Rahmat* could embark one of the navy's current Westland Wasp HAS. Mk 1.

PROPULSION

System: Combined diesel or gas turbine (CODOG)

Main machinery: 1 Rolls-Royce (Bristol Siddeley) Olympus TM1B gas-turbine; 15.4 MW (20,626 hp); 1 Crossley Pielstick PC2.2 V diesel; 2.94 MW (4,000 hp)

Shafts: 2

Propellers: 2 Stone/KaMeWa cp

FURTHER INFORMATION

PROGRAMME

Rahmat was ordered on 11 February 1966 and was the first major unit to be designed and built for the (then) young Malaysian Navy. The ship was launched on 18 December 1967 and arrived in Malaysian waters on 23 December 1972.

NAMES

Rahmat was originally to have been named *Hang Jabat* after a legendary Malay hero, but this was changed to *Rahmat* before launch.

DESIGN

This ship was built to the 'Yarrow Mk 1 frigate' design for a general purpose, long-range warship with high endurance and high maximum speed. Payload is 150 tonnes of weapons and ammunition, which was higher than any other contemporary frigate at the time it was built.

The hull form has a fairly narrow beam, water-compensated fuel tanks are used, and the high freeboard and form result in a positive stability range. The ship has two spade-type rudders and non-retractable fin stabilisers.

PROPULSION AND POWER

The propulsion system was, for the time, quite unusual, as it was designed as a two-shafted CODOG installation in which the two driving elements were not used together. This required a combining gearbox enabling only one prime mover to drive both shafts. Both shafts are, therefore, permanently locked together and always revolving at the same speed, with thrust being varied by controllable pitch propellers. The engines are one Rolls-Royce Olympus in the forward engine room and one Paxman diesel in the after engine room, both using the same standard diesel fuel.

Rahmat *(24) was one of a series of frigates designed and constructed by Yarrow of Glasgow. Although it has been in service since 1971 the Royal Malaysian Navy plans to modernise it and extend its service into the 21st century*

Electrical power is supplied by four Paxman Ventura diesel engines, with three engines in one room aft and the fourth forward and above the waterline for survivability reasons. The whole ship load can be carried by any combination of two generators.

MODERNISATION

As built, the ship was armed with a Seacat SAM system, but this was removed during a major refit in 1982-83 and replaced by an additional Bofors gun. A fourth Bofors has been seen on a temporary mounting on the forward part of the flight deck.

There are plans for further modernisation.

THE FUTURE

The ship is now fairly old and the weapons and sensor systems dated. Nevertheless, the ship is in good condition and has proved successful in service, and continues to play a valuable role in helping the Malaysian Navy to meet its heavy commitments.

LEANDER

OVERVIEW

First of class, Leander *(F 109), was completed in 1963. The raised forecastle and the considerable freeboard gave excellent sea-keeping abilities, but the armament was relatively light, consisting of twin 114 mm (4.5 in) guns, two 40 mm Bofors and a Limbo ASW mortar* (Jane's)

During the 1950s the British produced no less than six classes of escort ships using four different hulls and it was then decided to combine the best characteristics of all these designs in a new, single, general purpose frigate. The result was the very successful 'Leander' class, of which a grand total of 44 were built in four countries, and, as of 1 January 1997, 24 remain in front-line service with seven navies (Table 1).

Basic design

The original Leander was armed with a single Mk 6 mounting with twin 114 mm (4.5 in) guns in 'A' position, two single Bofors 40 mm and one Mk 10 Limbo ASW mortar, which was located in a well at the after end of the flight deck. The flight deck and hangar were designed to operate a Westland Wasp helicopter. Compared to the previous 'Rothesay' class, the Leander hull had the forecastle extended aft and a superstructure deck. The ship was powered by the Y100 steam plant and was fitted with twin rudders, which combined to give it exceptional acceleration and manoeuvrability. As built, the 44 Leanders were divided into five versions.

UK

Two slightly different designs were built for the RN, with sixteen of the first version, outlined previously. These were followed by a second group of ten, known as the 'Broad Beam Leander,' because the hull was widened by 0.61 m (2 ft) to create extra space for future developments. The extra beam also increased both endurance and stability, but at the cost of a reduction of 0.5 knots in maximum speed.

Netherlands

In the mid-1960s the Dutch Navy needed to replace its six ex-US Navy 'Cannon' class destroyer escorts ('Van Amstel' class) and it was decided to adopt the Leander design. The Dutch ships retained the basic British design, but used Dutch equipment wherever this was both feasible and would not delay construction. The Dutch ships also had a broader enclosed bridge and two (as opposed to one) Seacat launchers.

India

The Indian Leanders were constructed between 1966 and 1981, and the first to be built was virtually identical with the British original, although, since the Indian Navy's standard Alouette III helicopter is longer than the British Wasp, a telescopic hangar was required. The last two were completed with a modified flight deck and hangar to enable them to accommodate a Sea King helicopter.

Australia

Australia intended to build six 'Yarra' class frigates between 1957 and 1964, which were improved versions of the British 'Rothesay' class frigates. However, the last two were cancelled in 1956 and there was then a nine year gap until a new order could be placed for the two additional frigates. These were produced to a design which represented a combination of the 'Yarra' class with many of the features of the British Leander, but without the hangar and flight deck. Nevertheless, these two ships are normally accounted as being 'Leander' class ships.

Chile

The Chilean Navy ordered two Leanders, which were built in the UK, being laid down in 1971 and delivered in

Jupiter *(F 60) was the third in the second series of ships known as the 'Broad Beam Leanders'. These had 0.61 m (2.0 ft) wider hulls, giving increased endurance, stability and internal volume*

TABLE I: BRITISH 'LEANDER' CLASS

A. ORIGINAL LEANDERS

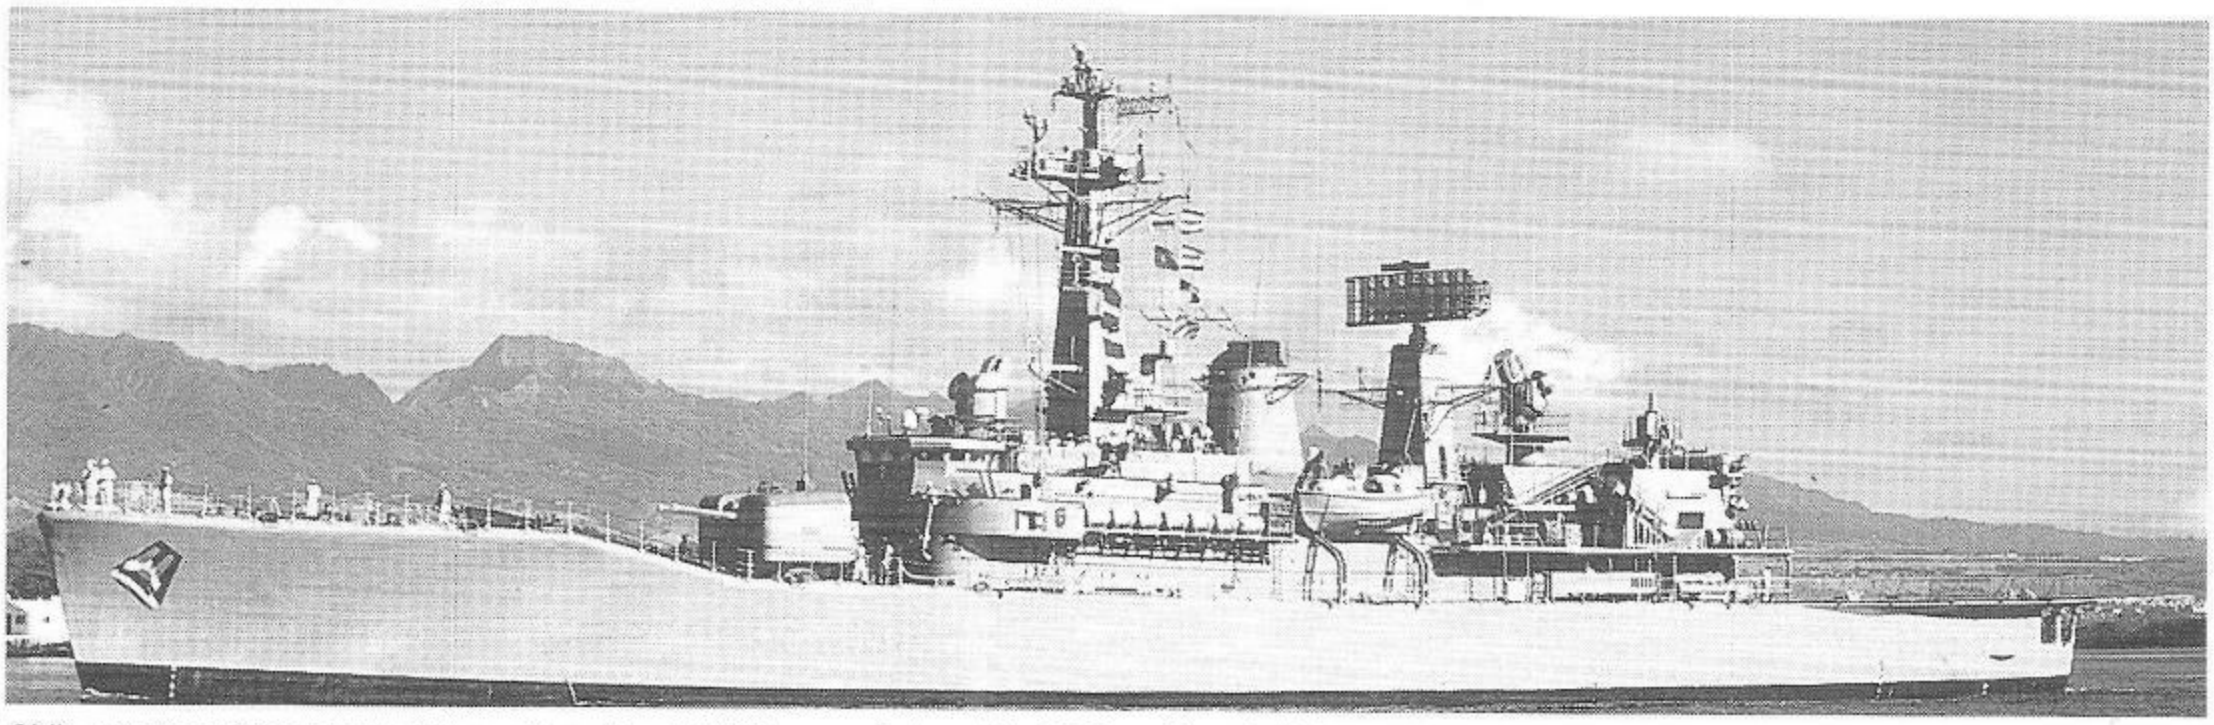
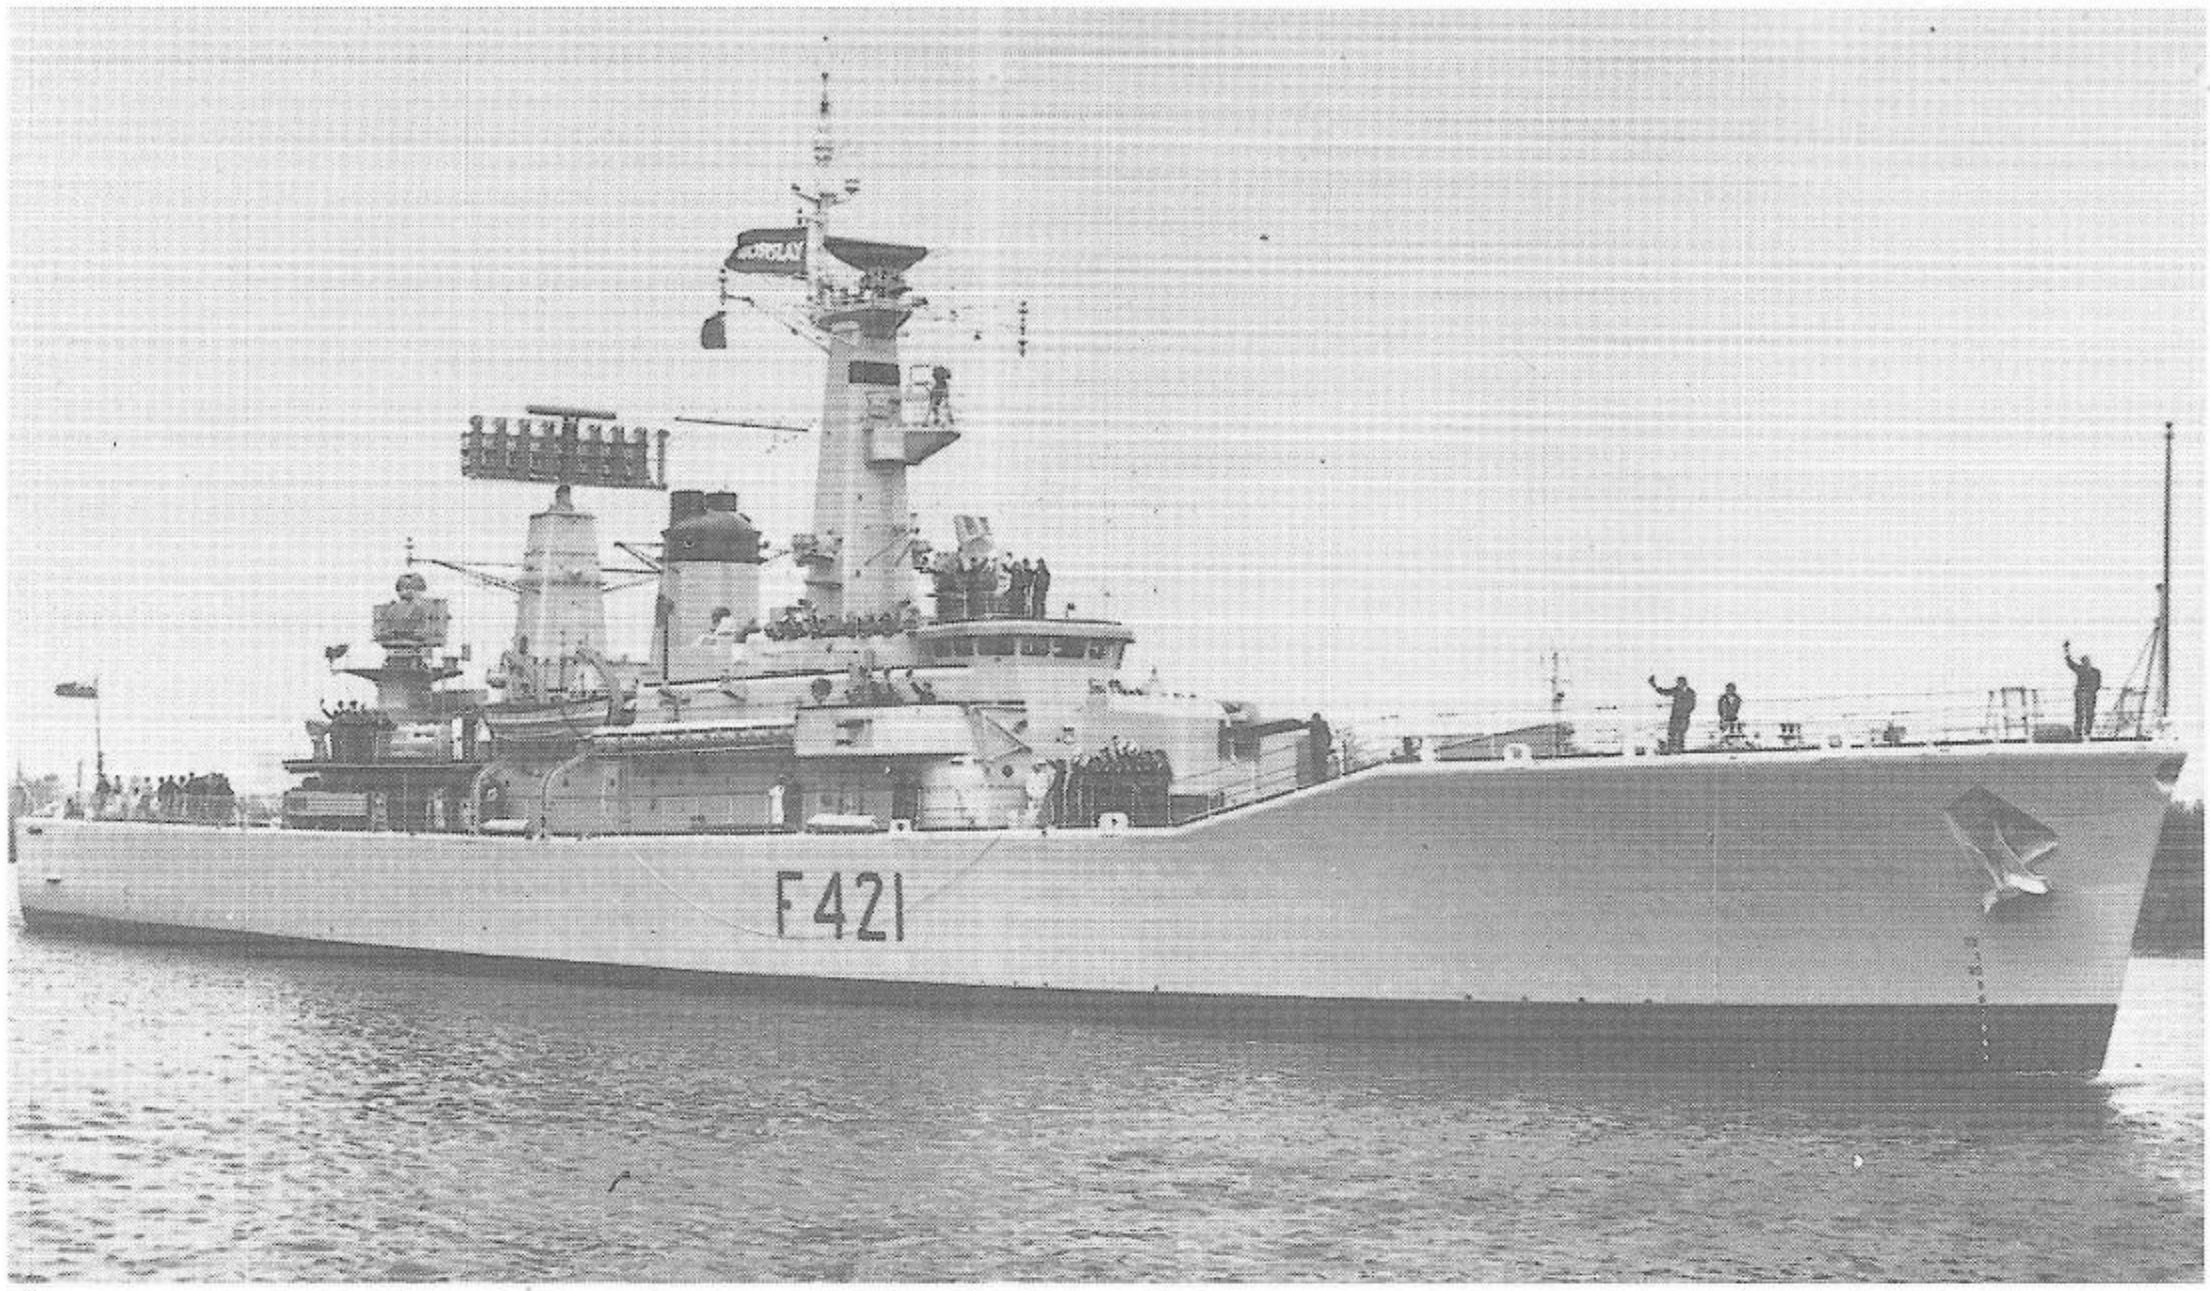
10	*Ariadne* (F 72)	Note 2	1973	Sold — 1992	Chile	*General Baquedano* (09)	

Notes

1. *Juno* was scheduled for conversion in the Batch 2 (Exocet) programme, but this was cancelled.
2. The conversion of these Broad Beam ships to Seawolf configuration was cancelled.



Chile purchased two new-build Leanders: Condell *(06) commissioned in 1973 and* Lynch *(07) - seen here - which was commissioned in 1974. After 22 years continuous front-line service and several major rebuilds, both ships are still in excellent condition. Chile also bought two ex-UK Royal Navy Leanders in 1990 and 1992* (H & L van Ginderen Collection)



Another overseas customer was New Zealand, which bought two new-build ships. The second was Canterbury *(F 421), a 'Broad Beam Leander'* (Yarrow)

1973-74. These were generally similar to the original RN Leanders, but with taller foremasts.

New Zealand

The Royal New Zealand Navy (RNZN) initially ordered one 'Leander' class frigate in 1963, which was to the original British design, and was delivered in 1966 (*Waikato* (F 55). The order for the second ship was not placed until 1968 by which time UK production had moved on to the 'Broad Beam Leander' and *Canterbury* (F 148) was delivered to this design in 1961.

Mid-life Conversions for British 'Leanders'

The original 16 Leanders were divided into two separate groups for the major development programmes, which were known as Batches 1 and 2. In the event only 15 ships were converted, since *Juno* (F 52), which was originally intended to receive a Batch 2 conversion, had it cancelled on financial grounds. As a result, *Juno* was given a minor refit, with most of its weapons being removed to enable it to be employed as a training ship.

Batch 1. The Batch 1 conversion was applied to eight ships (see Table I) and involved replacing the twin 114 mm (4.5 in) gun with a GWS.41 Ikara anti-submarine missile and the addition of an ADAWS 5 tactical data system. The Type 965 air warning radar was removed, while a rearrangement of various equipments aft enabled a second Seacat SAM launcher to be mounted. The Mk 10 Limbo was retained and, since this occupied a large well at the rear end of the flight deck, this limited helicopter operations to the Westland Wasp.

Batch 2. Seven ships were converted under the Batch 2 programme, of which four were to Batch 2A standard and three to Batch 2B. In the Batch 2TA (TA = towed array) the work involved removing the 114 mm (4.5 in) gun and using the space to install four MM 38 Exocet launchers (GWS.50 in RN service) on low plinths. The Limbo mortar was removed and the well plated over to enable the flight deck to be used by Lynx helicopters. A Type 2031(1) towed array was installed right aft and since the winch and other elements took up a lot of deck space, F 40, F 42 and F 56 had a sponson fitted to ease the congestion. This was not, however, done in F 28. As further measures to reduce topweight, the forward Seacat launcher and director were removed, together with the Type 965 radar.

In the Batch 2B conversions the twin 114 mm (4.5 in) mount was also removed and replaced by four MM 38 Exocet launchers, but in this case each pair of launchers was mounted on a raised platform. The Limbo ASW mortar was removed and the hangar was enlarged to accommodate the new Lynx helicopter, and the ASW armament was enhanced by the installation of two triple 324 mm torpedo tubes (STWS.1 system). The number of Seacat launchers was also increased from one to three.

Batch 3. Five Broad Beam ships were converted to take Seawolf missiles and were then known as either 'Batch 3 Leanders' or 'Seawolf Conversions'. The work involved the ships being almost totally gutted and rebuilt, and was completed between 1981 and 1984. The twin 114 mm mounting and the Limbo ASW mortar were removed and various items resited, mainly in order to reduce topweight. This enabled a six-cell Seawolf SAM launcher (GWS.25 Mod 0) and four MM 38 Exocet launchers to be installed forward of the bridge, and the hangar and the flight deck to be adapted to take the Lynx helicopter. A new foremast was fitted and, since the large and heavy Type 965 antenna was removed, a much lighter mainmast was also fitted. The CAAIS tactical data handling system was installed. Other enhancements included the Type 967 radar, Sonar 2016, two triple lightweight STWS.1 torpedo tubes and the latest ESM/ECM equipment.

Unmodified Broad Beam Leanders. The curtailment of the Batch 3 conversion programme left five unmodified Broad Beam Leanders. One of these, *Bacchante* (F 69), was sold to New Zealand in 1982, and although the remaining four RN ships received major refits in the mid-1980s this did not amount to a 'mid-life' conversion.

Dispersal of the British and Dutch Leanders

Of the 26 Leanders which served with the RN, 17 were either scrapped or expended as targets, while nine were sold to foreign customers:

New Zealand: 1 — 1982; 1 — 1983
Pakistan: 2 — 1988
Chile: 1 — 1990; 1 — 1992
Ecuador: 2 — 1991
India: 1 — 1995

The RNethN built and operated six 'Van Speijk' class, and all six were sold to Indonesia between 1986 and 1989.

(**Footnote.** It is important to note that, while in later British classes batch numbers were applied to different groups as constructed (for example, Type 22 Batches 1, 2 and 3), in the 'Leander' class the term was applied to the different in-service conversions.)

CONDELL (LEANDER)

GENERAL SPECIFICATIONS

Country of origin: UK
Operator: Chile
Type: Leander

Class: CONDELL (FFG)

Built: 2
Purchased: 2
Active: 4

Displacement:
standard: 2,500 t
full load: 2,962 t

Dimensions
Length: 113.4 m (372 ft) (oa); 109.7 m (360 ft) (wl)
Beam: 13.1 m (43 ft)
Draught: 5.5 m (18 ft) (screws)

Speed: 29 kts
Range: 4,500 n miles at 12 kts

Complement: 263 (20 officers)

SHIPS

CONDELL (06)

Builder	Yarrow & Co, Scotstoun, UK
Laid down	5 Jun 1971
Launched	12 Jun 1972
Commissioned	21 Dec 1973

ALMIRANTE LYNCH (07)

Builder	Yarrow & Co, Scotstoun, UK
Laid down	6 Dec 1971
Launched	6 Dec 1972
Commissioned	25 May 1974

MINISTRO ZENTENO (08)

Builder	Yarrow & Co, Scotstoun, UK
Laid down	1 Dec 1967
Launched	21 Nov 1968
Commissioned (RN)	9 Jul 1970 (*Achilles* (F 12))
Sold to Chile	Sep 1990

GENERAL BAQUEDANO (09)

Builder	Yarrow & Co, Scotstoun, UK
Laid down	1 Nov 1969
Launched	10 Sep 1971
Commissioned (RN)	10 Feb 1973 (*Ariadne* (F 72))
Sold to Chile	Jun 1992

WEAPONS SYSTEMS

Lynch *(07). This is one of the two original ships built for Chile and has a taller foremast than the British ships topped by a GEC-Marconi Type 992Q radar* (Yarrow)

ANTI-SHIP MISSILES (ASM)

Exocet MM 40 Block 1 anti-ship missiles

Four MM 40 Exocet anti-ship missile launchers were installed in all four ships in the early 1990s, replacing MM 38 in *Condell* and *Lynch,* and adding to the weapon fit in *Zenteno* and *Baquedano.* They are located in two pairs either side of the hangar at the 01 deck level. Targets for the missiles are acquired by the ship's sensors, and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence which can take up to 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change in the course of its flight. Once the missile has cleared the launcher-container, the sustainer carries it into the cruise phase and it then travels towards the general location of the target at a height of about 100 m (330 ft) which is low enough to reduce the chance of detection but adequate for target acquisition. Once the target is detected the missile descends to 9-15 m (30-50 ft) in the approach phase before descending to 8 m (26 ft) (2-5 m (6.6-16.4 ft) in a calm sea) for a sea-skimming terminal phase. A salvo may be fired in 12-20 seconds.

Specifications

MM 40 Block 1
Length: 5.78 m (18.96 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.13 m (3.67 ft)
Weight: 855 kg (1,885 lb)
Speed: Mach 0.9
Range: 2-38 n miles (4-70 km)
Warhead: 165 kg (364 lb) HE frag
Fuze: Delay impact/proximity
Guidance: Inertial and active radar

Manufacturers/Contractors

Aerospatiale Missiles, Paris Cedex, France (prime).
Luchaire Défense, Versailles Cedex, France (warhead).

BARAK-1 point defence system

These Chilean ships have recently been fitted with two Barak-1 vertical launch units (replacing the previous Seacat SAM launchers), each containing eight missiles. The Barak-1 point defence missile system is designed to protect ships against both manned aircraft and anti-ship missiles; it has a quick reaction time, typically 3 seconds, which includes 0.6 seconds to turnover in the anti-missile role. The Barak-1 missile is powered by a triple-thrust rocket motor, giving it a speed of approximately Mach 2.

The fire-control system is based upon the Elta EL/M-2221GM I/J and K-band monopulse coherent tracking and illumination radar which is supplemented, on its right-hand side, by a Rafael thermal imager. The radar has a dish antenna with front feed on four 'legs', with an elevation of −25 to +85°. Search acquisition and tracking may be conducted in either I/J (8-20 GHz) or K (20-40 GHz) bands and it can track the target or targets while controlling two missiles. The system can also be used to control guns, possibly with the assistance of a separate ballistic computer. The Fire-Control Console (FCC) is used to control both the Barak weapon system (through the missile control unit) and also guns (through the gun control unit) and it acts as interface between the Barak weapons system and other ship systems. Upon acquisition of the target/targets by the ship's search radar the fire-control radar designates the targets and the system automatically calculates the level of threat from each target, allocates a missile or missiles and automatically launches them. In the anti-ship missile role the Barak-1 leaves the launcher vertically and is then 'turned over' towards the target by the thrust vector control system which is automatically discarded, presumably by explosive bolts, upon completion of the task. The missile is acquired and controlled by the fire-control radar which then guides it towards the target. The missile is capable of engaging targets 2 m (6.56 ft) above the sea and can manoeuvre at 25 *g*.

Specifications

Length: 2.17 m (7.12 ft)
Diameter: 17 cm (6.7 in)
Wing span: 68.4 cm (26.9 in)
Weight: 97.9 kg (216 lb)
Speed: Mach 2 (580 m/s (1,900 ft/s))
Range:
aircraft: 6.5 n miles (500 m to 12 km)
missiles: approx 2.7 n miles (5 km)
Guidance: Command/line of sight (CLOS) or optical
Warhead: 22 kg (48.5 lb) HE fragmentation

Manufacturers/Contractors

Israel Aircraft Industries (IAI), Ben Gurion International Airport, Israel (prime).
Rafael, Haifa, Israel (launch unit).

TUBES

Six 324 mm US Mk 32 (two triple) torpedo tubes. These were originally mounted either side of the hangar at the 01 deck level but have now been moved down to the 02 level.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

Manufacturer/Contractor

GEC-Marconi Naval Systems, UK.

TORPEDOES

Alliant Techsystems Mk 44 Mod 1 324 mm torpedoes

Specifications

Length: 2.56 m (8.4 ft)
Diameter: 324 mm (12.75 in)
Weight: 233 kg (514 lb)
Warhead: 34 kg (75 lb) HE
Propulsion:
Speed: 30 kts
Range: 3 n miles (5.5 km)
Homing: Active acoustic homing
Max depth: 300 m (approx)

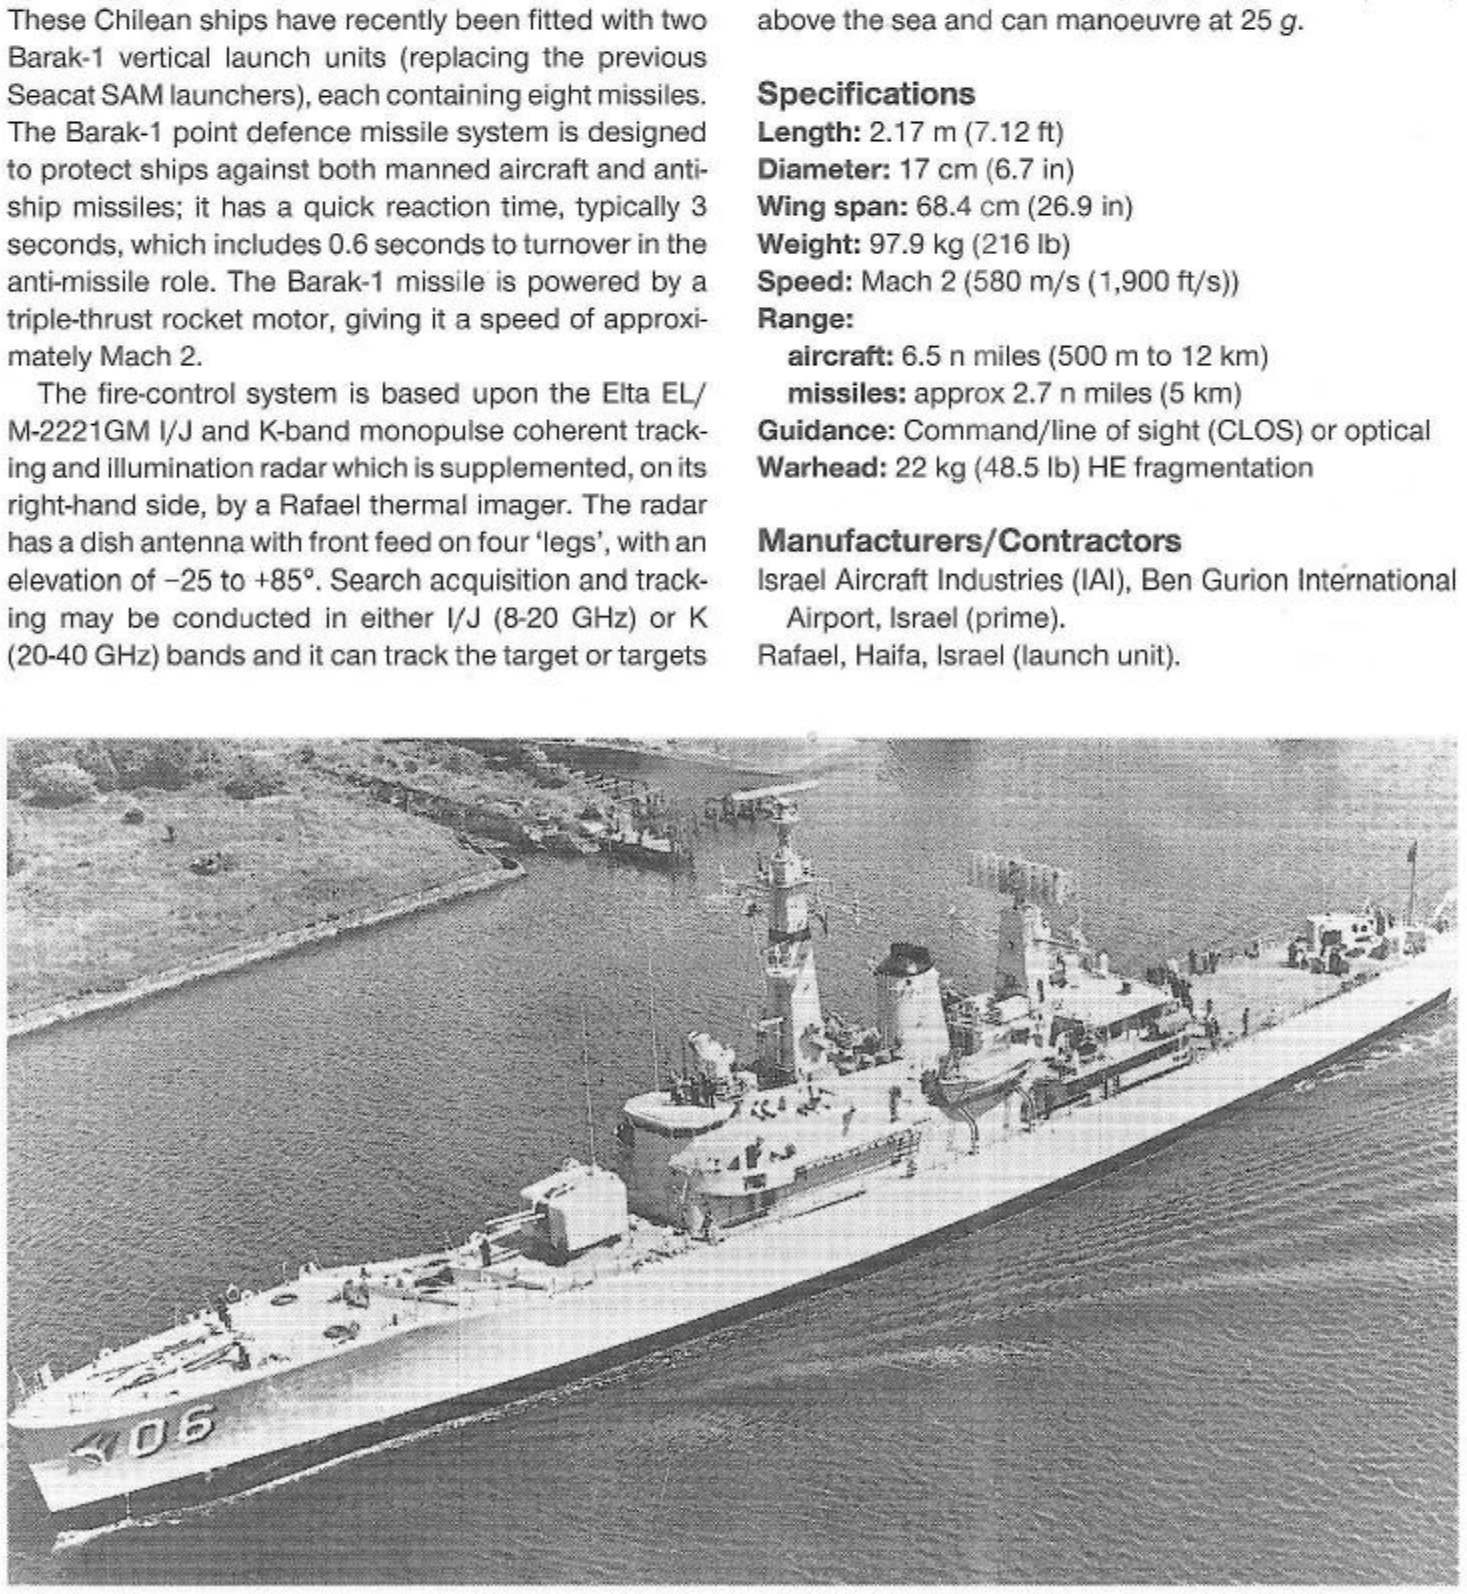
GUNS

Vickers 114 mm (4.5 in)/55 Mk 6 multipurpose gun

All four ships retain their twin 114 mm (4.5 in) Mk 6 mounting in 'A' position to provide quick-reaction short-range air defence, to engage surface targets including fast attack craft, and to provide gunfire support to ground forces. The weapon system consists of the gun mounting, the ammunition feed system, the remote power control system, and the captain-of-turret panel. The mounting includes two Mk V barrels, which are 6.22 m long, fitted with a muzzle brake and fume extractor, and have a life of 3,300 rounds EFC. The mounting is completely enclosed in a shield which protects it against the environment, blast and shrapnel. The loading system is hydraulically operated, with an autoloader which is manually fed by two loaders and has a capacity of six rounds. The hoist transfers them in two stages to the turret from where they are raised by a pivoting loading arm to the breech where they are inserted by a power rammer. After the shell is fired the case is extracted automatically and ejected through a chute in the front of the mounting.

Specifications

Calibre: 114 mm



Condell *(06). Note the gear at the after end of the flight deck, restricting the space available for use by the helicopter* (Yarrow)

Length of barrel: 45 calibres
Traverse: 360°
Elevation: *0 to +89°*
Muzzle velocity: 746 m/s (2,448 ft/s)
Weight of projectile: 25.5 kg (56 lb)
Rate of fire: 14 rds/min/barrel
Range:
anti-surface: 10.25 n miles (19 km)
anti-air: 12,500 m (41,000 ft)
Crew: 20

Manufacturer/Contractor

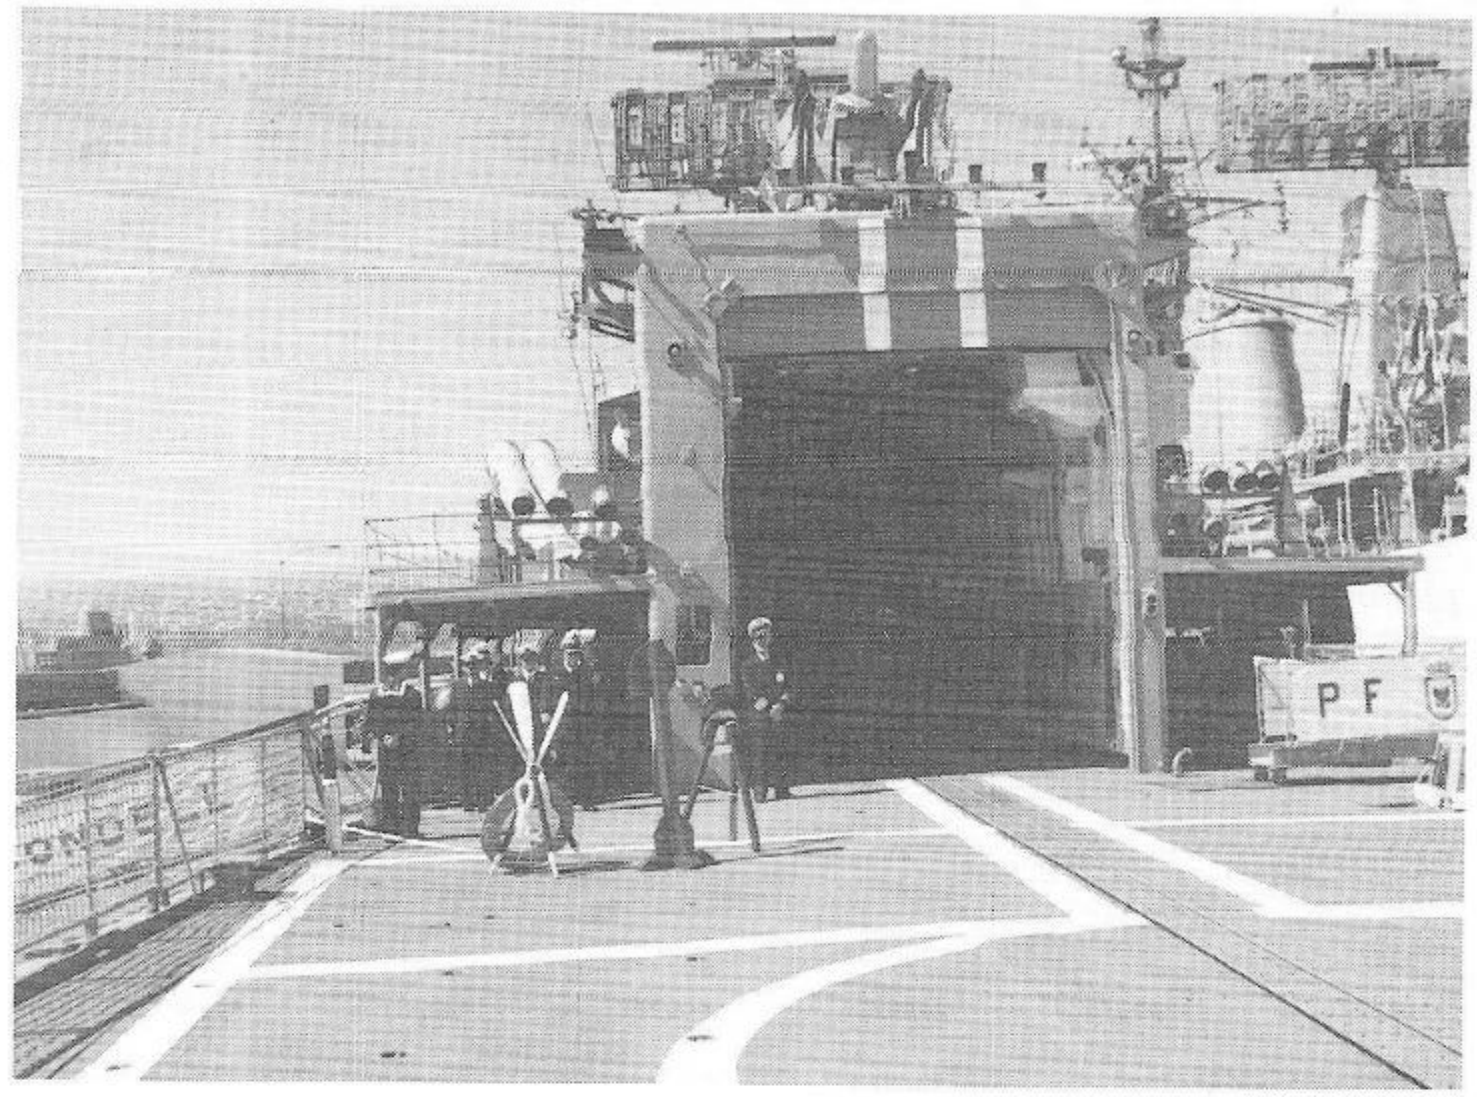
Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

Oerlikon 20 mm Mk 9 in Mk 7 mounts

There are two Oerlikon 20 mm cannon mounts in *Condell* and *Lynch* only.

Specifications

Calibre: 85 mm
Muzzle velocity: 1,050-1,150 m/s (3,445-3,772 ft/s)
Range:
anti-surface: 0.9 n miles (1.7 km)
anti-air: 1,700 m (5,600 ft)
Rate of fire: 900 rds/min
Max elevation: 55°



Condell *(06). The flight deck of the rebuilt* Condell *showing the new, larger hangar, the Indal's ASIST recovery-gear trackway, the Seacat on the hangar roof and the MM 40 Exocet launchers on the platforms either side of the hangar* (Jane's/David Miller)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Elisra NS-9003A radar ESM system

The Israeli NS-9003A naval ESM system is designed to operate in a dense environment and to cope with frequency agility, frequency-hopping, and staggered (wobbulated) PRI emitters. The system automatically receives, analyses and identifies over-the-horizon radar signals with a 100 per cent probability of intercept over the frequency range 2 to 18 GHz. The direction of arrival of each pulse is instantaneously measured using an accurate multibeam antenna array. This instantaneous direction-finding enables the system to locate any exotic type radar signal in the reception range within a fraction of a second. The analysed information is presented on a graphic situation display in several operator-selected modes for various EW tasks and the system has built-in power management provisions for ECM and chaff/flare activation. The NS-9003A antenna assembly includes a multibeam static antenna array with associated RF video and digital DF processing hardware, and an omnidirectional antenna array.

Specifications

Frequency range: 2-18 GHz (0.5-40 GHz optional)
DF accuracy: 1° I and J-bands; 2° E/F and G/H-bands
Sensitivity: −70 dBm
Frequency measurement: Instantaneous 2 MHz resolution

Manufacturer/Contractor

Elisra Electronic Systems, Bene Beraq, Israel.

FH-12 HF/DF

FH-12 is a British high-frequency direction-finding (HF/DF) set, which uses the 'birdcage' antenna array found at the head of the foremast on many 'Leander' class ships.

Outfit UA-13

Outfit UA-13 is a British VHF (25-1,400 MHz) direction-finding set with a conical antenna mounted at the masthead. Such a set was mounted in *Ariadne* (in place of the FH-12) while in British service and appears to have remained installed on transfer to Chile.

Elta IR sensor

An Elta IR sensor is fitted.

DECOYS

Corvus chaff dispensing system

There are two Corvus 8-barrel decoy launchers. Corvus is a quick reaction, self-defence system firing chaff dispensing rockets to form a radar decoy screen around the vessel. The system comprises: two multibarrelled rocket launchers, launcher control and firing panel, and the 'window' dispensing rockets themselves. There are two modes of operation: distraction decoy; and centroid decoy. A cylindrical rotating structure carries eight launching tubes mounted in two sets of three, one above the other, and crossed at 90° in azimuth with two further tubes set above, and aligned midway between the other tubes, all at a fixed elevation of 30°. The maximum loading of 16 'window' rockets provides protection against three missile attacks, before reloading. The normal limits of the training arc for the launcher are between 60 and 120° but as the lower sets of rocket barrels are angled about the centreline of the rotating structure, the arc covered by the rockets is considerably greater.

Specifications

Training
Bearing arc (normal) ie launcher axis: 60-120°
Bearing arc (max) ie tube axis: 15-165°
Tube diameter: 195 mm (7.67 in)
Tube length: 1.6 m (5.24 ft)
Weight (empty): 25 kg (55 lb)
No of guides: 4, RH spiral

Manufacturer/Contractor

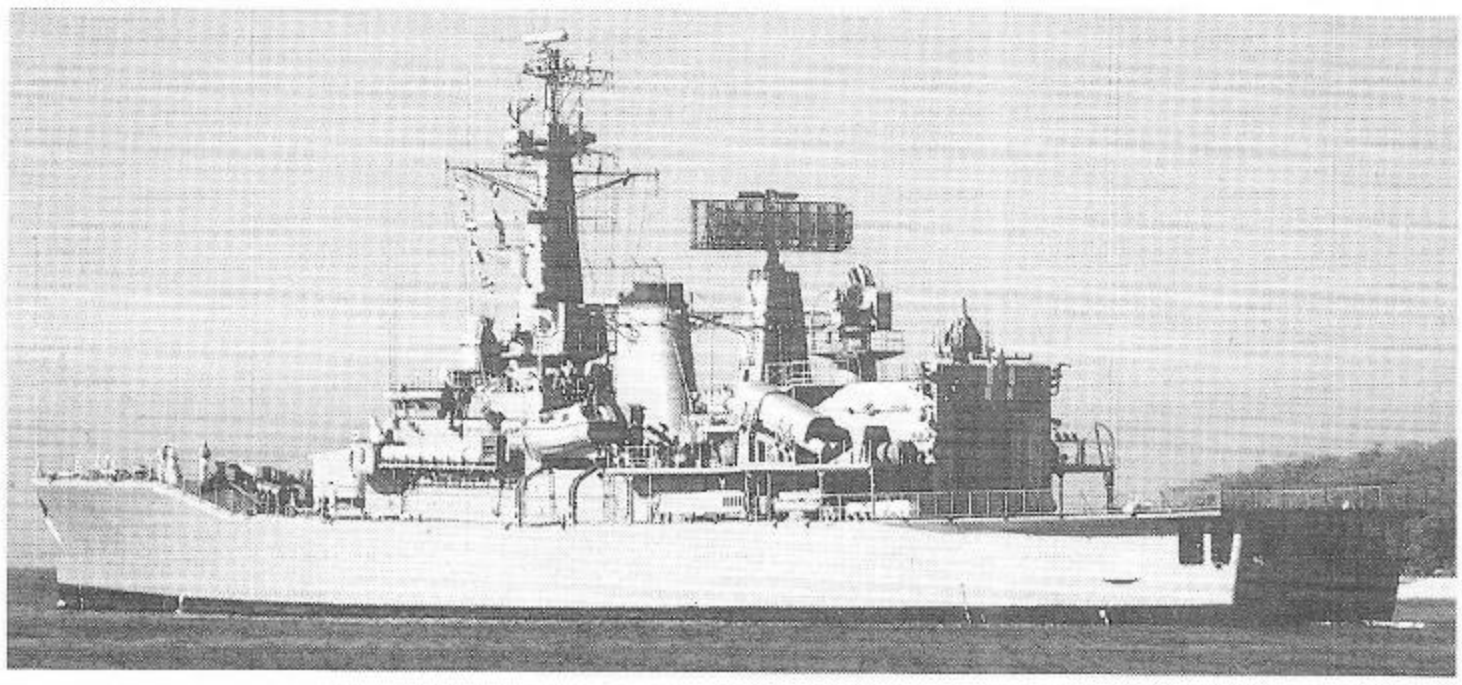
Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

ML Aviation Barricade countermeasures system

Barricade (British Navy designation = Outfit DLK) provides ships with means of deploying chaff and infra-red (IR) decoys to counter missile attacks, using a layered defence against the various types of anti-ship missile. The system uses a 57 mm rocket with a 900 rpm spin, to combine stabilisation with rapid chaff blooming. There are two types of rocket: Stockade — long range; and Palisade — short range. The system is integrated into the tactical data handling and command/weapon control system's electronic warfare suite.
The Chilean ships have two launchers (port and starboard), each consisting of six sets of triple cells, the outer three sets being angled 60° from the next in bearing so that the launchers provide all-round coverage. The inner three sets are preset to point to the same bearing, as required, but in different elevations. The inner three sets fire short-range Palisade rockets in centroid mode, while the outer barrels fire medium- and long-range Stockade rockets in dump, distraction and confusion modes. There are four decoy modes: confusion, distraction, dump and centroid.

Specifications

Stockade
Dimensions: 375 × 57 mm (14.8 × 2.24 in)
Weight: 1.89 kg (4.16 lb) (chaff); 1.77 kg (3.9 lb) (IR)
Payload: 0.4 kg (0.88 lb)
Range: 400-2,000 m (1,300-6,560 ft) at 30°
Rocket burn: 0.6 s



Lynch *showing the new wider and longer flight deck* (H & L van Ginderen Collection)

Recommended range:
confusion mode: 2,000 m (6,560 ft)
dilution mode: 800 m (2,625 ft)
Chaff frequency range: 2-20 GHz
IR payload: 550 W/steradian in 8-13 µm band

Palisade
Dimensions: 360 × 57 mm (14.1 × 2.22 in)
Weight: 2.1 kg (4.63 lb)
Payload: 0.6 kg (1.32 lb)
Rocket burn: 0.6 s

Chaff frequency coverage: 8-35 GHz
IR payload: 3-14 µm band for 20 s

Manufacturer/Contractor
ML Wallop Defence Systems, Andover, Hampshire, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEM

SISDEF SP 100 Command and weapon control system
The original British systems have been replaced by the SISDEF *(Sistemas de Defensa)* SP100 command and weapon control system. This is a distributed architecture system based upon the 32-bit Intel 80486DX2-66 and the TMS34020 processors, with the 8-bit Zilog Z80 being used for some interfaces. It uses Ada in all software applications, works to MIL-STD-2167A and uses commercial-off-the-shelf (COTS) hardware wherever possible. The basic hardware consists of Consolas Tacticas (CONTAC) with a typical destroyer/frigate system having three vertical and two horizontal units. A console has four Intel 80486 microprocessors including one for interface purposes, one for MMI and a graphics engine. Up to 512 tracks can be displayed and a similar number of ESM bearings while the console can interface with two datalink channels. The system has tactical preprocessors to link each sensor to the Ethernet-standard local area network, an environmental preprocessor to interface with the sensors such as log, wind indicator and gyrocompass, and weapons preprocessors to link with each weapon system. Peripherals such as plotter and printer have their own computer linked as does the datalink system.

Manufacturer/Contractor
Sisdef Ltda, Vinha del Mar, Chile.

SONARS

Type 184 P sonar
The Type 184 P is a modernised version of the British Type 184 active/passive search and attack sonar system, using a circular 32-stave transducer array 1 m (3.28 ft) in diameter and 1 m (3.28 ft) high in a retractable, keel-mounted dome. It operates at 6, 7.5 and 9 kHz with pulse lengths of 45 ms and 75 ms.

Manufacturer/Contractor
Graseby Marine (Graseby Dynamics Ltd), Watford, UK.

Type 170 B sonar
Type 170 was the sonar used to control the ASW mortar. Since that weapon has now been removed it is probable (but not confirmed) that Type 170 sonar has been removed also.

Kelvin Hughes Type 162 M
The British Kelvin Hughes Type 162 M ('Cockchafer') side-looking target detection sonar is designed to detect and classify seabed targets, such as a bottomed submarine. There are three transducers: one faces downwards at 25° below the horizontal, while the other two face sideways to cover a 3° wide and 40° vertical sector. The transmitter delivers 40 W to the central, downward-looking transducer and 80 W each to the side-looking transducers. The set operates at 50 kHz and range scales are 270 m (300 yd), 550 m (600 yd) and 1,100 m (1,200 yd)

Manufacturer/Contractor
Kelvin Hughes, Watford, UK.

AVIATION

AVIATION FACILITIES

Specifications
Flight deck: *Condell* and *Lynch* now both have flight decks extending back to the stern and can handle a Cougar (Super Puma) helicopter

HELICOPTERS

Nurtanio (Eurocopter) NAS 332SC Cougar

Specifications
Dimensions:
main rotor diameter: 15.60 m (51.18 ft)
tail rotor diameter: 3.05 m (10.0 ft)
length, overall, rotors turning: 18.70 m (61.35 ft)
height, overall: 4.92 m (16.14 ft)
Weights:
empty: 4,460 kg (9,832 lb)
max take-off: 8,600 kg (18,960 lb)
Performance (at max take-off weight):
never-exceed speed (VNE): 150 kts (278 km/h)
cruising speed at sea level: 144 kts (266 km/h)
max rate of climb (sea level): 486 m (1,594 ft)/min
service ceiling: 4,600 m (15,090 ft)
range (sea level): 470 n miles (870 km)
Power plant: 2 Turbomeca Makila 1A1 turboshafts: each max continuous rating of 1,184 kW (1,588 shp)
Accommodation: 1 pilot (VFR)/2 pilots side by side (IFR); max accommodation 24 passengers
Equipment: Optional fixed or retractable rescue hoist (capacity 275 kg; 606 lb) starboard side; equipment for naval missions can include sonar, MAD and sonobuoys
Armament: 2 AM 39 Exocet missiles or 2 lightweight torpedoes, plus 2–20 mm guns or 2–7.62 mm machine guns

PROPULSION

Specifications
System: Steam-turbines
Main machinery: 2 Babcock & Wilcox boilers; 38.7 kg/cm² (550 psi); 450°C (850°F); 2 White/English Electric turbines; 22.4 MW (30,000 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The Chilean Navy ordered *Condell* and *Lynch* direct from Yarrow & Co Ltd, Scotstoun, UK in the late 1960s. These were generally similar to the original British Leanders, but with some differences in the sensors and a slightly higher foremast.

The second pair of ships, *Zenteno* and *Baquedano,* were both originally British 'Broad Beam' Leanders, which were purchased by Chile in 1991 and 1992, respectively.

DESIGN

The two original Chilean ships were generally similar to the British 'Broad Beam Leanders' but carry a Type 992Q surveillance radar atop a taller foremast, and a Plessey PMS-32 sonar. In addition, four MM 38 Exocet launchers were mounted right aft in two pairs, angled outwards at about 30°, the only Leanders ever to have such an arrangement. The two later ships were ex-British 'Broad Beam Leanders' from the unmodified group (see Overview).

MODERNISATION

All four ships have been modernised at the ASMAR yard at Talcahuano. *Lynch* was considerably modified in 1989 and was given two twin MM 40 Exocet launchers on the 01 deck either side of the hangar in place of the MM 38s aft. This displaced the Mk 32 torpedo tubes which were moved down one level to the 02 deck. The flight deck was also enlarged to enable it to take a Cougar (Super Puma) helicopter. The Elisra NS-9003 ESM suite replaced the UA-8/9 equipment.

Condell completed its ASMAR refit in 1993. This ship now has an even larger flight deck which extends right aft and is fitted with an Indal ASIST recovery system.

General Baquedano *(09), formerly the UK Royal Navy's Ariadne* (Chilean Navy)

The hangar has also been enlarged to accommodate a Super Puma. A single Seacat launcher was retained on the hangar roof, but this has since been replaced by a Barak system. *Condell* was also fitted with a SISDEF SP-100 tactical data handling system. *Lynch* is having a similar refit.

THE FUTURE

The Chilean Navy is known to want to buy two more Leanders, but all the former British ships have now been disposed of and it appears unlikely that any of the others will come on the market for some years. Meanwhile, the four existing ships will continue to be modernised, and it has been suggested that one possibility under consideration is to replace the steam plant by a gas-turbine installation.

It is also understood that the current torpedoes will be replaced by Murène in due course.

WEAPONS SYSTEMS

ANTI-SHIP MISSILES (ASM)

MM 38 medium-range anti-ship missile

Four Aerospatiale MM 38 Exocets are mounted on the foredeck in individual ITS *(Installation de Tir Standard)* launcher-containers, within which they are suspended from a launch rail in the ceiling. The launcher-containers point outwards and are raised at an angle of 12° to the horizontal. Targets are acquired by the ship's search radar and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence. This involves turning on the thermal battery, releasing the mechanical safety locks, igniting the booster and, finally, breaking the umbilical cord; the total process takes some 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change of course during its flight.

The attack consists of three phases:

Cruise phase. The cruise phase starts as the missile clears the container and the missile, powered by the sustainer motor, flies towards the general location of the target at a height of about 100 m (328 ft) which is low enough to reduce the chance of detection but adequate for target acquisition. This phase can be as long as 22 km and ends when the seeker acquires the target. This seeker is a Dassault Electronique ADAC (Auto Directeur Anti-Clutter) active monopulse radar, working in the I-band (8-10 GHz), which has a typical range of 13 n miles (24 km) against FACs.

Approach phase. On detecting the target the missile descends to 9-15 m (29.53-49.21 ft) in the approach phase.

Terminal phase. During this final phase the missile descends to 8 m (26.2 ft) (2-5 m (6.5-16.4 ft) in a calm sea) for a sea-skimming run in to the target.

A salvo may be fired in 12-20 seconds.

Specifications

MM 38
Length: 5.21 m (17.09 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,621 lb)
Speed: Mach 0.9
Range: 2-22.5 n miles (4-42 km)
Guidance: Inertial and active radar
Sustainer motor: SNPE Eole alloy-cased CDB; weight 151 kg (333 lb); max burn time 93 s.
Booster: 100 kg (220.5 lb) SNPE Epervier boost motor, weight 100 kg, burn time of 2.4 s
Warhead: Luchaire 165 kg (364 lb) fragmentation warhead
Fuzes: Delayed impact fuze and autopilot-controlled proximity fuze

Manufacturer/Contractor

Aerospatiale Tactical Missiles, Chatillon Cedex, France.

Short Seacat GWS.22

There are three Short Seacat GWS.22 quadruple launchers: one on the foredeck, ahead of the Exocet launchers, and two aft, on the hangar roof. These missiles also have a secondary, anti-ship capability.

Specifications

Missile
Length: 1.48 m (4.85 ft)
Diameter: 19 cm (7.48 in)
Wing span: 65 cm (25.59 in)
Weight: 68 kg (149.94 lb)
Speed: Mach 0.8
Range: 2.7 n miles (5 km)
Radar: Type 904 (see radar table (p 1126))

Manufacturer/Contractor

MSI-Defence Systems (formerly Short Brothers plc), Belfast, UK.

GUNS

Bofors 40 mm/60 Mk 9

Two single Bofors 40 mm/60 Mk 9 guns are mounted on the superstructure, either side of the mast.

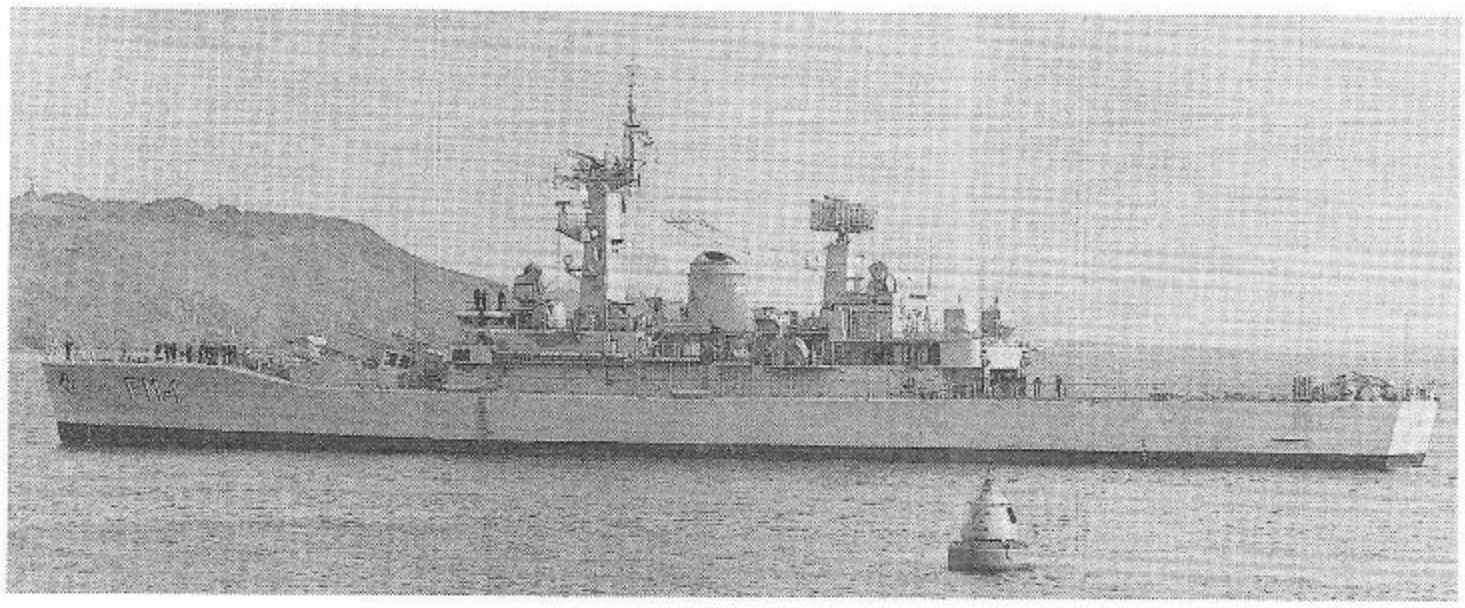
Specifications

Traverse: 360° (nominal) at 90°/s
Elevation: −3 to +85° at 60°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Max range:
anti-surface: 6.5 n miles (12 km)
anti-air: 2.2 n miles (4,000 m)

Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

20 mm Oerlikon mountings

Two GAM-BO1 mountings can be fitted, if required. GAM-BO1 uses a swivel fork with the sidewalls having the trunnion bearings. The cradle is made of light alloy and the weapon's working parts are enclosed in a protective case whose top opens to ease maintenance and installation. The sight, shoulder rests and back support strap are all attached to the sight bracket which is adjustable for height. Usually these mountings have an optical ring sight but they can also be fitted with a lead computing sight. The ammunition box with 200 rounds is attached to the front of the mounting and the belt is fed from the right side of the gun, with spent cartridge cases being ejected between the sidewalls of the cradle into a separate compartment, while the links are collected in a bag on the other side of the mounting.



Presidente Eloy Alfaro *(FM-01)* (David Warren)

Specifications

GAM-B01
Elevation: 55°
Gun Model: KAA
Calibre: 20 mm
Barrel length: 85 calibres
Effective range:
anti-surface: 2,500 m (2,700 yd)
anti-air: 1,200 m (4,000 ft)
Rate of fire: 1,000 rds/m
Round weight: 320-345 g
Projectile: 110-125 g

Manufacturers/Contractors

Royal Ordnance. Medium Calibre Gun Division (mounting).
Oerlikon Contraves AG, Defence (cannon).

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

UA-8/UA-9

These ships retain their British passive radar intercept systems: UA-8 covering the frequency band 2.4-4.1 GHz; and UA-9 (7-11.5 GHz). Both are elderly, analogue, manually operated equipments.

Manufacturer/Contractor

MEL.

ELECTRONIC COUNTERMEASURES (ECM)

Type 667/668 jammers

Type 667 and Type 668 are British-made noise jammers from the 1960s. Type 667 operates in two discrete areas in the D/E and H/I-bands, while Type 668 covers part of the F/G-band.

DECOYS

Graseby Type 182 towed torpedo decoy equipment

Type 182 towed torpedo decoy is designed to decoy both active and passive homing torpedoes, using signals electronically generated within the ship and fed, via the towing cable, to electroacoustic transducers within the towed body. The Type 182 produces two independently controllable output signals which are radiated simultaneously from the towed decoy. An amplitude modulated noise signal simulates the ship's propeller noise and causes passive-homing torpedoes to be seduced away from the ship towards the towed decoy. The second signal is a swept CW signal, which simulates sonar echoes, in order to confuse or jam the guidance system of active homing torpedoes, thus causing them to miss the ship. The frequency bands covered by both types of output are switchable to meet tactical scenarios and to enable concurrent operation of other sonar and communication equipments.

Specifications

Towed decoy:
diameter: 533 mm (21 in)
length: 2.01 m (6.6 ft)
weight: 74 kg (163 lb)
Towing cable:
length: 411 m (1,350 ft)
diameter: 1.5 cm (0.6 in)
weight: 269 kg (593 lb)

Manufacturer/Contractor

Graseby Marine (Graseby Dynamics Ltd), Watford, UK.

Corvus chaff dispensing system

There are two Corvus 8-barrel decoy launchers. Corvus is a quick reaction, self-defence system firing chaff dispensing rockets to form a radar decoy screen around the vessel. The system comprises: two multibarrelled rocket launchers, launcher control and firing panel, and the 'window' dispensing rockets themselves. There are two modes of operation: distraction decoy; and centroid decoy. A cylindrical rotating structure carries eight launching tubes mounted in two sets of three, one above the other, and crossed at 90° in azimuth with two further tubes set above, and aligned midway between the other tubes, all at a fixed elevation of 30°. The maximum loading of 16 'window' rockets provides protection against three missile attacks, before reloading. The normal limits of the training arc for the launcher are between 60 and 120° but as the lower sets of rocket barrels are angled about the centreline of the rotating structure, the arc covered by the rockets is considerably greater.

Specifications

Training
Bearing arc (normal) ie launcher axis: 60-120°
Bearing arc (max) ie tube axis: 15-165°
Tube diameter: 195 mm (7.67 in)
Tube length: 1.6 m (5.25 ft)
Weight (empty): 25 kg (55 lb)
No of guides: 4, RH spiral

Manufacturer/Contractor

Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launchers

There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications

Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturers/Contractors

Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

CAAIS (Outfit DBA(1)) action data automation

CAAIS (Computer Assisted Action Information System) was developed in the early 1960s and entered service in 1974. CAAIS is a tactical picture compilation system, providing automatic tracking of air and surface targets, processing sonar and EW inputs, operating a digital datalink, designating targets, and providing torpedo control and vectored attack orders for ASW helicopters. The hardware includes a three-cabinet digital suite housing a 24-bit computer, operating at 200 Kips and with a 780 k memory, as well as a datalink terminal. In addition there are peripheral control units which include radar extraction units, encoder/decoders, display drive unit and the MMI control units. The datalink, known as Link X in NATO navies, is a serial transmission, medium-speed (1,200 baud) link suitable for HF and UHF channels. The programming language is Coral 66.

Manufacturer/Contractor

Ferranti Naval Systems Ltd.

COMMUNICATIONS AND DATALINKS

Datalinks

Link 10
Link 14 (receive)
Link X.

WEAPONS CONTROL

There are two weapons control systems: GWS.22 for Seacat and GWS.50 for Exocet.

SONARS

Type 162M sonar

Sonar Type 162M detects and classifies both mid-water and seabed targets, displaying port and starboard recordings simultaneously on a single straight-line recorder, which has a maximum range scale of 1,200 yd. Operation is simplified by entirely automatic gain control. The three transducers are all similar and employ 49.8 kHz barium titanate elements. Their beam pattern is fan-shaped, about 3° wide and 40° vertical angle; the side-looking elements have their axes 25° below the horizontal. A loudspeaker and a socket for headphones enable signals to be monitored aurally if required. The three range scales are 0 to 300, 0 to 600 and 0 to 1,200 yds, and accuracy is better than two per cent assuming a sound velocity of 4,920 ft/s.

Manufacturer/Contractor

AB Precision (Poole) Limited, Poole, Dorset, UK.

Type 184P active/passive hull-mounted search sonar

Type 184P was an in-service upgrade to Type 184M. Type 184P is a 360° scanning sonar, incorporating both active and passive modes of operation, which provides range, bearing and target Doppler data to the fire-control computer. The equipment provides a dual frequency transmission and three receiver systems. The latter comprise: an all-round search and tracking PPI system with, in the Type 184P, 16 receiving channels, which gives greater bearing accuracy. The upgrading also involved inserting 31 digital filters in each of the four beam channels, enabling the system to measure Doppler speeds of up to ±40 kts. There is also a continuous torpedo warning system with its own display. A circular 32-stave transducer array is employed. The keel-mounted, retractable dome is 3.99 m (13.0 ft) long, 1.62 m (5.3 ft) wide and 1.55 m (5.0 ft) deep. Operating frequencies are 7.5 kHz and 9 kHz.

Manufacturer/Contractor

Graseby Marine (Graseby Dynamics Ltd), Watford, UK.

Shafts: 2

FURTHER INFORMATION

PROGRAMME

These two ships were purchased from the UK to replace two ex-US Navy ships: the 'Gearing' class destroyer *Presidente Eloy Alfaro* (DO 01) and the 'Charles H Lawrence' class destroyer-escort *Moran Valverde* (D 01). The two British ships were bought on 25 April 1991 and were given the same names as the two ships they had replaced, but with new pennant numbers. Their crews worked up in British waters and then sailed for their home country in July and August, respectively.

STRUCTURE

These were both units of the original production standard and were converted under the Batch 2 programme in 1980 and 1982, respectively. Their torpedo tubes were removed in 1988/89 and two Mk 36 SRBOC chaff launchers were fitted after transfer.

The two ships were transferred without any Exocet missiles, but it should be noted that the Ecuador Navy already operates both MM 38 and MM 40 Exocets aboard existing classes of ship. No Seacat missiles were sold either, but these will be much more difficult to replace should the navy wish to bring them into service.

FURTHER WORK

It was planned to send these two ships to the ASMAR yard at Talcahuano, Chile in 1995 for a refit, but this has been postponed for financial reasons.

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

Short Seacat GWS.22

Nilgiri (F 33) and *Himgiri* (F 34) have one Seacat launcher each, both with GWS.22 weapons control system, situated on the hangar roof. The remaining four ships each have two launchers and two Dutch M44 directors, located on small platforms either side of the hangar. The missiles also have a secondary, anti-ship capability.

Specifications

Missile
Length: 1.48 m (4.85 ft)
Diameter: 19 cm (7.48 in)
Wing span: 65 cm (25.59 in)
Weight: 68 kg (149.94 lb)
Speed: Mach 0.8
Range: 2.7 n miles (5 km)
Radar: Type 904 (see radar table (p 1129))

Manufacturer/Contractor

MSI-Defence Systems (formerly Short Brothers plc), Belfast, UK.

TORPEDOES

ILAS-3 surface vessel torpedo launching system

The last two ships to be completed, *Taragiri* (F 41) and *Vindhyagiri* (F 42) have two triple ILAS-3 torpedo launchers mounted on the upper deck abreast the hangar, with one set on either beam. Each torpedo launching system consists of three 324 mm torpedo tubes which launch lightweight anti-submarine torpedoes. The tubes are mounted on a base which can be manually trained by means of a suitable retractable handle, with the torpedo being fired after the tube has been trained into the designated sector.

Firing is achieved using compressed air stored in air bottles secured to the tube's outer surface and refilled via the air charging station (also made by Whitehead). Torpedo launching is controlled either electrically, by means of the Shipborne Remote-Control Panel (Whitehead production), or manually, acting on a special push-button located on each tube.

Specifications

Length: 3.4 m (11.15 ft)
Width: 1.2 m (3.94 ft)
Height: 1.20 m (4.2 ft)
Weight: 1,050 kg (2,315 lb)

Manufacturers/Contractors

Eurotorp, Sophia Antipolis, France.
Whitehead Motofides, Livorno, Italy.

Whitehead A244/S lightweight anti-submarine torpedo

The torpedo used is the Whitehead A244/S or the Indian-produced version, NST 58. The seeker in the A244/S is the Alenia CIACIO-S which is capable of active, passive or mixed modes for closing on to its target and can discriminate between decoys and real targets, in the presence of heavy reverberations, by specially emitted pulses and signal processing. It also discriminates between target noise and reverberations, as well as having a series preset of programmable search patterns and tactical manoeuvres (including re-attack procedures). The seeker has a large search volume covered by multiple preformed beams following a number of self-adaptive search patterns and is reported capable of target detection at −5 dB in good acoustic conditions. The computerised homing system also provides for presettable combinations of signal processing, spatial filtering and tactical torpedo manoeuvring. The software may be reprogrammed by the customer to meet new tactical conditions. Upon launching the A244/S initially steers a straight course and, if the target is not detected, it then begins a search pattern which may be either a spiral between preselected depths or a helix pattern.

Specifications

Length: 2.7 m (8.86 ft)
Diameter: 324 mm (12.75 in)
Weight: 215 kg (474 lb)
Warhead: 34 kg (80 lb) shaped charge HBX-3 HE
Propulsion: Electric; silver-zinc batteries
Range: 3.5 n miles (6 km)
Speed: 30 kts
Guidance: Active/passive sonar, self-adaptive programmed patterns

Manufacturer/Contractor

Whitehead SpA, Salviano, Italy.

GUNS

Vickers 114 mm (4.5 in)/55 Mk 6 multipurpose gun

All ships have a twin 114 mm (4.5 in) Mk 6 mounting in 'A' position to provide quick-reaction short-range air defence, to engage surface targets including fast attack craft, and to provide gunfire support to ground forces. The weapon system consists of the gun mounting, the ammunition feed system, the remote power control system, and the captain-of-turret panel. The mounting includes two Mk V barrels, which are 6.22 m (20.4 ft) long, fitted with a muzzle brake and fume extractor, and have a life of 3,300 rounds EFC. The mounting is completely enclosed in a shield which protects it against the environment, blast and shrapnel. The loading system is hydraulically operated, with an autoloader which is manually fed by two loaders and has a capacity of six rounds. The hoist transfers them in two stages to the turret from where they are raised by a pivoting loading arm to the breech where they are inserted by a power rammer. After the shell is fired the case is extracted automatically and ejected through a chute in the front of the mounting.

Specifications

Calibre: 114 mm
Length of barrel: 45 calibres
Traverse: 360°
Elevation: 0 to +89°
Muzzle velocity: 746 m/s (2,448 ft/s)
Weight of projectile: 25.5 kg (56.23 lb)
Rate of fire: 14 rds/min/barrel
Range:
anti-surface: 10.25 n miles (19 km)
anti-air: 12,500 m (41,012.5 ft)
Crew: 20

Oerlikon 20 mm Mk 9 in Mk 7 mounts

There are two Oerlikon 20 mm cannon mounts.

Specifications

Calibre: 85 mm
Muzzle velocity: 1,050-1,150 m/s (3,445-3,773 ft/s)
Range:
anti-surface: 1.7 km
anti-air: 1,700 m
Rate of fire: 900 rds/min
Weight of round: 320-345 g
Weight of projectile: 110-125 g
Max elevation: 55°

Manufacturer/Contractor

Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

ANTI-SUBMARINE MORTARS

Bofors 375 mm Model B2 ASW rocket system

There is a single, twin-tubed ASW rocket launcher on the forecastle in *Taragiri* and *Vindhyagiri* only. The system consists of a rocket launcher, handling system, the ship sonar and a fire-control system. The launch tubes are mounted on trunnions with an automatic contact device to connect the rockets with the fire-control system. The hydraulic laying machinery is in the front of the mounting and a flame deflector in the rear. Each system features an automatic electrohydraulic handling system. The rounds are stored vertically beneath the mounting and selected by an operator. A grab on a roof-mounted rail picks up the round by the nose and transfers it to the loading table. A hoist brings this through the deck hatch to where the launch tubes have been elevated to their loading position. The rounds are then inserted through the rear of the launch tube. Reload time is approximately one minute, each tube being loaded separately. The rate of fire is one round a second and rockets may be fired singly or in salvo. There are two types of rocket, both with Hexotonal filling. The Type E (Erika) rocket has Stidar time and impact fuzes, while the Type N (Nelli) uses the Zambo proximity and impact fuzes.

Specifications

Launcher
Tubes: 4
Weight: 7,500 kg (16,534 lb)
Traverse: 260° at 18°/s
Elevation: −15 to +90° at 18°/s
Crew: 4

Rockets

	Type E	Type N
Weight	250 kg (551 lb)	230 kg (507 lb)
Muzzle velocity	130 m/s (426 ft/s)	205 m/s (673 ft/s)
Explosive weight	107 kg (236 lb)	80 kg (176 lb)
Range	0.35/0.87 n miles (0.65/1.63 km)	0.85/2.11 n miles (1.58/3.62 km)
Final sinking speed	10.7 m/s (35 ft/s)	9.2 m/s (30 ft/s)

Manufacturer/Contractor

Bofors Ordnance, Sweden.

Anti-Submarine Mortar Mk 10 Limbo

The first four ships — *Nilgiri, Himgiri, Udaygiri and Dunagiri* — retain the British-developed Limbo, triple-barrel, 304.8 mm (12 in) mortar system, which is mounted aft of the flight deck. The three barrels are installed in line on a massive metal mounting with a metadyne system for stabilising it in pitch and roll. The projectiles are loaded automatically from magazines alongside the mounting, the mortar tubes being laid horizontally with a pneumatic system moving rounds down the barrel. Fuze settings are set automatically through relays and uniselectors. The magazine has a capacity of 51 rounds. Training of the mortar is carried out automatically from the combat information centre using data from the ship's sonar system. The Limbo system fires its projectiles in a three-dimensional pattern. The projectiles can be set to explode at various depths using hydrostatic or impact fuzes. Limbo has a crew of seven.

Limbo is controlled by the MCS (Mortar Control System) Mk 10. The original system used vacuum-tube technology and during the 1960s systems in British service were updated with new solid-state electronics in the computer and sonar display system. The sonar is the Type 170 with square transducer and a frequency of 15 kHz.

Specifications

Weight: 35 t
Range: 900 m (984 yd)
Projectile: 177 kg (390 lb)
Explosive: 94 kg (207 lb)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Ajanta

The Ajanta radar intercept suite is the first such Indian set to reach operational status. It is believed to be based on the Selenia (now Alenia) INS-3, but appears to have a much larger threat library. It is also installed in 'Delhi' class destroyers.

Manufacturer/Contractor

Bharat Electronics Ltd (BEL), Bangalore, India.

FH 5 HF/DF

Some ships are fitted with the FH 5 direction-finding equipment.

Type 667 jammer

All ships are fitted with the Type 667, a British, 1960s-vintage, noise jammer. Type 667 operates in two discrete areas in the D/E and H/I-bands.

DECOYS

G 738 towed torpedo decoy

G 738 is an improved and re-engineered version of the Type 182 towed torpedo decoy using solid-state signal generation equipment and compact, lightweight deck machinery. G 738 decoys both active and passive homing torpedoes with decoy signals being electronically generated within the ship and fed via the 411 m (450 yd) long towing cable to electroacoustic transducers within the towed body; the signals thus produced divert passive homing torpedoes astern and confuse or jam the steering mechanisms of active homing torpedoes.

The G 738 produces two independently controllable output signals. One is an amplitude modulated noise signal which simulates the ship's propeller noise and causes passive homing torpedoes to be seduced away from the ship towards the towed decoy. The second is a swept CW signal, which simulates sonar echoes and thus confuses or jams the guidance system of active homing torpedoes, and causes them to miss the ship.

Manufacturer/Contractor

Graseby Marine (Graseby Dynamics Ltd) Watford, UK.

COMMAND AND CONTROL SYSTEMS

COMMUNICATIONS AND DATALINKS

IFF Type 944; 954M.

WEAPONS CONTROL

Weapons control equipments are:
Seacat
Nilgiri, Himgiri: GWS 22
Remainder: two M 44
Guns
Nilgiri: MRS 3

RADARS

The radars in first of class, *Nilgiri* (F 33), were virtually identical with those in the British Leanders. The remainder of the class, however, has most of the British radars replaced by Signaal systems.

AN/SQS-505	hull mounted	X		
Thomson-CSF Diodon	hull mounted			X
AN/SQS-505	VDS	X	X	
Thomson-CSF Sorel	VDS			X
Type 162M	hull mounted bottom classification	X	X	X

Type 170 B sonar

Type 170 B is the sonar used to control the Limbo Mk 10 ASW mortar; it was also produced in Canada as the AN/SQS-502. Operating frequency is 15-25 kHz and the system has a maximum operating range of about 1,800 m (2,000 yd) and a maximum depth of about 350 m (1,200 ft).

APSOH/G 750 active/passive hull-mounted search sonar

The Graseby G 750 is a search and attack all-round sonar, which was developed from the British Type 184M. It provides accurate fire-control data from two independent automatic tracking systems, whilst simultaneously maintaining all-round surveillance, independent Doppler search, and classification and continuous torpedo warning. Three separate processing and display systems are incorporated for all-round search and tracking; Doppler, and passive search.

In the standard G 750 system, an improved version of the Type 184M cylindrical 32-stave transducer is used to form a large number of beams. Range and bearing measurement is by in-beam scanning, obviating the need for separate expanded displays. Target range and bearing are measured by either: using a manually positioned marker technique, in which the circular markers are placed over the target echo, it being the marker position that is measured; or by echo gating, where the echo range and bearing are measured directly. This form of tracking is normally on acquisition of a possible target and is available either with or without computer assistance.

Operational capabilities of the equipment include active detection of submarines throughout 360° and the ability to track two targets simultaneously. Similar detection coverage and tracking capabilities are available in respect of torpedo targets, with suitable outputs to torpedo warning and avoidance systems. There is also an active search capability over a 45° arc with facilities for determining target Doppler. Four 11° beams forming a 45° 'searchlight' are providing a 360° search facility capable of measuring target Doppler up to ±40 knots. Targets can be tracked to a maximum range of 20 km. G 750 is being developed in India by Bharat Electronics as the APSOH (Advanced Panoramic Sonar) and underwent trials in *Himgiri* (F 34).

Manufacturers/Contractors

Graseby Marine (Graseby Dynamics Ltd) Watford.
Bharat Electronics, Bangalore, India.

Westinghouse Canada AN/SQS-505 sonar

The Canadian Westinghouse AN/SQS-505 sonar is a hull-mounted 7 kHz, search and attack sonar. It is a deep water, omnidirectional, surveillance system, but is also able to operate in a directional mode that can maintain search ability while tracking defined targets. Three selectable frequencies are available so that several ships can survey an area in close proximity without cross-talk. In high sea states leading to excessive roll and pitch of the ship, the AN/SQS-505 utilises transmit beam stabilisation, which delays transmission until near optimum roll and submergence conditions prevail, thereby minimising chances of the target being missed altogether.

Specifications

Coverage: 360° (azimuth)
Range: 183-3,000 m (200-3,200 yd)
Doppler range: ±40 kts (7.2 kHz)
Displays: Range (A Scan); Bearing (B Scan)
Doppler frequencies: 6.4, 7.2 and 8.0 kHz
Source levels: From 224.233 dB/µPa/m (transmission mode dependent)
Initial detection: 12 ping history of returns
Bearing accuracy: 1° RMS
Range accuracy: ±1% range reading
Transmission modes: Omni, TRDT, DT, ASPECT
Power level: High and low (10 dB reduction)

Manufacturer/Contractor

Westinghouse Canada Inc, Burlington, Ontario, Canada.

Thomson-CSF Diodon/Sorel sonar (TSM 2630)

Diodon is a hull-mounted sonar and Sorel the associated variable-depth sonar (VDS). They produce a panoramic medium-frequency sonar signal and a common data handling and sonar processing system provide target classification, automatic detection and tracking, and a man/machine interface. Embedded facilities include passive listening, sound ray tracer, an acoustic propagation prediction for the day and a recording system that can be used for debriefing and training.

Specifications

Acoustic array: 24 identical staves
Frequencies: 11, kHz, 12 kHz, 13 kHz
Transmitter: Omnidirectional transmission in CW and FM modes
Receiver: 36 preformed beams; advanced processing with replica correlator in FM and spectrum analysis (FFT) in CW
Video processing: Data processing in FM and CW modes; automatic detection and tracking; simultaneous multitrack extraction (up to 64); target analysis (apparent length, Doppler measurement)
Range scales: max 15,000 m (49,212 ft)
Display: High-resolution flicker-free colour TV monitors
Total weight: 1,500 kg (3,307 lb)

Manufacturer/Contractor

Thomson CSF, Sophia Antipolis Cedex, France.

Type 162M sonar

Sonar Type 162M detects and classifies both mid-water and seabed targets, displaying port and starboard recordings simultaneously on a single straight-line recorder, which has a maximum range scale of 1,200 yd. Operation is simplified by entirely automatic gain control. The three transducers are all similar and employ 49.8 kHz barium titanate elements. Their beam pattern is fan-shaped, about 3° wide and 40° vertical angle; the side-looking elements have their axes 25° below the horizontal. A loudspeaker and a socket for headphones enable signals to be monitored aurally if required. The three range scales are 0 to 300, 0 to 600 and 0 to 1,200 yds, and accuracy is better than two per cent assuming a sound velocity of 4,920 ft/s.

Manufacturer/Contractor

AB Precision (Poole) Limited, Poole, Dorset, UK.

AVIATION

AVIATION FACILITIES

General

There are two different arrangements for helicopters. In the first four ships (F 33, F 34, F 35, F 36) the layout is the same as in the British 'Broad Beam' Leanders. Thus, the Limbo Mk 10 ASW mortar is set into the main deck immediately aft of the flight deck, resulting in an area of sufficient size to operate a Chetak (Alouette III). The hangar is of the standard 'Leander' class design and size.

In the last two (F 41, F 42), the after end of the hull has been completely redesigned enabling the flight deck to be extended to the stern and resulting in an area of sufficient size to operate a Sea King helicopter. The hangar has also been rebuilt and is considerably larger.

HELICOPTERS

One HAL Chetak (licence-built Aerospatiale Alouette III) light helicopter

F 33, F 34, F 35, F 36.

Specifications

Dimensions:
main rotor diameter: 11.02 m (36.15 ft)
rotor disc area: 95.38 m² (1,026.6 sq ft)
Length overall, rotors turning: 12.84 m (42.13 ft)
height to rotor head: 2.97 m (9.45 ft)
Weights:
empty, standard: 1,230 kg (2,711 lb)
max take-off weight: 2,200 kg (4,850 lb)
Speed:
max speed (never-exceed) at sea level: 113 kts (210 km/h)
max cruising speed at sea level: 100 kts (185 km/h)
range with max fuel at sea level: 257 n miles (477 km)
Endurance: 3 h
Engine: 1–649 kW (870 shp) HAL-built Turbomeca Artouste IIIB turboshaft, derated to 410 kW (550 shp) for max continuous operation
Accommodation: 7 (pilot plus 6 persons)
Weapons: 7.62 mm machine gun (with 1,000 rds), or 20 mm gun (with 480 rds), or 2/4 wire-guided missiles, or 68 mm rocket pods

Manufacturer/Contractor

Hindustan Aircraft Ltd, India.

Westland Sea King Mk 48 B/C ASW helicopter

F 41, F 42.

Specifications

Dimensions:
main rotor diameter: 18.90 m (62.0 ft)
length overall (both rotors turning): 22.15 m (72.66 ft)
fuselage length: 17.02 m (55.83 ft)
height to rotor head: 4.74 m (15.5 ft)
Weights:
max take-off: 9,752 kg (21,500 lb)
internal cargo capacity: 2,720 kg (6,000 lb)
max speed (never-exceed): 144 kts (267 km/h)
Speed:
typical cruising speed: 120 kts (222 km/h)
service ceiling: 3,720 m (12,200 ft)
range with max standard fuel: 630 n miles (1,166 km)

Engines: 2—1,092 kW (1,465 shp) Rolls-Royce Gnome H.1400-IT turboshafts
Role equipment: 6 underwing pylons, torpedo bay, 32 sonobuoy ports, 2 depth-charge racks, search radar, FLIR, MAD
Accommodation: 4 (pilot, co-pilot, two sonar operators)
Sensors: Low-frequency 360° AQS-18/AQS-13F sonar; Doppler radar; SMA/APS-707 radar (chin radome)
Weapons: 2 or 4 homing torpedoes, or 4 depth charges or 2 Sea Eagle anti-ship missiles

Manufacturer/Contractor
Westland Helicopters, Yeovil, UK.

PROPULSION

Specifications
System: Steam turbine
Main machinery: 2 Babcock & Wilcox boilers; 38.7 kg/cm² (550 psi); 450°C (850°F); 2 steam turbines; 22.4 MW (30,000 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The Indian Navy depended on British warships for the first two decades of its independent existence; many of these were former RN ships, although some were built to Indian orders, but in British yards. When a new class of frigates was required, however, it was decided to take a British design, but to build it in India.

DESIGN

The basic design that was selected was the 'Broad Beam Leander' and the first to be built, *Nilgiri* (F 31), was an almost total repeat of the parent design, complete with the then standard RN combat suite, which comprised a Mk 6 twin 114 mm mounting, a Mk 10 Limbo ASW mortar, GWS.22 Seacat SAM launcher, Type 993 surveillance radar, Type 965 air warning radar, Type 184 hull-mounted sonar and Type 199 VDS.

The second, *Himgiri* (F 32), was very similar, but the electronics were increasingly replaced by Signaal-designed equipment, manufactured under licence in India by Bharat Electronics. Thus, in *Himgiri:*

air warning radar; DA 08 replaced Type 965
surveillance radar; ZW 06 replaced Type 993
forward fire control; M45 replaced Type 903

The third and fourth ships, *Udaygiri* (F 33) and *Dunagiri* (F 34), included all the changes made in *Himgiri,* but had two additional Seacat launchers aft (with Signaal M44 directors), and were delivered without the Type 199 VDS.

In the fifth and sixth ships, *Taragiri* (F 41) and *Vindhyagiri* (F 42), the after end was completely redesigned. The Limbo Mk 10 ASW launcher was removed, the flight deck considerably enlarged and a much bigger hangar installed.

This enabled the ships to operate a Sea King helicopter, but, since the new flight deck displaced the mooring facilities, it became necessary to open the deck below for handling mooring gear and to cut down the stern.

Other changes in the last two ships included installing two triple torpedo mountings abreast the hangar and a twin Bofors 375 mm ASW rocket launcher forward. There have also been reports, as yet unconfirmed, that these two ships have more powerful engines than the previous four.

MODERNISATION

At future refits it is planned that the first four ships will be brought up to the same standard of weapons and sensors as the last two.

DEPLOYMENT

These six ships form the 14th Frigate Squadron.

OPERATIONAL

Taragiri had a serious fire in 1994 but was repaired and returned to active duty in 1995.

INS Krishna
In addition to these six ships, the Indian Navy operates an ex-RN Leander, the former *Andromeda* (F 57), which was purchased in 1995. As *Andromeda* the ship had recently undergone an extensive refit for further RN service, but was then declared redundant and offered for sale. The Indian Navy bought the ship and has converted it for use in the training role. It now has minimum armament and although wearing a frigate pennant number (F 46) it is effectively an auxiliary.

Vindhyagiri *(F 42) in refit at Mazagon Dock, Bombay* (Mazagon Dock Ltd)

WEAPONS SYSTEMS

ANTI-SHIP MISSILES (ASM)

McDonnell Douglas RGM-84B Harpoon

Eight Harpoon anti-ship missiles are carried in two pairs of four launcher-containers mounted abaft the stack. The missiles are either Block 1B or Block 1C versions, the latter having a similar performance to the Block 1B but with certain additional options, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications

Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

Short Seacat GWS.22

These ships have two Seacat launchers and two Signaal M 44 directors, situated on the hangar roof. The missiles also have a secondary, anti-ship capability.

Specifications

Missile
Length: 1.48 m (4.86 ft)
Diameter: 19 cm (7.48 in)
Wing span: 65 cm (25.6 in)
Weight: 68 kg (150 lb)
Speed: Mach 0.8
Range: 5 km (2.7 n miles)
Radar: Type 904 (see radar table)

Manufacturer/Contractor

MSI-Defence Systems (formerly Short Brothers plc), Belfast, UK.

TUBES

Two 324 mm US Mk 32 torpedo tubes are mounted at the forward end of the after superstructure.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 76 mm (3 in)/62 Compact

There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck. This was installed by Rykswerf, Den Helder during the Dutch Navy's mid-life modernisation programme.

Oswald Siahaan *(354) showing the hangar, the Seacat launcher and the large antenna for the Signaal LW-03 radar. Note also the 12.7 mm machinegun below and to the right of the crane jib, mounted for anti-piracy missions*

Specifications
Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/sec
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

UA-8/UA-9/UA-13

These ships retain their British passive radar intercept systems, which are all elderly, analogue, manually operated equipments.

UA-8 (all) covers the frequency band 2.4-4.1 GHz
UA-9 (all) covers the frequency band 7-11.5 GHz
UA-13 (355 and 356 only) is a DF equipment covering the frequencies 24 to 1,400 MHz.

FH 5 HF/DF

All ships are fitted with the FH 5 direction-finding equipment.

DECOYS

Corvus chaff dispensing system

There are two Corvus 8-barrel decoy launchers. Corvus is a quick reaction, self-defence system firing chaff dispensing rockets to form a radar decoy screen around the vessel. The system comprises: two multibarrelled rocket launchers, launcher control and firing panel, and the 'window' dispensing rockets themselves. There are two modes of operation: distraction decoy; and centroid decoy. A cylindrical rotating structure carries eight launching tubes mounted in two sets of three, one above the other, and crossed at 90° in azimuth with two further tubes set above, and aligned midway between the other tubes, all at a fixed elevation of 30°. The maximum loading of 16 'window' rockets provides protection against three missile attacks, before reloading. The normal limits of the training arc for the launcher are between 60 and 120° but as the lower sets of rocket barrels are angled about the centreline of the rotating structure, the arc covered by the rockets is considerably greater.

Indonesian frigate Ahmad Yani *(351) is the former Dutch* Tjerk Hiddes. *These ships have Signaal radars and electronic systems, an OTOBREDA 76 mm gun and US Mk 32 torpedo tubes*

Specifications
Training
Bearing arc (normal) ie launcher axis: 60-120°
Bearing arc (max) ie tube axis: 15-165°
Tube diameter: 195 mm (7.68 in)
Tube length: 1.6 m (5.25 ft)
Weight (empty): 25 kg (55 lb)
No of guides: 4, RH spiral

Manufacturer/Contractor
Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

SEWACO V action data automation/Daisy data processing

SEWACO V is the system which was installed during the mid-life update of the six 'Van Speijk' class frigates. Sensors include an LW-02 air warning radar, a DA-05 air and surface warning and target indication radar, a Decca navigation radar with two displays, IFF and helicopter transponder system, two optical target designation sights, two sonar sets, an ESM system and an automatic datalink. The action information system is of the DAISY type and includes four horizontal tactical display consoles with alphanumeric displays and a plotting table. The weapons fit comprises an OTO Melara 76 mm/62 dual-purpose gun, controlled by an M 45 weapon control system, Seacat launchers controlled by an M 44 system, a Harpoon SSM system, ASW torpedoes and ECM equipment, and a Westland Wasp ASW helicopter.

SEWACO V's functions include:
Air, surface and subsurface warning
Compilation and display of tactical air, surface and subsurface situations
Threat evaluation and target engagement in AAW, EW, Anti-Surface Warfare, ASW and shore bombardment
Navigation including ASW helicopter direction
Communication including tactical datalink operation
Onboard scenario-driven training
Organisation and system management.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

WEAPONS CONTROL

LIOD electro-optic director

Signaal LIOD Mk 2 directors have been fitted in 353, 354 and 356. LIOD (LIghtweight Optronic Director) is a weapon control system designed to conduct automatic or manual rate-aided tracking of an air and a surface target while controlling two or more dual-purpose guns of different types. The system tracks targets moving at up to 800 m/s (3,048 ft/s) and can track large warships at 20 km and fighter-size aircraft at 10 km. It consists of an electro-optical director, one or two TDS directors and a control console. The main director has a TV camera with a field of view of 2-20°, an 8-12 micron IR camera with a field of view of 1.2/7.5° and an Nd:YAG laser rangefinder. The two cameras operate to the CCIR standard.

The console, which also houses the SMR-MU general purpose computer, receives data not only from the electro-optic systems but also from the ship's reference systems. Tracking is by the optical contrast technique whereby the target is tracked against its background as viewed by a TV or infra-red camera. The TV camera has automatic filters to adjust for light conditions. Alternatively a correlation tracker can be implemented which is capable of automatic target acquisition. Range information is provided by a laser rangefinder. Alternatively a laser-tracker can be fitted. Both the camera and rangefinder are co-mounted on the director head unit, which is provided with appropriate servos and anti-vibration mountings. The daylight version is fitted with a TV camera and laser, while the high-performance model has a TV camera, infra-red camera and laser rangefinder.

The LIOD sensor in its basic version, employed as an autonomous weapon control system, is capable of performing the following functions:

Optical surveillance for air and surface targets
Target designation for anti-air and anti-surface engagements
Air or surface fire control
Automatic or rate-aided tracking of one air or surface target
Air or surface target gun prediction calculation
Independent control of two or more dual-purpose guns of the same or different calibre
Engagement monitoring, kill assessment, and gun fire correction
System status monitoring.

Specifications

Director
Weight: 200 kg (441 lb)
Traverse: 360°
Elevation: −30 to +115°
Traverse speed: 130°/s
Elevation speed: 130°/s
Laser rangefinder
Beam divergency: 1.2-1.5 mrad
Pulse length: 20 ns
Max repetition frequency: 10 Hz
Fields of view: 3-30° (TV camera); 3° (IR camera)
Power requirements: 115 V 400 Hz (2.5 kVA); 115 V 60 Hz (0.7 kVA)

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

SONAR

EDO CWE-610 hull-mounted active sonar system

The CWE-610 low-frequency (LF) sonar is designed for the long-range detection of submarines in deep and shallow water. There is a 36 stave transducer in a dome under the hull and two active consoles, enabling it to perform a search-while-track function. Facilities offered include a search capability in three 120° sectors, passive correlation, and reverberation processing. Transmissions are at 6, 7 and 8 kHz and use 10° preformed receiver beams. Range of the active system is approximately 30,000 m (98,430 ft) and there is a passive display for greater ranges. The sonar system outputs data automatically into SEWACO-V. All mode changes and range scale changes are controlled by console push-buttons, and displays include a Doppler display on each of the active consoles and a passive sonar bearing time recorder display. CWE-610 was designed specifically to meet Dutch requirements for the 'Tromp' class and was also fitted in the 'Van Speijk' class. There is also a VDS.

Manufacturers/Contractors

EDO Corporation, Government Systems Division, College Point, New York.
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

AVIATION

AVIATION FACILITIES

Shafts: 2

FURTHER INFORMATION

PROGRAMME

On 11 February 1986 an agreement was signed with the Netherlands for the transfer of two of this class with an option on two more. The ships were provided with all spare parts but not towed arrays.

DUTCH MODERNISATION

While still serving with the Dutch Navy, this class underwent mid-life modernisation at Rykswerf, Den Helder between 1976 and 1983. The work included replacing the 114 mm (4.5 in) turret by an OTO Melara (now OTO-BREDA) 76 mm Compact, removing the Mk 10 Limbo ASW mortar and mounting twin triple 324 mm torpedo tubes. Other work included installing the Signaal SEWACO V combat data system, new electronics, communications systems and electrics. The hangar was enlarged and made telescopic, and the flight deck extended to enable the ships to accommodate Lynx. Extensive automation enabled the complement to be reduced from 250 to 190 and the extra space resulted in considerably enhanced habitability.

Two quadruple Harpoon anti-ship missile launchers were installed, although initially only the first two ships could be fitted, because there was no FMS funding for the others. Later, however, the US Navy provided sufficient SWG-1A panels for all of the class to be retrofitted with Harpoon missiles. During this mid-life refit all six ships received the PDE 700 VDS.

Later improvements while in Dutch service included the installation of AN/SQR-18A passive towed array in *Evertsen* and *Isaac Sweers*. Also, all six ships were fitted with the characteristic IR suppressing funnel caps.

TRANSFER

Only two ships, *Ahmad Yani* and *Slamat Riyadi* were transferred with a complete Harpoon capability, but it is reported that all six ships are now fully Harpoon capable. In addition, the AN/SQR-18A towed arrays were removed from *Evertsen* and *Isaac Sweers* prior to transfer. Although the ships had been converted while in Dutch service to operate Lynx helicopters, they were transferred with the smaller Wasp helicopters, also from Dutch Navy stocks.

INDONESIAN MODERNISATION

In 1994 the Indonesian Navy ordered three LIOD electro-optical (TV/IR/laser) fire-control systems from Signaal. These were fitted in 1995/96 by PT PAL, Soerabaya, to *Yos Sudarso* (353), *Oswald Siahaan* (354) and *Karel Satsuitubun* (356) as the fire-control director for the 76 mm gun. LIOD is also integrated with the SEWACO V tactical data system.

Oswald Siahaan *(354) was commissioned in 1967 as the Dutch* Van Nes *and was sold to Indonesia in 1988* (John Mortimer)

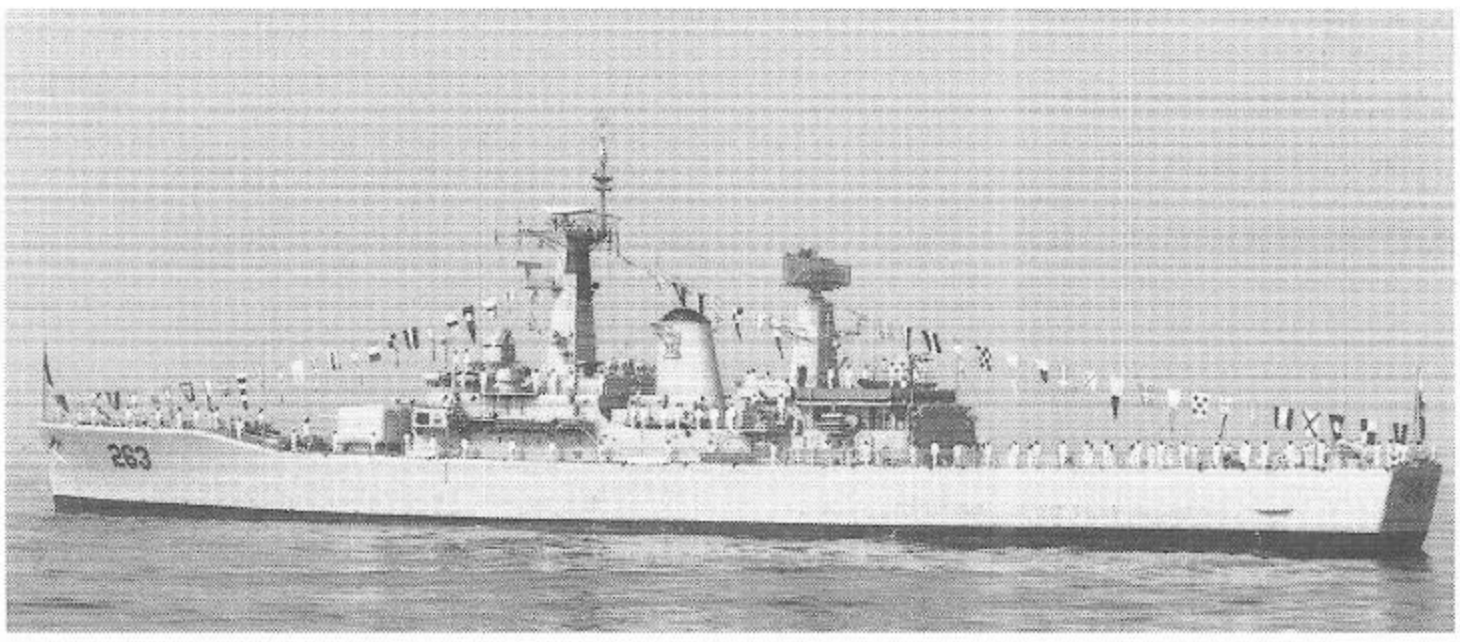
WEAPONS SYSTEMS

GUNS

Vickers 114 mm (4.5 in)/55 Mk 6 multipurpose gun

There is a twin 114 mm (4.5 in) Mk 6 mounting in 'A' position to provide quick-reaction short-range air defence, to engage surface targets including fast attack craft, and to provide gunfire support to ground forces. The weapon system consists of the gun mounting, the ammunition feed system, the remote power control system, and the captain-of-turret panel. The mounting includes two Mk V barrels, which are 6.22 m long, fitted with a muzzle brake and fume extractor, and have a life of 3,300 rounds EFC. The mounting is completely enclosed in a shield which protects it against the environment, blast and shrapnel. The loading system is hydraulically operated, with an autoloader which is manually fed by two loaders and has a capacity of six rounds. The hoist transfers them in two stages to the turret from where they are raised by a pivoting loading arm to the breech where they are inserted by a power rammer. After the shell is fired the case is extracted automatically and ejected through a chute in the front of the mounting.

Specifications
Calibre: 114 mm
Length of barrel: 45 calibres
Traverse: 360°
Elevation: 0 to +89°
Muzzle velocity: 746 m/s (2,447 ft/s)
Weight of projectile: 25.5 kg (56 lb)
Rate of fire: 14 rds/min/barrel



Shamsher *(F 263) with three twin Type 61 25 mm cannon*

Range:
anti-surface: 10.25 n miles (19 km)
anti-air: 12,500 m (41,000 ft)
Crew: 20

Manufacturer/Contractor
Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

Type 61 25 mm air defence cannon

When these ships were transferred from the UK their armament included one Seacat SAM launcher and a number of 20 mm cannon, but these have all been removed and replaced by three twin Type 61 25 mm mounts, a weapon which is already in use with the Pakistan Navy. This Chinese weapon is based on the Soviet 2-M-3 twin 25 mm mounting which was supplied to China where it entered production as Type 61; it arms 'Luda' class destroyers and various types of smaller craft. 2-M-3 consists of two guns installed one above the other in separate cradles and lying on their sides; they are fed from the right-hand side. The barrel is 1.5 m long and air-cooled with a flash suppressor and an exposed spring recuperator wrapped around the barrel near the breech. A hydraulic recoil buffer is on the underside of the gun. The weapon has a vertical wedge breech block and the breech casing contains both the breech mechanism and part of the loading mechanism. The ammunition is either in five-round clips or 65-round belts whose boxes are attached to the trunnions. The first round is loaded manually into the breech, the breech block rises and the gun fires when the firing pin strikes the cartridge percussion cap. Upon recoil the breech block opens and extractor arms propel the spent case along the loading tray and down a

chute to one side of the gun. The recoil forces activate the loading mechanism and allow succeeding rounds to be rammed into the breech automatically.

Specifications

2-M-3
Calibre: 25 mm
Length of barrel: 60 calibres
Traverse: Unlimited
Elevation: −10 to +85°
Traverse speed: 25°/s
(manual/hydraulic): 70°/s
Elevation speed: 15°/s
(manual/hydraulic): 40°/s
Rates of fire: 450 rds/min/barrel
Projectile: 0.28 kg HEI-T
Range:
anti-surface: 1.5 n miles (2.75 km)
anti-air: 2,800 m

ANTI-SUBMARINE MORTARS

Anti-Submarine 304.8 mm (12 in) Mortar Mk 10 Limbo

These ships retain the British-developed Limbo, triple-barrel 304.8 mm mortar system, which is mounted aft of the flight deck. The three barrels are installed in line on a massive metal mounting with a metadyne system for stabilising it in pitch and roll. The projectiles are loaded automatically from magazines alongside the mounting, the mortar tubes being laid horizontally with a pneumatic system moving rounds down the barrel. Fuze settings are set automatically through relays and uniselectors. The magazine has a capacity of 51 rounds. Training of the mortar is carried out automatically from the combat information centre using data from the ship's sonar system. The Limbo system fires its projectiles in a three-dimensional pattern. The projectiles can be set to explode at various depths using hydrostatic or impact fuzes. Limbo has a crew of seven.

Limbo is controlled by the MCS (Mortar Control System) Mk 10. The original system used vacuum-tube technology and during the 1960s systems in British service were updated with new solid-state electronics in the computer and sonar display system. The sonar is the Type 170 with square transducer and a frequency of 15 kHz.

Specifications

Weight: 35 t
Range: 900 m (984 yd)
Projectile: 177 kg (390 lb)
Explosive: 94 kg (207 lb)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

UA-8/UA-9/UA-13

These ships retain their British passive radar intercept systems, which are all elderly, analogue, manually operated equipments.

UA-8 covers the frequency band 2.4-4.1 GHz
UA-9 covers the frequency band 7-11.5 GHz
UA-13 is a DF equipment covering the frequencies 24-1,400 MHz.

ELECTRONIC COUNTERMEASURES (ECM)

Type 668 jammer

Type 668 is a British-made noise jammer from the 1960s. It covers the frequencies 2.5-4.1 GHz.

DECOYS

Graseby Type 182 towed torpedo decoy equipment

Type 182 towed torpedo decoy is designed to decoy both active and passive homing torpedoes, using signals electronically generated within the ship and fed, via the towing cable, to electroacoustic transducers within the towed body. The Type 182 produces two independently controllable output signals which are radiated simultaneously from the towed decoy. An amplitude modulated noise signal simulates the ship's propeller noise and causes passive-homing torpedoes to be seduced away from the ship towards the towed decoy. The second signal is a swept CW signal, which simulates sonar echoes, in order to confuse or jam the guidance system of active homing torpedoes, thus causing them to miss the ship. The frequency bands covered by both types of output are switchable to meet tactical scenarios and to enable concurrent operation of other sonar and communication equipments.

Specifications

Towed decoy:
diameter: 533 mm (21 in)
length: 2.01 m (6.6 ft)
weight: 74 kg (163 lb)
Towing cable:
length: 411 m (1,348 ft)
diameter: 14.48 mm (0.57 in)
weight: 269 kg (593 lb)

Manufacturer/Contractor

Graseby Marine (Graseby Dynamics Ltd), Watford, UK.

Corvus chaff dispensing system

There are two Corvus 8-barrel decoy launchers. Corvus is a quick reaction, self-defence system firing chaff dispensing rockets to form a radar decoy screen around the vessel. The system comprises: two multibarrelled rocket launchers, launcher control and firing panel, and the 'window' dispensing rockets themselves. There are two modes of operation: distraction decoy; and centroid decoy. A cylindrical rotating structure carries eight launching tubes mounted in two sets of three, one above the other, and crossed at 90° in azimuth with two further tubes set above, and aligned midway between the other tubes, all at a fixed elevation of 30°. The maximum loading of 16 'window' rockets provides protection against three missile attacks, before reloading. The normal limits of the training arc for the launcher are between 60 and 120° but as the lower sets of rocket barrels are angled about the centreline of the rotating structure, the arc covered by the rockets is considerably greater.

Specifications

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

MRS 3 system for 114 mm guns.

SONARS

Kelvin Hughes Type 162 M

The British Kelvin Hughes Type 162 M ('Cockchafer') side-looking target detection sonar is designed to detect and classify seabed targets, such as a bottomed submarine. There are three transducers: one faces downwards at 25° below the horizontal, while the other two face sideways to cover a 3° wide and 40° vertical sector. The transmitter delivers 40 W to the central, downward-looking transducer and 80 W each to the side-looking transducers. The set operates at 50 kHz and range scales are 270 m (300 yd), 550 m (600 yd) and 1,100 m (1,200 yd)

Manufacturer/Contractor

Kelvin Hughes, Watford, UK.

Type 170 B sonar

Type 170 B is the sonar used to control the Limbo Mk 10 ASW mortar; it was also produced in Canada as

the AN/SQS-502. Operating frequency is 15-25 kHz and the system has a maximum operating range of about 1,800 m (2,000 yd) and a maximum depth of about 350 m (1,200 ft)

Type 184P active/passive hull-mounted search sonar

Type 184P was an in-service upgrade to Type 184M. Type 184P is a 360° scanning sonar, incorporating both active and passive modes of operation, which provides range, bearing and target Doppler data to the fire-control computer. The equipment provides a dual-frequency transmission and three receiver systems. The latter comprise: an all-round search and tracking PPI system with, in the Type 184P, 16 receiving channels, which gives greater bearing accuracy. The upgrading also involved inserting 31 digital filters in each of the four beam channels, enabling the system to measure Doppler speeds of up to ±40 kts. There is also a continuous torpedo warning system with its own display. A circular 32-stave transducer array is employed. The keel-mounted, retractable dome is 3.99 m long, 1,62 m wide and 1.55 m deep. Operating frequencies are 7.5 kHz and 9 kHz.

Manufacturer/Contractor

Graseby Marine (Graseby Dynamics Ltd), Watford, Hertfordshire, UK.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 19.2 × 13.1 m (63 × 43 ft)

HELICOPTERS

One Aerospatiale SA319B Alouette III light helicopter

Specifications

Dimensions:
main rotor diameter: 11.02 m (36.15 ft)
rotor disc area: 95.38 m² (1,026.6 sq ft)
length overall, rotors turning: 12.84 m (42.13 ft)
height to rotor head: 2.97 m (9.45 ft)
Weights:
empty, standard: 1,230 kg (2,711 lb)
max take-off weight: 2,200 kg (4,850 lb)
max speed (never-exceed) at sea level: 113 kts (210 km/h)
max cruising speed at sea level: 100 kts (185 km/h)
range with max fuel at sea level: 257 n miles (477 km)
Endurance: 3 h
Engine: One 649 kW (870 shp) HAL-built Turbomeca Artouste IIIB turboshaft, derated to 410 kW (550 shp) for max continuous operation
Accommodation: 7 (pilot plus 6 persons)
Sensors: 2 of the 8 helicopters have MAD
Weapons: 2 depth charges or one Type 244S torpedo

PROPULSION

Specifications

System: Steam turbines
Main machinery: 2 Babcock & Wilcox boilers; 38.7 kg/cm² (550 psi); 454°C (850°F); 2 White/English Electric turbines; 22.4 MW (30,000 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

Since its formation in 1947 the Pakistan Navy's surface fleet has consisted of a mixture of second-hand British and US destroyers and frigates. Recent acquisitions from the UK have included six Type 21 frigates and these two Leanders. Both *Diomede* and *Apollo* were Broad Beam Leanders, belonging to the unconverted group and had thus had no modernisation work done on them. They were transferred to the Pakistan Navy as *Zulfiquar* (14 October 1988) and *Shamsher* (15 July 1988) respectively.

MODERNISATION

The Wasp helicopter was not included in the transfer and the Pakistan Navy operates an Alouette III from these ships.

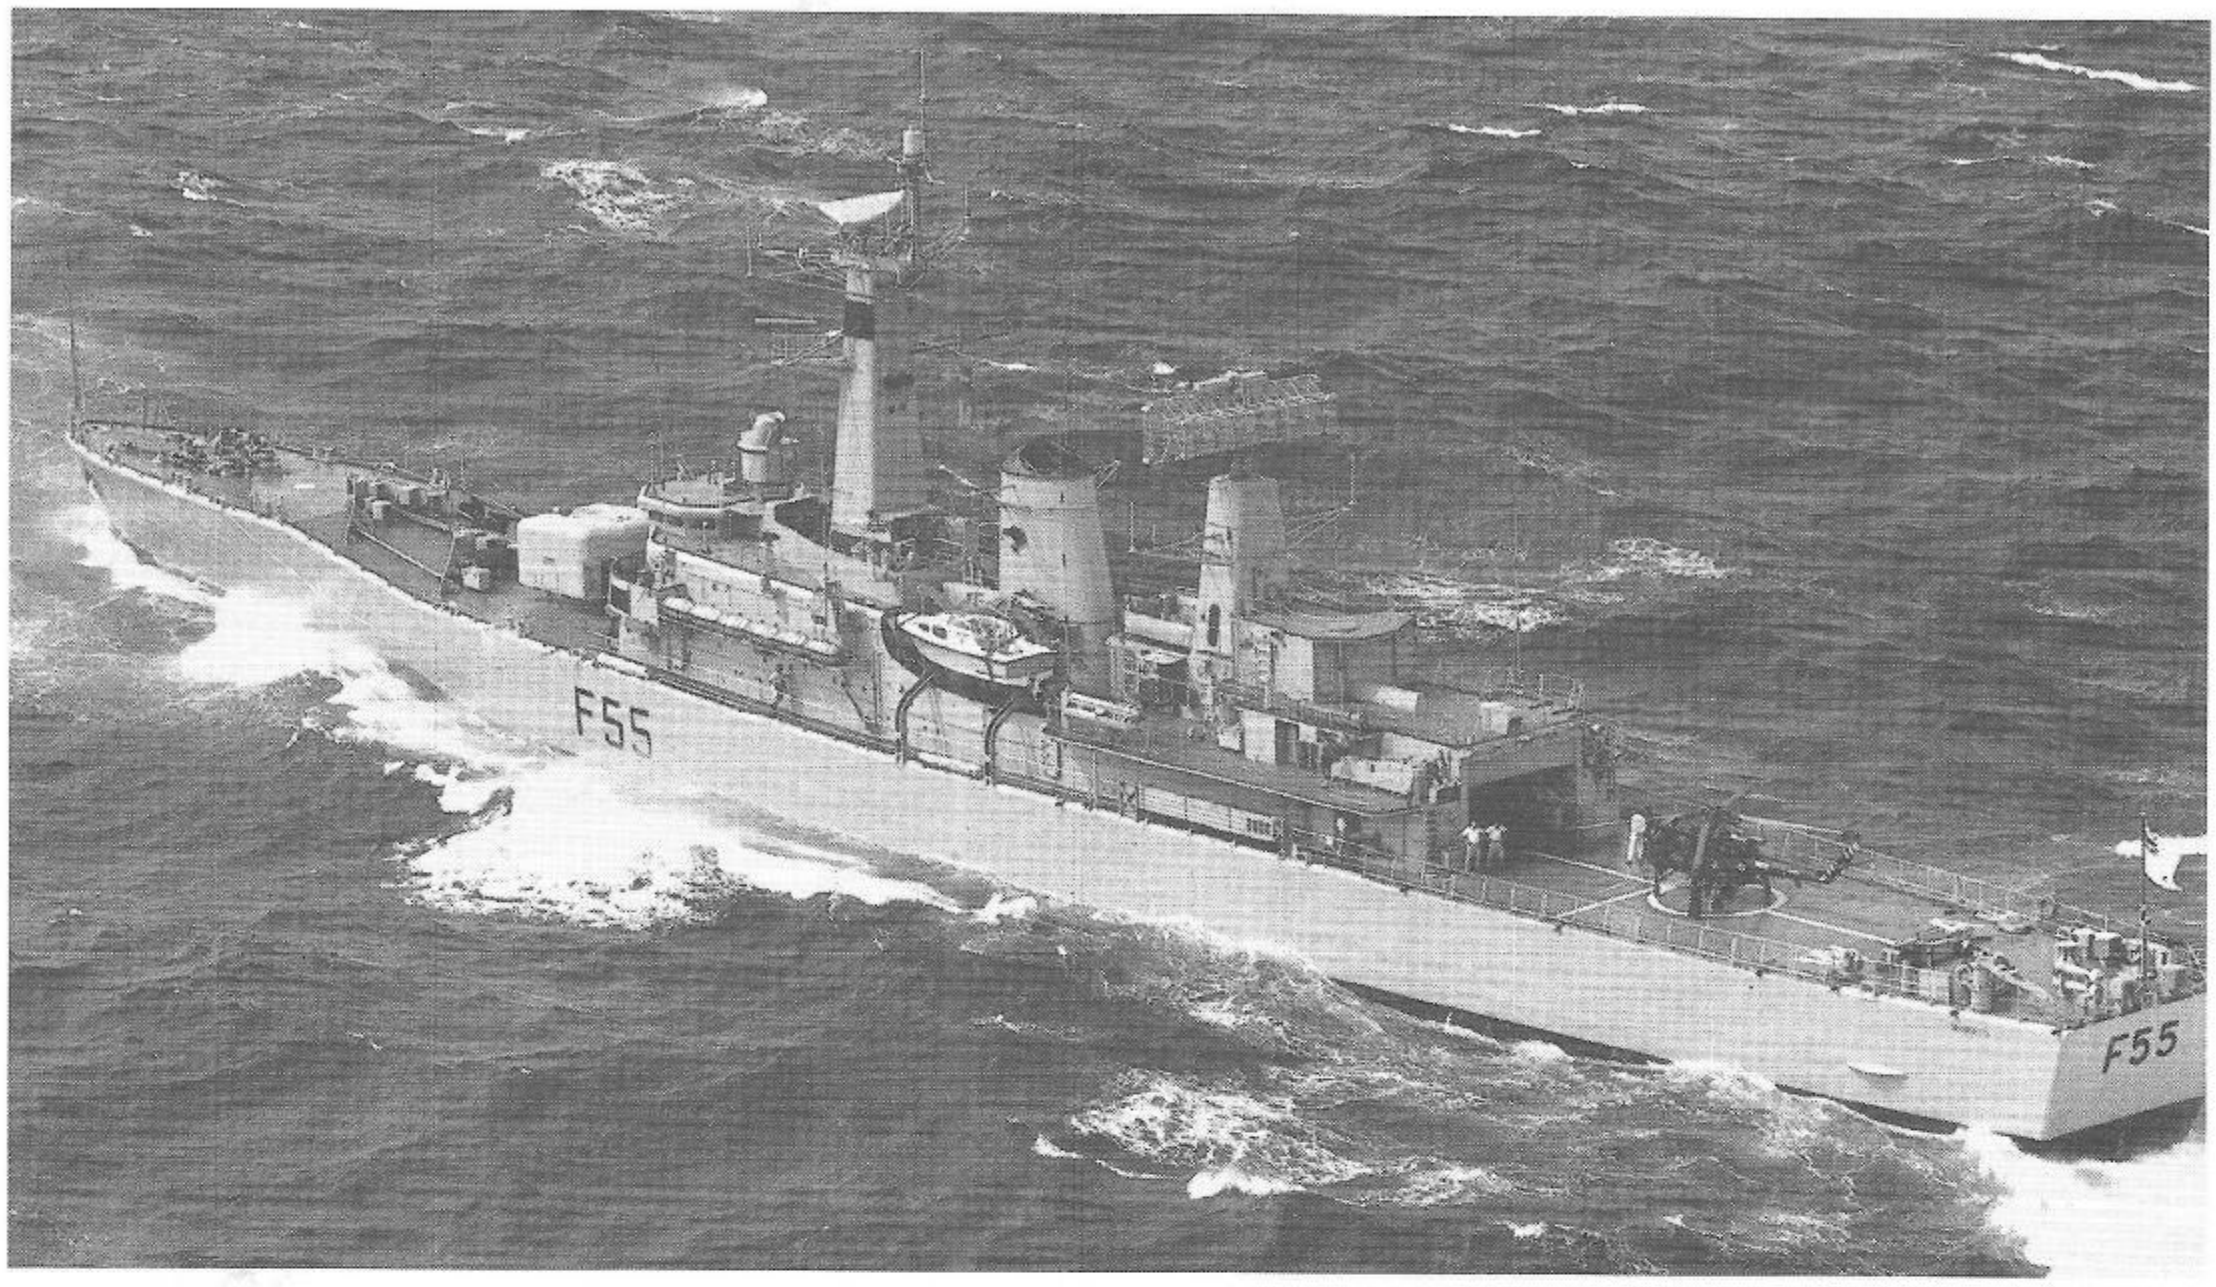
The ships were refitted in 1991-92 and among the work carried out was the removal of the GWS.22 Seacat launchers and the 20 mm guns, and their replacement by Chinese Type 61 twin 25 mm mounts.

OPERATIONAL

These ships are rather lightly armed, with only the twin 114 mm mounting and the three twin 25 mm cannon for air and surface engagements. For ASW operations there is the Limbo mortar and the Alouette helicopter, which has limited capabilities.

The Pakistan Navy's Zulfiquar *(F 262) is virtually unmodified from when it left the UK Royal Navy in 1988. Note the 'half-cheese' antenna of the Type 993 radar atop the foremast and the UA-13 conical DF array at the masthead* (H M Steele)

WELLINGTON (LEANDER)



Waikato *(F 55) is due to be paid off in 1999 at the latest* (Royal New Zealand Navy)

GENERAL SPECIFICATIONS

Operator: New Zealand
Type: Leander (Broad Beamed)

Class: WELLINGTON (FF)

Purchased: 4
Active: 3

Displacement:
standard: 2,474 t
full load: 2,945 t

Dimensions
Length: 113.4 m (372 ft)
Beam: 13.1 m (43 ft)
Draught: 5.5 m (18 ft)

Speed: 28 kts
Range: 5,500 n miles at 15 kts

Complement: 245 (15 officers) *(Canterbury);* 260 (19 officers) *(Wellington)*

WEAPONS SYSTEMS

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited aft, either side of the hangar.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

Vickers 114 mm (4.5 in)/55 Mk 6 multipurpose gun

There is a twin 114 mm (4.5 in) Mk 6 mounting in 'A' position to provide quick-reaction short-range air defence, to engage surface targets including fast attack craft, and to provide gunfire support to ground forces. The weapon system consists of the gun mounting, the ammunition feed system, the remote power control system, and the captain-of-turret panel. The mounting includes two Mk V barrels, which are 6.22 m (20.4 ft) long, fitted with a muzzle brake and fume extractor, and have a life of 3,300 rounds EFC. The mounting is completely enclosed in a shield which protects it against the environment, blast and shrapnel. The loading system is hydraulically operated, with an autoloader which is manually fed by two loaders and has a capacity of six rounds. The hoist transfers them in two stages to the turret from where they are raised by a pivoting loading arm to the breech where they are inserted by a power rammer. After the shell is fired the case is extracted automatically and ejected through a chute in the front of the mounting.

Specifications
Calibre: 114 mm
Length of barrel: 45 calibres
Traverse: 360°
Elevation: 0 to +89°
Muzzle velocity: 746 m/s (2,448 ft/s)
Weight of projectile: 25.5 kg (52.3 lb)

Canterbury *(F 421) in 1996 approaching the end of a long refit. The newly installed Phalanx can be seen on the hangar roof, although the enlarged flight deck and hangar are not so obvious* (RNZN)

Rate of fire: 14 rds/min/barrel
Range:
anti-surface: 10.25 n miles (19 km)
anti-air: 12,500 m (41,012.5 ft)
Crew: 20

Manufacturer/Contractor
Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

Hughes Mk 15 Mod 11 CIWS Phalanx
A single Hughes Mk 15 Mod 11 Phalanx close in weapons system (CIWS) is mounted on the roof of the hangar aft, replacing the GWS.22 Seacat system previously carried. The Phalanx provides the innermost layer of defence against anti-ship missiles. The 20 mm M61A1 Vulcan, six-barrel, Gatling-principle gun has a cylindrical magazine with the feed mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds. This is the only known Phalanx installation in 'Leander' class frigates.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 3,000 rds/min
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor
Hughes Missile Systems, Tucson, Arizona, USA (systems).

M2HB 12.7 mm (0.50 in) machine guns
Up to six M2HB 12.7 mm machine guns are carried and can be mounted on flexible mounts.

Specifications
Calibre: 12.7 mm (0.50 in)
Rate of fire: 450-550 rds/min
Muzzle velocity: 883 m/s (2,900 ft/s)
Max effective range:
anti-surface: 6,700 m (7,400 yd)
anti-air: 1,380 m (4,500 ft)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Argo AR-700 Phoenix
Argo AR-700 is an advanced modular ESM suite covering frequencies from 0.5 to 18 GHz, which is designed to counter most known radar threats. The Argo AR-700 is an IFM receiver, providing surveillance and radar warning over 2-18 GHz band. The antenna array consists of a mast-mounted ESM antenna assembly with two DF arrays, one omnidirectional unit and two monopulse units.

Specifications
AR-700
Frequency coverage: 0.5-18 GHz
High sensitivity: up to −67 dBm
Detection range: 200 n miles ships; 50 n miles aircraft
DF accuracy: 4° RMS; 2° RMS fine DF
Automatic tracking: 500 active signals in dense signal environment
Signal identification speed: <1 s

Manufacturer/Contractor
ARGOSystems Inc, Sunnyvale, California.

Telegon PST 1288 HVU
The PST 1288 is a direction-finding (DF) equipment from Telegon (TELEfunken GONiometer).

ELECTRONIC COUNTERMEASURES (ECM)

Type 668/669 jammers
Type 668 and Type 669 are British-made noise jammers from the 1960s and formed the basis of Outfit UA-8/9. They give coverage across the frequencies 2.5-4.1 GHz and 7-11.5 GHz.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launchers
There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

Graseby Type 182 towed torpedo decoy equipment
Type 182 towed torpedo decoy is designed to decoy both active and passive homing torpedoes, using signals electronically generated within the ship and fed, via the towing cable, to electroacoustic transducers within the towed body. The Type 182 produces two independently controllable output signals which are radiated simultaneously from the towed decoy. An amplitude modulated noise signal simulates the ship's propeller noise and causes passive-homing torpedoes to be seduced away from the ship towards the towed decoy. The second signal is a swept CW signal, which simulates sonar echoes, in order to confuse or jam the guidance system of active homing torpedoes, thus causing them to miss the ship. The frequency bands covered by both types of output are switchable to meet tactical scenarios and to enable concurrent operation of other sonar and communication equipments.

Specifications
Towed decoy:
diameter: 533 mm (21 in)
length: 2.01 m (6.6 ft)
weight: 74 kg (163 lb)
Towing cable:
length: 411 m (1,348 ft)
diameter: 14.48 mm (0.57 in)
weight: 269 kg (593 lb)

Manufacturer/Contractor
Graseby Marine (Graseby Dynamics Ltd), Watford, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

NAUTIS command and weapon control system

NAUTIS (Naval AUTonomous Information System) is a command and weapon control system, which, as installed in the RNZN ships, uses five NAUTIC (Naval AUTonomous Intelligent Console) multifunction intelligent workstations. NAUTICs are based upon Intel iAPX-86 processors with 3 Mbyte RAM together with 2 Mbyte non-volatile magnetic bubble memory. Dual iAPX-286 microprocessors are used in Multibus configurations, while iAPX-186 microprocessors are used for intelligent interfaces. Each NAUTIC uses 150,000 lines of Ada-language software code. NAUTIC consoles are linked by a dual-redundant MIL-STD-1553B data highway.

An extensive system database is replicated in each console, and typically covers an area 2,000 × 2,000 n miles square (3,704 × 3,704 km). It includes radar and sonar tracks, route/search plans, user-designated tactical maps and synthetic charts. System capacity is 200 air, surface and submarine tracks and reference points with integral radar auto-tracking for up to 80 air and surface targets. The database can also include up to six user-designated tactical maps, 15 synthetic charts, 200 labelled reference points, 5,000 fully detailed underwater contacts and 32 labelled bearing lines. Manually initiated automatic radar tracking is possible for a minimum of 20 tracks.

Workstations accept various combinations of digital, synchro and analogue input/output for the whole range of sensors and weapons and interface options, including point-to-point, the data highway or a general purpose combat system highway. They also interface with optional elements, such as chart tables, plotter/printers and magnetic tape units, through point-to-point interfaces or the data highway. The NAUTICs are networked into a system designed to meet customer requirements with the workstations configured to meet specific tasks such as radar displays, automatic target tracking, tactical picture compilation, weapon direction and navigation.

Manufacturer/Contractor

GEC-Marconi Naval Systems, Combat Systems Division.

COMMUNICATIONS AND DATALINKS

Datalink

IFF: Hazeltine AN/TPX-54(V) Mk XII IFF
HF: GEC-Marconi ICS 4/ARC 109.

WEAPONS CONTROL

Lockheed Martin R-76C5 weapon control system

The R-76C5 is a gun fire-control system with distributed architecture system based upon seven RCA MIL-STD-1750A and Texas Instruments 9989 microcomputers within the consoles. The microcomputers are for gun control, ballistic calculations, radar data processing, data recording, data storage, interface and radar control. The software is written in the Assembler language. There are two consoles, one for Track and Gunfire Control (T/GFC), the other for Search and Designation (S/DC).

The associated TR-76 fire-control director is an I-band monopulse radar housed in a stabilised mounting with a TV tracker. Dual-monopulse tracking enables the use of missiles and guns simultaneously with data displayed on two A-scopes. The transmitter, with a peak power of 250 kW, employs a vacuum tube modulator allowing multiple waveforms and it features multiple pulsewidths of 0.25, 0.5 and 1.0 µs. The PRF is 1,000 to 3,000 pps and accuracy at 20 km is 10 m in range and 1 mrad angular. A 1 m² target can be detected at 21.5 n miles (40 km). The RNZN was the only customer for R-76C5, which is now out of production.

Manufacturer/Contractor

Lockheed Martin Government Systems.

SONARS

G 750 active/passive hull-mounted search sonar

The Graseby G 750 is a modernised and improved version of the Type 184M, providing accurate fire-control data from two independent automatic tracking systems whilst simultaneously maintaining all-round surveillance, independent Doppler search, and classification and continuous torpedo warning. Three separate processing and display systems are incorporated for: all-round search and tracking (PPI); Doppler; and passive search. The standard G 750 system uses a cylindrical 32-stave transducer to form a large number of beams. Range and bearing measurement is by in-beam scanning, obviating the need for separate expanded displays. Target range and bearing are measured by either a manually positioned marker technique, in which the circular markers are placed over the target echo, it being the marker position that is measured; or by echo gating, where the echo range and bearing are measured directly.

Provision is made for interfacing the G 750 sonar with computer-based ASW and tactical information systems to provide a source of range, bearing, and target Doppler data. Operational capabilities of the equipment include active detection of submarines throughout 360° and the ability to track two targets simultaneously. Similar detection coverage and tracking capabilities are available in respect of torpedo targets, with suitable outputs to torpedo warning and avoidance systems. There is also an active search capability over a 45° arc with facilities for determining target Doppler. Four 11° beams forming a 45° 'searchlight' are providing a 360° search facility capable of measuring target Doppler up to ±40 knots. The system is designed for operation in adverse reverberation conditions, with ripple or omnidirectional dual-frequency modulated and Doppler CW transmission modes. The system can be applied as an HF or LF variant. Targets can be tracked to a maximum range of 20 km.

Manufacturer/Contractor

Graseby Marine (Graseby Dynamics Ltd), Watford, UK.

Kelvin Hughes Type 162 M

The British Kelvin Hughes Type 162 M ('Cockchafer') side-looking target detection sonar is designed to detect and classify seabed targets, such as a bottomed submarine. There are three transducers: one faces downwards at 25° below the horizontal, while the other two face sideways to cover a 3° wide and 40° vertical sector. The transmitter delivers 40 W to the central, downward-looking transducer and 80 W each to the side-looking transducers. The set operates at 50 kHz and range scales are 270 m (300 yd), 550 m (600 yd) and 1,100 m (1,200 yd)

Manufacturer/Contractor

Kelvin Hughes, Watford, UK.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 19.2 × 13.1 m (63 × 43 ft)

HELICOPTERS

The RNZN currently operates one Westland Wasp HAS Mk 1 five-seat general purpose naval helicopter from these two ships. However, it is known that a replacement is being sought, with the front runners being the Kaman SH-2 Sea Sprite and the Westland Lynx. *Wellington* and *Canterbury* are both having their hangars and flight decks enlarged to take the new helicopter.

Wasp HAS Mk 1

Specifications

Dimensions:
- **main rotor diameter:** 9.83 m (32.25 ft)
- **tail rotor diameter:** 2.29 m (7.5 ft)

Fuselage length: 9.24 m (30.33 ft)
Height to top of rotor hub: 2.72 m (8.92 ft)
Weights:
- **empty:** 1,566 kg (3,452 lb)
- **max take-off:** 2,95 kg (5,500 lb)

Performance:
- **max level speed (sea level):** 104 kts (193 km/h)
- **economic cruising speed:** 96 kts (177 km/h)
- **max range:** 263 n miles (488 km)

Power plant: 1—710 ehp (derated) Rolls-Royce/Bristol Nimbus 503 turboshaft
Avionics: PTR 170 and PV 141 UHF and UHF homing radio, and standby UHF
Weapons: 2 Mk 44 or one Mk 46 torpedoes, or two AS.12 anti-ship missiles

PROPULSION

Main machinery: 2 Babcock & Wilcox boilers; 38.7 kg/cm² (550 psi); 454°C (850°F); 2 White-English Electric turbines; 22.4 MW (30,000 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The Royal New Zealand Navy (RNZN) acquired a total of four Leanders: *Waikato* (F 55). To the original Leander design, this ship was ordered in June 1963 and arrived in New Zealand in May 1967.

Canterbury (F 148). A Broad Beam Leander, *Canterbury* was ordered in 1968 and delivered in 1971.

Wellington (F 69). A Broad Beam Leander, *Wellington* served in the RN for 13 years as *Bacchante,* and was sold to the RNZN in 1982.

Southland (F 104). The former *Dido, Southland* was one of the original production Leanders (in fact, the third to be completed). *Dido* was converted to Batch 1 (Ikara) standard and was sold to the RNZN in 1983, but was stricken and scrapped in 1995, even though its replacement, *Te Kaha,* the first of the RNZN ANZAC frigates will not enter service until 1997.

Of the three remaining ships, *Waikato* is scheduled to pay off in 1999 at the latest, having been replaced by the second ANZAC frigate. Modernisation and improvements are, therefore, being concentrated on *Canterbury* and *Wellington,* which are scheduled to remain in service beyond 2005.

MODERNISATION

Waikato was given limited refits in 1990 and again in 1994, during which the Seacat SAM system was removed, but it is unlikely that any further work will be done on a unit which is due to be stricken in two years time.

Current and future work will therefore be concentrated on *Canterbury* and *Wellington.* Numerous improvements were incorporated between 1984 and the latest refits. These included the installation of: Signaal LW 08 radar (replacing Type 965); Graseby G 750 hull-mounted sonar (in place of Type 177); ARGOSystems Phoenix AR-700 ESM (replacing UA-8/9); Telegon PST 1288 Advanced Shipborne high-frequency (HF) direction-finding (DF) system; LORAL Hycor Mk 36 SRBOC chaff launchers; and the RCA R-76C5 gunnery fire-control system (which replaced MRS 3), and Mk 32 torpedo tubes. The Nautis-F computer-aided message handling system has also been installed.

Canterbury completed a long refit at the Devonport Naval Base in Auckland, New Zealand in March 1996. The work done included removal of the Seacat SAM system and the associated Type 904 director and the installation of a Phalanx 20 mm CIWS on the hangar roof. New accommodation facilities are also being created for female crew. A five-console, full colour GEC-Marconi Nautis system is also being installed to match the system already installed in *Wellington,* and will enable a small reduction to be made in the crew numbers due to savings in operations room staff.

Other work includes a Whittaker Track Management system, IFF Mk 12, Link 11 and replacement of the HF communications system. The hangar and flight deck are also being enlarged to accommodate the new helicopter.

THE FUTURE

Canterbury and *Wellington* are scheduled to remain operational and compatible with the new 'Anzac' class frigate until 2005. Ferranti FMS 15/2 TACTASS may be fitted in due course.

Wellington *(F 69) served in the UK Royal Navy for 13 years before being purchased by New Zealand in 1983. Note the Signaal LW 08 air search radar on the mainmast, which replaced the British Type 965 in the mid-1980s* (G Toremans)

TYPE 21

OVERVIEW

The British Type 21 had its genesis in the mid-1960s when the UK Royal Navy started to look for a replacement for its Type 41 and Type 61 frigates. At the time there was strong political and industrial pressure to move away from the traditional system of in-house design and to relax the customarily stringent naval standards of design and construction. This, coupled with a promise of a cheaper project (which was never achieved), led to the adoption of the Type 21, which was designed by Vosper Thornycroft and Yarrow.

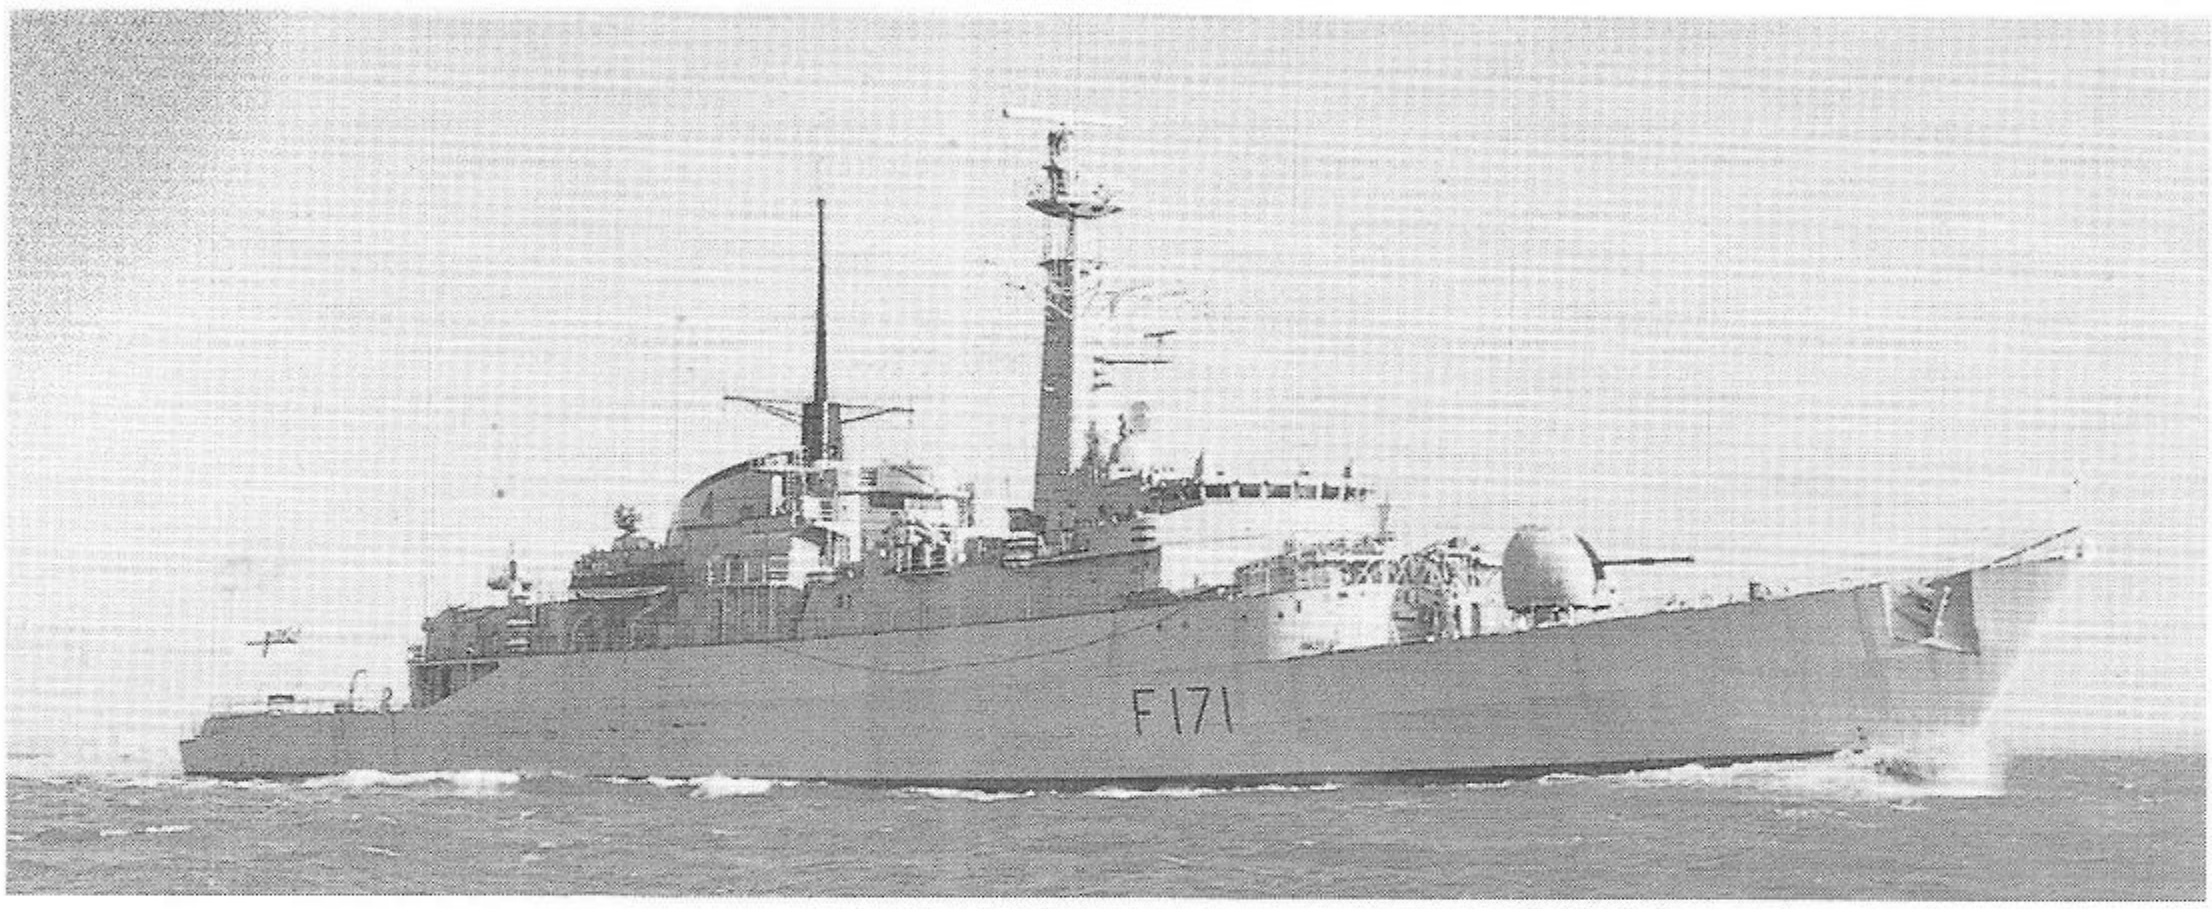
The result was one of the most attractive looking warships of its generation with a startling performance and excellent manoeuvrability, factors which concealed some very serious drawbacks. From the start, the design suffered from topweight problems, even though the entire superstructure was constructed of aluminium.

The weapons outfit was not particularly impressive, and reflected little advance on a 'Broad Beam Leander'. There was a 114 mm gun on the foredeck, a Seacat short-range missile system and a Wasp helicopter. The third and later ships added four Exocet launchers, which were retrofitted to the first two (but not until 1985), while only two ships, *Active* and *Alacrity,* were ever fitted with STWS-1 torpedo systems.

A considerable amount of ballast had to be shipped but the stability problem persisted. A proposal to replace Seacat by Seawolf was cancelled for that reason, as was a mid-life refit, scheduled for 1980.

Six of the eight Type 21s participated in the Falklands (Malvinas) war in 1982, where two were lost through enemy action. In addition *Arrow* suffered structural damage and several others developed cracks in the upper deck, and the surviving six ships were fitted with strengthening plates from 1983 onwards.

The six survivors were given a further, but limited, refit in the late 1980s, most of the work involving modifications to the hull to reduce noise and vibration. With the end of the Cold War, however, the British were presented with the opportunity to sell off these ships and they were sold en bloc to Pakistan.



Amazon *(F 171) lead ship of the class was built by Vosper Thornycroft and entered service in 1967. It was transferred to Pakistan in 1993 and is now* Tariq *(D 181)*
(Vosper Thornycroft)

TARIQ (TYPE 21)

WEAPONS SYSTEMS

TUBES

STWS Mk 2 anti-submarine torpedo launching system

***Badr* (D 184) and *Shahjahan* (D186) only.** The British STWS Mk 2 (Shipborne Torpedo Weapon System) was fitted to all ships in the class while they were in British service, but were removed before transfer, except in these two ships. STWS Mk 2 consists of two triple tube launchers, a launch control and presetter unit which are linked to the launchers through local control panels. The launchers are manually trained to an angle of 45° using a training handle installed between the two lower tubes. They are then remotely operated. The tubes themselves are made of glass fibre-reinforced epoxide resin and mounted in a triangular configuration. STWS Mk 2 is designed to operate with the Mk 46 and the Sting Ray lightweight torpedoes. It has electrically operated muzzle doors while the presetter/launch controller features Motorola 30800 microprocessors. It also features a strengthened mounting, better access to the tubes and improvements in the diagnostic and heater systems.

Specifications

Length: 3.65 m (12 ft)
Height: 1.4 m (4.6 ft)
Width: 1.23 m (4.0 ft)
Weight: 1,560 kg (3,440 lb) (unloaded)

Manufacturer/Contractor

GEC-Marconi Underwater Systems Ltd.

TORPEDOES

No torpedoes accompanied the ships on transfer, but it is possible that the US Mk 46 already deployed in the 'Alamgir' (Gearing) class could be used.

GUNS

Vickers 114 mm (4.5 in)/55 Mk 8 multipurpose gun

The 'Tariq' class mounts a single 114 mm (4.5 in)/55 calibre Mk 8 gun in 'A' position. This weapon provides quick reaction short-range air defence, engages surface targets including fast attack craft, and provides gunfire support to ground forces. The weapon system consists of the gun mounting, the ammunition feed system, the remote power control system, and the captain-of-turret panel.

The barrel is 6.22 m (20.4 ft) long, is fitted with a muzzle brake and fume extractor, and has a life of 3,300 rounds EFC. The mounting is completely enclosed in a glass fibre shield which protects it against the environment, blast and shrapnel. The loading system is hydraulically operated, with an autoloader which is manually fed by two loaders and has a capacity of six rounds. The hoist transfers them in two stages to the

turret from where they are raised by a pivoting loading arm to the breech where they are inserted by a power rammer. After the shell is fired the case is extracted automatically and ejected through a chute in the front of the mounting.

Specifications
Calibre: 114 mm
Length of barrel: 55 calibres
Traverse: 340° at 40°/s
Elevation: −10 to +55° at 40°/s
Muzzle velocity: 868.7 m/s (2,850 ft/s)
Weight of projectile: 21 kg (46.3 lb)
Rate of fire: 25 rds/min
Range:
anti-surface: 11.9 n miles (22 km)
anti-air: 6,000 m (20,000 ft)
Crew: 4 (gun captain (CIC), loading supervisor, 2 loaders)

Manufacturer/Contractor
Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

Hughes Mk 15 CIWS Phalanx
A single Hughes Mk 15 CIWS Phalanx close in weapons system (CIWS) is mounted on the roof of the hangar aft to provide the innermost layer of defence against anti-ship missiles. The 20 mm M61A1, six-barrel, Gatling-principle gun has a cylindrical magazine with the feed mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 3,000 rds/min
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor
Hughes Missile Systems, Tucson, Arizona, USA (system).

Oerlikon 20 mm cannon
Two or four single, manually operated Oerlikon 20 mm cannon are fitted.

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +90°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Thomson-CSF DR 3000S ESM receiver
The DR 3000S tactical ESM receiver has been installed since the transfer to Pakistan, having replaced the MEL UAA-1 Abbey Hill. DR 3000S (S. = surface ship) conducts threat detection, direction-finding, identification and target designation of enemy radars over the C to J frequency bands. It monitors the tactical situation in a given area, and performs intelligence (ELINT) functions. The system has a high sensitivity range with a detection capability of nearly 100 per cent, while direction finding accuracy is of the order of 6°. Highly automated operation includes the use of artificial intelligence and allows for very short reaction times.

DR 3000S is available in two configurations; a single 40 kg (88.2 lb) masthead-mounted antenna or a two-unit hexagonal aerial, with six DF antennas. DR 3000S can be fitted with a high-precision DF option, using interferometers.

Specifications
Frequency: C to J-bands
Azimuth coverage: 360°
Elevation coverage: −10 to +45°
Sensitivity: −68 dBm
Dynamic range: Up to 60 dB
Radar modes: 4,000 in library

Manufacturer/Contractor
Thomson-CSF, Radars and Countermeasures Division, Elancourt, France.

DECOYS

Graseby Type 182 towed torpedo decoy equipment
The Type 182 was transferred with the ships. This is designed to decoy both active and passive homing torpedoes, using signals electronically generated within the ship and fed, via the towing cable, to electroacoustic transducers within the towed body. The Type 182 produces two independently controllable output signals which are radiated simultaneously from the towed decoy. An amplitude modulated noise signal simulates the ship's propeller noise and causes passive homing torpedoes to be seduced away from the ship towards the towed decoy. The second signal is a swept CW signal, which simulates sonar echoes in order to confuse or jam the guidance system of active homing torpedoes, thus causing them to miss the ship. The frequency bands covered by both types of output are switchable to meet tactical scenarios and to enable concurrent operation of other sonar and communication equipments.

Specifications
Towed decoy:
diameter: 533 mm (21 in)
length: 2,005 mm (79 in)
weight: 74 kg (163 lb)
Towing cable:
length: 411 m (1,348 ft)
diameter: 14.48 mm
weight: 269 kg (593 lb)

Manufacturer/Contractor
Graseby Marine (Graseby Dynamics Ltd), Watford, UK.

Corvus chaff decoy launching system
There are two Corvus fixed launchers. Corvus is a simple, lightweight, quick reaction system for the self-defence of surface vessels against surface-to-surface and air-to-surface missiles. Window (chaff) dispensing rockets are fired to form a radar decoy screen around the vessel. Two modes of operation are available for the system. The two modes — distraction decoy and centroid decoy — differ in the azimuth angle at firing and the range at which window is released. A cylindrical rotating structure carries eight launching tubes mounted in two sets of three, one above the other, and crossed at 90° in azimuth with two further tubes set above, and aligned midway between the other tubes, all at a fixed elevation of 30°. A deck-mounted pedestal supports the rotating structure on its training bearing and also houses a self-contained electrical power conversion unit for the control circuits and the associated electrical equipment.

Specifications
Training
Bearing arc (normal) that is, launcher axis: 60-120°
Bearing arc (max) that is, tube axis: 15-165°
Launcher weight: 585 kg (1,290 lb)
Off-launcher equipment weight: 42 kg (93 lb)
Tube diameter: 195 mm (7.7 in)
Tube length: 1.6 m (5.24 ft)
Weight (empty): 25 kg (55 lb)
No of guides: 4, RH spiral

Manufacturer/Contractor
Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

Alacrity *(F 174) while in UK Royal Navy service. The British set great value on the high speed, rapid acceleration and good manoeuvrability* (Yarrow)

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

CAAIS (Outfit DBA) action data automation

The Type 21s were transferred with their CAAIS (Computer Assisted Action Information System) systems still in place. CAAIS was known in the UK Royal Navy as Outfit DBA and was developed in the early 1960s, the first production system, DBA (2), entering service with HMS *Amazon* in 1974. CAAIS is a tactical picture compilation system, providing automatic tracking of air and surface targets, processing sonar and EW inputs, operating a digital datalink, designating targets, and providing torpedo control and vectored attack orders for ASW helicopters. Outfit DBA (3) is a mainframe system using the Ferranti FM1600B computer and Decca displays. The hardware includes a three-cabinet digital suite housing a 24-bit computer, operating at 200 Kips and with a 780 k memory, as well as a datalink terminal. In addition there are peripheral control units which include radar extraction units, encoder/decoders, display drive unit and the MMI control units. The last two elements support the display system which includes up to six CA 1600 horizontal displays. The programming language is Coral 66.

WEAPONS CONTROL

Ferranti WSA 4 fire-control/command and weapon control system

WSA 4 (Weapon System Automation Mk 4) fire-control system has a mainframe architecture based upon a single FM1600B computer and two Alenia (now Alenia) RTN-10X tracker radars with targets designated through the CAAIS. Two targets may be engaged simultaneously with the trackers. The system includes a control console with four operators. The console includes target acquisition units, one for each tracker radar each with a PPI display and an A/R scope. These two units have an MMI which includes flowline lamps and push buttons. The centre section houses the weapon control units.

The RTN-10X radar, designated Type 912 by the Royal Navy, is an I-band conical scan radar with a maximum range of 20 km. It features a slatted parabolic reflector and feed with integral trunnion box, the antenna coverage being −30 to +90°. The antenna includes a GEC-Marconi closed-circuit television camera. It has a 200 kW peak-power, frequency changeable, high-power magnetron transmitter.

The WSA 4 also includes the Vickers Lookout and Aiming Sight Mk 1 (also known as the Sight, Stabilised, Visual Data Transmitting (SSVDT) and the Target Designation Sight or TDS). It was designed to support the Vickers 4.5 in Mk 8 gun and the Shorts Seacat air defence missile (now removed). The weapon control units are for the gun and the missile, the latter including a closed-circuit television screen and an MMI which includes a joystick and flowline control unit.

RADARS

Set	Type 992R	Type 1006	Type 912 (RTN-10X)
Company	GEC-Marconi	Kelvin Hughes	Selenia
Role	Short-range, air target designator	Navigation	Fire control
Band	I	I	I/J
Range	air target: 90 n miles (165 km)	64 n miles	22 n miles (40 km)
Beam	1.25 × 15°	1 × 18°/0.75 × 18°	—
Peak power	2 MW	25 kW	200 kW
Gain	30 dB	31 dB/34 dB	—
Pulsewidth	2.0 µs	0.8 or 0.25 µs/0.75 µs	1.5 µs
PRF	750 pps	1,600/800 pps	450-550 pps
Scan rate	—	24 rpm	—

The gun section includes two electronic data displays for data in graphical and alphanumeric form. These displays show the role, bearing and angle of sight of the trackers, target locations, course and speeds. The tracker roles, gun control, shell and fuze types and firing parameters are selected by means of a light pen.

Manufacturer/Contractor

Ferranti International Plc, Defence Systems Integration, UK.

SONARS

Type 184P active/passive hull-mounted search sonar

Type 184P was a UK Royal Navy in-service upgrade to the Type 184M. Type 184P is a 360° scanning sonar, incorporating both active and passive modes of operation, which provides range, bearing and target Doppler data to the fire-control computer. The equipment provides a dual-frequency transmission and three receiver systems. The latter comprise: an all-round search and tracking PPI system with, in the Type 184P, 16 receiving channels, which gives greater bearing accuracy.

The upgrading also involved inserting 31 digital filters in each of the four beam channels, enabling the system to measure Doppler speeds of up to ±40 knots.

There is also a continuous torpedo warning system with its own display. A circular 32-stave transducer array is employed. The keel-mounted, retractable dome is 3.99 m (13.1 ft) long, 1.62 m (5.3 ft) wide and 1.55 m (5.1 ft) deep. Operating frequencies are 6 kHz, 7.5 kHz and 9 kHz.

Manufacturer/Contractor

Graseby Marine (Graseby Dynamics Ltd), Watford, UK.

Type 162M sonar

Sonar Type 162M detects and classifies both mid-water and seabed targets, displaying port and starboard recordings simultaneously on a single straight-line recorder, which has a maximum range scale of 1,096 m (1,200 yd). Operation is simplified by entirely automatic gain control. The three strip transducers are all similar and employ 49.8 kHz barium titanate elements. Their beam pattern is fan-shaped, about 3° wide and 40° vertical angle; the side-looking elements have their axes 25° below the horizontal. A loudspeaker and a socket for headphones enable signals to be monitored aurally, if required; for example, to give warning of an approaching torpedo. The three range scales are 0-274 m, 0-548, 0-1,096 m (0 to 300, 0 to 600 and 0 to 1,200 yds), and accuracy is better than two per cent assuming a sound velocity of 1,500 m/s (4,920 ft/s).

Manufacturer/Contractor

AB Precision (Poole) Limited, Poole, Dorset, UK.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 19 × 12 m (62 × 40 ft)

Helicopters: The Pakistani Navy has purchased three Westland Lynx HAS Mk 3 ASW helicopters for use from these ships and has an option on three more.

HELICOPTERS

1 Westland Lynx HAS Mk 3

Specifications

Dimensions:
- **main rotor diameter:** 12.80 m (42.00 ft)
- **tail rotor diameter:** 2.21 m (7.25 ft)

Weights:
- **empty:** 2,740 kg (6,040 lb)
- **empty, equipped (ASW):** 3,343 kg (7,370 lb)

Performance:
- **cruising speed:** 120 kts
- **speed for max endurance:** 70 kts (130 km/h)
- **max rate of climb:** 661 m (2,170 ft)/min
- **time on station (ASW) 50 n miles (93 km) radius:** 2 h
- **max range:** 320 n miles (593 km)
- **max endurance:** 2 h 50 min

Power plant: 2 Rolls-Royce Gem 41-1 with max contingency rating of 835 kW (1,120 shp)

Crew: 2 (pilot and co-pilot/observer)

Radar: GEC-Marconi ARI5979 Seaspray Mk 3 lightweight search and tracking radar

Mission: CAE Electronics AN/ASQ-504(V) internal MAD

EW: Orange Crop ESM

ASW role: 2 A244/S 46 torpedoes

Anti-ship: 2 — 12.7 mm machine guns

PROPULSION

Specifications

System: Combined gas turbine or gas turbine (COGOG)

Main machinery: 2 Rolls-Royce Olympus TM3B gas turbines; 37.3 MW (50,000 hp) sustained; 2 Rolls-Royce Tyne RM1C gas turbines (cruising); 7.4 MW (9,900 hp) sustained

Shafts: 2

Propellers: cp

FURTHER INFORMATION

PROGRAMME

These six ships were acquired from the UK in 1993/94, *Tariq* (D 181) arriving in Karachi on 1 November 1993 and the last pair in January 1995. These ships replaced the five US Navy 'Garcia' and 'Brooke' class frigates, three 'Gearing' class destroyers and a 'Country' class destroyer. To replace such a miscellany of ships by one class of six, all built and equipped to a common standard, must have greatly eased the Pakistani Navy's logistical problems. Although classified as frigates while in British service they have been reclassified as destroyers by the Pakistan Navy and given 'D' pennant numbers.

MODERNISATION

Despite the well-known topweight problems, numerous changes have taken place in these ships and even more are scheduled. The projected changes include:

- Installing Harpoon missiles, which would be taken from the 'Alamgir' (Gearing) class destroyers. (These are to be installed in the gap abaft the foremast and not before the bridge in the place previously occupied by the Exocet launchers.)
- Remove the present Second World War-vintage Bofors 40 mm and replace by two GCM-AO3 (twin) 30 mm and two GAM-BO1 20 mm
- Remove Type 992R air search radar and install Signaal DA 08 in its place.
- Remove present STWS-2 in *Badr* (D 184) and *Shahjehan* (D 186) and fit all six ships with Bofors Type Tp45 single or quad launchers for Swedish torpedoes.
- Remove CAAIS and replace with CelsiusTech 9LV Mk 3 including Link Y.
- Fit Mk 36 SRBOC launchers
- Fit CSEE Najir Mk 2 or Sea Archer electro-optic director
- Fit Thomson Sintra ATAS
- Update hull-mounted sonar

The start date for this programme has yet to be announced. In addition, the availability of funds may not only limit the programme overall, but may also result in not all ships receiving identical refits.

Tippu Sultan *(D 185) under the Pakistani flag* (Jane's/H M Steele)

TYPE 22

OVERVIEW

Type 22 Batch 1. First of class Broadsword *(F 88) on builder's trials in 1978. Note four Exocet anti-ship missiles on the foredeck, Seawolf launcher before the bridge and Type 967 radar atop the foremast* (Yarrow)

The British had scored a major success with the effective and popular 'Leander' class, 16 of which entered service between 1963 and 1967, and the ten 'Broad Beam Leanders' which followed in 1969 to 1973. A Future Fleet Working Party concluded in 1966 that over the next two decades the RN would need three types of ship: an air-capable cruiser; an area air-defence ship; and a general purpose frigate. These became the 'Invincible' class, the Type 42 destroyer and the Type 22 frigate, respectively. In developing the latter it appeared that collaboration with the Dutch would be possible, but this failed to materialise, allegedly because the Dutch did not like Seawolf, while the British were unhappy about the Dutch suggestion that the hull length be constrained to 112 m (367 ft) to enable it to fit into the dry dock at Den Helder.

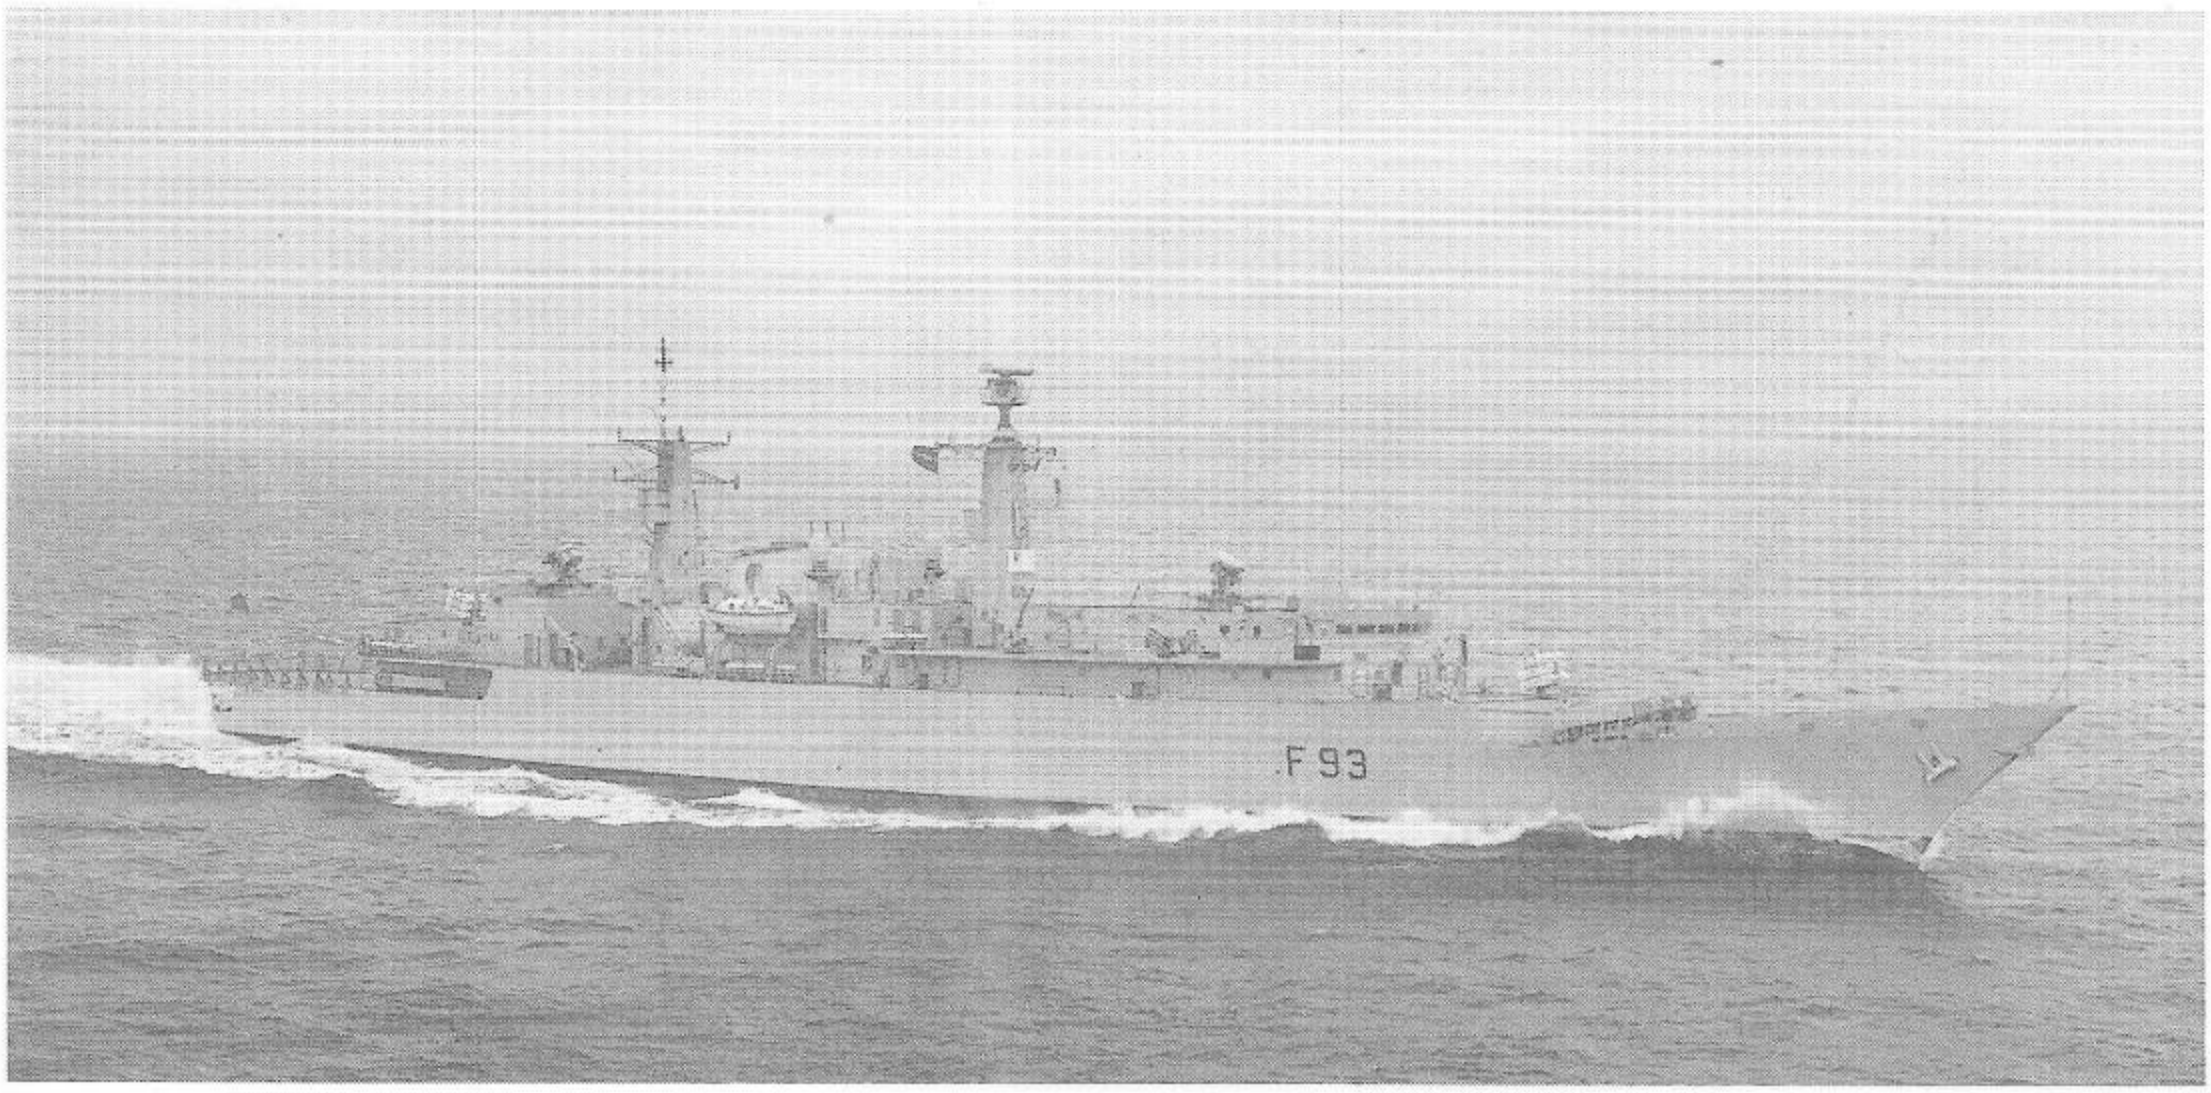
DESIGN

The hull is divided into four deck levels and is constructed of all-welded mild steel. The superstructure is also of steel, although a certain amount of aluminium is used, the reductions in topweight in those pre-Falklands (Malvinas) War days being considered to offset the known problems of spalling and fire damage. There is considerable freeboard and a substantial bulwark.

The four machinery rooms are laid out in tandem and positioned as far aft as possible to reduce shaft length, but balanced with the need for easy access for maintenance and equipment replacement. The propulsion system is as nearly as possible the same as that used in the Type 21 frigate and Type 42 destroyer, with the two Rolls-Royce Spey boost engines in the forward room and the two Rolls-Royce Tynes, plus the synchro self-shifting clutches and double-reduction gearboxes, in the after room. As built, the ships were powered by Rolls-Royce Spey SM1A boost engines, but the more powerful SM1C was installed and trialled in F 94 in early 1990 and will be installed in the remaining British ships in due course.

There are also two auxiliary machinery spaces, each containing a switchboard and two GEC generators each driven by a Paxman Ventura diesel.

The weapons fit of the Batch 1 ships comprised four MM 38 Exocet; two six-tube Seawolf SAM launchers and two 40 mm Bofors; two triple STWS-1 torpedo



Type 22 Batch 2. The first two ships of Batch II were 15 m (49 ft) longer than Batch I, with a long, almost clipper bow and a long deckhouse between the bridge and the mast reported to contain an EW installation (Yarrow)

Type 22 Batch 2. Coventry (F 98) was built as a replacement for a ship of the same name lost in the Falklands (Malvinas) war. The last four Batch II ships were 2.1 m (6.89 ft) longer than the first two. Note also the extended flight deck

launchers; and two Lynx ASW helicopters, armed with either Sting Ray torpedoes or Sea Skua anti-ship missiles.

Batch 2

The initial plan was to build some 12 Type 22s but it was soon decided that a greater length was needed in order to accommodate the Type 2031Z towed array and to provide for a larger operations room and Action Information Organisation (AIO). This resulted in the Batch 2 design and it was intended to build some 22 of this type.

Batch 3

The Falklands (Malvinas) War then intervened and once the war was over it was decided to restrict Batch 2 to six units and then to build a further four, based on the Batch 2 hull and propulsion, but with elements of the design recast in the light of the lessons of the South Atlantic conflict. This final group was designated Type 22 Batch 3.

MODERNISATION

Seawolf GWS.25 is being progressively upgraded to Mod 4 standard, while Type 2016 sonar is being replaced by the Type 2050. In addition, the Bofors 40 mm/60 installed in Batch 2 have been replaced by Oerlikon 30 mm guns. The EW fit is also being updated and NATO Sea Gnat is now the standard launcher for a variety of distraction and seduction decoys.

SALES

All four Batch 1 ships have been sold to Brazil. *Broadsword* was taken over in May 1995, *Brilliant* and *Brazen* in August 1996 and *Battleaxe* in April 1997.

Type 22 Batch 3. Cumberland (F 85) Batch 3 ships are the same as the last four Batch 2 ships, but have a 114 mm gun in place of the Exocets on the foredeck and eight Harpoons (not installed in this shot) in the break in the deckhouse abaft the bridge (Yarrow)

'GREENHALGH' (TYPE 22 BATCH 1)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 40 anti-ship missiles

As built for the RN and as sold to Brazil, these four ships had four MM 38 Exocet launchers mounted on the foredeck. Since transfer, however, these weapons have been removed and new MM 40 launcher-containers mounted in the waist, where they displaced the single 20 mm gun mounts. In their new position they face outwards at an angle of about 60° to the centreline and at +12° to the horizontal.

There are two versions of MM 40, designated Blocks 1 and 2. Block 2 missiles feature a new J-band (10-20 GHz) seeker with improved ECCM performance, associated electronics and a new guidance computer, although no further details are currently available. The new electronics permit the missile to optimise its sea-skimming height, allowing it to operate in conditions to Sea State 7 even in severe ECM conditions. The fire-control system has also been adapted with the development of the Cat-Visac console which can operate with two types of the Exocet missile simultaneously. The new fire-control system allows improved target selectivity, attacks upon multiple targets by diverging and converging salvos.

Targets for the missiles are acquired by the ship's sensors, and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence which can take up to 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change in the course of its flight. Once the missile has cleared the launcher-container, the sustainer carries it into the cruise phase and it then travels towards the general location of the target at a height of about 100 m (330 ft) which is low enough to reduce the chance of detection but adequate for target acquisition. Once the target is detected, the missile descends to 9-15 m (30 - 50 ft) in the approach phase before descending to 8 m (26.2 ft) (2-5 m (6.5-16.4 ft) in a calm sea) for a sea-skimming terminal phase. A salvo may be fired in 12-20 seconds.

Specifications

MM 40 Block 1
Length: 5.78 m (19.0 ft)
Diameter: 35 cm (14 in)
Wing span: 1.13 m (3.7 ft)
Weight: 855 kg (1,885 lb)
Speed: Mach 0.9
Range: 2-38 n miles (4-70 km)
Warhead: 165 kg (363.8 lb) HE frag
Fuze: Delay impact/proximity
Guidance: Inertial and active radar

MM 40 Block 2
Length: 5.80 m (19.02 ft)
Diameter: 35 cm (14 in)
Wing span: 1.13 m (3.7 ft)
Weight: 870 kg (1,918 lb)
Speed: Mach 0.9
Range: 2-40.5 n miles (4-75 km)
Warhead: 155 kg (342 lb) HE frag
Fuze: Impact/proximity
Guidance: Inertial and active radar

Seawolf GWS.25 Mod 4

There are two GWS.25 Mod 4 Seawolf systems, with the six-tube launchers mounted before the bridge and on the hangar roof.

GWS.25 Mod 4 consists of an air search radar, two trackers, a missile, 32-round magazine, six-tube launcher and a command subsystem. The air search radar is the GEC-Marconi Type 967 D-band system whose waveguide antenna is mounted back to back with that of the Type 968 surface search antenna. The rounds are lifted by hydraulic hoist to ready-use magazines near the launcher and are then moved manually

on a trolley to the launcher and placed on the launcher rails. The launch tubes, three either side of the pedestal, have clam-shell front and rear shutters, which open automatically for firing.

The GEC-Marconi Type 911 tracker has unspecified improvements over the set used in the Mod 3 system, but it is a dual-frequency radar with two antennas: one for I-band transmission, the other for millimetric-wave (L/M-bands) transmission. The I-band element is used for long-range tracking and high-angle engagements. Its signal processing includes fast Fourier transform techniques to ensure effective operation in severe clutter. It is designed to provide accurate tracking at close range and at low levels. This facility is assisted by separate illumination of the upper and lower parts of the antenna. The computer is the FM1600E. The tracker is normally dedicated to a launcher and uses time-division multiplexing to control two missiles and to track both target and missile. The tracking loop also incorporates electronic angle tracking to minimise antenna movement when correcting missile line of sight guidance for small angles.

The command subsystem associated with each tracker includes a command transmitter, a Ferranti data handling system based upon the Ferranti FM1600E, a guiding shaping unit and operator consoles. The process is completely automatic, but with manual override, and it is able to analyse sensor data, to establish a track, to conduct threat analysis then allocate target priorities. Targets are detected by the air search radar and assigned through the ship's command system to the Seawolf command subsystem. There the threat is evaluated and the target is assigned to a tracker-launcher combination. Both slew towards the target, the tracker searches in elevation until it acquires and locks on to the target to establish a radar line of sight. When the target is within range, one missile is automatically launched, although frequently a second will follow it moments later. After launch the missile is acquired by the wide-angle antenna and gathered into the target line of sight. Its position relative to the centre of the tracking beam is monitored by the radar, and the ship-borne guidance computer generates the necessary steering commands to keep the missile in the centre of the beam until it intercepts the target. The missile's rearward-facing antennas help to provide a good ECCM capability. The television camera is used for low-level tracking with flares showing the missile's location.

Specifications
GWS.25 Mod 4
Length: 2 m (6.56 ft)
Diameter: 18 cm (7.0 in)
Wing span: 70 cm (27.5 in)
Weight: 82 kg (180 lb)
Speed: Mach 2+
Range: 2.7 n miles (5 km)
Guidance: CLOS
Warhead: Royal Ordnance 14 kg (30.87 lb) fragmentation high-explosive warhead with Thorn EMI impact-proximity fuze.

Manufacturer/Contractor
British Aerospace, London, UK.

TORPEDOES

STWS Mk 2 anti-submarine torpedo launching system
These ships are fitted with two sets of triple 324 mm Plessey STWS Mk 2 (Shipborne Torpedo Weapon System) torpedo tubes which are mounted abreast the stack. Each group consists of a triple-tube launcher, a launch control, and a presetter unit, which are linked to the launchers through local control panels. On the possibility of action the launchers are manually trained to an angle of 45° using a training handle installed between the two lower tubes, but thereafter they are remotely operated. The tubes themselves are made of glass fibre-reinforced epoxide resin and mounted in a triangular configuration. STWS 2 is designed to operate with the Mk 46 and the Sting Ray lightweight torpedoes. It has electrically operated muzzle doors while the presetter/launch controller features Motorola 30800 microprocessors. It also features a strengthened mounting, better access to the tubes and improvements in the diagnostic and heater systems.

Specifications
Length: 3.65 m (12 ft)
Height: 1.4 m (4.6 ft)
Width: 1.23 m (4.0 ft)
Weight: 1,560 kg (3,440 lb) (unloaded)

Manufacturer/Contractor
GEC-Marconi Underwater Systems Ltd, Waterlooville, Hampshire, UK.

Sting Ray lightweight anti-submarine weapon
Sting Ray lightweight ASW torpedo can be used in deep or shallow waters, using its multiband, multibeam sonar. The narrowband capability gives good Doppler discrimination against slow or quiet targets, while the broadband capability provides target discrimination, range and bearing resolution. The acoustic beam sweeps the whole volume of the water from the surface to the maximum operating depth. The computer can be reprogrammed 'through the skin' whenever updated software is required, with the programs adapting themselves to the tactical and environmental conditions in which the torpedo operates. The computer also controls the signals, beam form, speed and trajectory of the weapon.

Power is provided by a Chloride seawater-activated magnesium-silver chloride battery. The reaction is controlled by recirculating hot, part-spent seawater using a pump while simultaneously controlling the amount of cold seawater reaching the battery. Power is produced 1.5 seconds after the weapon enters the water. The propulsion system uses a Lucas DC electric motor driving two contrarotating propulsors housed in a duct to form the pump-jet. The control surfaces are actuated by an electrohydraulically driven proportional control system developed by BAe Dynamics Group.

On entering the water the torpedo sets up a programmed search pattern designed to maximise the chances of target detection. On acquiring the target, the computer and active sonar sensors make it almost impossible for the target to evade attack. The software of the guidance/homing system enables it to filter out background noise and decoys, and to intercept the target rather than perform a conventional tailchase attack. Maximum speed is about 45 knots with an estimated endurance of some eight minutes at that speed.

Specifications
Length: 2.59 m (8.5 ft)
Diameter: 324 mm (12.75 in)
Weight: 267 kg (589 lb) (in air)
Warhead: 35 kg (77 lb)
Speed: 45 kts (estimated)
Range: 6 n miles (11 km) (estimated)
Endurance: Approximately 8 minutes
Depth: 750 m (2,500 ft)

Manufacturer/Contractor
GEC-Marconi Underwater Weapons Systems Ltd.

GUNS

Bofors SAK 57 L/70 Mk 2
Since arriving in Brazil the four Exocet MM 38 launcher-containers have been removed from the foredeck and replaced by a single Bofors SAK 57 mm/70 Mk 2 mount. This weapon is intended to engage air and surface targets, and to provide gunfire in support of troops ashore. It is housed inside a 'stealthy' shield.

Specifications
Calibre: 57 mm (2.24 in)
Length of barrel: 70 calibres
Traverse: 360° at 55°/s
Elevation: −10 to +77° at 40°/s
Crew: 3
Range: 9 n miles (17 km)
Rate of fire: 220 rds/min
Projectile weight: 2.4 kg (5.3 lb)

ELECTRONIC WARFARE SYSTEMS

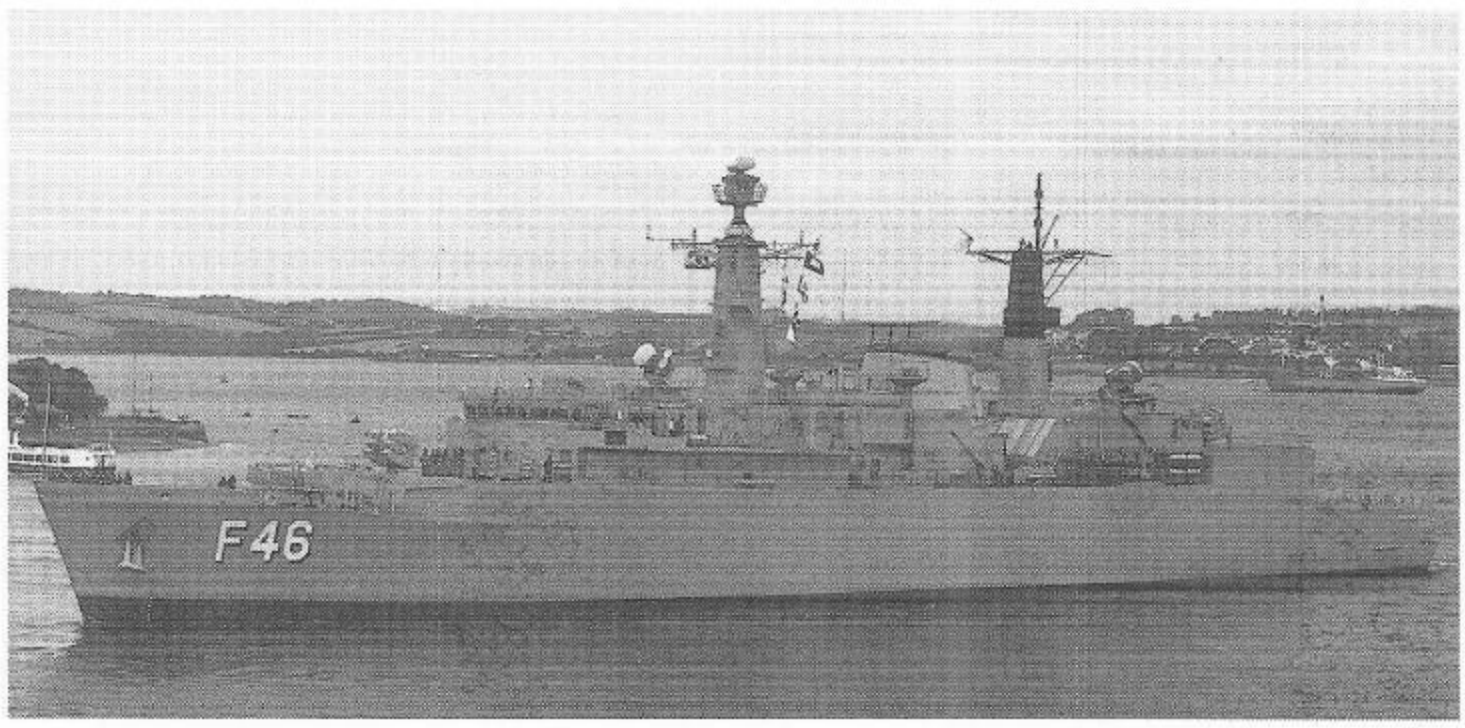
ELECTRONIC SUPPORT MEASURES (ESM)

UAA-2 (Abbey Hill) ESM system
UAA-2 is a passive reception, signal analysis and direction-finding system using IFM receivers. Frequency range has never been released but is almost certainly 1 to 18 GHz. The intercept and DF antennas are a series of radome-covered horns mounted under the foremast masthead radar. Accuracy of measurement is reported to be ±1.5 MHz in frequency and 3° in bearing. The intercept part is combined with a threat identification system and is presumably integrated with the Type 670 ('Heather') jammer. UAA-2 is an upgraded version of UAA-1 and features solid-state electronics in its front end, an improved threat library and an increase in the number of warner channels.

Manufacturer/Contractor
Thorn EMI Electronics, Sensors Group, Crawley, UK.

ELECTRONIC COUNTERMEASURES (ECM)

Type 670
Type 670 is a jammer system, nicknamed 'Heather'. It is a somewhat elderly equipment and the fact that ships are fitted with the more up-to-date Type 675 for particular missions suggests that it may not be capable of dealing with the latest threats. Type 670 is characterised by a rectangular radome, located either side of a container abaft the stack.



Greenhalgh *(F 46) under the Brazilian flag, but before the changes to the armament. Sensors are also unchanged but SCOT satellite terminals have been removed leaving their platforms (just forward of the stack) empty* (Jane's H M Steele)

DECOYS

Outfit DLB

Outfit DLB consists of four Hunting Engineering 130 mm 'Sea Gnat' six-barrel launchers which are grouped in two pairs on either side of the bridge structure. The control unit, by Thorn EMI, provides for the launching of the most effective combination of rounds for distraction and centroid/seduction giving the type, speed and direction of the threat, the ship's speed and heading as well as wind direction and speed.

The munitions involved are the Mk 214 RF seduction, Mk 216 RF distraction rounds, and Mk 218 IR seduction rounds.

Manufacturers/Contractors

Thorn EMI/AB Precision Ltd (control unit).
Hunting Engineering (launchers).
Chemring Ltd (munitions).

Graseby Type 182 towed torpedo decoy

The Type 182 towed torpedo decoy is designed to decoy both active and passive homing torpedoes, using signals electronically generated within the ship and fed, via the towing cable, to electroacoustic transducers within the towed body. The Type 182 produces two independently controllable output signals which are radiated simultaneously from the towed decoy. An amplitude-modulated noise signal simulates the ship's propeller noise and causes passive-homing torpedoes to be seduced away from the ship towards the towed decoy. The second signal is a swept CW signal, which simulates sonar echoes, in order to confuse or jam the guidance system of active homing torpedoes, thus causing them to miss the ship. The frequency bands covered by both types of output are switchable to meet tactical scenarios and to enable concurrent operation of other sonar and communication equipments.

Specifications

Towed decoy:
diameter: 533 mm (21 in)
length: 2,005 mm (79 in)
weight: 74 kg (163 lb)
Towing cable:
length: 411 m (1,348 ft)
diameter: 14.48 mm
weight: 269 kg (593 lb)

Manufacturer/Contractor

Graseby Marine (Graseby Dynamics Ltd), Watford, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Outfit DBA(1) (CAAIS) action data automation

In RN service the Type 22 Batch 1 ships had the Outfit DBA (also known as CAAIS Computer Assisted Action Information System) action data automation system, which had been developed in the early 1960s and entered service in 1974 with the Leander Batch 3 frigates. The system was still in the ships on transfer to Brazil and it should be noted that the Brazilian Navy already uses the export version, CAAIS 400/450, in the 'Niteroi' and 'Inhauma' class frigates.

CAAIS is a tactical picture compilation system, providing automatic tracking of air and surface targets, processing sonar and EW inputs, operating a digital datalink, designating targets, and providing torpedo control and vectored attack orders for ASW helicopters. The hardware includes a three-cabinet digital suite housing a 24-bit computer, operating at 200 Kips and with a 780 k memory, as well as a datalink terminal. In addition there are peripheral control units which include radar extraction units, encoder/decoders, display drive unit and the MMI control units. The datalink, known as Link X in NATO navies, is a serial transmission, medium-speed (1,200 baud) link suitable for HF and UHF channels. The programming language is Coral 66.

Manufacturer/Contractor

Ferranti Naval Systems Ltd.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 10; Link 14 (receive)

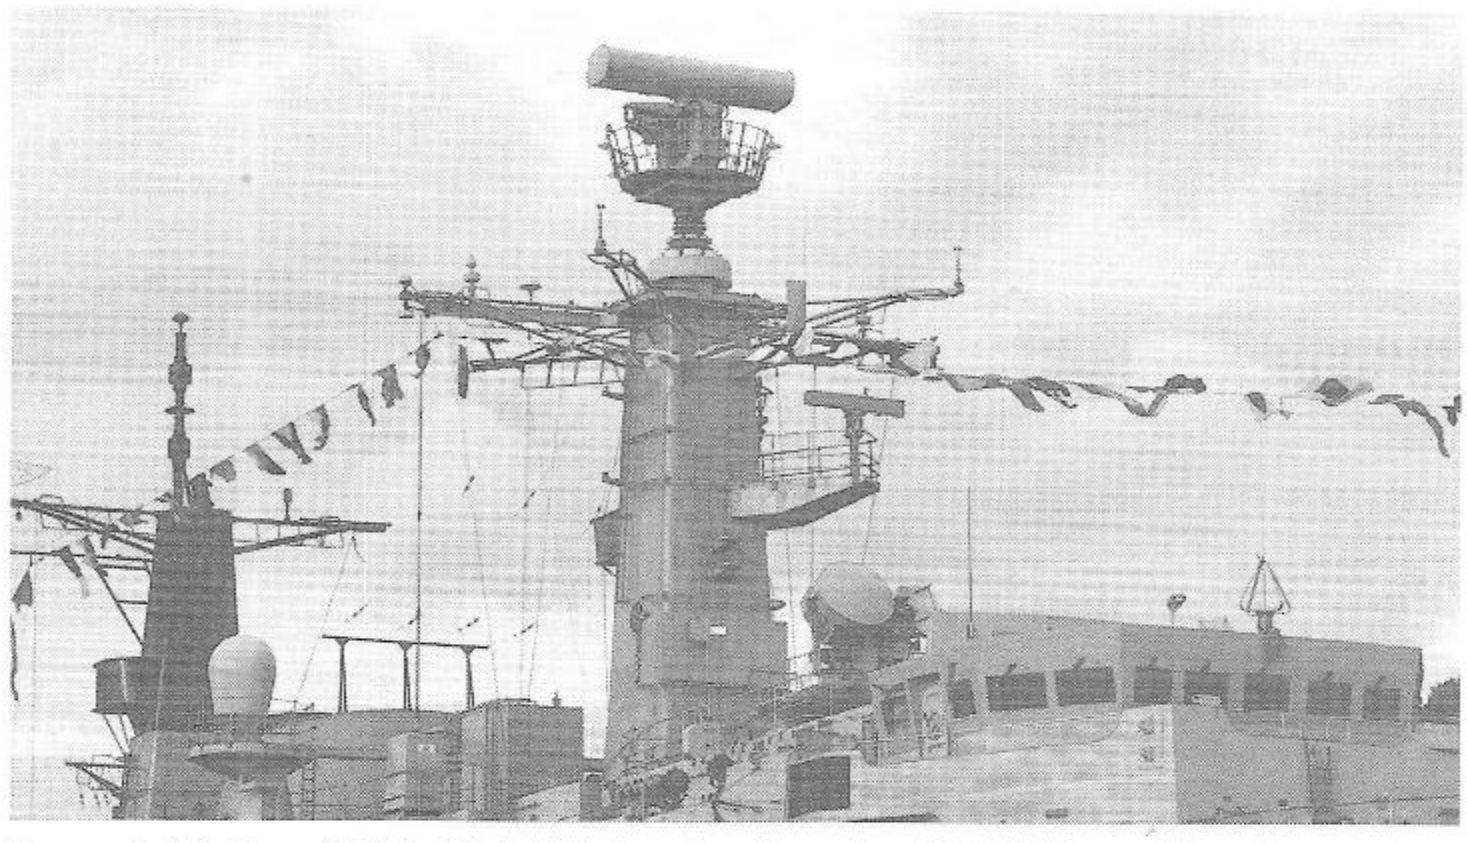
SONAR

Type 2016 sonar

The hull-mounted Type 2016 is installed in all Batch 1 ships. This is an active/passive sonar which is reported to have a range of 10 km. It operates at 5.5, 6.5 and 7.5 kHz and features a cylindrical, retractable, stabilised array with 1.83 m (6 ft) diameter with 64 staves. It uses computerised signal processing based on a Ferranti FM 1600B.

Manufacturer/Contractor

Plessey, UK.



Foremast of Battleaxe (F 89) *while in British service. At masthead is GEC-Marconi Type 967 air/surface search radar. Immediately underneath the masthead platform is the UAA-2 (Abbey Hill) array surrounding the mast like a collar. The antenna on the small platform offset to port is the Kelvin Hughes Type 1007* (Jane's/David Miller)

RADARS

Type	Type 967*	Type 968*	Type 1006/1007	Type 911 (2)
Company	GEC-Marconi	GEC-Marconi	Kelvin Hughes	GEC-Marconi
Role	Long-range search/ acquisition	Low-level air search and target acquisition	Navigation	Fire control
Band	D (1,260-1,360 MHz)	E/F (2,950-3,040 MHz)	I	I; L/M

Typical range			64 n miles	

Note:
* Antennas for Types 967 and 968 radars are mounted back to back.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 20.5 × 14.8 m (67 × 49 ft)

HELICOPTERS

Westland SAH-11 (HAS.21) twin-engined multipurpose helicopter

Specifications

Dimensions:

main rotor: 12.80 m (42.00 ft)
tail rotor diameter: 2.21 m (7.25 ft)
length overall: 15.165 m (49.75 ft)
height overall, rotors stopped: 3.48 m (11.42 ft)

Weights:

operating, empty, equipped, ASW: 3,343 kg (7,370 lb)
reconnaissance (crew of 2): 3,277 kg (7,224 lb)
ASW classification and strike: 3,472 kg (7,654 lb)
ASV search and strike: 3,414 kg (7,526 lb)
search and rescue (crew of 3): 3,416 kg (7,531 lb)
dunking sonar search and strike: 3,650 kg (8,047 lb)
max take-off weight, Gem Mk 41: 4,763 kg (10,500 lb)

Performance:

continuous cruising speed: 125 kts (232 km/h; 144 mph)
speed for max endurance: 70 kts (130 km/h)
hovering ceiling out of ground effect: 2,575 m (8,450 ft)
max range: 320 n miles (593 km)
max endurance: 2 h 50 min

Power plant: 2 Rolls-Royce Gem 41 — 2 turboshafts, with max contingency rating of 835 kW (1,120 shp)
Accommodation: 2 (pilot and co-pilot/observer on side-by-side seats)
Radar: GEC-Marconi ARI5979 Seaspray Mk 1 light-weight search and tracking radar.
ESM: Racal MIR 2
EW: Racal Kestrel EW suite
Mission: ASW versions have dipping sonar and/or MAD.
Weapons: ASW armament two Mk 44, Mk 46, homing torpedoes, one each on an external pylon on each side of fuselage, and six marine markers; or two Mk 11 depth charges. Alternatively, up to four Sea Skua semi-active homing missiles.

PROPULSION

Specifications

System: Combined gas turbine or gas turbine (COGOG)
Main machinery: 2 Rolls-Royce Olympus TM3B gas turbines; 37.3 MW (50,000 hp) sustained; 2 Rolls-Royce Tyne RM1C gas turbines; 7.4 MW (9,900 hp) sustained
Shafts: 2
Propellers: 2 Stone Manganese Model 119XX, 5-bladed, controllable-pitch (inward turning).
Ship's services: 4 Paxman Ventura diesels/four GEC generators; 1 MW

FURTHER INFORMATION

PROGRAMME

The four British 'Broadsword' class (Type 22 Batch 1) frigates entered service with the RN between 1979 and 1982, and then, after little more than a decade of service, including participation by *Broadsword* (F 88) and *Brilliant* (F 90) in the 1982 Falklands (Malvinas) War, the entire group was sold to Brazil. The contract with the Brazilian Navy was signed on 18 November 1994 and the ships were duly transferred: *Greenhalgh* (former *Broadsword*) — 1995; *Dodsworth* (former *Brilliant*) — 1996; *Bosisio* (former *Brazen* (1996) and *Rademaker* (former *Battleaxe)* — 1997. This purchase of British ships resulted in the cancellation of the Brazilian Navy's previous plan to lease a number of units of the ex-US 'Knox' class.

MODERNISATION

The accommodation was modified in UK service to take 65 officers under training while, since transfer to Brazil, the 57 mm gun has been mounted in 'A' position, the MM 38 Exocets removed and new MM 40 launcher-containers mounted in the waist.

Greenhalgh *(F 46). The Brazilian Navy had been offered a number of ex-US Navy 'Knox' class frigates when they received the offer of the much more modern and capable Type 22 Batch I ships* (Jane's/HM Steele)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 38 medium-range anti-ship missile

Ship-launched MM 38 Exocets are carried in two twin launcher-containers sited on the foredeck and pointing across the centreline at the opposite beam. These launcher-containers are inclined at an angle of 12° to the horizontal. In addition to the launcher installations there is a control console and there is a co-ordinate converter to interface the missile with the ship's sensors.

Targets are acquired by the ship's search radar and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence. This involves turning on the thermal battery, releasing the mechanical safety locks, igniting the booster and, finally, breaking the umbilical cord; the total process takes some 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change of course during its flight.

The attack consists of three phases:

Cruise phase. The cruise phase starts as the missile clears the container and the missile, powered by the sustainer motor, flies towards the general location of the target at a height of about 100 m (328 ft) which is low enough to reduce the chance of detection but adequate for target acquisition. This phase can be as long as 22 km and ends when the seeker acquires the target. The seeker is a Dassault Electronique ADAC (Auto Directeur Anti-Clutter) active monopulse radar, working in the I-band (8-10 GHz), which has a typical range of 13 n miles (24 km) against FACs.

Approach phase. On detecting the target the missile descends to 9-15 m (29.5-49 ft) in the approach phase.

Terminal phase. During this final phase the missile descends to 8 m (26 ft) (2-5 m (6.5-16 ft)) in a calm sea) for a sea-skimming run in to the target.

A salvo may be fired in 12-20 seconds.

Specifications

(MM 38)
Length: 5.21 m (17.09 ft)
Diameter: 35 cm (13.7 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 2-22.5 n miles (4-42 km)
Guidance: Inertial and active radar
Sustainer motor: SNPE Eole alloy-cased CDB; weight 151 kg (333 lb); max burn time 93 s.
Booster: 100 kg (220 lb) SNPE Epervier boost motor, burn time of 2.4 s.
Warhead: Luchaire 165 kg (363 lb) fragmentation warhead
Fuzes: Delayed impact fuze and autopilot-controlled proximity fuze

SURFACE-TO-AIR MISSILES (SAM)

Seawolf GWS.25

Overview

Batch 2 ships are all fitted with the Seawolf SAM system launched from two six-tube launchers. As built, F 92 and F 93 were fitted with GWS.25 Mod 0, but this has now been upgraded to GWS.25 Mod 4. The remaining four ships (F94, F 95, F 96 and F 98) were built with and (currently) retain GWS.25 Mod 3.

Seawolf GWS.25 Mod 3

GWS.25 Mod 3 consists of an air search radar, two trackers, a missile, 32-round magazine, six-tube launcher and a command subsystem. The air search radar is the GEC-Marconi Type 967 D-band system whose waveguide antenna is mounted back to back with that of the Type 968 surface search antenna. The rounds are lifted by hydraulic hoist to ready-use magazines near the launcher and are then moved manually on a trolley to the launcher and placed on the launcher rails. The launch tubes, three either side of the pedestal, have clam-shell front and rear shutters, which open automatically for firing.

The GEC-Marconi Type 911 Mod 1 tracker is a dual-frequency radar with two antennas: one for I-band transmission, the other for millimetric-wave (L/M-bands) transmission. The I-band element is used for long-range tracking and high-angle engagements. Its signal processing includes fast Fourier transform techniques to ensure effective operation in severe clutter. It is designed to provide accurate tracking at close range and at low levels. This facility is assisted by separate illumination of the upper and lower parts of the antenna. The computer is the FM1600E. The tracker is normally dedicated to a launcher and uses time-division multiplexing to control two missiles and to track both target and missile. The tracking loop also incorporates electronic angle tracking to minimise antenna movement when correcting missile line of sight guidance for small angles.

The command subsystem associated with each tracker includes a command transmitter, a Ferranti data handling system based upon the Ferranti FM1600E, a guiding shaping unit and operator consoles. The process is completely automatic, but with manual override, and it is able to analyse sensor data, to establish a track, to conduct threat analysis then allocate target priorities. Targets are detected by the air search radar and assigned through the ship's command system to the Seawolf command subsystem. There the threat is evaluated and the target is assigned to a tracker-launcher combination. Both slew towards the target, the tracker searches in elevation until it acquires and locks on to the target to establish a radar line of sight. When the target is within range, one missile is automatically launched, although frequently a second will follow it moments later. After launch the missile is acquired by the wide-angle antenna and gathered into the target line of sight. Its position relative to the centre of the tracking beam is monitored by the radar, and the ship-borne guidance computer generates the necessary steering commands to keep the missile in the centre of the beam until it intercepts the target. The missile's rearward facing antennas help to provide a good ECCM capability. The television camera is used for low-level tracking with flares showing the missile's location.

GWS.25 Mod 4

GWS.25 Mod 4 is an upgraded Mod 0, and is essentially a Mod 3, but with an upgraded Type 911 tracker, which has unspecified improvements compared to that in the Mod 3 system, and a Ferranti FM1600E computer.

Specifications

GWS.25
Length: 2 m (6.5 ft)
Diameter: 18 cm (7 in)
Wing span: 70 cm (27.5 in)
Weight: 82 kg (181 lb)

Brave *(F 94). On the bridge roof are : a large section of radar absorbing material (RAM); GEC-Marconi Type 911 (for Seawolf) and a Marisat satcom antenna. Atop the foremast is a Marconi Type 967 air/surface search antenna, and below the platform is the circular UAA-2 (Abbey Hill) ESM array. Just forward of the stack is one of two SCOT satellite antennas and abreast the mainmast and pointing outwards is Type 670 jammer* (HMS Osprey/UK MoD)

discrimination against slow or quiet targets, while the broadband capability provides target discrimination, range and bearing resolution. The acoustic beam sweeps the whole volume of the water from the surface to the maximum operating depth. The computer can be reprogrammed 'through the skin' whenever updated software is required, with the programs adapting themselves to the tactical and environmental conditions in which the torpedo operates. The computer also controls the signals, beam form, speed and trajectory of the weapon.

Power is provided by a Chloride seawater-activated magnesium-silver chloride battery. The reaction is controlled by recirculating hot, part-spent seawater using a pump while simultaneously controlling the amount of cold seawater reaching the battery. Power is produced 1.5 seconds after the weapon enters the water. The propulsion system uses a Lucas DC electric motor driving two contrarotating propulsors housed in a duct to form the pump-jet. The control surfaces are actuated by an electrohydraulically driven proportional control system developed by BAe Dynamics Group.

On entering the water, the torpedo sets up a programmed search pattern designed to maximise the chances of target detection. On acquiring the target, the computer and active/sonar sensors make it almost impossible for the target to evade attack. The software of the guidance/homing system enables it to filter out background noise and decoys, and to intercept the target rather than perform a conventional tailchase attack. Maximum speed is about 45 knots with an estimated endurance of some eight minutes at that speed.

Specifications
Length: 2.59 m (8.5 ft)
Diameter: 324 mm
Weight: 267 kg (588 lb) (in air)
Warhead: 35 kg (77 lb)
Speed: 45 kts (estimated)
Range: 6 n miles (11 km) (estimated)
Endurance: Approximately 8 min
Depth: 750 m (2.460 ft)

Manufacturer/Contractor
GEC-Marconi Underwater Weapons Systems Ltd.

GUNS

Royal Ordnance/Oerlikon GCM-A03-2 twin 30 mm mountings
There are two twin GCM-A03-2 twin 30 mm mounts, one either side of the forward deckhouse, just forward of the foremast.

The GCM-A03-2 is a locally operated mounting with an open operator's position and two boxes of ammunition each with 250 rounds. It has a GEC-Marconi Avionics (formerly Ferranti) GSA Mk 201 gyro gunsight. It weighs 2.05 tonnes without ammunition and the swept area is 2.52 m (55 ft).

The gun is the Oerlikon KCB, a single barrel, 75 calibre gas-operated, air-cooled, link-belt fed weapon with feeding from either side. The weapon is 3.52 m (11.5 ft) long, 2.37 m (7.8 ft) high, 2.18 m (7.15 ft) wide and weighs 156 kg (344 lb). The GCM-A mountings all incorporate a substantial amount of high-strength, light alloys and plastic to reduce weight. They are gyrostabilised and electrically powered with the weapon operated hydraulically but manual operation is possible in the event of power loss.

The guns share a cradle and are 350 mm apart. The elevating gear is between the trunnion supports and the training gear on the left of the small platform upon which the mounting rests. A generator is in the front of the mounting and the operator's position is on the right. Each gun has a box of ammunition fitted rigidly to the trunnion supports and linked to the gun by a flexible feeding system.

Specifications
Gun
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Round: 870 g
Rate of fire: 650 rds/min/barrel
Range:
anti-surface: 1.5 n miles (3 km)
anti-air: 3,500 m (11,483 ft)

Mounting
Traverse: 360°
Elevation: −13 to +75°
Traverse speed: 80°/s
Elevation speed: 60°/s (all mountings)

Manufacturers/Contractors
Royal Ordnance, Medium Calibre Gun Division.
Oerlikon Contraves AG, Switzerland.

20 mm Oerlikon mountings
Two single GAM-BO1 20 mm mounts are fitted, on the upper deck, either side of the stack. GAM-BO1 uses a swivel fork with the sidewalls having the trunnion bearings. The cradle is made of light alloy and the weapon's working parts are enclosed in a protective case whose top opens to ease maintenance and installation. The sight, shoulder rests and back support strap are all attached to the sight bracket which is adjustable for height. Usually these mountings have an optical ring sight but they can also be fitted with a lead computing sight. The ammunition box with 200 rounds is attached to the front of the mounting and the belt is fed from the right side of the gun, with spent cartridge cases being ejected between the sidewalls of the cradle into a separate compartment, while the links are collected in a bag on the other side of the mounting.

Specifications
(GAM-BO1)
Elevation: 55°
Gun Model: KAA
Calibre: 20 mm
Length of barrel: 85 calibres
Effective range:
anti-surface: 2,500 m (2,700 yd)
anti-air: 4,000 ft (1,200 m)
Rate of fire: 1,000 rds/min
Round weight: 320-345 g
Projectile: 110-125 g

Manufacturers/Contractors
Royal Ordnance. Medium Calibre Gun Division (mounting).
Oerlikon Contraves AG, Defence, Switzerland.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

AN/SSQ-72 Classic Outboard

The Batch 2 ships are fitted with the AN/SSQ-72 Classic Outboard tactical electronic warfare suite, which operates in the communications frequency bands, providing a shipboard capability for signal exploitation at over-the-horizon ranges. AN/SSQ-72 incorporates spread spectrum receivers for detection and demodulation of both frequency-hopping and direct sequence, pseudo-random noise signals. High-speed signal processing is provided for demodulation, analysis and signal recognition of a wide variety of both conventional and spread spectrum signal types. The elements of the AN/SSQ-72 system include:

AN/SRD-19A, comprising a number of VHF direction-finding Adcock-type arrays, which are located at the head of the mainmast. There are also a number of deck-edge antennas, which are electronically switched to form receiving beams.

AN/SLR-16A countermeasures receiver, operating in the HF band.

It is possible that the additional accommodation abaft the bridge may be used as the operations centre for the AN/SSQ-72 system.

Manufacturer/Contractor

Lockheed Sanders, Nashua, New Hampshire, USA.

UAA-2 (Abbey Hill) ESM system

UAA-2 is a passive reception, signal analysis and direction-finding system using IFM receivers. Frequency range has never been released but is almost certainly 1 to 18 GHz. The intercept and DF antennas are a series of radome-covered horns mounted under the foremast masthead radar. Accuracy of measurement is reported to be ±1.5 MHz in frequency and 3° in bearing. The intercept part is combined with a threat identification system and is presumably integrated with the Type 670 ('Heather') jammer. UAA-2 is an upgraded version of UAA-1 and features solid-state electronics in its front end, an improved threat library and an increase in the number of warner channels.

Manufacturer/Contractor

Thorn EMI Electronics, Sensors Group, Crawley, UK.

ELECTRONIC COUNTERMEASURES (ECM)

Type 670

Type 670 is a jammer system, nicknamed 'Heather'. It is a somewhat elderly equipment and the fact that ships are fitted with the more up-to-date Type 675 for particular missions suggests that it may not be capable of dealing with all the latest threats. Type 670 is characterised by a rectangular radome, located either side of a container abaft the stack.

Manufacturer/Contractor

Thorn EMI Electronics, Sensors Group, Crawley, UK.

Type 675(2) radar detection and jamming system

Type 675(2) is installed in some Batch 2 ships, where it replaces Type 670. Type 675 is an active/passive EW system designed to counter a wide range of operational threats, particularly those of radar-guided missiles. The system counters and confuses surveillance and missile homing radars by the use of selective jamming techniques for both area and point defence. Azimuth coverage is 360° with an elevation cover of 50° and a detection range of up to 500 km. Two antenna mounts, both with mechanical steering to give full azimuth and elevation coverage, ensure uninterrupted all-round view. Each mount carries a direction-finding receiving antenna together with transmit antennas. Received signals are analysed to identify those which may pose a threat and the selected signals are processed to allow generation of the jamming signal.

High-power transmitter subsystems, matched to the antenna, provide jamming capability against several types of target simultaneously. A comprehensive ECM library stores the appropriate countermeasures to a range of potential threats and, on receipt of a warning from the ESM system, the ECM processor selects the appropriate jamming mode to give fast response.

The main equipment cabinets can be situated below decks or installed in containers for mounting on the upper deck or superstructure, as has been done in a number of British ships serving in the Gulf. Such containers provide for easy removal and refit to other ships. In the British Navy the Type 675 is also known as 'Millpost' while an export variant is designated 'Guardian' by the company.

Manufacturer/Contractor

Thorn EMI Electronics Ltd, Sensors Group, Crawley, UK.

DECOYS

Outfit DLB

Outfit DLB consists of four Hunting Engineering 130 mm 'Sea Gnat' six-barrel launchers which are grouped in pairs on either side of the bridge structure. The control unit, by Thorn EMI, provides for the launching of the most effective combination of rounds for distraction and centroid/seduction giving the type, speed and direction of the threat, the ship's speed and heading as well as wind direction and speed.

The munitions involved are the Mk 214 RF seduction, Mk 216 RF distraction rounds, and Mk 218 IR seduction rounds.

Manufacturers/Contractors

Thorn EMI/AB Precision Ltd (control unit).
Hunting Engineering (launchers).
Chemring Ltd (munitions).

Graseby Type 182 towed torpedo decoy

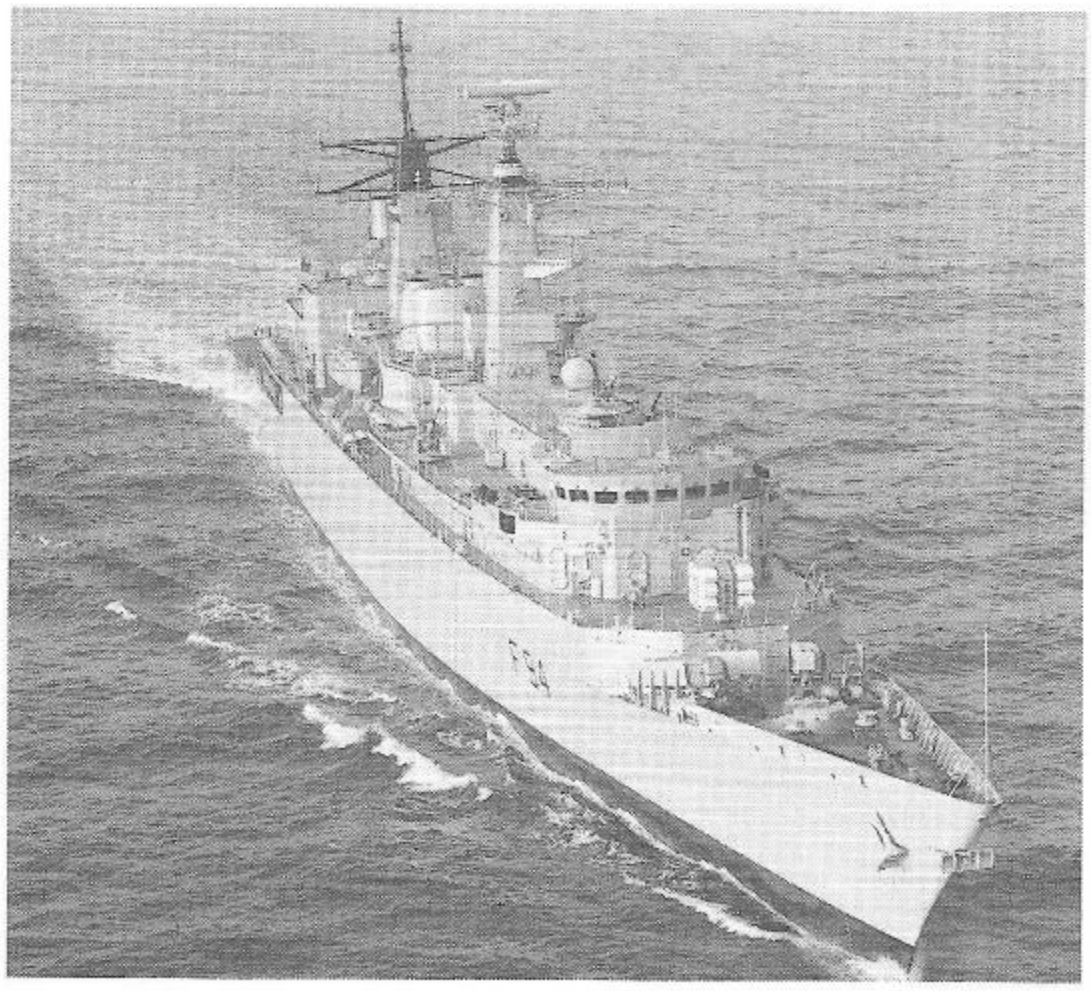
The Type 182 towed torpedo decoy is designed to decoy both active and passive homing torpedoes, using signals electronically generated within the ship and fed, via the towing cable, to electroacoustic transducers within the towed body. The Type 182 produces two independently controllable output signals which are radiated simultaneously from the towed decoy. An amplitude modulated noise signal simulates the ship's propeller noise and causes passive-homing torpedoes to be seduced away from the ship towards the towed decoy. The second signal is a swept CW signal, which simulates sonar echoes, in order to confuse or jam the guidance system of active-homing torpedoes, thus causing them to miss the ship. The frequency bands covered by both types of output are switchable to meet tactical scenarios and to enable concurrent operation of other sonar and communication equipments.

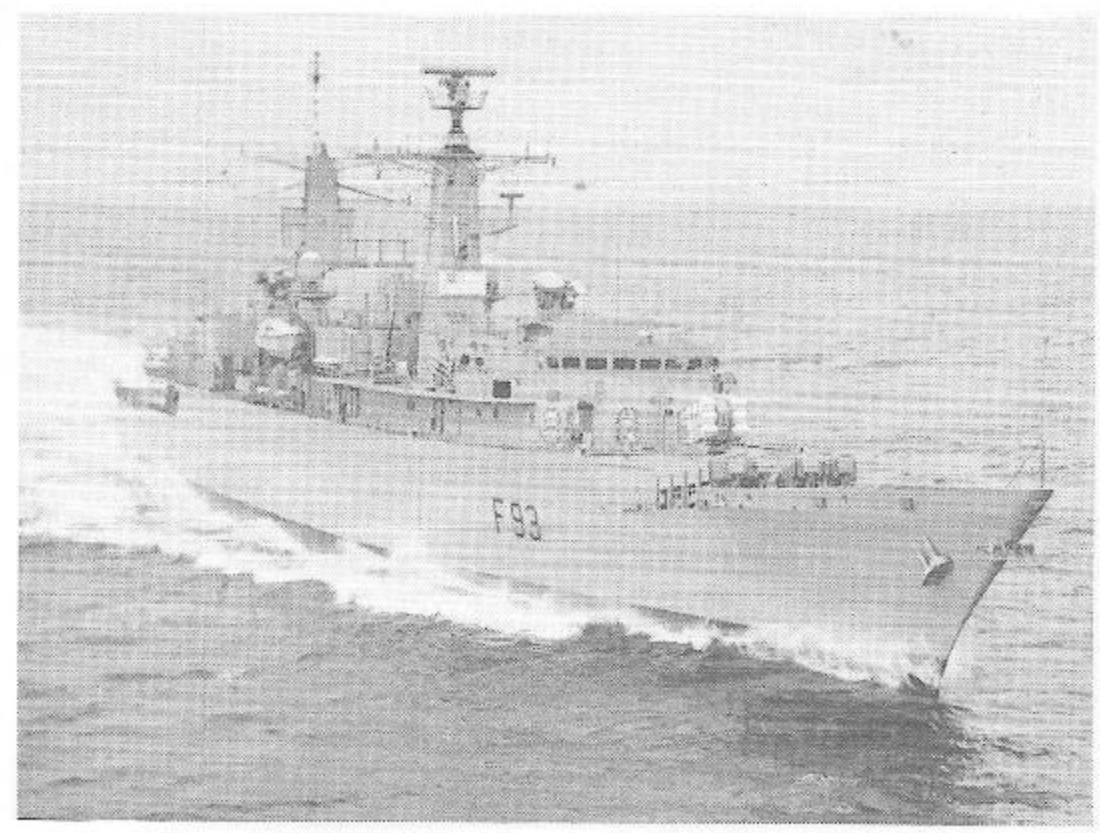
Specifications

Towed decoy:
diameter: 533 mm
length: 2,005 mm
weight: 74 kg (163 lb)
Towing cable:
length: 411 m (1,348 ft)
diameter: 14.48 mm
weight: 269 kg (593 lb)

Manufacturer/Contractor

Graseby Marine (Graseby Dynamics Ltd), Watford, UK.





There are two sub-groups within Batch 2. The first two ships Boxer *(F 92) and* Beaver *(F 93) (above) were 16.9 m (55.8 ft) longer than Batch 1, with the remaining four ships, including* Brave *(F 94) (left), being not quite as long at 146.5 m (480.5 ft)* (Yarrow)

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Ferranti CACS 1

The Computer Assisted Command System 1 (CACS 1) was the first of a family of new command systems for the Royal Navy, installed for the first time in Type 22 Batch 2 frigates. The architecture is based on dual F2420 computers, connected by a distributed highway to several display positions, each of which contains its own Argus M700/20 microprocessor system to optimise operator effectiveness and minimise angle point failures. The consoles are based on the new GEC-Marconi Series 9 display system which, with greatly increased quality and capacity, supersedes the Mk 8 display technology, used in ADAWS. There is extensive use of video retiming and scan compression techniques. The principal input device is the light pen, replacing most of the rolling ball and keyboard functions. CACS employs an all-vertical display concept which, besides offering the operator a more comfortable and efficient working position, overcomes severe ship-fitting constraints and the problems associated with conventional horizontal dual-operator displays. The most significant advance from the user's viewpoint is the implementation of the 'prompt' interface for operator communication with the system.

Typical range				64 n miles	

Notes:
* Antennas for Types 967 and 968 radars are mounted back to back
** Type 967M replaces Type 967 in *Brave* (F 97) only

SONARS

Type 2016 sonar

The bow-mounted Type 2016 is installed in the earlier Batch 2 ships. This is an active/passive sonar which is reported to have a range of 10 km. It operates at 5.5, 6.5 and 7.5 kHz and features a cylindrical, retractable, stabilised array with (6 ft (1.8 m) diameter with 64 staves. It uses computerised signal processing based on a Ferranti FM 1600B.

Type 2050 sonar

The bow-mounted Type 2050 sonar is mounted in the later Batch 2 ships and may also replace the Type 2016 in earlier ships. This digital equipment uses distributed data processing with Ferranti Digital Signal Processing (DSP) cards and multiple Ferranti Argus M700 processors. The provision of extensive data processing facilities and improved man/machine interfaces allows one operator to control the complete system. The equipment interfaces with the combat system data highway, feeding data to the Ferranti CACS action-information system. Type 2050 operates at 4.5 to 7.5 kHz, using 64 5.5° beams.

Manufacturer/Contractor

Thomson-Marconi Sonar Systems UK Ltd, Stockport, UK (prime system contractor).

Type 2031Z towed array sonar system

All Batch 2 ships are fitted with Type 2031Z towed array sonar. Using the innovative 'Curtis' architecture developed by Professor Curtis at the UK Admiralty Research Establishment in Portland, Dorset, the 2031Z electronic signal processing suite has, because of its compactness, a considerably lower installed cost than other systems, and yet provides a multi-octave broad and narrowband analysis facility capable of tracking the most elusive threats. The array itself is towed behind the ship and has a very low self-noise characteristic and is considerably longer than that used by any other self-contained sonar. It provides good bearing accuracy, even down to the very low-frequency end of the acoustic spectrum. The combination of an advanced signal processing architecture and a high-performance towed array ensures that the system is a dual-capability sensor, able to fulfil both the tactical and surveillance role. A 2031Z-equipped frigate can, therefore, act as an ASW picket or close escort.

Manufacturers/Contractors

Ultra Electronics Ocean Systems, Weymouth, UK (inboard electronics suite).
Basys Marine, Barnstaple, Devon, UK (towed array).
Clarke Chapman, Gateshead, UK (winching equipment).

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: The last four Batch 2 ships are 2.04 m (6.7 ft) longer in order to enlarge the flight deck, the dimensions being:

F 92, F 93 — 20.7 × 14.8 m (68 × 48.5 ft)
F 94-96, F 98 — 23.0 × 14.0 m (75.5 × 45.9 ft)

HELICOPTERS

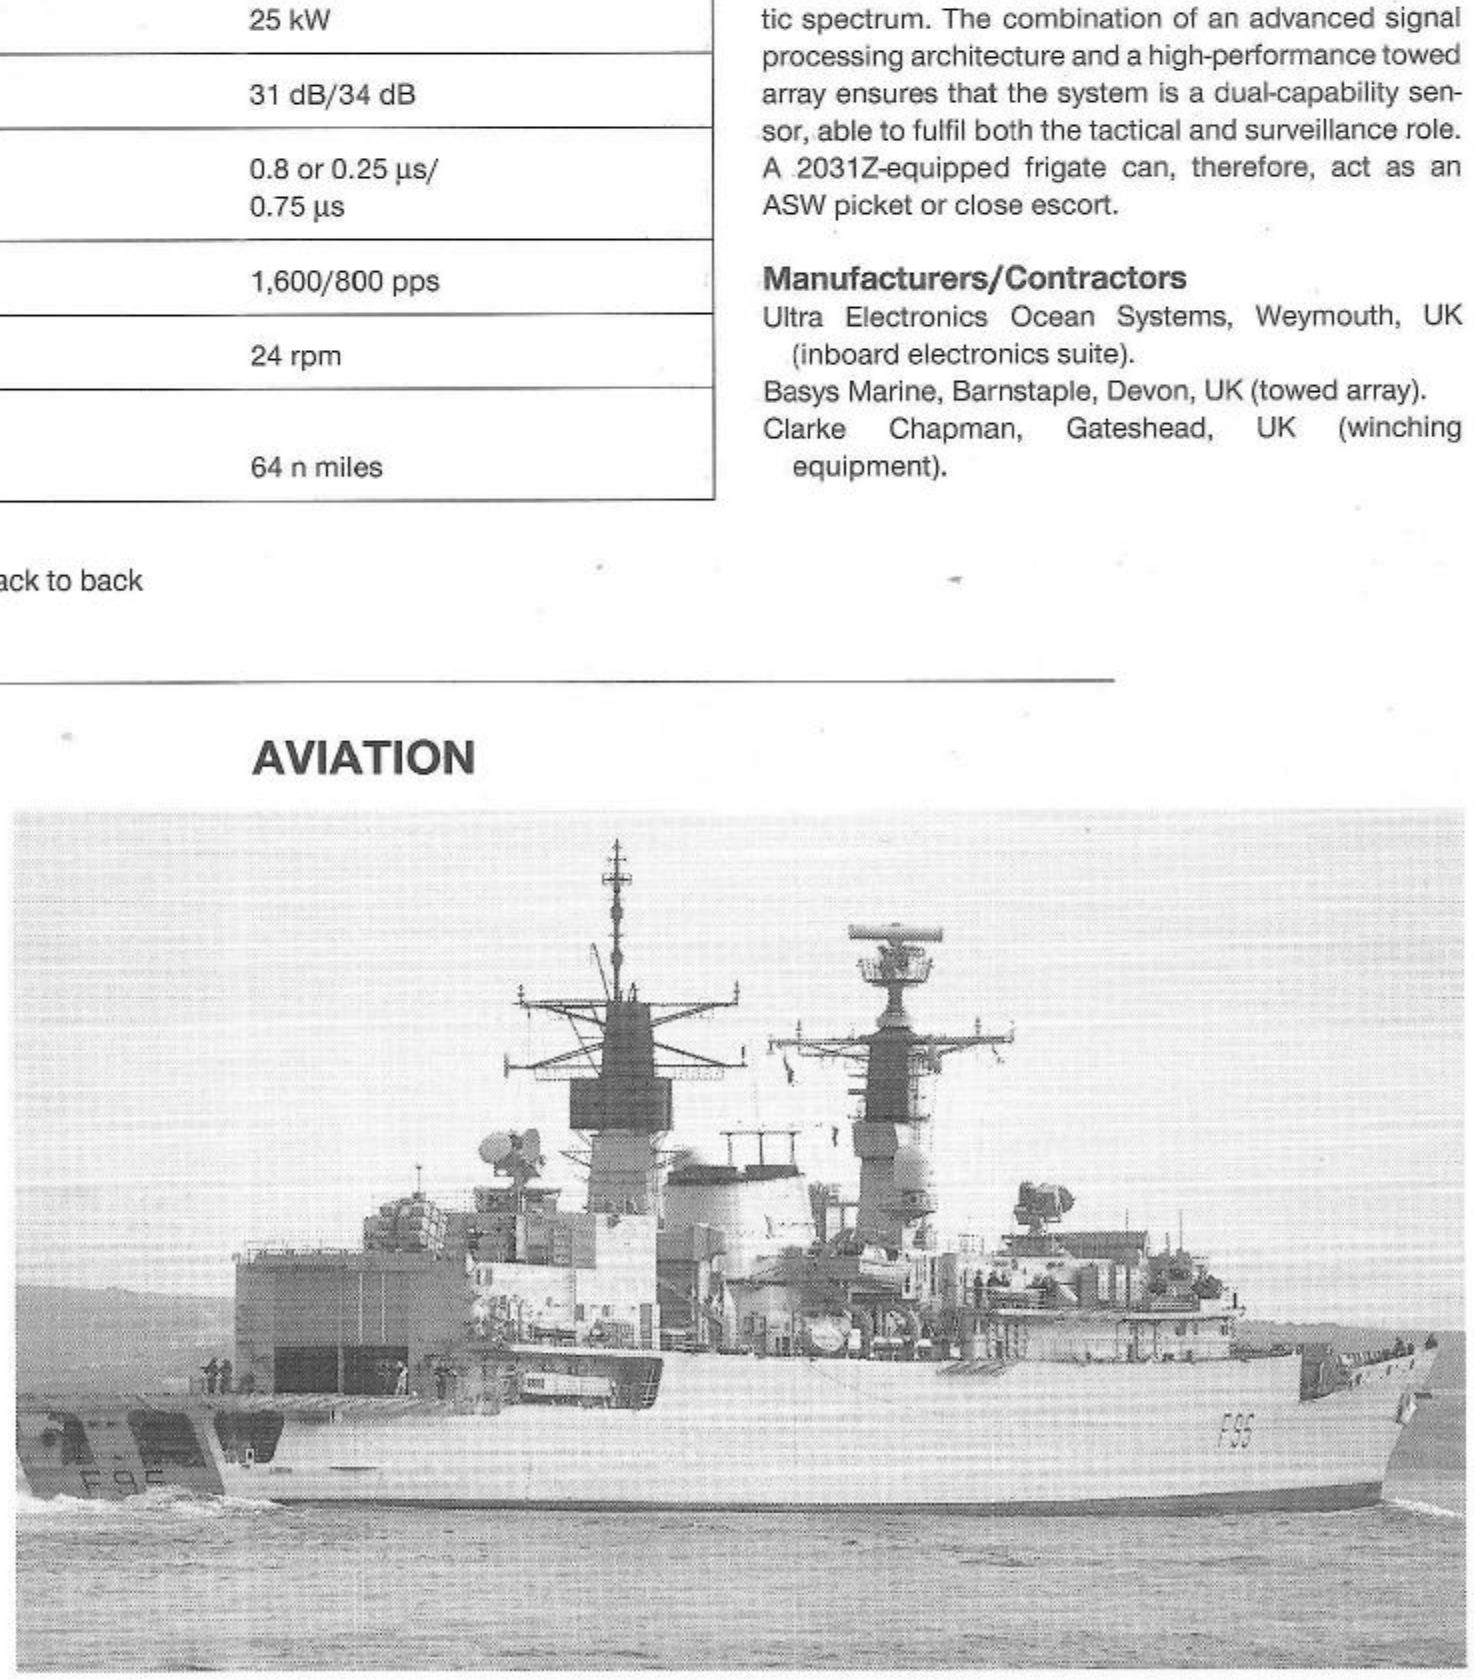
1 EH.101 Merlin HAS 1 (in due course).



London *(F 95). The after Seawolf launcher and Type 911 fire director are on the hangar roof. The antenna arrays at the head of the mainmast are related to the Outboard SIGINT system*
(Jane's/HM Steele)

PROPULSION

Specifications
System: Combined gas turbine or gas turbine (COGOG)
Main machinery: 2 Rolls-Royce Olympus TM3B gas turbines; 37.3 MW (50,000 hp) sustained or 2 Rolls-Royce Spey SM1C (F 94); 32.8 MW (44,000 hp) sustained; 2 Rolls-Royce Tyne RM1C gas turbines; 7.4 MW (9,900 hp) sustained
Shafts: 2
Propellers: cp

FURTHER INFORMATION

DESIGN

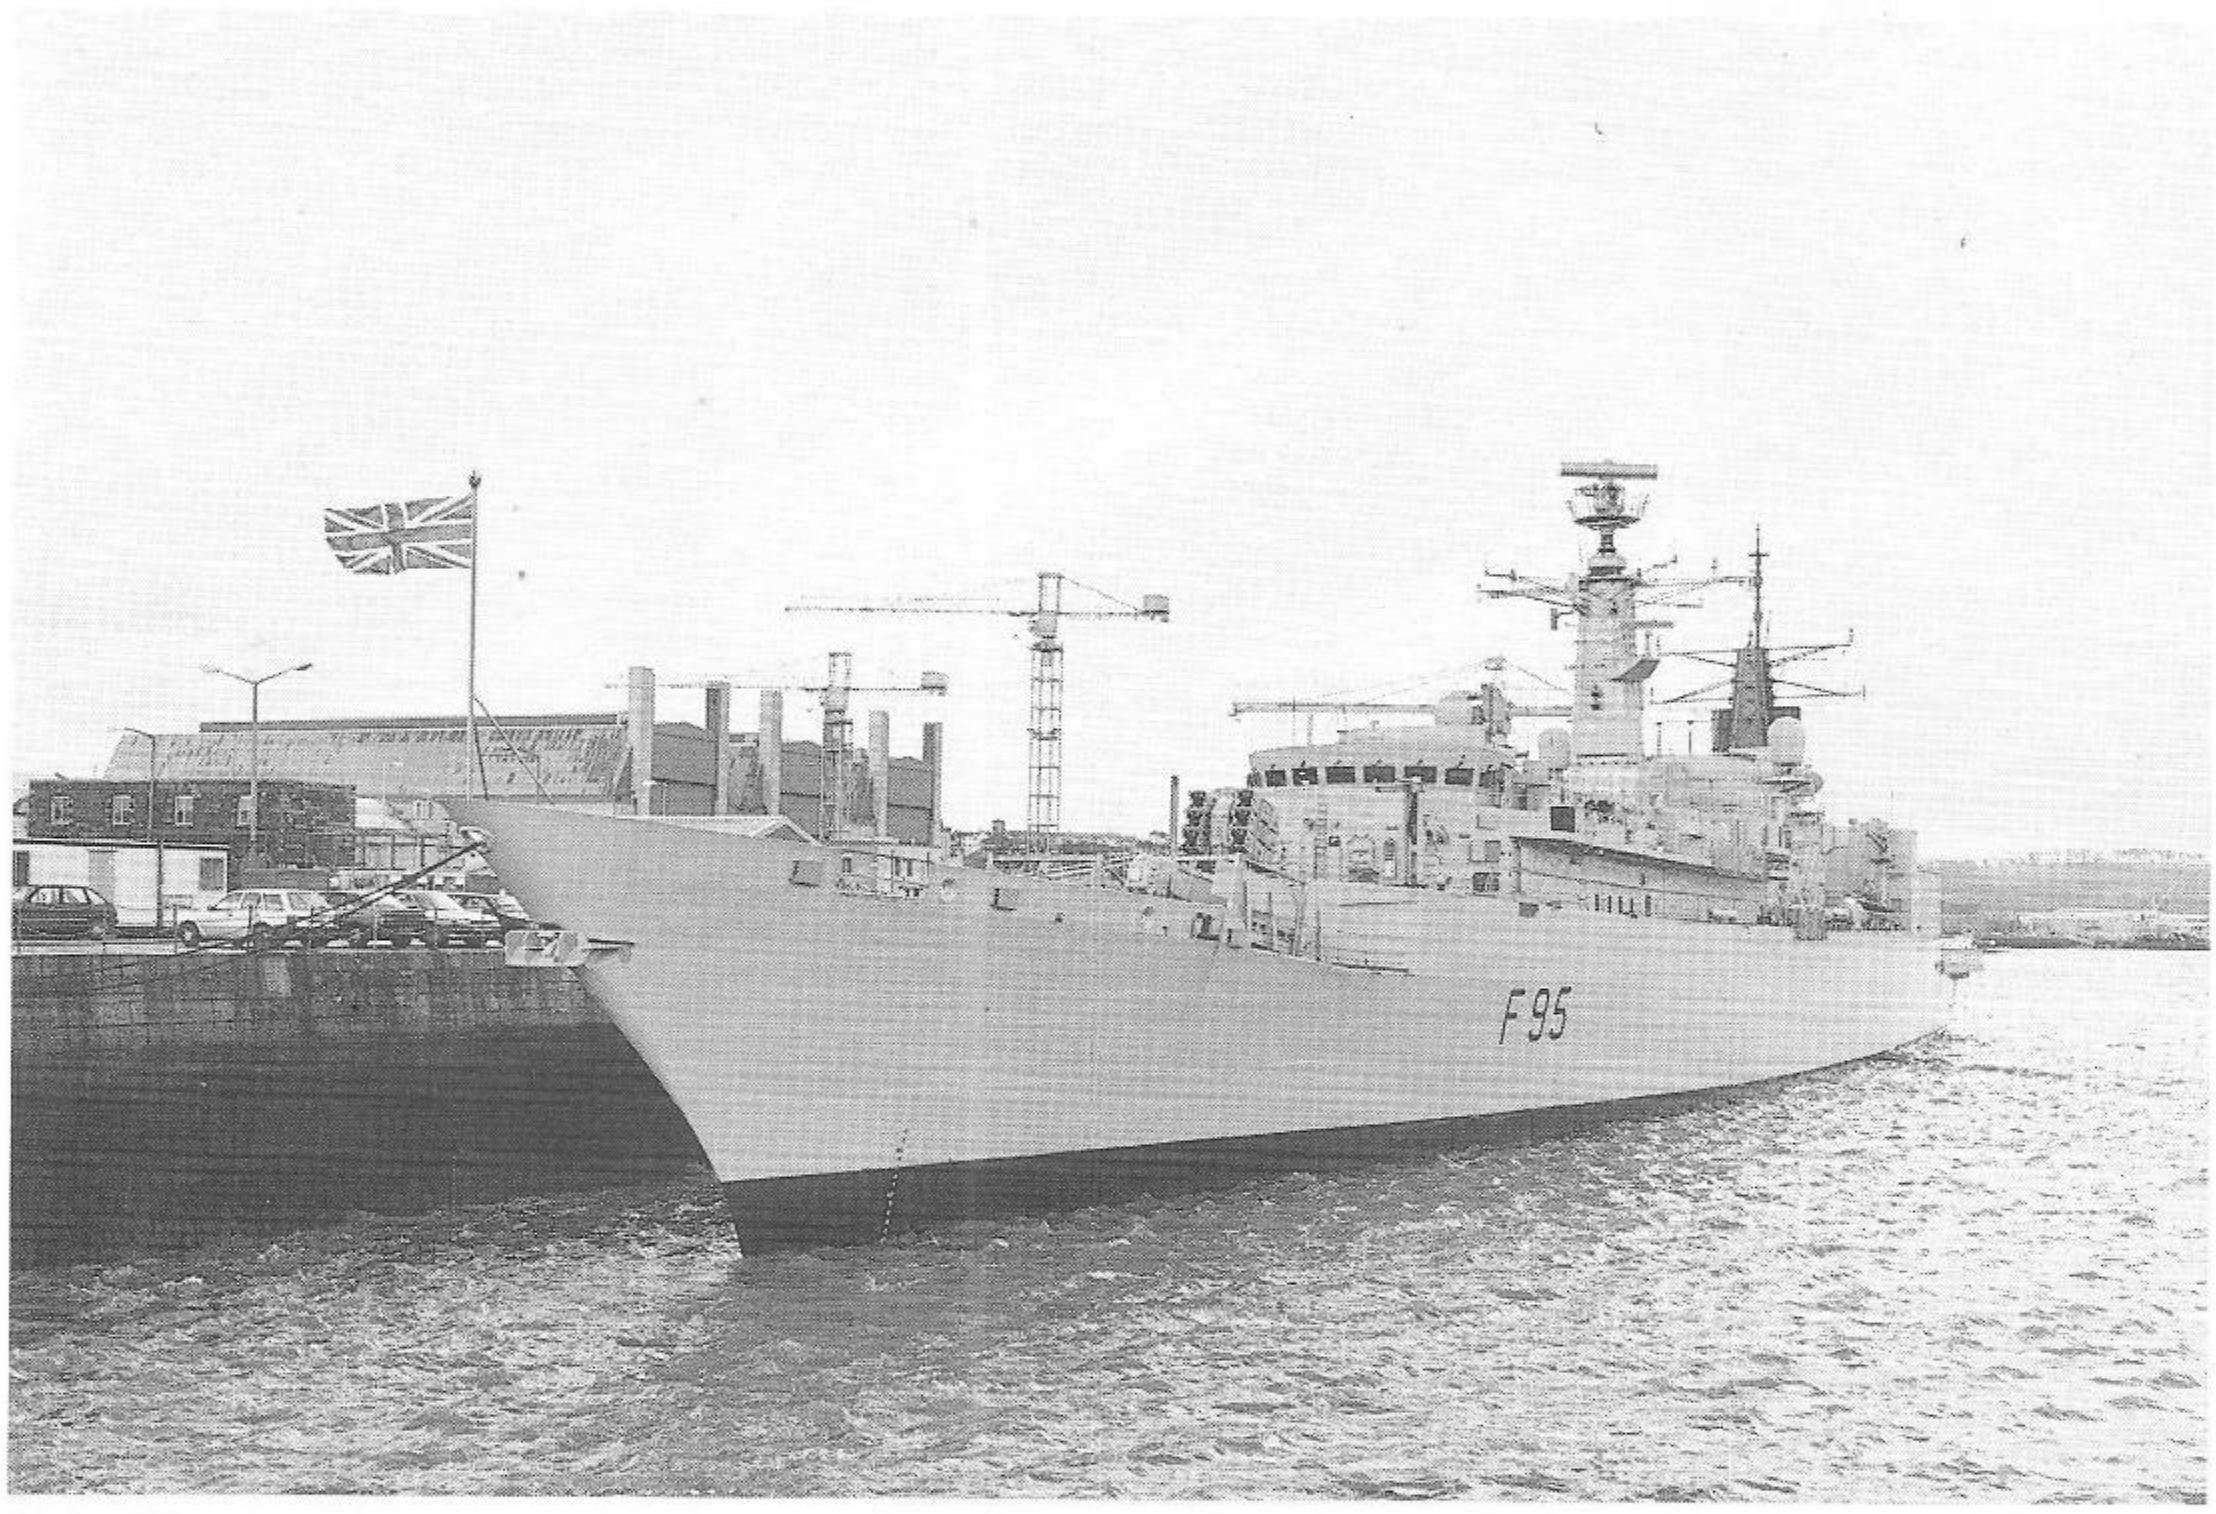
The Batch 2 ships were lengthened on build, primarily in order to give more space for EW equipment. The last four Batch 2 are slightly longer than the first two and have enlarged flight decks to enable them to accommodate either one Sea King now, or one EH.101 Merlin when it enters service.

OPERATIONAL

This class is primarily designed for ASW operations and is capable of acting as OTC (Officer in Tactical Command).

DEPLOYMENT

The Batch 2 frigates form the 1st Frigate Squadron, based at Devonport.



London *(F 95) at the completion of its 1995 refit at Devonport Royal Dockyard* (DML)

Cornwall *(F 99), first of the Batch 3s. On the same, longer hull as the first two Batch 2s, the Batch 3s have a significantly different weapons fit. There is a Vickers 114 mm gun on the foredeck, displacing the Exocets, which are replaced by eight Harpoons located on the upper deck forward of the foremast. This picture also shows the two GPEODs on the bridge roof* (Jane's/HM Steele)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84C Harpoon

Eight Harpoon anti-ship missile canisters are mounted in a gap in the forward deckhouse, created by deleting the EW room. There are two groups of four launchers each, with one group pointing to either beam. The missiles are Block 1C versions, with certain additional options over earlier blocks, including the ability to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications (Block 1C)

Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st.
Booster: Thiokol or Aerojet rocket; 5,400 kg (11,907 lb) thrust for about 2.9 s.
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

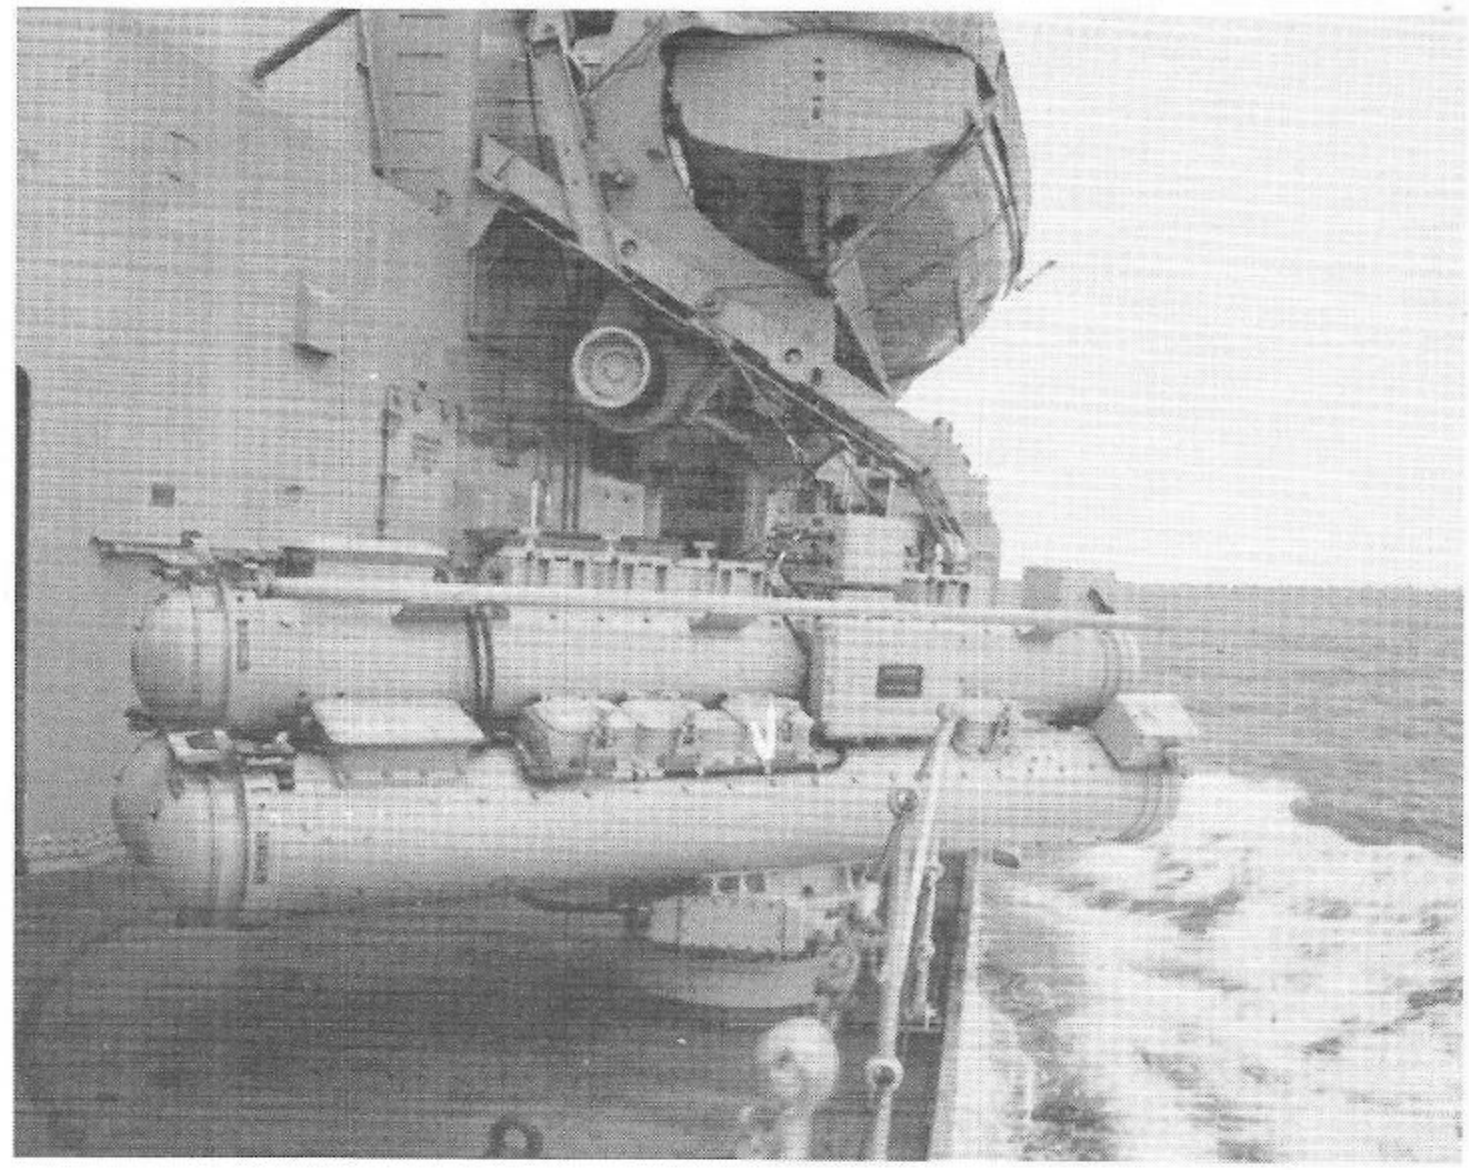
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

Seawolf GWS.25 Mod 3

GWS.25 Mod 3 consists of an air search radar, two trackers, a missile, 32-round magazine, six-tube launcher and a command subsystem. The air search radar is the GEC-Marconi Type 967 D-band system whose waveguide antenna is mounted back to back with that of the Type 968 surface search antenna. The rounds are lifted by hydraulic hoist to ready-use magazines near the launcher and are then moved manually on a trolley to the launcher and placed on the launcher rails. The launch tubes, three either side of the pedestal, have clam-shell front and rear shutters, which open automatically for firing.

The GEC-Marconi Type 911 Mod 1 tracker is a dual-frequency radar with two antennas: one for I-band transmission, the other for millimetric-wave (L/M-bands) transmission. The I-band element is used for long-range tracking and high-angle engagements. Its signal processing includes fast Fourier transform techniques to ensure effective operation in severe clutter. It is designed to provide accurate tracking at close range and at low levels. This facility is assisted by separate illumination of the upper and lower parts of the antenna. The computer is the FM1600E. The tracker is normally dedicated to a launcher and uses time-division multiplexing to control two missiles and to track both target and missile. The tracking loop also incorporates electronic angle tracking to minimise antenna movement when correcting missile line of sight guidance for small angles.

The command subsystem associated with each tracker includes a command transmitter, a Ferranti data handling system based upon the Ferranti FM1600E, a guiding shaping unit and operator consoles. The process is completely automatic, but with manual override, and it is able to analyse sensor data, to establish a track, to conduct threat analysis then allocate target priorities. Targets are detected by the air search radar and assigned through the ship's command system to the Seawolf command subsystem. There the threat is evaluated and the target is assigned to a tracker-launcher combination. Both slew towards the target, the tracker searches in elevation until it acquires and locks on to the target to establish a radar line of sight. When the target is within range, one missile is automatically launched, although frequently a second will follow it moments later. After launch, the missile is acquired by the wide-angle antenna and gathered into the target line of sight. Its position relative to the centre of the tracking beam is monitored by the radar, and the shipborne guidance computer generates the necessary steering commands to keep the missile in the centre of the beam until it intercepts the target. The missile's rearward-facing antennas help to provide a good ECCM capability. The television camera is used for low-level tracking with flares showing the missile's location.



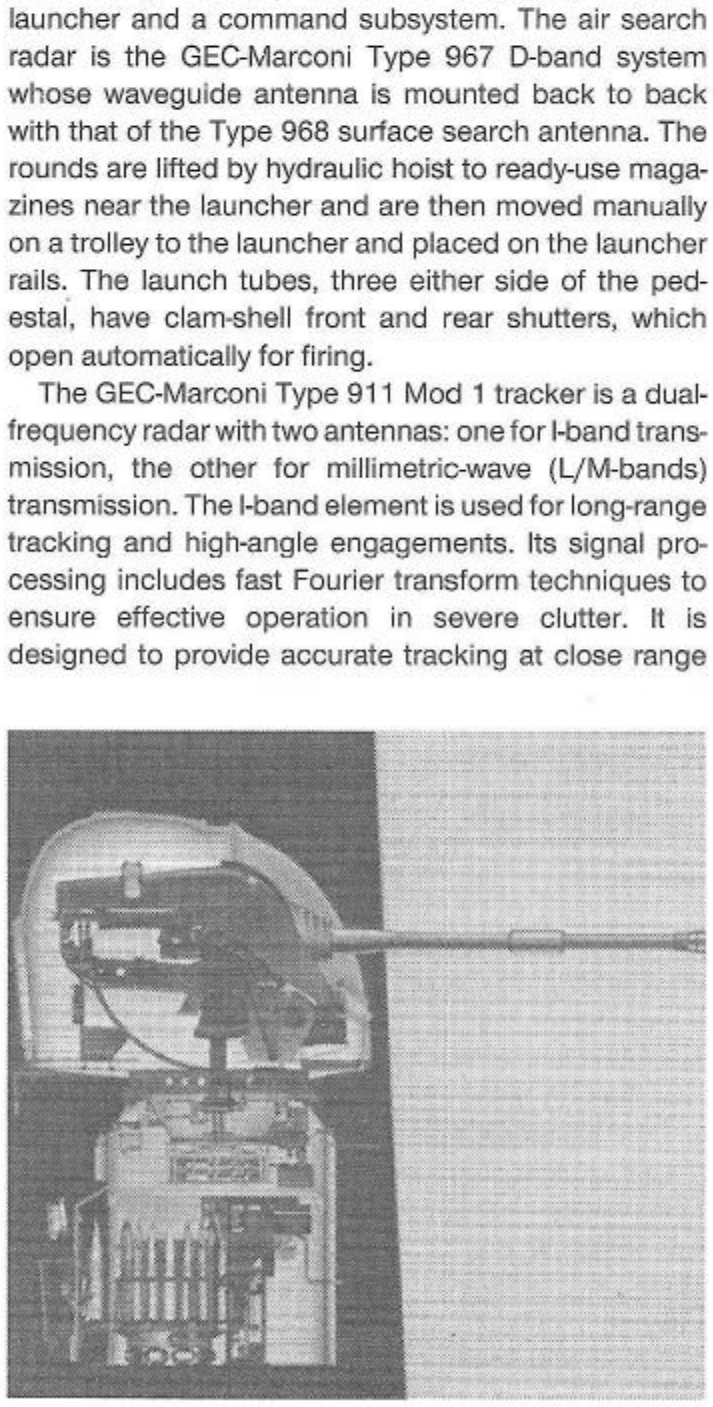
STWS 2 324 mm torpedo launcher aboard a Type 22 frigate

Specifications (GWS.25)

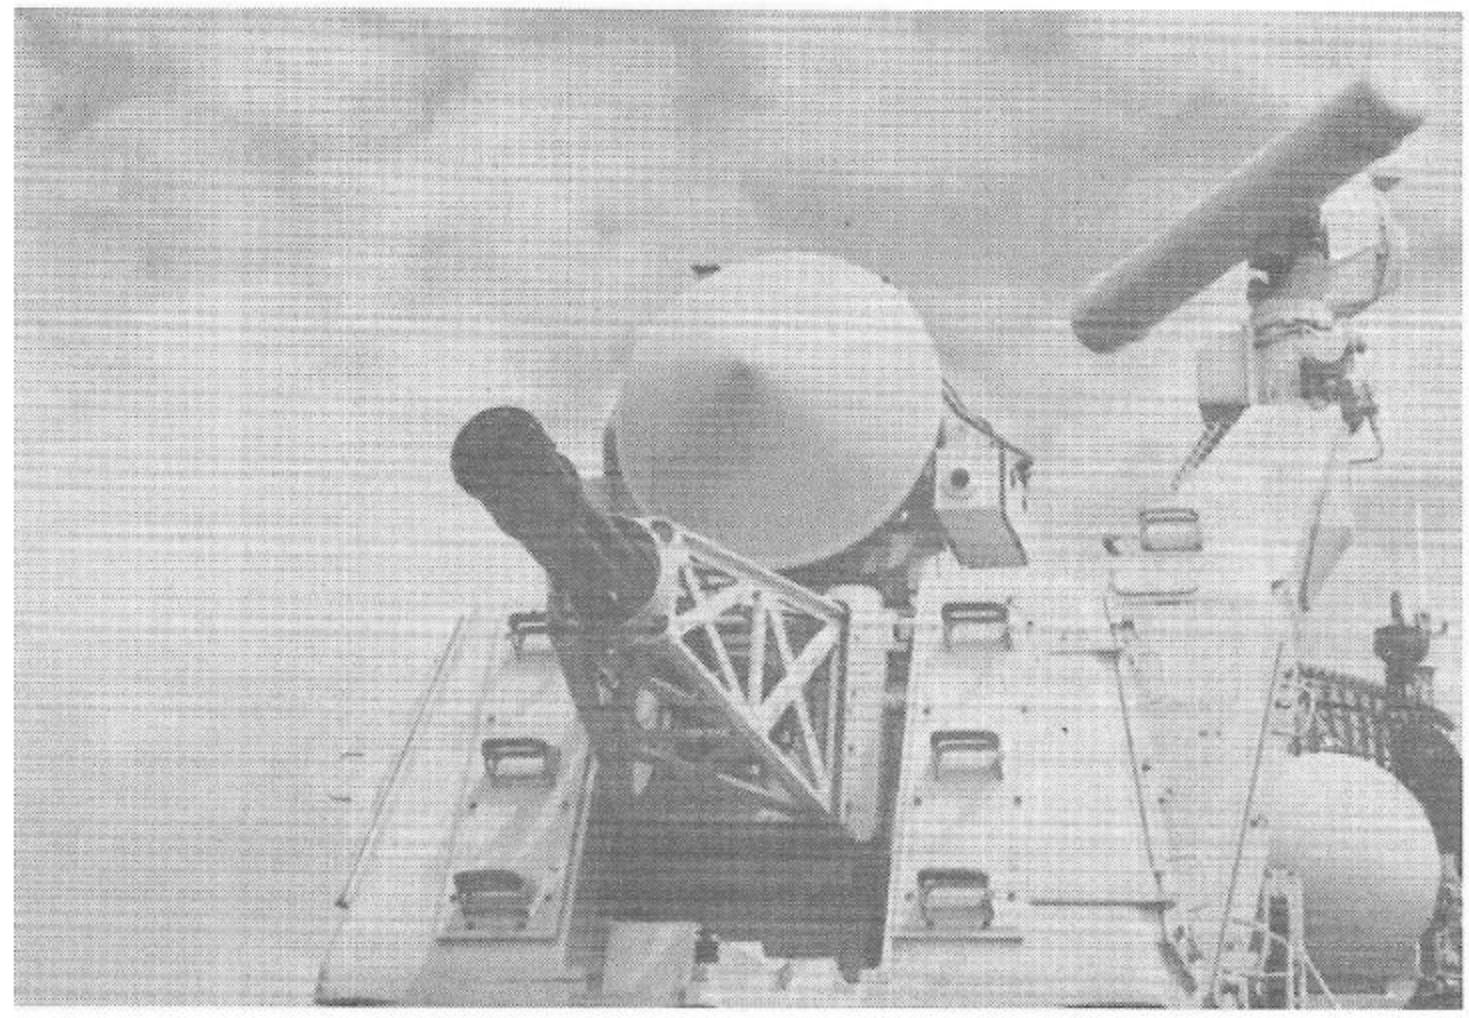
Length: 2 m (6.5 ft)
Diameter: 18 cm (7 in)
Wing span: 70 cm (27.5 in)
Weight: 82 kg (181 lb)
Speed: Mach 2+
Range: 2.7 n miles (5 km)
Guidance: CLOS
Warhead: Royal Ordnance 14 kg (31 lb) fragmentation high explosive warhead with Thorn EMI impact-proximity fuze.

Manufacturer/Contractor

British Aerospace, UK.



Cutaway of the Vickers 114 mm (4.5 in)/55 Mk 8



Close-up of Signaal/GE Goalkeeper CIWS

TORPEDOES

STWS Mk 2 anti-submarine torpedo launching system

These ships are fitted with two sets of triple 324 mm Plessey STWS Mk 2 (Shipborne Torpedo Weapon System) torpedo tubes. Each group consists of a triple-tube launcher, a launch control, and a presetter unit, which are linked to the launchers through local control panels. On the possibility of action the launchers are manually trained to an angle of 45° using a training handle installed between the two lower tubes, but thereafter they are remotely operated. The tubes themselves are made of glass fibre-reinforced epoxide resin and mounted in a triangular configuration. STWS 2 is designed to operate with the Mk 46 and the Sting Ray lightweight torpedoes. It has electrically operated muzzle doors while the presetter/launch controller features Motorola 30800 microprocessors. It also features a strengthened mounting, better access to the tubes and improvements in the diagnostic and heater systems.

Specifications
Length: 3.65 m (12.0 ft)
Height: 1.4 m (4.6 ft)
Width: 1.23 m (4.0 ft)
Weight: 1,560 kg, (3,440 lb) (unloaded)

Manufacturer/Contractor
GEC-Marconi Underwater Systems Ltd, UK.

Sting Ray lightweight anti-submarine weapon

Sting Ray lightweight ASW torpedo can be used in deep or shallow waters, using its multiband, multibeam sonar. The narrowband capability gives good Doppler discrimination against slow or quiet targets, while the broadband capability provides target discrimination, range and bearing resolution. The acoustic beam sweeps the whole volume of the water from the surface to the maximum operating depth. The computer can be reprogrammed 'through the skin' whenever updated software is required, with the programs adapting themselves to the tactical and environmental conditions in which the torpedo operates. The computer also controls the signals, beam form, speed and trajectory of the weapon.

Power is provided by a Chloride seawater-activated magnesium-silver chloride battery. The reaction is controlled by recirculating hot, part-spent seawater using a pump while simultaneously controlling the amount of cold seawater reaching the battery. Power is produced 1.5 seconds after the weapon enters the water. The propulsion system uses a Lucas DC electric motor driving two contrarotating propulsors housed in a duct to form the pump-jet. The control surfaces are actuated by an electrohydraulically driven proportional control system developed by BAe Dynamics Group.

On entering the water the torpedo sets up a programmed search pattern designed to maximise the chances of target detection. On acquiring the target, the computer and active/sonar sensors make it almost impossible for the target to evade attack. The software of the guidance/homing system enables it to filter out background noise and decoys, and to intercept the target rather than perform a conventional tailchase attack. Maximum speed is about 45 knots with an estimated endurance of some eight minutes at that speed.

Specifications
Length: 2.59 m (8.5 ft)
Diameter: 324 mm
Weight: 267 kg (588 lb) (in air)
Warhead: 35 kg (77 lb)
Speed: 45 kts (estimated)
Range: 6 n miles (11 km) (estimated)
Endurance: approximately 8 min
Depth: 750 m (2,460 ft)

Manufacturer/Contractor
GEC-Marconi Underwater Systems, UK.

Sea Archer 30 (GSA 8)

GUNS

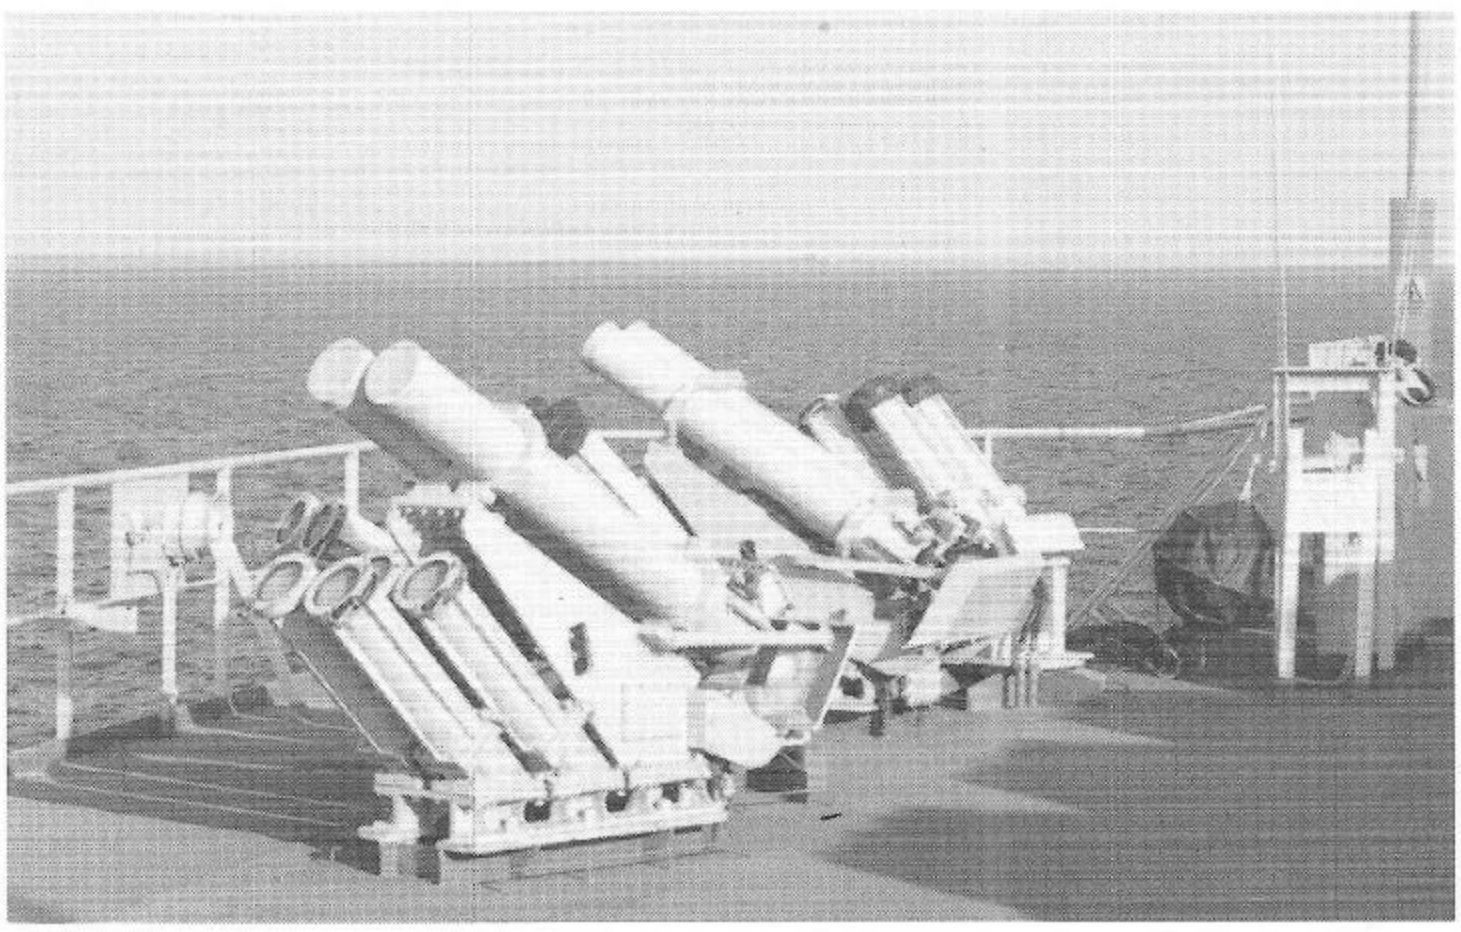
Vickers 114 mm (4.5 in)/55 Mk 8 multipurpose gun

The Type 22 Batch 3 mounts a single 114 mm (4.5 in)/55 calibre Mk 8 gun in 'A' position. This weapon provides quick-reaction short-range air defence, engages surface targets including fast attack craft, and provides gunfire support to ground forces. The weapon system consists of the gun mounting, the ammunition feed system, the remote power control system, and the captain-of-turret panel.

The barrel is 6.22 m (20.4 ft) long, is fitted with a muzzle brake and fume extractor, and has a life of 3,300 rounds EFC. The mounting is completely enclosed in a glass fibre shield which protects it against the environment, blast and shrapnel. The loading system is hydraulically operated, with an autoloader which is manually fed by two loaders and has a capacity of six rounds. The hoist transfers them in two stages to the turret from where they are raised by a pivoting loading arm to the breech where they are inserted by a power rammer. After the shell is fired the case is extracted automatically and ejected through a chute in the front of the mounting.

Specifications
Calibre: 113 mm
Length of barrel: 55 calibres
Traverse: 340° at 40°/s
Elevation: −10 to +55° at 40°/s
Muzzle velocity: 868.7 m/s (2,850 ft/s)
Weight of projectile: 21 kg (69 lb)
Rate of fire: 25 rds/min
Range:
anti-surface: 11.9 n miles (22 km)
anti-air: 6,000 m (20,000 ft)
Crew: 4 (gun captain (CIC), loading supervisor, 2 loaders)

Manufacturer/Contractor
Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

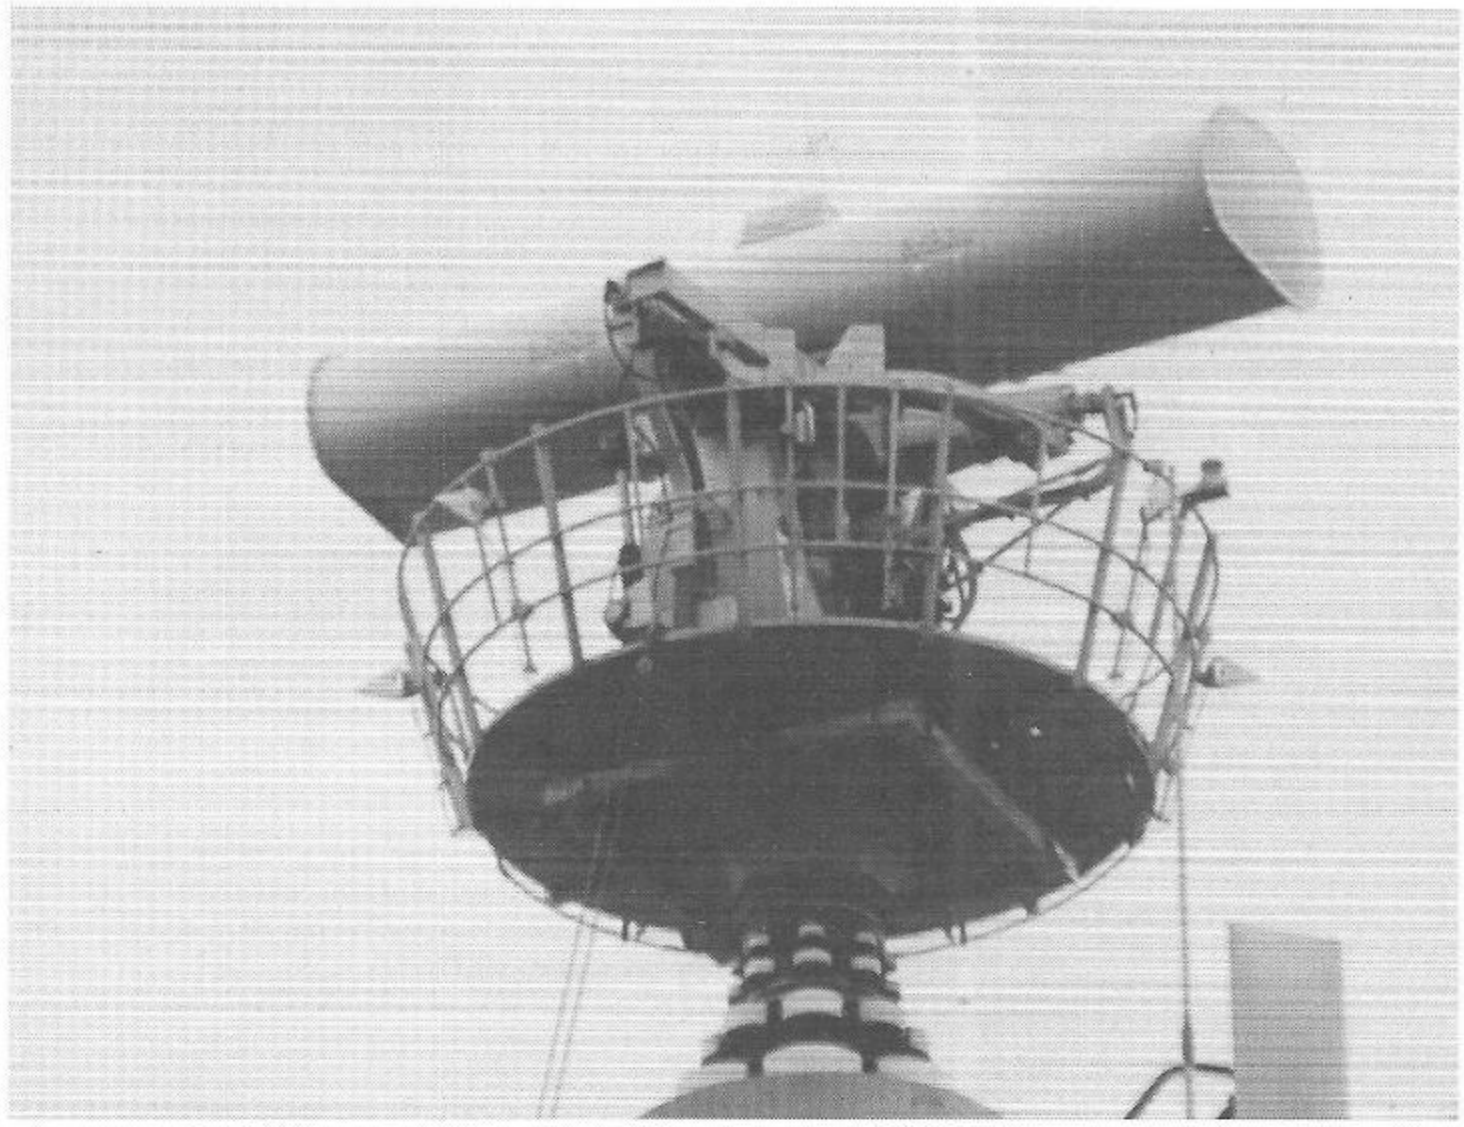


Outfit DLB, the UK Royal Navy version of NATO Sea Gnat (Jane's/Peter Saracino)

Signaal/Hughes SGE-30 30 mm Goalkeeper close in weapons system

One Signaal/Hughes 30 mm 7-barrelled Gatling Goalkeeper close in weapons system is mounted at the forward end of the hangar roof. Goalkeeper is an autonomous, fully automatic system, consisting of a Hughes Sea Vulcan 30 gun, I-band search radar, I/K-band tracking radar, TV camera, and ancillaries. The Sea Vulcan 30 is based upon the electrohydraulically powered GAU-8/A 30 mm seven-barrel, Gatling gun, with each barrel firing once during each revolution of the barrel cluster. The gun is very reliable, with 33,000 mean rounds between stoppages. The mounting has an ammunition capacity of 1,190 rounds carried in a linkless system using a feed and storage drum, which is claimed to be sufficient for several target engagements before reloading is necessary. The warhead kill capability of Goalkeeper against anti-ship missiles is achieved by use of MPDS rounds which have high-density, tungsten-alloy penetrators. For 'soft' targets, HEI and TP types of ammunition can be used.

The I-band search radar uses a 2,050 × 280 mm



Type 967 antenna with VAA-2 (Abbey Hill) ESM array below platform

linear array antenna with an integrated sidelobe suppression antenna. The antenna rotates at 60 rpm and has a horizontal beamwidth of 1.7° and a vertical beamwidth of 60°. The radar is powered by a water-cooled, synthesiser-driven, TWT transmitter with high-output power for greater frequency and PRF flexibility in the face of ECM threats.

Specifications:

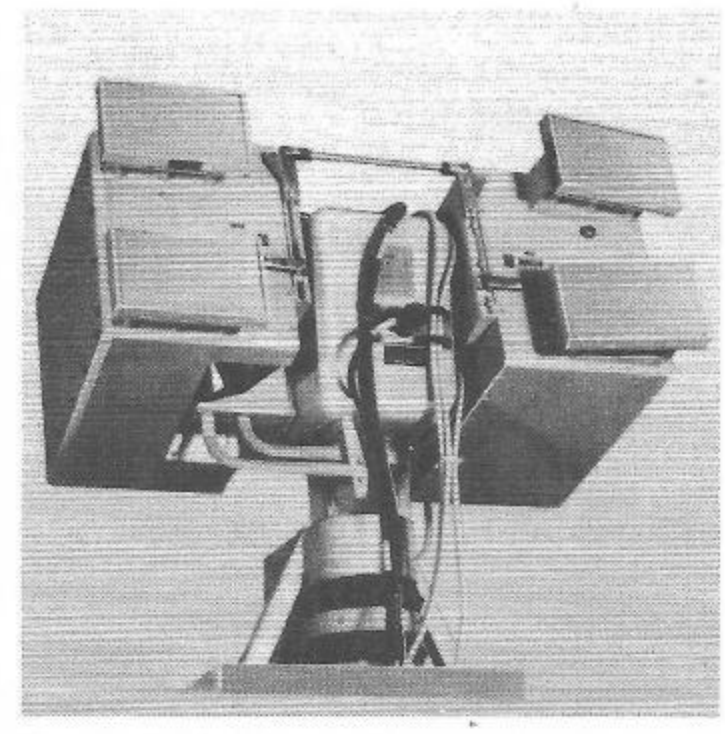
Calibre: 30 mm
Muzzle velocity: 1,020 m/s (3,346 ft/s)(TP, HEI); 1,150 m/s (3,773 ft/st) (APDS)
Traverse: 360°
Elevation: −25 to +85°
Mounting weight: 6,800 kg (14,994 lb)
Crew: 0
Range: 1.61 n miles (200 m to 3 km)
Rate of fire: 4,200 rds/min
Ammunition: 369 g (TP, HEI, HEISD, API, MPDS)

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands (system/radar).

MSI DS 30B 30 mm gun mounting

There are two 30 mm gun mountings on the main deck below the foremast. The weapon itself is an Oerlikon KCB 30 mm cannon, which is positively locked and gas operated, with a belt-feed mechanism fixed to the cradle. The left-hand feed KCB-B02 is used in the DS 30B mounting. The ribbed barrel has constant rifling with 18 grooves and a 6° clockwise constant turn. The weapon includes a muzzle brake, axial recoil buffer and mechanical ignition system. The KCB normally fires in automatic mode only but in the DS 30B, a single shot capability has been included.



Type 674(2) jammer array

The mounting is a locally controlled, power-driven and line of sight-stabilised unit designed to allow a variety of sensor and weapon packages to be fitted. The pedestal contains the stabilisation and training machinery and the open gunner's position is on the right of the mounting with the 160-round magazine on the left. The mounting incorporates alloys to reduce magnetic signature and has clean lines to meet NBC washdown requirements. An integral battery pack provides up to 10 minutes of operation in the event of ship power failure.

Specifications

Mounting (DS 30B)
Traverse: 230° (operational)
Elevation: −25 to +70°
Traverse speed: 55°/s
Elevation speed: 55°/s
Crew: 1

Gun (KCB)
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Rate of fire: 650 rds/min
Ammunition weight: 870 g (31 oz)

Manufacturer/Contractor

MSI Defence Systems Ltd.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

UAA-2 (Abbey Hill) ESM systems

UAA-2 is a passive reception, signal analysis and direction-finding system using IFM receivers. Frequency range has never been released but is almost certainly 1 to 18 GHz. The intercept and DF antennas are a series of radome-covered horns mounted under the foremast masthead Type 967/968 radar. Accuracy of measurement is reported to be ±1.5 MHz in frequency and 3° in bearing. The intercept part is combined with a threat identification system and is presumably integrated with the Type 670 (see below) jammer. UAA-2 is an upgraded version of UAA-1 and features solid-state electronics in its front end, an improved threat library and an increase in the number of warner channels.

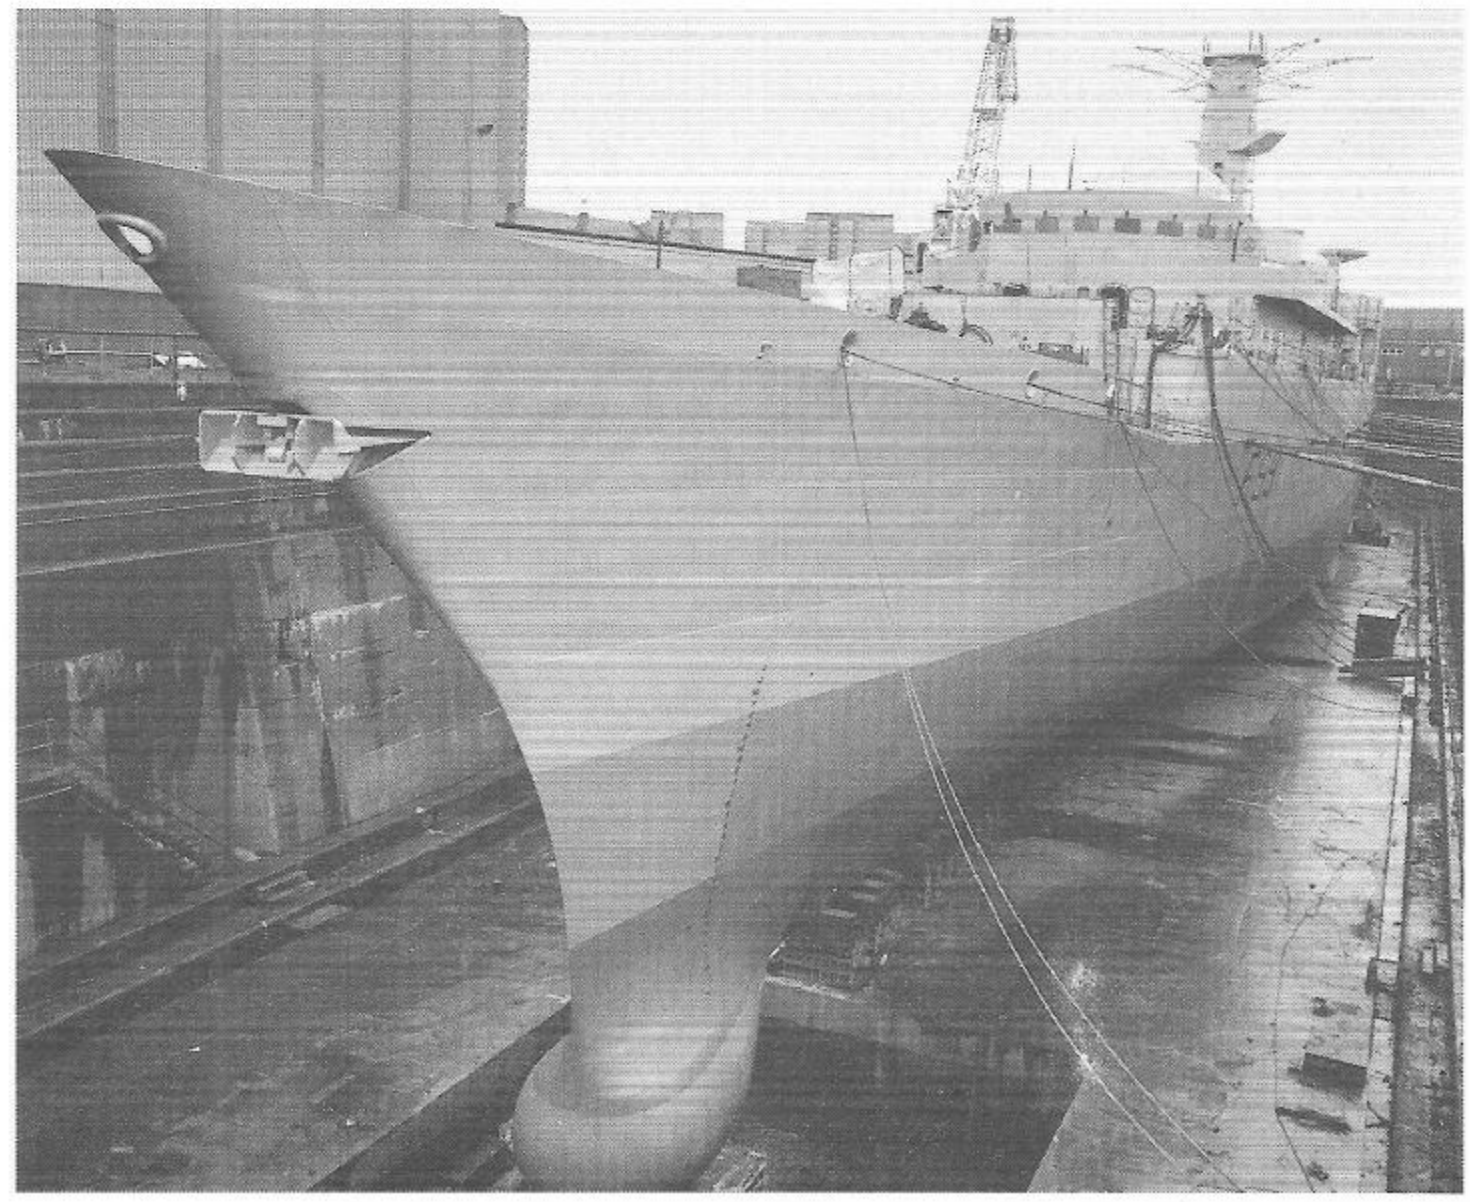
Manufacturer/Contractor

Thorn EMI Electronics, Sensors Group, Crawley, UK.

ELECTRONIC COUNTERMEASURES (ECM)

Type 675(2) radar detection and jamming system

Type 675(2) appears to have replaced Type 670 in all Batch 3 ships. Type 675 is an active/passive EW system designed to counter a wide range of operational threats, particularly those of radar-guided missiles. The system counters and confuses surveillance and missile homing radars by the use of selective jamming



Cornwall *(F 99), being fitted out, displays its Type 2016 sonar dome. This picture makes obvious the need for such a sharply raked bow to keep the anchor chain clear of the vulnerable dome; such ships also drop anchor while going astern* (Yarrow)

Pilot's view of Cornwall's (F 99) flight deck which is large enough to take the EH.101 Merlin when it enters service (Jane's/H M Steele)

techniques for both area and point defence. Azimuth coverage is 360° with an elevation cover of 50° and a detection range of up to 500 km. Two antenna mounts, both with mechanical steering to give full azimuth and elevation coverage, ensure uninterrupted all-round view. Each mount carries a direction-finding receiving antenna together with transmit antennas. Received signals are analysed to identify those which may pose a threat and the selected signals are processed to allow generation of the jamming signal.

High-power transmitter subsystems, matched to the antenna, provide jamming capability against several types of target simultaneously. A comprehensive ECM library stores the appropriate countermeasures to a range of potential threats and, on receipt of a warning from the ESM system, the ECM processor selects the appropriate jamming mode to give fast response.

The main equipment cabinets can be situated below decks or installed in containers for mounting on the upper deck or superstructure, as has been done in a number of British ships serving in the Gulf. Such containers provide for easy removal and refit to other ships. In the British Navy the Type 675 is also known as 'Millpost' while an export variant is designated 'Guardian' by the company.

Manufacturer/Contractor
Thorn EMI Electronics Ltd, Sensors Group, Crawley.

DECOYS

Outfit DLB

Outfit DLB consists of four Hunting Engineering 130 mm 'Sea Gnat' six-barrel launchers which are grouped in pairs on either side of the bridge structure. The control unit, by Thorn EMI, provides for the launching of the most effective combination of rounds for distraction and centroid/seduction giving the type, speed and direction of the threat, the ship's speed and heading as well as wind direction and speed.

The munitions involved are the Mk 214 RF seduction, Mk 216 RF distraction rounds, and Mk 218 IR seduction rounds.

Manufacturers/Contractors
Thorn EMI/AB Precision Ltd (control unit).
Hunting Engineering (launchers).
Chemring Ltd (munitions).

Graseby Type 182 towed torpedo decoy

The Type 182 towed torpedo decoy is designed to decoy both active and passive homing torpedoes, using signals electronically generated within the ship and fed, via the towing cable, to electroacoustic transducers within the towed body. The Type 182 produces two independently controllable output signals which are radiated simultaneously from the towed decoy. An amplitude modulated noise signal simulates the ship's propeller noise and causes passive-homing torpedoes to be seduced away from the ship towards the towed decoy. The second signal is a swept CW signal, which simulates sonar echoes, in order to confuse or jam the guidance system of active homing torpedoes, thus causing them to miss the ship. The frequency bands covered by both types of output are switchable to meet tactical scenarios and to enable concurrent operation of other sonar and communication equipments.

Specifications
Towed decoy:
diameter: 533 mm (21 in)
length: 2,005 mm (79 in)
weight: 74 kg (163 lb)
Towing cable:
length: 411 m (1,348 ft)
diameter: 14.48 mm
weight: 269 kg (593 lb)

Manufacturer/Contractor
Graseby Marine (Graseby Dynamics Ltd), Watford, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

CACS 5

Computer Assisted Command System 5 (CACS 5) was developed specially for the four Batch 3 Type 22 frigates. It is designed to interface, via the Command System Highway, with the new range of weapons incorporated in these ships, including the Harpoon surface-to-surface missile system, GSA8 gun system and Goalkeeper CIWS.

The architecture is based on a partially federated system, using a single Ferranti F2420 computer, with a second as an operating standby. The F2420 has a 1.9 million word memory and an operating speed of 2.3 Mips. All elements of the system are interconnected by the MIL-STD 1553B Command System Highway (CSH). Each of some 26 display positions contains three Argus M700/20 microprocessors to optimise operator effectiveness and minimise angle point failures. The consoles are based on the GEC-Marconi Series 9 display system and there is extensive use of video retiming and scan compression techniques. The principal input device is the light pen, replacing most of the rolling ball and keyboard functions.

CACS employs an all-vertical display concept.

Manufacturer/Contractor
GEC-Marconi Naval Systems Ltd, Combat Systems Division, Addlestone, Surrey.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 11; Link 14.

GWS.25 Mod 4. F 92, F 93. Seawolf
(See under 'Weapons Systems' above.)

GSA8A electro-optical fire-control system

Type 22 Batch 3 frigates have two General Purpose Electro-Optic Directors (GPEOD, but referred to in speech as 'Gee-pod'), which are located on the bridge roof. These two directors are used to detect and track air and surface targets, and engage them with the 114 mm gun. The system operates in four modes: surveillance; air defence; surface engagement; and shore bombardment. There are four units in the system: the GPEOD, a console, a director electronic unit (DEU), a predictor unit and a director power unit. The system can also accept external track data from sources such as the ship's tracking radars.

The lightweight director provides smooth and accurate tracking with low-vibration and noise levels, using direct drive motors, inductosyns for accurate position feedback and the latest digital servo technology. High-acceleration rates (90°/s² in elevation and traverse) together with software-based slew control ensures fast reactions.

The sensor package includes a thermal imager, a television camera and a laser rangefinder. The thermal imager features the SPRITE detector, TICM (Thermal Imaging Common Modules) and a closed-cycle cooling engine. The TI operates in the 8-12 µm range with CCIR 625-line output and has a 3-17° field of view. There is a large object lens and a zoom facility. The TV camera is the Radamec Naval Mk 3 based upon the HK 202, and is a daylight, monochrome unit with fields of view of 3-18°. It is a CCD camera with Peltier cooler and a resolution of 450,000 pixels. The DEU contains the precision digital servos and Passive Angle Tracking System (PATS).

Typical range			64 n miles	

Note:
* Antennas for Types 967 and 968 radars are mounted back to back

SONARS

Type 2016 sonar

The bow-mounted Type 2016 is installed in the earlier Batch 3 ships. This is an active/passive sonar which is reported to have a range of 10 km. It operates at 5.5, 6.5 and 7.5 kHz and features a cylindrical, retractable, stabilised array with 1.83 m (6 ft) diameter with 64 staves. It uses computerised signal processing based on a Ferranti FM 1600B.

Manufacturer/Contractor

Thomson-Marconi Sonar Systems UK Ltd, Stockport, UK.

Type 2050 sonar

The bow-mounted Type 2050 sonar is mounted in the later Batch 3 ships. This digital equipment uses distributed data processing with Ferranti Digital Signal Processing (DSP) cards and multiple Ferranti Argus M700 processors. The provision of extensive data processing facilities and improved man/machine interfaces allows one operator to control the complete system. The equipment interfaces with the combat system data highway, feeding data to the Ferranti CACS action-information system. Type 2050 operates at 4.5 to 7.5 kHz, using 64 5.5° beams.

Manufacturer/Contractor

Thomson-Marconi Sonar Systems UK Ltd, Stockport, UK.

Type 2031Z towed array sonar system

All Batch 3 ships are fitted with Type 2031Z towed array sonar. Using the innovative 'Curtis' architecture developed at the UK Admiralty Research Establishment in Portland, Dorset, the 2031Z electronic signal processing suite has, because of its compactness, a considerably lower installed cost than other systems, and yet provides a multi-octave broad and narrowband analysis facility capable of tracking the most elusive threats. The array itself is towed behind the ship and has a very low self-noise characteristic and is considerably longer than that used by any other self-contained sonar. It provides good bearing accuracy, even down to the very low-frequency end of the acoustic spectrum. The combination of an advanced signal processing architecture and a high-performance towed array ensures that the system is a dual-capability sensor, able to fulfil both the tactical and surveillance role. A 2031Z-equipped frigate can, therefore, act as an ASW picket or close escort.

Manufacturers/Contractors

Ultra Electronics Ocean Systems, Weymouth (inboard electronics suite).
Basys Marine, Barnstaple, Devon, UK (towed array).
Clarke Chapman, Gateshead (winching equipment).

AVIATION

AVIATION FACILITIES

General: These four ships were constructed to handle two Westland Lynx, one Westland Sea King or one EH.101 Merlin. They thus have the larger hangar and flight deck.
Flight deck: 23.0 × 14.0 m (75.7 × 48.5 ft)

HELICOPTERS

2 Westland Lynx HMA 3/8, or 1 Westland Séa King HAS 5, or EH 101 Merlin HAS 1 when it enters service.

PROPULSION

Specifications
System: Combined gas turbine or gas turbine (COGOG)
Main machinery: 2 RR Spey SM1A gas turbines; 22 MW (29,500 hp) sustained; 2 Rolls-Royce Tyne RM3C gas turbines; 8 MW (10,680 hp) sustained
Shafts: 2
Propellers: cp

FURTHER INFORMATION

DESIGN

The Batch 3 ships have the same hull as the last four Batch 2 ships but with weapons and sensors rearranged on the upper deck to enable some of the lessons of the Falklands (Malvinas) War to be implemented. This included a 114 mm (4.5 in) gun on the foredeck, which displaced the four Exocet SSMs, which were replaced by eight Harpoons. A Goalkeeper CIWS was also included in the ship's armaments as a final defence should the Seawolf missile fail to deal with incoming aircraft or missiles.

Batch 3 ships have facilities for a Flag officer and his staff.

WEAPONS SYSTEMS

ANTI-SHIP MISSILES (ASM)

McDonnell Douglas RGM-84C Harpoon

Eight Harpoon anti-ship missile canisters are mounted immediately before the bridge screen, with two groups of four launchers each, with one group pointing to either beam. (Although the capacity is eight missiles, in peacetime only four missiles are usually carried).

The missiles are Block 1C versions, with certain additional options over earlier blocks, including the ability to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications

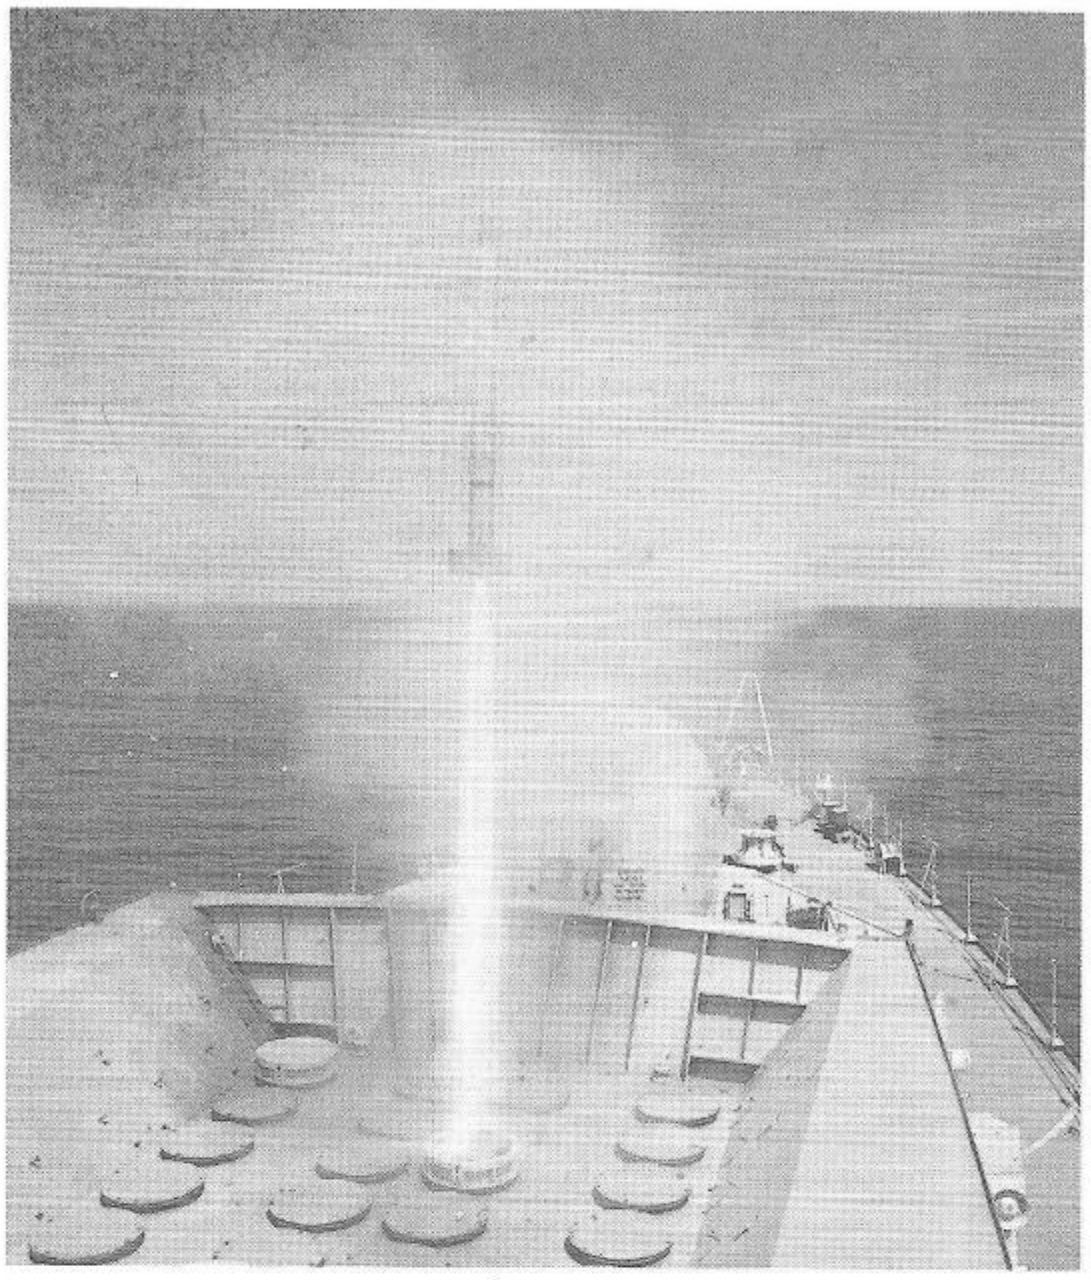
Block 1C

Length:

with booster: 4.63 m (15.19 ft)

without booster: 3.84 m (12.59 ft)

Diameter: 34 cm (1:12 ft)



Firing of vertical launch Seawolfs from HMS Norfolk (British Aerospace)

Weapons on the foredeck are 114 mm (4.5 in) Mk 8 gun. 16 vertical launched Seawolf in the zareba behind the gun and eight Harpoon anti-ship missiles. The radomes either side of the bridge are SCOT 1D Satcom antennas and on the bridge roof is the Type 911 fire controller. The circular device on the platform below the yard-arm is the electro-optical GPEOD. At the masthead is the Plessey Type 996(I) 3D radar and below it, encircling the mast the UAF-1 Cutlass intercept array (Jane's/H M Steele)

Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 kg)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

Seawolf (GWS.26) close area defence and anti-missile system

Type 23s are fitted with the Seawolf GWS.26 Mod 1, with 32 vertically launched missiles in a so-called 'zareba' on the foredeck. The GWS.26 system consists of a Type 996 air search radar, two Type 911 Mod 2 trackers, a missile and a command subsystem, using a Ferranti FM1600E processor.

GWS.26 features the most radical change with the introduction of vertical launch, a new launcher and the Type 911 Mod 2 tracker. The Seawolf VL missile is identical internally to earlier models but differs externally in having no taper at the rear. The missile is in a 3.3 m (10.8 ft) long, 60 cm (23.6 in) diameter, sealed launcher-container, which weighs 70 kg (154 lb) and is delivered to the ship in a transport frame. The canister, which has its own efflux management system, is then loaded into a missile silo. The canisters are grouped into eight-cell modules with a missile firing unit and efflux ducting system. The Type 911 fire controller is a dual-frequency radar with two antennas: one for I-band transmission and the other for L/M-band transmission. The I-band element is used for long-range tracking and high-angle engagements, its signal processing including fast-Fourier transform techniques to ensure effective operation in severe clutter. The L/M-band element is derived from the DN 181 Rapier Blindfire radar and provides accurate tracking at close range and at low levels. This facility is assisted by separate illumination of the upper and lower parts of the antenna.

Specifications

Seawolf VL
Length: 3 m (9.8 ft)
Diameter: 18 cm (7.0 in)
Wing span: 70 cm (27.5 in)
Weight: 140 kg (308.7 lb) (Seawolf VL)
Speed: Mach 2.5
Range: 3.2 n miles (6 km) (Seawolf VL)
Guidance: CLOS
Warhead: Royal Ordnance 14 kg (30.87 lb) fragmentation high explosive
Fuze: Impact proximity

Manufacturer/Contractor

British Aerospace Defence Ltd, Dynamics Division.

TORPEDOES

Cray Marine 324 mm anti-submarine torpedo launching system

There are four fixed Cray Marine 324 mm MTLS torpedo tubes (MTLS = Magazine Torpedo Launch System) with two on each side of the forward end of the hangar, firing across the weather deck. MTLS was developed specifically for the Type 23 frigates and, compared to STWS, it has an air flask mechanism which swings down on two metal arms and there is only one electrical interface. Two of these tubes are fitted, on shockproof mountings, to a steel frame with their mouths pointing out of the magazine through a bulkhead closure. An electropneumatic door protects the mouth of each tube. Between the port and starboard tubes is a roof-mounted mechanical handling system, produced by GEC Mechanical Handling, for ease of reloading. This can be moved to the torpedo racks and can extract a weapon which is then presented to the tubes and loaded manually. All four tubes can be reloaded in 9 minutes.

The system is integrated with the ship's sonar, command and control systems through an electrical equipment cabinet in the sonar instrumentation space, with data being exchanged along the CSH (Combat System Highway). Controls in the ASW Director's console consist of a fire-control panel, a torpedo selection panel and a jettison unit. The control panel selects the data acquisition mode, defines the target and selects the tube. It automatically opens the muzzle door, sets the weapon parameters then launches the weapon. In the event of major system failure there are two manually operated local launcher control panels in the aircraft hangar for weapon discharge.

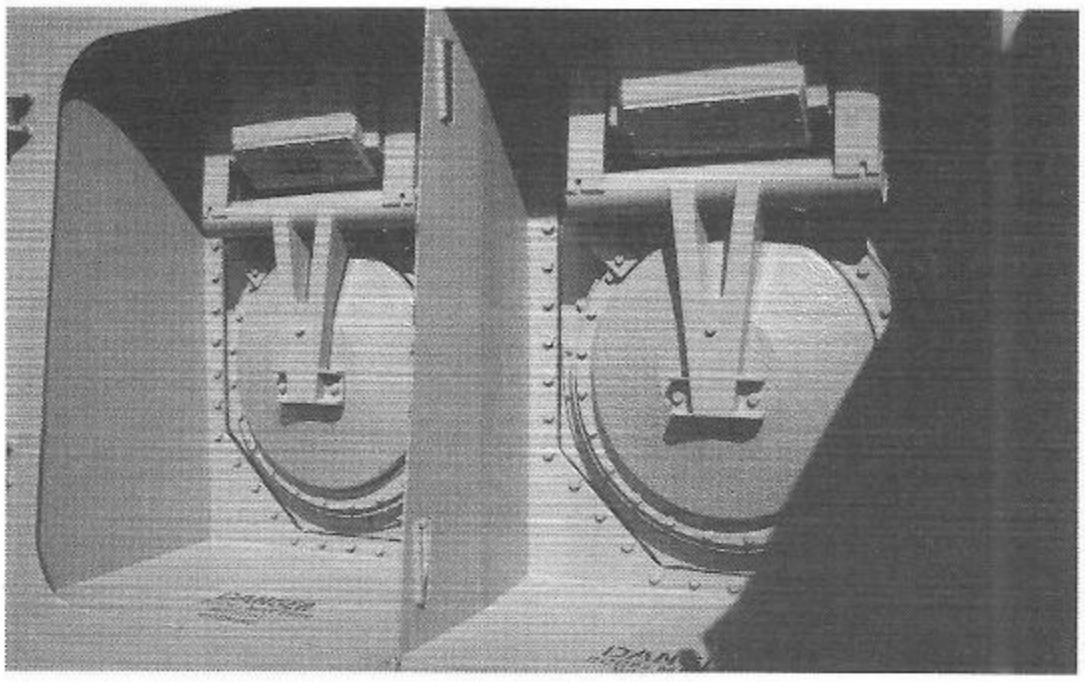
Manufacturer/Contractor

Cray Marine Ltd, Barnstaple, Devon, UK.

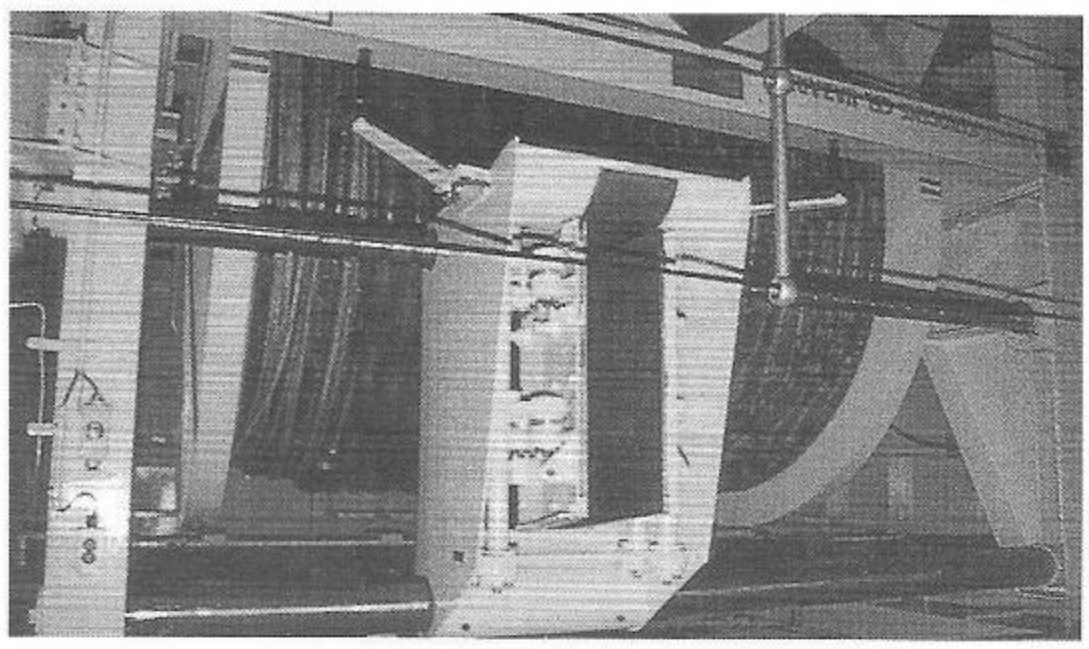
Sting Ray lightweight anti-submarine weapon

The Sting Ray lightweight ASW torpedo is intended for use in either deep or shallow waters, using a multiband, multibeam sonar, with a narrowband capability to give good Doppler discrimination against slow or quiet targets, while the broadband capability provides target discrimination, range and bearing resolution. The acoustic beam sweeps the whole volume of the water from the surface to the maximum operating depth.

The computer can be reprogrammed 'through the skin' whenever updated software, or programs tailored to a particular customer's operational requirements, are required. These programs then adapt themselves to the particular tactical and environmental conditions in which the torpedo operates. The computer also controls the signals, beam form, speed and trajectory of the weapon. Power is provided by a Chloride seawater-activated magnesium/silver chloride battery driving a Lucas DC electric motor which, in turn, drives two contrarotating ducted propulsors. The control surfaces are



Cray Marine 324 mm torpedo tubes are fixed, with the magazine in the forward end of the hangar (Jane's/H M Steele)



The Type 2031Z towed array occupies its own citadel and is streamed centrally to avoid asymmetric stresses on the stern. It can be towed at speeds up to 28 knots (Jane's/H M Steele)

actuated by an electrohydraulically driven proportional control system developed by BAe Dynamics Group.

When the torpedo enters the water it starts a preprogrammed search pattern designed to maximise the chances of target detection. On acquiring the target, the computer and active/sonar sensors make it almost impossible for the target to evade attack. The advanced software of the guidance/homing system allows it to filter out background noise and decoys and to make interception rather than perform a conventional tail-chase attack. Maximum speed of about 45 knots with an estimated endurance of some eight minutes at that speed.

Specifications

Length: 2.59 m (8.5 ft)
Diameter: 0.32 m (1.05 ft)
Weight: 267 kg (588.7 lb) (in air)
Warhead: 35 kg (77 lb), Torpex, directed energy
Speed: 45 kts
Range: 6 n miles (11 km)
Max depth: 750 m (2,640 ft)

Manufacturer/Contractor

GEC-Marconi Underwater Weapons Systems Ltd.

GUNS

Vickers 114 mm (4.5 in)/55 Mk 8 multipurpose gun

The Type 23 mounts a single 114 mm (4.5 in)/55 calibre Mk 8 gun in 'A' position. This weapon provides quick-reaction short-range air defence, engages surface targets including fast attack craft, and provides gunfire support to ground forces. The weapon system consists of the gun mounting, the ammunition feed system, the remote power control system, and the captain-of-turret panel.

The barrel is 6.22 m (20.4 ft) long, is fitted with a muzzle brake and fume extractor, and has a life of 3,300 rounds EFC. The mounting is completely enclosed in a glass fibre shield which protects it against the environment, blast and shrapnel. The loading system is hydraulically operated, with an autoloader which is manually fed by two loaders and has a capacity of six rounds. The hoist transfers them in two stages to the turret from where they are raised by a pivoting loading arm to the breech where they are inserted by a power rammer. After the shell is fired, the case is extracted automatically and ejected through a chute in the front of the mounting.

Specifications

Calibre: 114 mm
Length of barrel: 55 calibres
Traverse: 340° at 40°/s
Elevation: −10 to +55° at 40°/s
Muzzle velocity: 868.7 m/s (2,850 ft/s)
Weight of projectile: 21 kg (46 lb)
Rate of fire: 25 rds/min
Range:
anti-surface: 11.9 n miles (22 km)
anti-air: 6,000 m (20,000 ft)
Crew: 4 (gun captain (CIC), loading supervisor, 2 loaders)

Manufacturer/Contractor

Vickers Shipbuilding and Engineering Ltd, Barrow-in-Furness, Cumbria, UK.

MSI DS 30B 30 mm gun mounting

There are two 30 mm gun mountings either side of the deckhouse immediately before the stack. The weapon itself is an Oerlikon KCB 30 mm cannon, which is positively locked and gas-operated, with a belt-feed mechanism fixed to the cradle. The left-hand feed KCB-B02 is used in the DS 30B mounting. The ribbed barrel has constant rifling with 18 grooves and a 6° clockwise constant turn. The weapon includes a muzzle brake, axial recoil buffer and mechanical ignition system. The KCB normally fires in automatic mode only but in the DS 30B a single shot capability has been included.

The mounting is a locally controlled, power-driven and line of sight stabilised unit designed to allow a variety of sensor and weapon packages to be fitted. The pedestal contains the stabilisation and training machinery and the open gunner's position is on the right of the mounting with the 160-round magazine on the left. The mounting incorporates alloys to reduce magnetic signature and has clean lines to meet NBC washdown requirements. An integral battery pack provides up to 10 minutes of operation in the event of ship power failure.

Specifications

Mounting (DS 30B)
Traverse: 230° (operational)
Elevation: −25 to +70°
Traverse speed: 55°/s
Elevation speed: 55°/s
Crew: 1

Gun (KCB)
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Rate of fire: 650 rds/min
Ammunition weight: 870 g

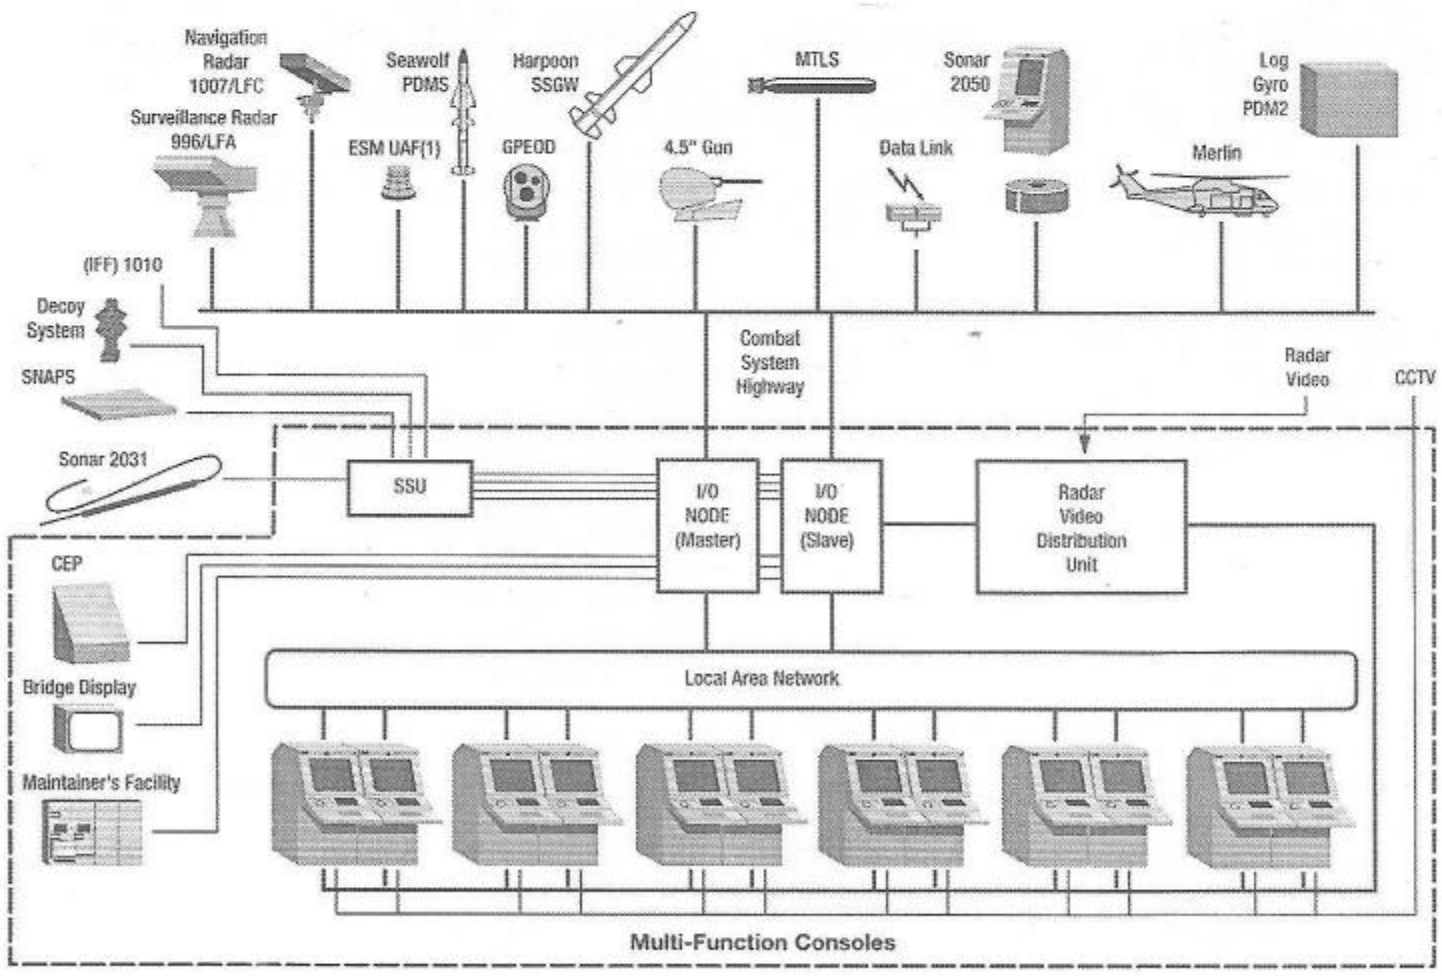
MSI Defence Systems Ltd.



BAeSema Surface Ship Command System (SSCS) as installed in British Type 23 frigates (BAeSema)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Outfit UAF(1) ESM system

Outfit UAF(1) is an advanced automated ESM system which measures the parameters of received radar signals and compares them with a programmed library of parameters. Signal identity, bearing and threat category are then displayed in tabular format on colour displays, the first such to be used in an RN ESM system. Raw data on bearing and frequency are given on a display which can be overlaid with symbols and data derived from the signal analysis processor. Specific intercepts can be analysed in greater depth using a manual pulse analyser. The antenna is an eight-port array just below the head of the foremast.

Manufacturer/Contractor
Racal.

Outfit UAT ESM system

Outfit UAT has been installed in F 237 onwards during construction and will be retrofitted in F 230 to F 236 when funds are available. Originally known as Outfit UAF(X), UAT is heavily based on the Thorn EMI Sceptre XL equipment and is intended to measure all radar parameters with a 'significantly increased sensitivity' over current systems. Sceptre XL covers the band 2 to 18 GHz and it is assumed that UAT does the same, providing threat lethality classification and possessing a high signal sorting capability. UAT consists of three major components; an eight-element antenna array, a receiver/processor and an operator's console, and can be integrated with the ship's command system. The receiver is a channelised type developed originally by the Philips Research Laboratory. Processing is undertaken by a system based on transputers which are configured in a neural network type of architecture. An integrated receiver system is employed and software control is used heavily across the entire system. The display is based on that of the Sceptre XL with two screens, one a situation display and the other an alphanumeric tabular display with emitter data information.

Manufacturer/Contractor
Thorn EMI Electronics Ltd, Sensors Group, Crawley.

Type 675(2) radar detection and jamming system

Type 675(2) is installed in all Type 23s. It is an active/passive EW system designed to counter a wide range of operational threats, particularly those of radar-guided missiles. The system counters and confuses surveillance and missile homing radars by the use of selective jamming techniques for both area and point defence. Azimuth coverage is 360° with an elevation cover of 50° and a detection range of up to 500 km. Two antenna mounts, both with mechanical steering to give full azimuth and elevation coverage, ensure uninterrupted all-round view. Each mount carries a direction-finding receiving antenna together with transmit antennas. Received signals are analysed to identify those which may pose a threat and the selected signals are processed to allow generation of the jamming signal.

High-power transmitter subsystems, matched to the antenna, provide jamming capability against several types of target simultaneously. A comprehensive ECM library stores the appropriate countermeasures to a range of potential threats, and on receipt of a warning from the ESM system the ECM processor selects the appropriate jamming mode to give fast response.

Manufacturer/Contractor
Thorn EMI Electronics Ltd, Sensors Group, Crawley.

DECOYS

Outfit DLB

Outfit DLB consists of four Hunting Engineering 130 mm 'Sea Gnat' six-barrel launchers which are grouped in pairs on either side of the bridge structure. The control unit, by Thorn EMI, provides for the launching of the most effective combination of rounds for distraction and centroid/seduction giving the type, speed and direction of the threat, the ship's speed and heading as well as wind direction and speed. The munitions involved are the Mk 214 RF seduction, Mk 216 RF distraction rounds, and Mk 218 IR seduction rounds.

Manufacturers/Contractors
Thorn EMI/AB Precision Ltd (control unit).
Hunting Engineering (launchers).
Chemring Ltd (munitions).

Graseby Type 182 towed torpedo decoy

The Type 182 towed torpedo decoy is designed to decoy both active and passive homing torpedoes, using signals electronically generated within the ship and fed, via the towing cable, to electroacoustic transducers within the towed body. The Type 182 produces two independently controllable output signals which

are radiated simultaneously from the towed decoy. An amplitude modulated noise signal simulates the ship's propeller noise and causes passive homing torpedoes to be seduced away from the ship towards the towed decoy. The second signal is a swept CW signal, which simulates sonar echoes, in order to confuse or jam the guidance system of active homing torpedoes, thus causing them to miss the ship. The frequency bands covered by both types of output are switchable to meet tactical scenarios and to enable concurrent operation of other sonar and communication equipments. The winch is located on the port side of the quarterdeck.

Specifications

Towed decoy
diameter: 533 mm (21 in)
length: 2,005 mm (79 in)
weight: 74 kg (163 lb)

Towing cable:
length: 411 m (1,348 ft)
diameter: 14.48 mm
weight: 269 kg (593 lb)

WEAPONS CONTROL

BAe GSA8B electro-optical fire-control system

Type 23 frigates have one General Purpose Electro-Optic Director (GPEOD, but referred to in speech as 'Gee-pod'), which is located on a small platform on the foremast. The system detects and tracks air and surface targets, and engages them with the 114 mm gun, using a single console. The system operates in four modes: surveillance; air defence; surface engagement; and shore bombardment. There are four units in the system: the GPEOD, a console, a director electronic unit (DEU), a predictor unit and a director power unit.

The lightweight director provides smooth and accurate tracking with low-vibration and noise levels, using direct drive motors, inductosyns for accurate position feedback and the latest digital servo technology. High acceleration rates (90°/s² in elevation and traverse) together with software-based slew control ensures fast reactions.

The sensor package includes a thermal imager, a television camera and a laser rangefinder. The thermal imager features the SPRITE detector, TICM (Thermal Imaging Common Modules) and a closed-cycle cooling engine. The TI operates in the 8-12 µm range with CCIR 625-line output and has a 3-17° field of view. There is a large object lens and a zoom facility. The TV camera is the Radamec Naval Mk 3 based upon the HK 202, and is a daylight, monochrome unit with fields of view of 3-18°. It is a CCD camera with Peltier cooler and a resolution of 450,000 pixels. The DEU contains the precision digital servos and Passive Angle Tracking System (PATS).

Manufacturer/Contractor

British Aerospace Systems and Equipment Ltd, UK.

RADARS

SONARS

Type 2050 sonar

The bow-mounted Type 2050 sonar uses digital signal processing and distributed data processing with Ferranti Digital Signal Processing (DSP) cards and multiple Ferranti Argus M700 processors. The provision of extensive data processing facilities and improved man/machine interfaces allows one operator to control the complete system. The equipment will interface to the combat system data highway feeding data to the BAeSema SSCS action-information system. Type 2050 operates at 4.5 to 7.5 kHz, using 64 5.5° beams.

Manufacturer/Contractor

Ferranti-Thomson Sonar Systems UK Ltd, Stockport, UK (prime system).

Type 2031Z towed array sonar system

Ships up to and including *Northumberland* (F 238) are fitted with Type 2031Z towed array sonar. Using the innovative 'Curtis' architecture developed by Professor Curtis at the UK Admiralty Research Establishment in Portland, Dorset, the 2031Z electronic signal processing suite has, because of its compactness, a considerably lower installed cost than other systems, and yet provides a multi-octave broad and narrowband analysis

CIC in Type 23 frigate (BAeSema)

SSCS operator's position at a Multi-Function Console (BAeSema)

facility capable of tracking the most elusive threats. The array itself is towed behind the ship and has a very low self-noise characteristic and is considerably longer than that used by any other self-contained sonar. It provides good bearing accuracy, even down to the very low-frequency end of the acoustic spectrum. The combination of an advanced signal processing architecture and a high-performance towed array ensures that the system is a dual-capability sensor, able to fulfil both the tactical and surveillance role. A 2031Z-equipped frigate can, therefore, act as an ASW picket or close escort.

Manufacturers/Contractors

Ultra Electronics Ocean Systems, Weymouth, UK (inboard electronics suite).

Basys Marine, Barnstaple, Devon, UK (towed array).

Clarke Chapman, Gateshead, UK (winching equipment).

PROPULSION

Specifications

System: Combined diesel-electric and gas turbine (CODLAG)

Main machinery: 2 Rolls-Royce Spey SM1A (F 229-F 236) or SM1C (F 237 onwards) gas turbines; 23.2 MW (31,100 hp) sustained; 4 Paxman 12CM diesels; 6 MW (8,100 hp); 2 GEC electric motors; 3 MW (4,000 hp)

Shafts: 2

Propellers: Skew-bladed, fixed-pitch propellers

FURTHER INFORMATION

PROGRAMME

The design that would eventually become the Type 23 had its origins in the late 1970s, when the early concept and feasibility designs were carried out for a new ASW frigate to succeed the very successful 'Leander' class. At that time the major issue in British warship design was the controversy over the relative merits of a 'short fat' hull and a 'long thin'. Such considerations were, however, overtaken by the Falklands (Malvinas) War of 1982 which brought with it many lessons about warship design, ship construction, materials to be used or

avoided, and combat systems. Not surprisingly, the entire operational requirement and ship design was completely reconsidered.

The first of class was eventually ordered on 29 October 1984, with the keel-laying in December 1985 and launch in June 1987. This was followed by a somewhat uneven pattern of orders, with three being ordered in September 1986 and an invitation to tender for another four being issued in October 1987, although only three orders were placed in July 1988. A second invitation to tender was issued in late 1988 and yet again resulted in only three orders on 19 December 1989. Long lead items for another six were ordered in 1990 but contracts were not placed until 23 January 1992 (three) and February 1996 (the final three).

NAMES

The class is named after British dukes, including *Iron Duke,* which is named after the first Duke of Wellington and is the only ship in the RN to carry a person's nickname rather than the formal surname or title. There is no F 232 pennant number as this is the number of the RN form used to report collisions and groundings' and is considered unlucky; the ship was, therefore renumbered F 229.

DESIGN

The hull is beamier than previous British frigate designs with the length matching the distance between peaks in a typical North Atlantic swell; thus, the Type 23s ride well and it is rare for waves to break over the forecastle, making bulwarks unnecessary.

Care has been taken to ensure that Type 23s have the lowest possible radar signature; all vertical surfaces are sloped at 7°, there are no 90° corners on the superstructure and the number of radar 'wave traps' has been minimised, with the attention to detail being emphasised by the bollards, which are not at the customary 90° to the deck. Flat horizontal surfaces are broken up by long, wedge-shaped strips of radar absorbent material (RAM), with a single strip on the bridge roof and three above the hangar, their apparently random, asymmetric siting being the outcome of computer assessments.

Numerous measures are incorporated to reduce the acoustic signature. All major equipment is raft-mounted, most machinery installed in acoustic cabinets, and the drive shafts are short, while the skew-bladed propellers have fixed pitch to avoid the noise made by controlled-pitch propellers. Underwater fittings are streamlined and the hull vibration monitoring display is on the helmsman's console, where it is under constant observation. There is a bubble device to reduce hull noise.

POWER SYSTEMS

The propulsion system is combined diesel-electric and gas turbine (CODLAG) which was selected to achieve extremely quiet running during ASW operations. Two Rolls-Royce Spey SM1A (F 229 to F 236) or SM1C (F 237 onwards) are sited in the gas turbine room. The diesels are, however, split: one pair of Paxman 12CM Valenta diesels is located in the upper auxiliary machine room on rubber mounts, but, since they are some 5 m (16.41 ft) above the waterline, there is no need for acoustic cabinets. Such cabinets are required for the other two Paxman diesels, which are in the forward auxiliary machine room, since they are well below the waterline. The two GEC electric motors are located in the motor generator room.

ASW SENSORS

The Type 2050 bow-mounted sonar has a very large dome, resulting in the Type 23's 6 m (19.7 ft) overall draft and leading to the requirement that the ship must go astern while anchoring so that the anchor does not foul the dome. The second ASW sensor is the Type 2031Z towed array, sited in its own citadel on the quarterdeck, which is streamed centrally to minimise asymmetric stresses on the stern. Towing speeds of up to 28 knots have been reported. A Type 182 torpedo decoy can also be deployed from its winch on the port side of the quarterdeck, although it is not normally carried at the moment.

FUTURE DEVELOPMENTS

The current towed array, Dowty Type 2031Z, may be replaced by Type 2087 in due course; this is an active low-frequency towed body with a VLF passive array.

The Type 23s will operate the new EH.101 Merlin HAS.1 in due course and all proving trials have already been completed, showing that the helicopter, despite its size can operate from this platform.

TRIALS

F 233 carried out a trial of a Dowty track management system (TMS) which uses a form of artificial intelligence.

DEPLOYMENT

F 233, F 229, F 234, F 237, F 239 and F 80 are based at Portsmouth and form the 4th Frigate Squadron. The remainder are at Devonport and form the 6th Frigate Squadron.

SSCS

The automated command system for the Type 23 frigates is the BAeSema Surface Ship Command System (SSCS), whose development is known to be some years behind that of the ship platform. This is, however, by no means a unique problem and it is now extremely rare for a software-centred system to be ready at the same time as the ship, and the system aboard the Dutch 'M' class frigates, for example, was only classified for use in the Adriatic in mid-1996, although the first of class had entered service in 1991. As the combat data system is now on the critical path for new ship development, the history of the SSCS project is of particular relevance.

THE REQUIREMENT

More than most projects, the Type 23's command system has suffered from change in the requirement. It was originally envisaged that the Type 23 would be an ASW frigate, with weapon and sensor systems that were similar in number and type to those in the Type 22 Batches 2 and 3 frigates, albeit with some advances in performance. It followed that the command system should also have been a development of the CACS 1, the command system installed in Type 22 Batches 1 and 2, even though this meant that the new system would be based on an old architectural concept and use dated technology, such as the FM1600 processor. Nevertheless, development of the new system, designated CACS 4, began.

Two unexpected problems then arose. First, the Falklands (Malvinas) War made it obvious that even CACS 4 would not be capable of performing the tasks now required. In addition to this, the planned role of the Type 23 changed from a specialised ASW frigate to a general purpose escort, which, in addition to its Type 2031 towed array and Stingray-based MTLS, would also have vertically launched Seawolf, Harpoon anti-ship missiles and a Vickers 114 mm gun.

In these new circumstances it became clear that the efforts to develop CACS 4 were misplaced and would almost certainly lead to failure. As a result, the MoD decided in late 1986 to cancel CACS 4 and to start again with a completely new system. An invitation to tender for a successor was subsequently issued, leading to a three-way competition between (the then) Ferranti, Plessey and Dowty-SEMA, with the last-named (now BAeSema) being declared the winner and receiving a development contract in August 1989 for what was then known as the New Command System (NCS).

These problems with the command system did not,

TABLE 1: TYPE 23 — ORDERS AND DELIVERIES

15					-	Nov 98	Oct 00
16					-	Mar 99	May 01

The original plan was for a total of 23 ships, but it now appears that the class will not exceed the 16 now in service or on order.

however, stop the ship construction programme which by this time was well down the line and the first three ships of the class had actually been launched. Indeed, the first six ships of the class entered service with the RN without an integrated combat system.

STAFF REQUIREMENT

The staff requirement for the new SSCS system, incorporated the lessons learnt from the Falklands (Malvinas) War and included:

Multifunction consoles with an easy-to-use MMI
Extensive command planning and management functions
Integrated organic ('own ship') sensor data, combined with datalink and intelligence inputs from external sources
Co-ordinated weapon assignment and control
A range of navigation functions and facilities
Very high system reliability and data resilience
Very high performance (response times) and high data (track management) capacity
On-board training, data recording and general system support (for example, system diagnostics).

This resulted in an extremely demanding specification, with a large-scale system using approximately two million lines of code in Ada and OCCAM languages, and running on about 200 processors.

FUNCTIONS

Stemming from the staff requirement, SSCS is required to:

Prepare and co-ordinate a tactical database from all available sensor data and collate it into an accurately defined tactical situation
Present the information comprising the agreed tactical picture in the appropriate manner to suit the current requirement of each member of the command team
Perform track management and link data co-ordination functions
Carry out and present threat evaluation
Provide the means to execute and to monitor weapons and sensor management policies in accordance with mission plans, rules of engagement, tactical doctrine and current tactical situation
Prepare and present weapon and situation status reports, including the identification of any conflicts in weapon/sensor assignment or the engagement process
Provide automatic assistance with combat system or data management tasks, including special-to-task functions
provide the facilities for planning, data recording, post-action analysis and training.

SOFTWARE DEVELOPMENT

The contract called for four operational releases of software, designated Phases 2 to 5 (Phase 1 was a 'trials only' release):

Phase 2 — ship safety and manual picture compilation. This comprised radar data processing, navigation, data recording, system management, tactical picture compilation (TPC), and manual data entry
Phase 3 — above water warfare. This comprised IFF; ESM; weapon control for Seawolf PDMS, 114 mm gun and Harpoon SSM and decoys; together with extensions of the TPC function to include automatic picture compilation
Phase 4 — subsurface and datalink capability. This involved passive and active sonar data processing, magazine torpedo launching system (MTLS), aviation (including Vectacs), datalink (including force picture compilation), anti-air and anti-submarine warfare command planning functions, and yet further extensions of TPC
Phase 5 — command planning, datalink extensions, training and support. This final phase includes command planning, extensions to existing functionality (datalink, aviation) training and recording

It was intended that the underlying 'machine', which consisted of the operating system (scheduler), communications and data management software, and the graphics 'engine' would be embodied in Phase 2. This meant that Phases 3, 4 and 5 would be achieved by the addition of more Applications code. This has been largely achieved, although some of the special purpose graphics engine software has had to be developed in support of particular phase requirements.

Software Status At 1 January 1997 the status was as follows:

Phase 2 software
seven ships were in service with Phase 2 software
Phase 3 software
One ship had completed trials
the software package was ready for installation in the seven ships with Phase 2 software as soon as they could spend sufficient time alongside
the shore-based training establishment had Phase 3 software in full use

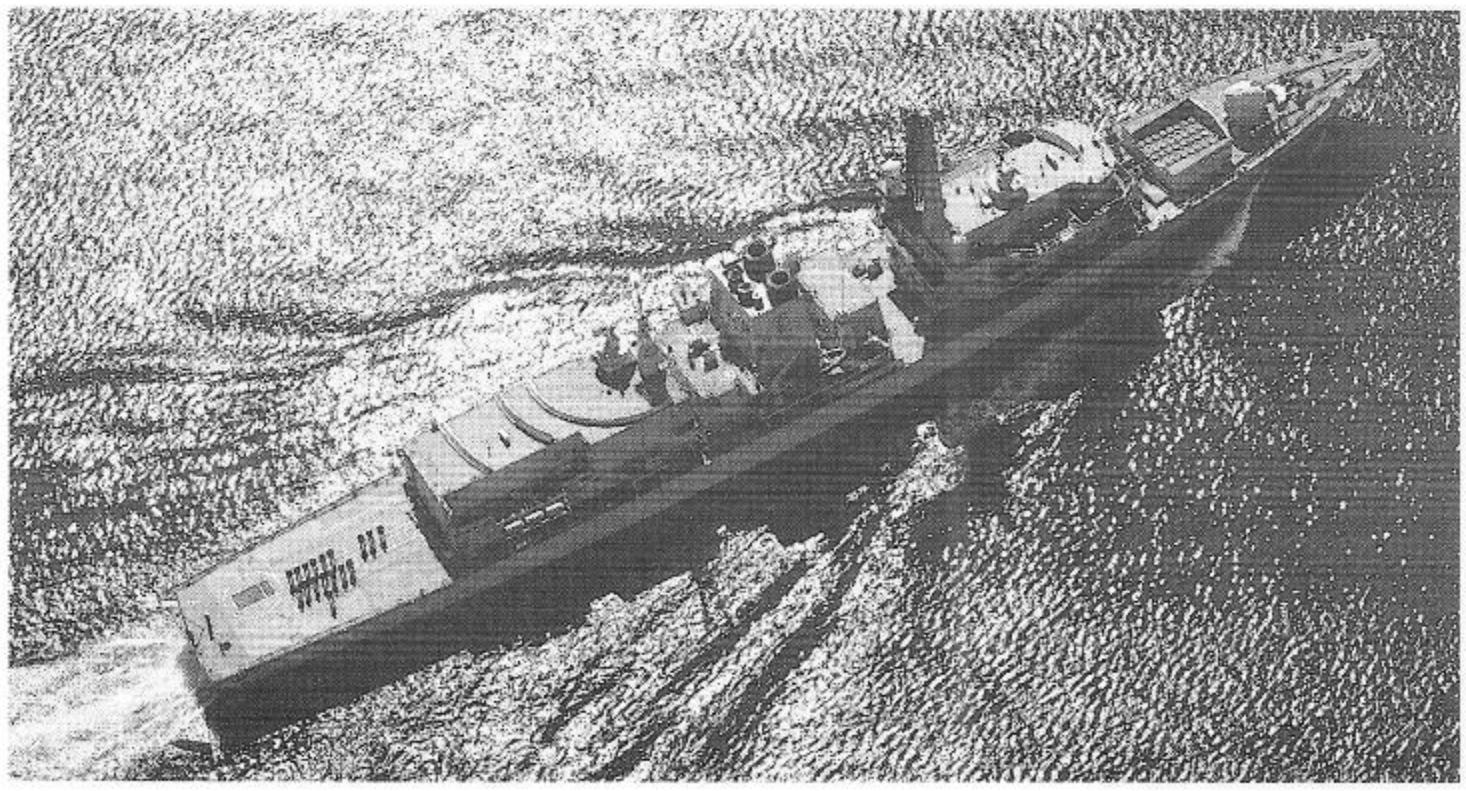
Phase 4 software
development was completed in late 1996
combat system integration trials were under way at the land-based test site.

Hardware status
two early-build ships were awaiting installation of SSCS hardware
three recently-completed ships had SSCS hardware but were still undergoing RN acceptance trials
all five ships would enter/return to service with SSCS Phase 3.

The SSCS system
SSCS is designed to provide:
The presentation of choices to operators and recommendations for action
the means by which the operator can execute the actions associated with his current task
a distributed-processing architecture with large memory and disc capacity, coupled with a high-bandwidth, dual-redundant, self-healing local area network, linking the principal elements of the command system.
high performance through the use of a specially developed software infrastructure, which enables large Ada applications to be run on a real-time, distributed-processing architecture.
replication and distribution of all processed data to all operator positions, with guaranteed data consistency without any degradation in system performance.

DAMAGE CONTROL AND SURVIVABILITY

Fire mains are triplicated and, while previous Type 23s are fitted with a dry main running along the keel to act as a last resort for fire hoses, *Northumberland* is the first to have a wet main, permanently filled with fresh water to prime the system for the smooth introduction of salt water, when required. There is a 150 per cent provision of ELSAs (Emergency Life Saving Equipment) positioned throughout the ship and all emergency gear, such as communications connectors and spanners, is luminous, while wiring is separated from bulkheads to reduce damage potential. There are hundreds of access boxes for the secondary communications system and all damage control personnel wear a communications box in a pouch. A particular concern from the Falklands (Malvinas) experience (and also from that of the US frigate *Samuel B Roberts*) is the disposal of water pumped into damaged compartments; as a result Type 23s have 11 overboard discharge pipes and 20 manually operated drain-down plugs, which are operated on orders from the CIC.



Argyll *(F 231) showing the strips of radar-absorbing material (RAM) positioned on the roofs of the bridge and hangar to disrupt the radar reflections given by the flat surfaces. Note also the layout of the Seawolf SAMs in the zareba on the foredeck* (UK MoD/PO Parker)

A Perkins emergency diesel generator powers emergency systems (five fire pumps, emergency lighting, and so on) and is located on the starboard side abreast the towed array citadel and thus well away from likely missile impact areas and other machinery. The cooling fan extracts onto the quarterdeck but, if all other extraction systems have failed, the generator room forward door is left open so that this fan will draw smoke from inside the ship.

The basic firefighting principle is to fight fires from the outside for as long as practicable. Thus, on detecting a fire there will be two separate halon shots, followed by water or foam, and only as a last resort will a five-sailor firefighting team be sent in.

PF 103

OVERVIEW

The PF 103 design has its origins in the Italian 'Albatros' class which was designed in the early 1950s under the aegis of the US-funded Mutual Defence Aid Pact (MDAP). The Italians designed a light anti-submarine frigate, with a full load displacement of 950 tonnes and eight were built during the 1950s. They went to three NATO navies: Denmark — four ('Triton' class); Italy — three ('Albatros' class); and Netherlands — one ('Lynx' class). They were powered by two diesels. All have now been stricken, the last to go being the Italian ships, which were stricken in 1986-91.

The Indonesian Navy was also expanding in the 1950s and ordered two ships to a slightly larger design which were launched in 1956-57 and designated the 'Puttimura' class. They displaced 1,200 tonnes and, as built, were armed with two 76 mm guns, two Hedgehog projectors and depth charges, although they were subsequently rearmed with Soviet weapons. Both have been stricken, one in 1979, the other in the 1980s. They had two shafts and were powered by three diesels.

In the early 1960s the Iranian Navy was expanding under the Shah and was seeking a light patrol ship for duties in the Gulf. The programme came under the Mutual Aid Pact (MAP) and as the US was funding the project, they selected the design, which was that of the PF 103, but built in a US rather than an Italian yard. This became the 'Bayandor' class, with one pair being launched in 1963 and the second pair some years later in 1968. The design was very similar to the Indonesian 'Puttimura' class. Two were sunk in 1982 and two remain in service.

Finally, came the Thai 'Tapi' class. Two were ordered from the USA and were launched in 1970 and 1973. As built, they were virtually identical to the Iranian 'Bayandor' class, but differences have arisen as a result of subsequent refits. All remain in service.

Thus, of the sixteen built, six remain.

Launched	10 Oct 1963
Commissioned	22 Jul 1964

WEAPONS SYSTEMS

GUNS

US Navy 76 mm (3 in) L/50 Mk 33 Mod 4 gun mounting

There are two single 76 mm (3 in) open mounts in 'A' and 'Y' positions. These are virtually the last mounts of this type left in service and use Mk 22 guns. Only the forward gun has a Mk 36 fire-control radar.

Specifications
Mk 22 gun
Calibre: 76.2 mm
Length of barrel: 50 calibres
Muzzle velocity: 823 m/s (2,700 ft/s) (new gun, nominal); 808 m/s (2,651 ft/s) (mid-life)
Range: 7 n miles (13 km)
Altitude: 8,951 m (29,368 ft)
Ammunition: 10.9 kg (24 lb)

Mk 33 mount
Traverse: 360°
Elevation: −14/15° to +85°
Traverse rate: 30°/s
Elevation rate: 24°/s
Rate of fire: 20 rds/min

Bofors 40 mm L/60 twin mounting

There is one twin Bofors 40 mm/60 in an open mounting on the after end of the superstructure.

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −13 to +85° at 60°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,000 m/s (3,280 ft/s)

Bayandor *(81) — in 1994. Note that the forward gun has a Mk 36 fire-control radar; the after gun does not*

Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

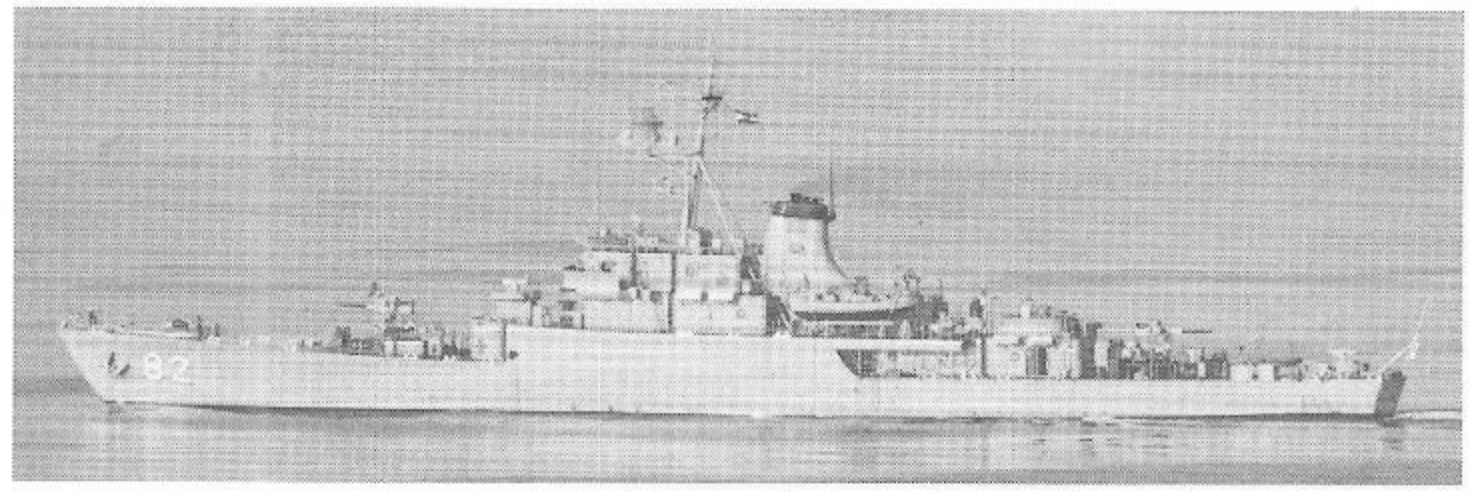
Oerlikon GAM-BO1 20 mm cannon

Two single, manually operated Oerlikon GAM-BO1 20 mm cannon mounts were installed in 1990; one on a small platform immediately before the bridge, the other on the stern.

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +90°

M2HB 12.7 mm (0.50 in) machine guns
Two M2HB 12.7 mm machine guns are carried and can be mounted on flexible mounts.

Specifications
Calibre: 12.7 mm (0.50 in)
Rate of fire: 450-550 rds/min
Muzzle velocity: 883 m/s (2,900 ft/s)



Iranian frigate Naghdi *(82) on patrol in Gulf waters in July 1995. The two 76 mm guns are in open mounts, as are the 40 mm Bofors. Note one GAM-BO1 20 mm mount on the stern and the second in 'B' position just forward of the bridge*

Max effective range:
anti-surface: 6,700 m (7,400 yd)
anti-air: 1,380 m (4,500 ft)

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Mk 51 Mod 2 GFCS
There are two Mk 51 Mod 2 Gun Fire Control Systems (GFCS), one for each Bofors 40 mm mounting. The system is a lead-computing gunsight.

Mk 63 GFCS
The Mk 63 GFCS is associated with the 76 mm gun and is a combination of the Mk 51 sight and an SPG-34 radar (see table).

IFF
UPX-23.

SONAR

EDO AN/SQS-17
The AN/SQS-17 is a 1950s-vintage sonar, which was designed by EDO and built under licence in France. It is a hull-mounted, active search set, working at 12, 13 and 14 kHz, using a 24 stave 50 cm (19.6 in) diameter array. In view of the fact that all ASW weapons have been removed from these ships, the sonar may well also have been removed.

RADARS

Type	AN/SPS-6C	1226	1650	AN/SPG-34
Company	Westinghouse	Racal-Decca	Raytheon	Western Electric
Role	Air/surface search	Surface search	Navigation	Fire control
Band	D	I	I/J	I/J
Beam	3.5 × 30°	1.2°		2.5°
Peak power	500 kW	25 kW		50 kW
Gain	27 dB	30 dB		36 dB
Pulsewidth	4/1 µs	0.05/0.25/1 µs		0.3 µs
PRF	150/600 pps			1,800 pps
Scan rate	2.5-15 rpm	28 rpm		—

PROPULSION

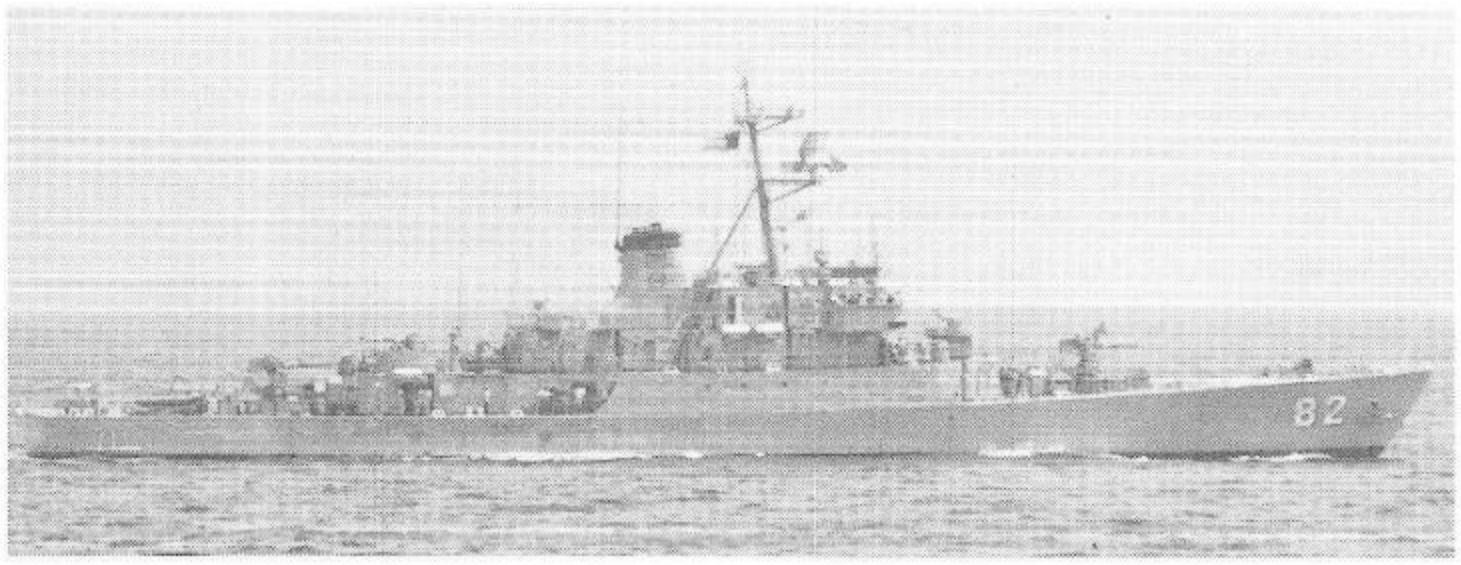
Specifications
System: Diesel
Main machinery: 2 Fairbanks-Morse 38TD8-1/8-9 diesels; 3.9 MW (5,250 hp) sustained

Shafts: 2
Note: *Naghdi* may now have different engines: see 'Modernisation (below).

FURTHER INFORMATION

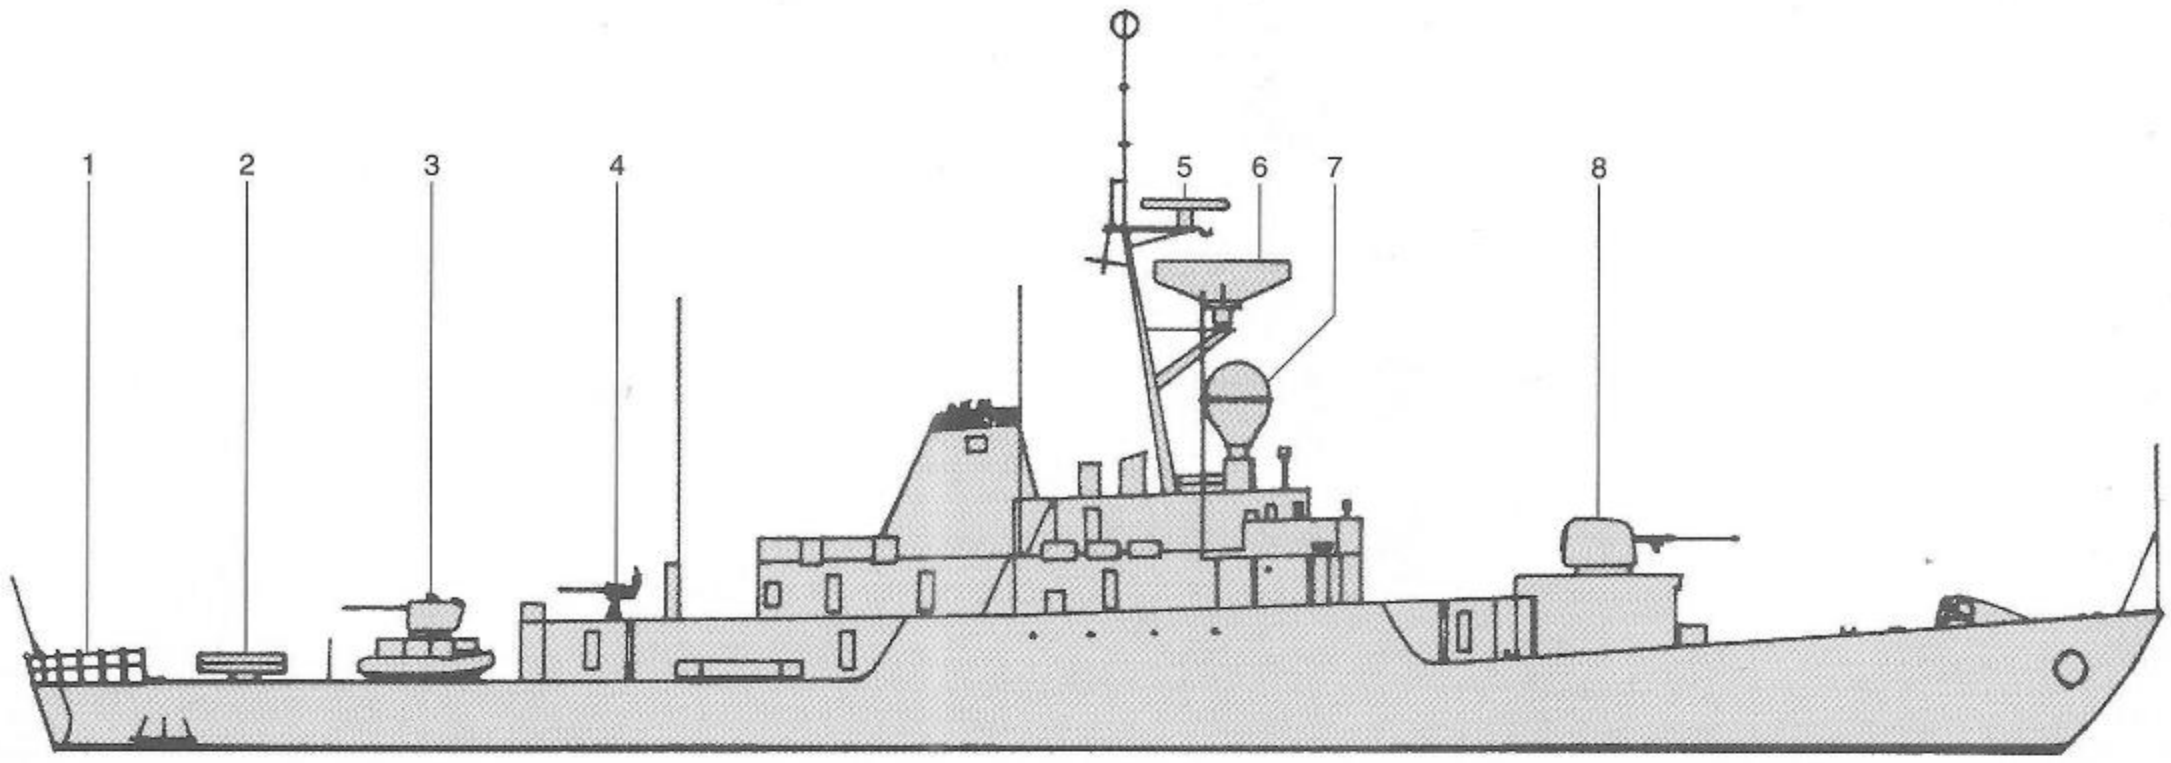
PROGRAMME
Four ships were supplied to Iran in the 1960s under the Mutual Aid Pact. Of these, two were sunk in the 1982 war with Iraq and two remain in service.

MODERNISATION
These ships have been modified several times during their service. *Naghdi* (82) completed a major refit in 1988 during which the engines were changed, probably to a new type. Russian-pattern 23 mm twin AA guns were removed and replaced by British-made GAM-BO1, 20 mm cannon. All ASW weapons have been removed and, although visual confirmation is impossible, it would appear likely that the sonar was removed at the same time. These ships are, therefore, suitable only for surface surveillance duties and have little combat capability except against light surface vessels. They are, however, very active and carry out frequent patrols in Gulf waters.



Naghdi *(82)*

TAPI (PF 103)



Tapi (Ian Sturton)
1 *Depth-charge rack* **2** *USN triple Mk 32 324 mm torpedo tubes* **3** *Bofors single 40 mm/70 cannon (open mount)* **4** *Oerlikon 20 mm/70 cannon (open mount)* **5** *Raytheon SPS-53E surface search radar* **6** *Signaal LW-04 air/surface search radar* **7** *Signaal WM-22/61 fire control* **8** *OTOBREDA 76 mm (3 in)/62 compact gun*

GENERAL SPECIFICATIONS

WEAPONS SYSTEMS

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited on the quarterdeck.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

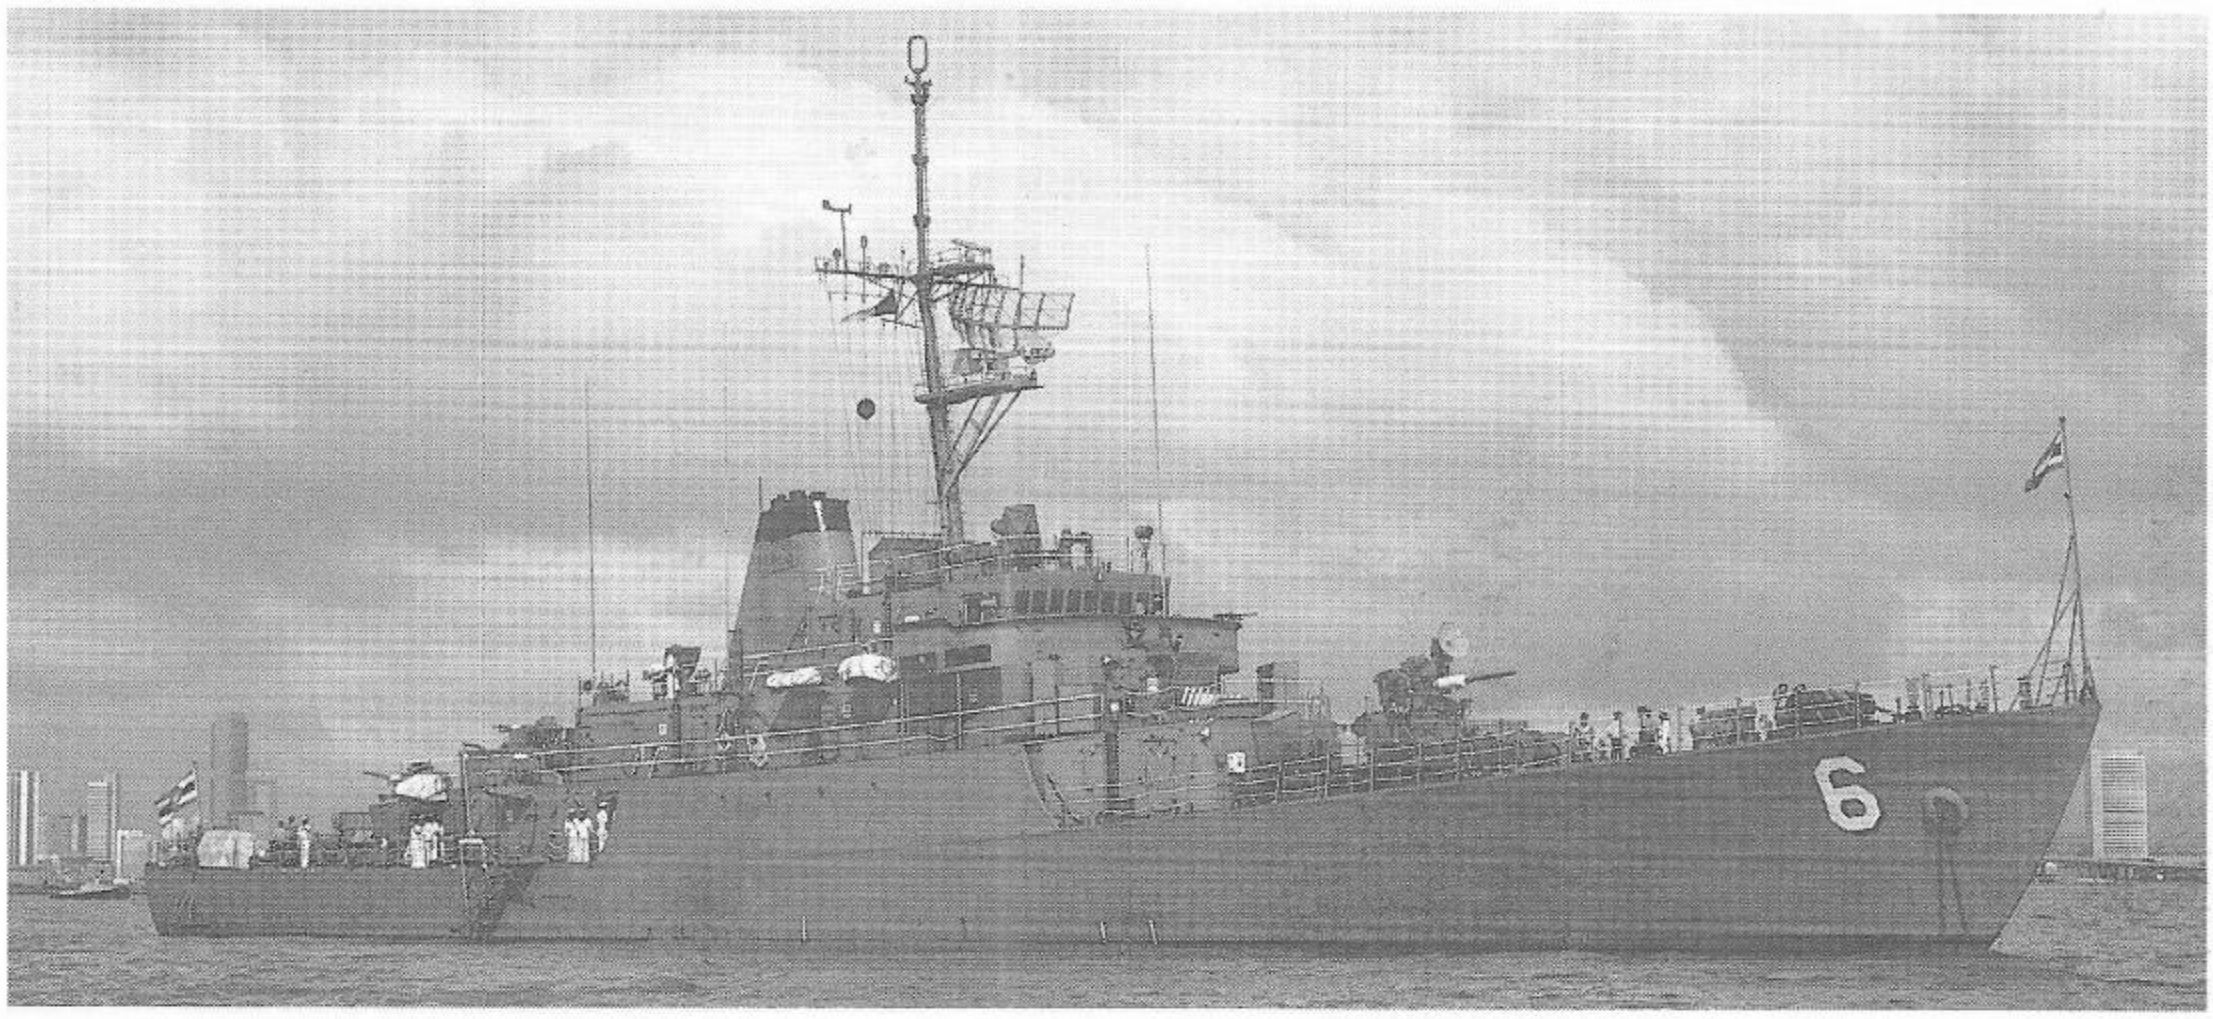
Alliant Techsystems Mk 46 Mod 5, 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 76 mm (3 in)/62 Compact
One OTOBREDA 76 mm (3 in)/62 Compact is mounted in 'A' position. These ships were originally armed with two US Navy 76 mm (3 in) guns but these were removed in the mid-1980s' refits and replaced by one OTOBREDA 76 mm and one Bofors 40 mm.

Specifications
Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s



Khirirat *(6) in the ship's original form. Note the US Navy open 76 mm mounts in 'A' and 'Y' position, and the Mk 10 Hedgehog launcher below the bridge. Since this picture,* Khirirat *has been given a new pennant number, 432* (Jane's/HM Steele)

Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Bofors 40 mm L/70 twin mounting
There is one single Bofors 40 mm/70 in 'Y' position in a 'tub' mounting.

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −13 to +85° at 60°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

Oerlikon 20 mm cannon
Two single, manually operated Oerlikon 20 mm cannon are mounted on the after superstructure.

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +90°

M2HB 12.7 mm (0.50 in) machine guns
Two M2HB 12.7 mm machine guns are carried and can be mounted on flexible mounts.

Specifications
Calibre: 12.7 mm (0.50 in)
Rate of fire: 450-550 rds/min
Muzzle velocity: 883 m/s (2,900 ft/s)
Max effective range:
anti-surface: 6,700 m (7,400 yd)
anti-air: 1,380 m (4,500 ft)

DEPTH CHARGES

There is one depth-charge rack.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Signaal SEWACO-TH
These ships are fitted with a Signaal DAISY (Digital Action Information SYstem) C^2 system which is integrated with the various radars and fire-control systems to form the SEWACO-TH (SEnsor Weapon Control And COmmand — Thailand) system. The DAISY system is designed to present raw and/or processed sensor data from search and fire-control radars together with IFF, sonar, electronic warfare and electro-optic systems to create a picture of the tactical situation. The data may also be used to designate targets to weapon systems and to assist in operations with auxiliary functions such as ASW helicopter direction and tactical navigation. As far as is known there is no link to enable the system to supplement 'own ship' data with data from offboard sensors.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

RADARS

Type	LW-04	AN/SPS-53E	WM 22-61
Maker	Signaal	Raytheon	Signaal
Role	Air/surface search	Surface search	Fire control
Band	E/F	I	I/J
Beam	2.2 × 10°	1.6 × 20°	Search: 1.5 × 7° Track: 2.4°
Peak power	1,100 kW	40 kW	200 kW
Gain	30 dB	30 dB	33.5 dB
Pulsewidth	1.3/2.6 µs	0.5/1.0 µs	0.22/0.45 µs

Scan rate	7.5/15 rpm	15 rpm	60 rpm

IFF
UPX-23.

SONAR

DSQS-21 hull-mounted sonar systems
DSQS-21 is an active search and attack radar using computer-aided detection techniques for classification and tracking, and the information is presented on colour CRT displays to permit Doppler coding and the discrimination of data on the integrated displays. The transducer array is 1 m (3.28 ft) in diameter and consists of 32 staves.

Manufacturer/Contractor
STN Atlas Elektronik GmbH, Bremen, Germany.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Fairbanks-Morse 38TD8-1/8-9 diesels; 3.9 MW (5,250 hp) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

Tapi was ordered in 1969 and *Khirirat* in June 1971, and commissioned in 1971 and 1974, respectively.

MODERNISATION

Both ships underwent a major refit in the 1980s: *Tapi* completed 1983 and *Khirirat* in 1987. This included new gunnery and radars and a slight heightening of the funnel. Further modernisation took place in 1988-89 mainly to external and internal communications.

Khirirat *with the new pennant number, 432*

WEAPONS SYSTEMS

ANTI-SUBMARINE MISSILES

Mk 16 launcher group

There is a single Mk 16 launcher group located on the foredeck, with a Mk 112 launcher, consisting of four pairs of launch tubes, each pair elevating independently. Maximum launch rate is three missiles per minute. These two ships have the early ASROC loading system, which is characterised by a vertical bridge screen.

Honeywell RUR-5A ASROC

ASROC consists of a Mk 46 torpedo with strap-on aerodynamic surfaces and a rocket motor to enable it to fly to within range of its submarine target. Attached to the rear end of the torpedo is a short airframe assembly of clam-like construction, held together by a steel band, with a Naval Propulsion Plant solid propellant booster and four trapezoidal aerodynamic surfaces to provide stability in flight. The torpedo has a dome-shaped frangible plastic nose cap to protect the transducer as it enters the water. Payload is an Alliant Mk 46 Mod 5 torpedo, which has a seeker designed specifically to detect most types of target including submarines with anechoically coated hulls and has an estimated acquisition range of 460 m (1,509 ft).

When a submarine target is detected, it is tracked and the attack console's fire-control computer predicts the target's position. The launcher is turned in the appropriate direction and elevated to an angle appropriate to the range. The fire-control computer then

orders the launch and the booster burns for a programmed time of between 1 and 4 seconds, by which time the missile will have reached a height of between 60 and 305 m (197 and 1,001 ft), although the aerodynamically stable airframe enables it to coast up to 600 m (1,969 ft). On reaching the programmed position, an explosive bolt cuts the steel band holding the airframe assembly sections together and, as they separate, the parachute deploys to retard the torpedo's fall, water, entry taking place some 14 to 50 seconds after launch. As the torpedo enters the water, the frangible nose cap breaks off and the torpedo begins its search for the target using a predetermined pattern.

Specifications

ASROC missile
Length: 4.6 m (15.1 ft)
Diameter: 32.5 cm (12.8 in)
Span: 84.5 cm (33.3 in)
Weight: 435 kg (959 lb)
Range: 0.86-5.39 n miles (1.6-10 km)
Speed: Mach 0.9

Mk 46 Mod 5 torpedo
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight: 230 kg (507 lb)
Speed: 40 kts (max)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg (97 lb); PBXN-103

Manufacturer/Contractor

Honeywell, USA.

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited in the waist. It is reported that the torpedoes used are Mk 46.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications

Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

US Navy 76 mm (3 in) L/50 Mk 33 Mod 4 gun mounting

There is one twin 76 mm (3 in) mount on the foredeck. This is a twin gun, power-driven, base-ring mount, with local or remote control, with a gun house (Mod 4). It uses two Mk 22 guns.

Specifications

Mk 22 gun
Calibre: 76.2 mm
Length of barrel: 50 calibres
Muzzle velocity: 823 m/s (2,700 ft/s) (new gun, nominal); 808 m/s (2,651 ft/s) (mid-life)
Range: 7 n miles (13 km)
Altitude: 8,951 m (29,368 ft)
Ammunition: 10.9 kg (24.0 lb)

Mk 33 mount
Traverse: 360°
Elevation: −14/15° to +85°
Traverse rate: 30°/s
Elevation rate: 24°/s
Rate of fire: 100 rds/min

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

AN/WLR-1

AN/WLR-1 is a US-manufactured, manually operated, radar warning system covering frequencies from 50 MHz to 10.75 GHz, employing a number of separate antennas.

AN/WLR-3

AN/WLR-3 is a 1950s-vintage radar warning receiver.

ELECTRONIC COUNTERMEASURES (ECM)

AN/ULQ-6

AN/ULQ-6 is a deception jammer which was originally developed to deal with the threat posed by Soviet missiles such as SS-N-2.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launchers

There are two Mk 33 systems. Mk 33 is the designation for a system consisting of four launchers, each with six fixed tubes arranged in two rows at elevation angles of 55, 65 and 75°. RBOC uses a Mk 164 Mod 0 bridge launcher control as a back-up control but the Mk 158 Mod 0 is the master launch control.

Each launcher has a ready-use locker with up to 40 cartridges depending upon type.

Specifications

Munitions	Dimensions (L × D)	Weight
Chaffstar I	412.1 × 112.3 mm	4.15 kg
Chaffstar II	1,067 × 112 mm	18.2 kg
Gemini	434 × 112 mm	5.2 kg
Hiram I	416.8 × 112.3 mm	4.1 kg
Hiram II	889 × 203 mm	13.3 kg
Loroc	1,200 × 112 mm	14.74 kg

Manufacturer/Contractor

Loral Hycor, USA.

T-Mk 6 Fanfare

The T-Mk 6 torpedo decoy consists of two winches each with a cable and a 'fish' containing a mechanical acoustic device.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Mk 56 Gun Fire Control System (GFCS)

The Mk 56 GFCS consists of a radar/optical director and a below-decks computer fit and requires a crew of five. The system can issue simultaneous gun and fuze-setting orders to the gun mounts and can produce a very fast fire-control solution, typically within 2 seconds of beginning to track.

The target is designated through the SPS-40B (air search) and SPS-10C (surface search) radars and the director is turned in the appropriate direction. In theory the director is capable of turning 360° in azimuth, although this is restricted in practice, while the elevation is −15 to +85°. Using elevation and traverse error signals, when the target moves out of the radar's line of sight, the radar antenna keeps on the target through the servo system. The error signal inputs are received by the tracking control circuits which are inserted in the servo loop. These inputs are processed to provide tracking signals for the antenna power drive as well as elevation and traverse rates for the fire-control computer. The tracking signals are passed to an on-mount gyro unit which modifies them so that the demands of the antenna power drives (also on-mount) allow for ship movement. From these two elements, two sets of data inputs are provided to the computer, one defines the target's line of sight relative to the ship while the other defines it relative to the gyro platform. The two computers were the Mk 42, for primary and secondary ballistics, and the Mk 30, for primary gun orders. These also receive inputs on ship speed and course from the log and gyrocompass as well as target range from the radar. Values are inserted for gun dead time, for initial velocity, true windspeed and wind direction. On the basis of all this data the computers generate training and elevation instructions together with fuze orders for the guns.

Manufacturer/Contractor

General Electric Company, Ordnance Systems Division.

Mk 114 ASW FCS

The main element in the Loral Mk 114 ASW fire-control system is the Mk 53 Attack Console, an electro-mechanical analogue system with two major units, the attack plotter and the ballistic computer. The latter conducts weapon presets for both ASROC and ASW torpedoes. The Mk 114 system also includes the Mk 33 underwater fire-control switchboard which accepts data from two Mk 19 gyrocompasses and other sensors, as well as from the Mk 134 sonar stabilisation computer. The consoles have an AN/UYK-44 reconfigurable processor with some 70,000 lines of CMS-2 language code. The system interfaces with the sonar: in this case the EDO SQS-26 AXR (D 29, D 30) or the EDO SQS-26B (D27, D 28).

Manufacturer/Contractor

Loral Librascope.

SONAR

AN/SQS-26AXR

Both ships are fitted with bow-mounted AN/SQS-26 active search and attack, medium-frequency sonar. AN/SQS-26 works in surface duct, bottom bounce and convergence zone modes, using surface duct for shorter ranges, bottom bounce for medium ranges and convergence zone for longer ranges. The last two modes require electronic beam-steering in elevation. SQS-26 is an active system transmitting at about 3.5 kHz with an output power of about 192 kW and receiving in seven channels between 1.5 and 4 kHz. The transducer is reported to be about 4.87 m (16.0 ft) in diameter and 1.68 m (5.5 ft) high, with 72 staves, each with eight elements. Ranges are reported to be approximately 10 n miles (18.5 km) in surface duct mode, and 34.5 n miles (64 km) in convergence zone mode. AN/SQS-26AXR was a variant with a modified power supply.

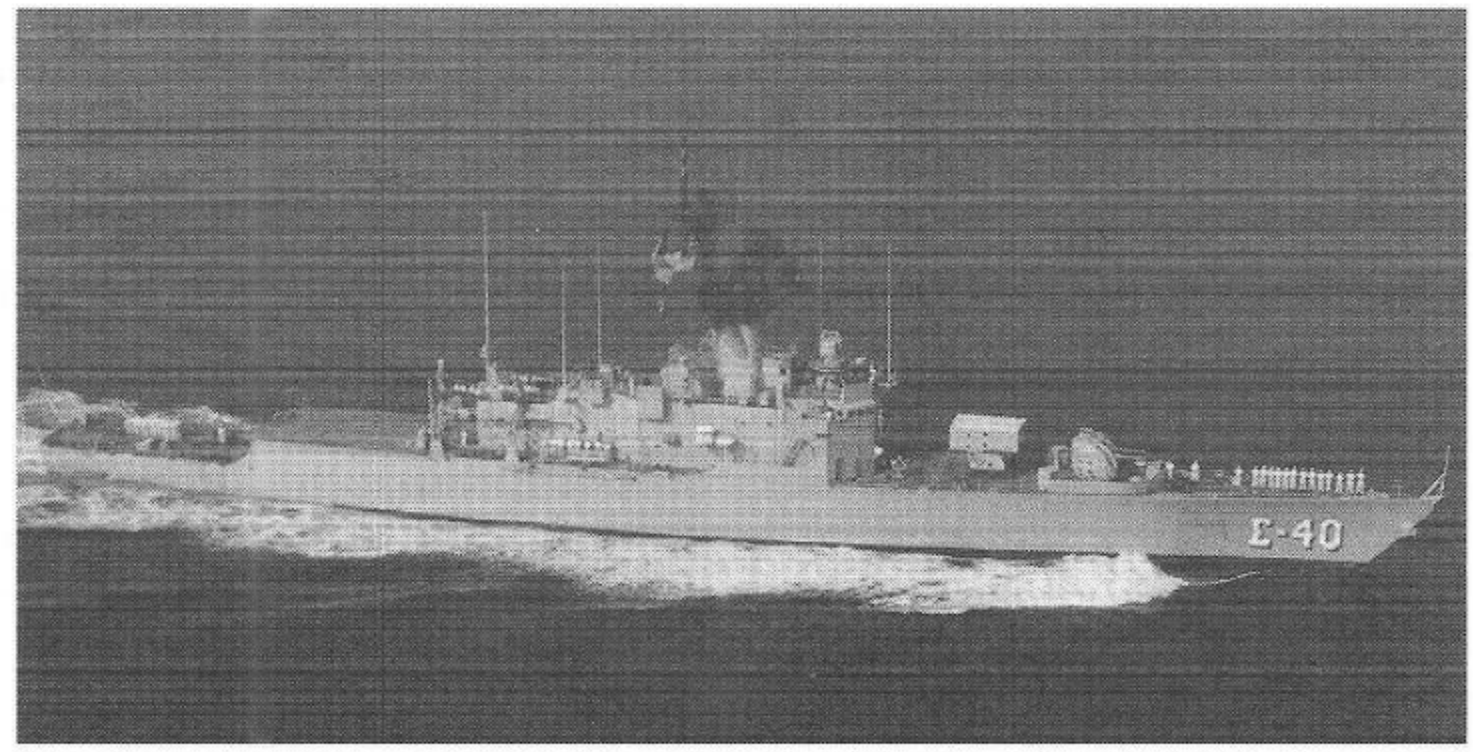
FURTHER INFORMATION

PROGRAMME

There was considerable dissatisfaction in the US Navy with the 'Claud Jones' (DE 1033) class, four of which were commissioned between 1958 and 1960. They were considered to be too slow and ill-equipped for their ASW mission. As a result, a new design — the 'Bronstein' class — was prepared which was faster, but at 26 knots was still not capable of keeping up with the 30 knot task group it was supposed to be protecting, and only two were built.

These two Bronsteins served in the US Navy from 1963 to 1990, when they were stricken from the Navy List. They were, however, not scrapped and were eventually bought by the Mexican Navy on 12 November 1993, providing a much-needed boost to that service's capabilities.



Nicolas Bravo *(E-40) one of two former US Navy 'Bronstein' class frigates which were sold to Mexico in 1993*

DESIGN

These Bronsteins were the first of the second generation of open-ocean ASW escorts for the US Navy, with a new design of hull and a high freeboard. They were also the first to have the new AN/SQS-26 bow-mounted sonar with its very large dome, which necessitated an overhanging stem and a stem anchor, with the portside anchor moved well back to just forward of the gun mount.

They also had a better ASW capability and were the first ships at sea with the (then) new ASROC system. They also had two triple torpedo tubes and a DASH helicopter drone, although this proved unsuccessful. Surface armament comprised three 76 mm (3 in) guns, two in a twin, closed mount in 'A' position and a single gun in an open mount in 'Y' position. Air defence weapons were non-existent.

The basic hull form and design were used as the basis for the subsequent 'Garcia' and 'Brooke' classes, which were larger and had more powerful engines.

MODERNISATION

While in US service the after 76 mm (3 in) gun mount was removed in order to accommodate a Towed Array Surveillance System (TASS). The DASH facilities were deactivated, but unlike other, larger ships there was insufficient space or weight allowance to enable the hangar and flight deck to be fitted to accommodate the LAMPS-I system.

Before delivery to Mexico the TASS facilities were removed. The Mexican Navy currently plans to install Bofors 57 mm SAK mounts, as has already been done in the *Ilhuicamina* (see 'Gearing' class). This might be achieved by installing the new gun on the quarterdeck in the position previously occupied by the single, open mounted 76 mm gun, or by replacing the ASROC launcher, for which the Mexican Navy would not seem to have a requirement.

GARCIA

OVERVIEW

The US Navy's 'Garcia' class had its origins in the late 1950s when there was a requirement for new escorts to replace the ageing Second World War destroyers. There was also interest at the time in pressure-fired propulsion systems, which promised faster ships, and it was decided to build a new class with these new systems, even though a prototype had not yet run. The result was a class of 17 ships with a common hull, of which ten were optimised for ASW ('Garcia' class), six for air defence ('Brooke' class), and one (Glover (AGDE 1)) had an experimental pump-jet system. Construction ended in 1967 as the ships were considered to have limited capabilities and to be very expensive, although their maximum speed of 30 knots was considered impressive.

The 'Garcia' class entered service between 1964 and 1968 and its ASW armament included two 533 mm (21 in) tubes in the transom and a hangar and flight deck for the short-lived DASH helicopter drone. During their service the flight deck and hangar were adapted and enlarged to take LAMPS I helicopters in all except *Sample* (FFG 1048) and *Albert David* (FFG 1050) which were modified instead to take the AN/SQR-15 towed array system.

The ships were decommissioned between 1988 and 1990, and offered for lease. Four were leased on five-year leases to Pakistan in 1988/89, which also took four of the very similar 'Brooke' class FFGs. All eight ships had to be returned in 1993-94 when the USA declined to renew the lease, due to Congressional disapproval of Pakistan's nuclear programme. These ships were all subsequently scrapped in Singapore.

The only other country to take up the leasing offer was Brazil, which took four 'Garcia' class ships, all being transferred in 1988. The lease on these ships was renewed for a further five years in 1993.

The other two 'Garcia' class ships were broken up in the USA in 1992.

US Navy 'Garcia' class frigate Davidson *(FF 1045) in 1978. Main armament was two 127 mm guns and Mk 112 launcher for ASROC. The ASROC launcher has one two-cell segment raised in the launching position* (US Navy)

WEAPONS SYSTEMS

ANTI-SUBMARINE MISSILES

Mk 16 launcher group

The 'Garcia' class is fitted with a Mk 16 Launcher Group located on the foredeck, with a single Mk 112 launcher, which consists of four pairs of launch tubes, each pair elevating independently. Maximum launch rate is 3 missiles per minute.

The first five ships to be built (FFG 1040 to FFG 1045) had an earlier ASROC loading system characterised by a vertical bridge screen and this is retained by the Brazilian ships *Pernambuco* (ex-FFG 1041) and *Paraiba* (ex-FFG 1045). The subsequent five 'Garcia' class ships were, however, built with a new automated ASROC reload system which had been developed for the 'Knox' class, which has a sloping front to the bridge screen, as in the other two Brazilian ships: *Parana* (ex-FFG 1048) and *Para* (ex-FFG 1050).

Honeywell RUR-5A ASROC

ASROC consists of a Mk 46 torpedo with strap-on aerodynamic surfaces and a rocket motor to enable it to fly to within range of its submarine target. Attached to the rear end of the torpedo is a short airframe assembly of clam-like construction, held together by a steel band, with a Naval Propulsion Plant solid propellant booster and four trapezoidal aerodynamic surfaces to provide stability in flight. The torpedo has a dome-shaped

frangible plastic nose cap to protect the transducer as it enters the water. Payload is an Alliant Mk 46 Mod 5 torpedo, which has a seeker designed specifically to detect most types of target including submarines with anechoically coated hulls and has an estimated acquisition range of 460 m (1,509 ft).

When a submarine target is detected it is tracked and the attack console's fire-control computer predicts the target's position. The launcher is turned in the appropriate direction and elevated to an angle appropriate to the range. The fire-control computer then orders the launch and the booster burns for a programmed time of between 1 and 4 seconds, by which time the missile will have reached a height of between 60 and 305 m (197 and 1,000 ft), although the aerodynamically stable airframe enables it to coast up to 600 m (1,969 ft). On reaching the programmed position, an explosive bolt cuts the steel band holding the airframe assembly sections together and, as they separate, the parachute deploys to retard the torpedo's fall, water entry taking place some 14 to 50 seconds after launch. As the torpedo enters the water the frangible nose cap breaks off and the torpedo begins its search for the target using a predetermined pattern.

Specifications
ASROC missile
Length: 4.6 m (15.1 ft)
Diameter: 32.5 cm (12.8 in)
Span: 84.5 cm (33.3 in)
Weight: 435 kg (959 lb)
Range: 0.86-5.39 n miles (1.6-10 km)
Speed: Mach 0.9

Mk 46 Mod 5 torpedo
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight: 230 kg (507 lb)
Speed: 40 kts (max)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg (97 lb); PBXN-103

Manufacturer/Contractor
Loral Defense Systems, Akron, Ohio, USA.

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited in the waist. 14 torpedoes are carried.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)

Close-up of Para *(D 27). The sloped bridge screen houses the ASROC magazine and reloading gear* (Giorgio Arra)

Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

Mk 30 127 mm (5 in) L/38 gun mounting
There are two Mk 30 127 mm (5 in) L/38 single mounts. One is on the foredeck, the other on the superstructure forward of the hangar. This weapon is based on the 127 mm (5 in) 38 calibre Mk 12 gun which is 5.68 m (18.6 ft) long and weighs 3.25 tonnes. The barrel is secured to the rest of the weapon by a bayonet joint, the weapon featuring a semi-automatic vertical sliding wedge breech block. On top of the weapon is a 5 or 7 hp rammer motor. Shells are loaded manually into a hydraulically powered ramming tray. The approximate life of the weapon is 4,600 EFC.

The Mk 30 is a single gun, base ring, mount with manual drive or power operation in local or remote control. The mount uses a 24.95 kg (55 lb) semi-fixed round with 6.89 kg (15.2 lb) of propellant and 0.93 kg (2.0 lb) of explosive.

Specifications
Mk 30
Calibre: 127 mm (5 in)
Length of barrel: 38 calibres
Muzzle velocity: 792 m/s (2,598 ft/s) (new gun), 762 m/s (2,500 ft/s) (mid-life)
Range: 13.5 n miles (25.26 km)
Altitude: 12,836 m (28,303 ft)
Ammunition: 24.95 kg (55 lb)
Traverse: ±115 to ±165°
Elevation: −15 to +85°
Traverse rate: 30°/s
Elevation rate: 15°/s
Rate of fire: 20 rds/min

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

AN/WLR-1
WLR-1 is a US-manufactured, manually operated, radar warning system covering frequencies from 50 MHz to 10.75 GHz, employing a number of separate antennas.

AN/WLR-6
WLR-6 is a communications ESM system.

AN/ULQ-6
AN/ULQ-6 is a US-supplied deception jammer, whose main function is to produce a false target to mislead incoming sea-skimming missiles.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launchers
There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

T-Mk 6 Fanfare
The T-Mk 6 torpedo decoy consists of two winches each with a cable and a 'fish' containing a mechanical acoustic device. It was introduced into the US Navy in the 1950s and was replaced in most ships by AN/SLQ-25 Nixie.

Masker/Prairie Masker noise suppression systems
The ships are fitted with both Masker and Prairie radiated noise suppression systems. In Prairie, high-pressure air is bled off from either the ship's gas turbine or dedicated compressors and ejected from a pipe placed laterally across the ship's hull just forward of the machinery spaces. The forward motion of the ship causes the air to form a layer separating the hull from the water and thus masking the machinery noises which would otherwise be radiated directly into the water. Such a system is less effective at slow speeds where the air bubbles tend to rise to the surface rather than remain attached to the hull.

In Masker air is passed down the propeller shaft and ejected from a groove in the leading edge of the blade, thus delaying the onset of cavitation.

COMMAND AND CONTROL SYSTEMS

COMMUNICATIONS AND DATALINKS

Satcom. All ships are fitted with Satcom.

Tacan: AN/SRN-15

IFF: UPX XII

WEAPONS CONTROL

Mk 56 Gun Fire Control System (GFCS)

The Mk 56 GFCS consists of a radar/optical director and a below-decks computer fit and requires a crew of five. The system can issue simultaneous gun and fuze-setting orders to the gun mounts and can produce a very fast fire-control solution, typically within 2 seconds of beginning to track.

The target is designated through the SPS-40B (air search) and SPS-10C (surface search) radars and the director is turned in the appropriate direction. In theory the director is capable of turning 360° in azimuth, although this is restricted in practice, while the elevation is −15 to +85°. Using elevation and traverse error signals when the target moves out of the radar's line of sight the radar antenna keeps on the target through the servo system. The error signal inputs are received by the tracking control circuits which are inserted in the servo loop. These inputs are processed to provide tracking signals for the antenna power drive as well as elevation and traverse rates for the fire-control computer. The tracking signals are passed to an on-mount gyro unit which modifies them so that the demands of the antenna power drives (also on-mount) allow for ship movement. From these two elements two sets of data inputs are provided to the computer, one defines the target's line of sight relative to the ship while the other defines it relative to the gyro platform. The two computers were the Mk 42, for primary and secondary ballistics, and the Mk 30, for primary gun orders. These also receive inputs on ship speed and course from the log and gyrocompass as well as target range from the radar. Values are inserted for gun dead time, for initial velocity, true windspeed and wind direction. On the basis of all this data the computers generate training and elevation instructions together with fuze orders for the guns.

Manufacturer/Contractor

General Electric Company, Ordnance Systems Division.

Mk 114 ASW FCS

The main element in the Singer Mk 114 ASW fire-control system is the Mk 53 Attack Console, an electro-mechanical analogue system with two major units, the attack plotter and the ballistic computer. The latter conducts weapon presets for both ASROC and ASW torpedoes. The Mk 114 system also includes the Mk 33 underwater fire-control switchboard which accepts data from two Mk 19 gyrocompasses and other sensors, as well as from the Mk 134 sonar stabilisation computer. The consoles have an AN/UYK-44 reconfigurable processor with some 70,000 lines of CMS-2 language code. The system interfaces with the sonar: in this case the EDO SQS-26 AXR (D 29, D 30) or the EDO SQS-26B (D27, D 28).

SONAR

AN/SQS-26AXR or AN/SQS-26BX

All four ships have the AN/SQS-26 bow-mounted, active search and attack, medium-frequency sonar, but of two different versions. *Parana* (D 29) and *Pernambuco* (D 30) have AN/SQS-26AXR, while *Para* (D 27) and *Paraiba* (D 28) have AN/SQS-26BX. AN/SQS-26 works in surface duct, bottom bounce and convergence zone modes, using surface duct for shorter ranges, bottom bounce for medium ranges and convergence zone for longer ranges. The last two modes require electronic beam-steering in elevation. SQS-26 is an active system transmitting at about 3.5 kHz with an output power of about 192 kW and receiving in seven channels between 1.5 and 4 kHz. The transducer is reported to be about 4.87 m (16.0 ft) in diameter and 1.68 m (5.5 ft) high, with 72 staves, each with eight elements. Ranges are reported to be approximately 10 n miles (18.5 km) in surface duct mode, and 34.5 n miles (64 km) in convergence zone mode.

SQS-26AXR was a variant with a modified power supply, while SQS-26BX was a DIMUS (digital multibeam steering) version.

Manufacturer/Contractor

FURTHER INFORMATION

PROGRAMME

The first three ships were transferred from the US Navy under the terms of a five-year lease on 15 April 1989, followed by the fourth ship on 1 October 1989. All arrived in Brazil on 13 December 1989. The lease was renewed in 1994.

DESIGNATION

When built, the 'Garcia' class was designated Destroyer Escorts by the US Navy and carried DE pennant numbers. This was changed to frigate (FF) on 30 June 1975, although the actual numbers remained unchanged. In the Brazilian Navy these four ships are designated Destroyers and carry D pennant numbers.

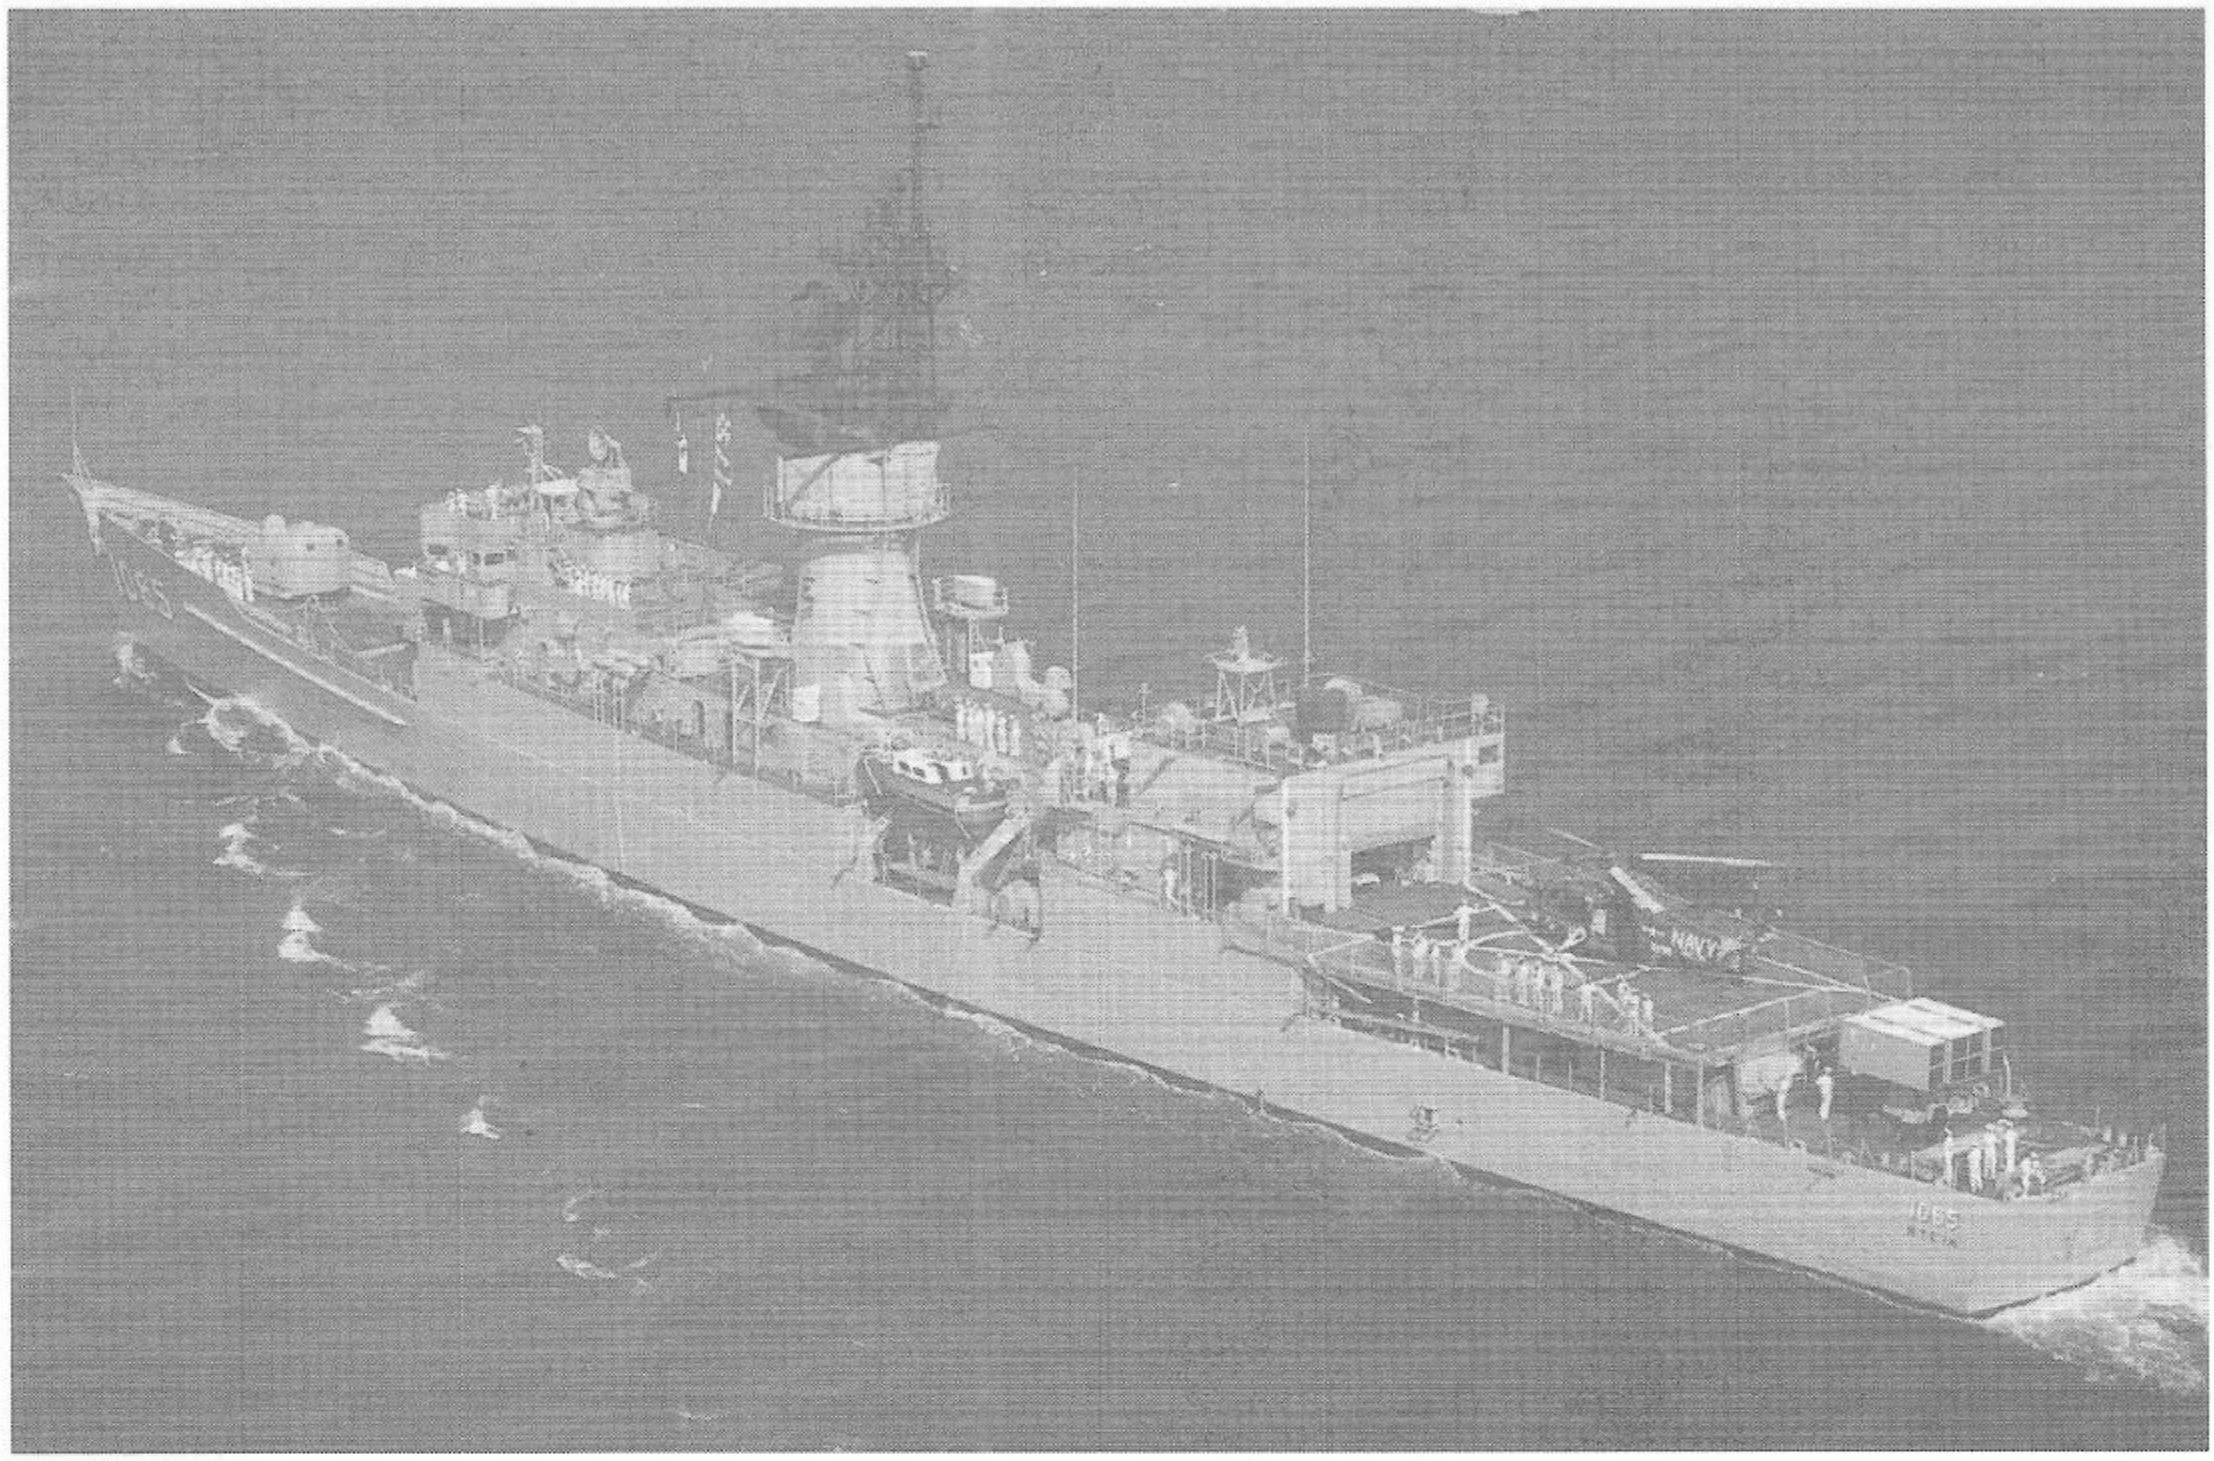
DESIGN

All four ships have an enlarged hangar capable of taking a Sea King-size helicopter although they normally operate a Lynx.

In US Navy service *Para* (D 27) and *Parana* (D 29) had the flight deck area converted to take the AN/SQR-15 towed array, but this was removed before transfer to Brazil.

'KNOX' CLASS

OVERVIEW



Stein *(F 1065) while in US Navy service. Forty-six of these useful ASW frigates were built, originally with the DASH helicopter drone and later, as here, with the Kaman SH-2G Seasprite LAMPS I helicopter* (Jane's/H M Steele)

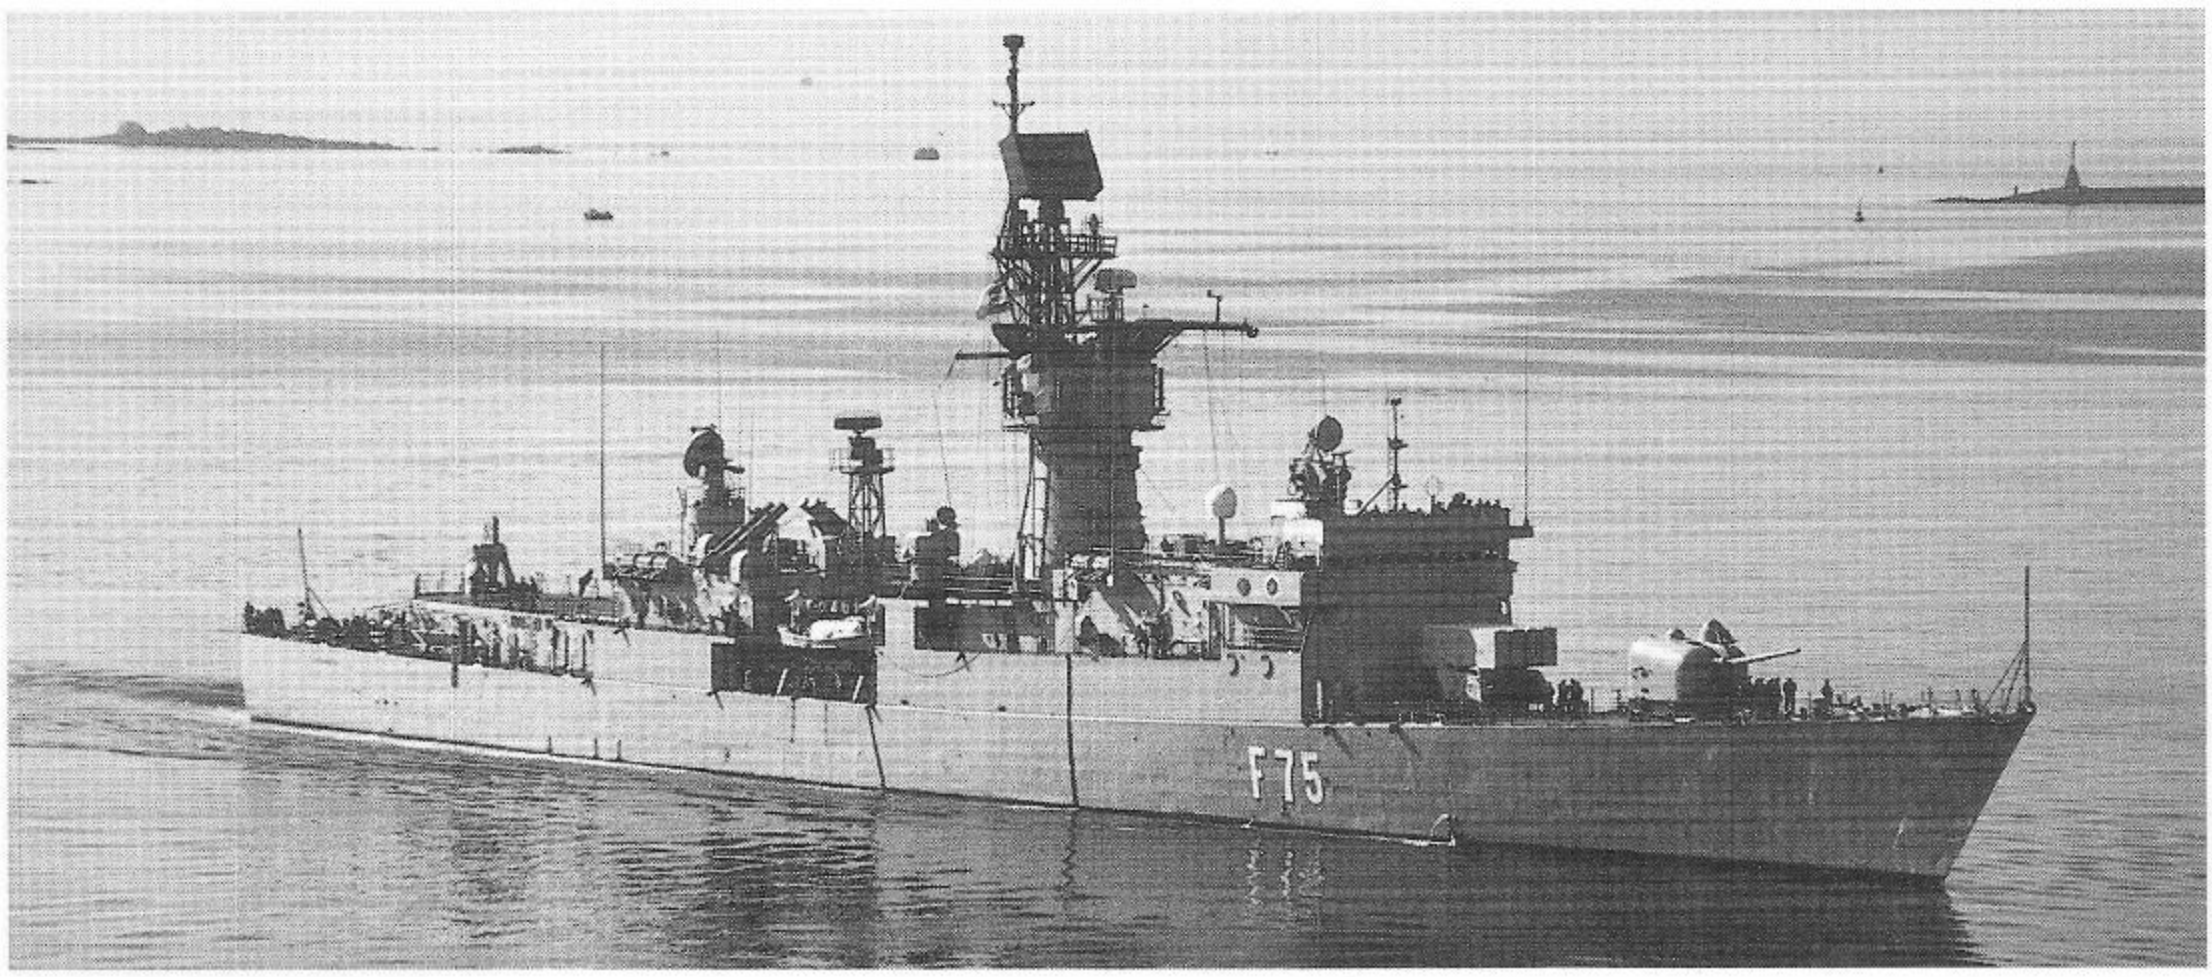
The 'Knox' class was designed in the mid-1960s, at the height of the Cold War, when large numbers of escorts were required for open-ocean patrol duties and to escort convoys. The design evolved from that of the 'Brooke' (DEG 1) class but was somewhat longer (126.5 m (414.9 ft) compared to 118.9 m (390.0 ft) to accommodate machinery that gave an increase in range from 4,000 to 4,500 n miles (7,408 to 8,334 km).

Forty-six were built, entering service between 1969 and 1974, the builders being: Avondale — 27; Lockheed, Seattle — five; Todd, San Pedro — six; and Todd, Seattle - eight. A further ten hulls (DE 1098 to DE 1107) were authorised in FY68, one of which was planned to be a gas-turbine trials ship, but all were cancelled. The ships were originally classified as 'destroyer escorts' (DE) but were redesignated 'frigates' (FF) in 1975.

The ship is dominated by the tall, tower-like 'mack' which was planned to provide the mounting for a series of billboard type antennas, although in practice only normal radar arrays were ever used. As built, the ships were armed with a 127 mm (5 in)/54 gun, four 324 mm Mk 32 ASW torpedo tubes, a DASH helicopter drone, and an eight-cell Mk 16 ASROC launcher, the latter having an improved ASROC-torpedo reloading capability, a visible sign of which is the slanting face of bridge structure immediately behind the launcher. The four Mk 32 torpedo tubes were fixed in the midships superstructure, two on each side, angled out at 45° which provides improved loading capability and a reduced maintenance requirement compared to the exposed triple Mk 32 torpedo tubes mountings.

An unusual feature of the design is the anchor arrangement. In this, there is a 1,800 kg (4,000 lb) lightweight anchor fitted on the port side and no stem or starboard anchors. Instead, there is a 3,600 kg (8,000 lb) anchor, which is housed in the after section of the sonar dome.

Non-retractable fin stabilisers were installed in all ships during construction. All are also fitted with the Prairie-Masker noise suppression system which emits bubbles through holes in the hull and propeller blades.



Extremadura *(F 75), the last of five modified 'Knox' class frigates built in Spain for the Spanish Navy* (H M Steele)

The propulsion plant features high-pressure steam boilers working at 84.37 kg/cm² (1,200 lb/sq in) and high temperature 510° C (1,081°F), which are designed to improve efficiency and take up less volume. This does, however, require a large, well-trained crew and takes at least 4 hours to become operational from a cold start. This is one reason why a number of navies have declined to accept these ships on lease.

MODERNISATION

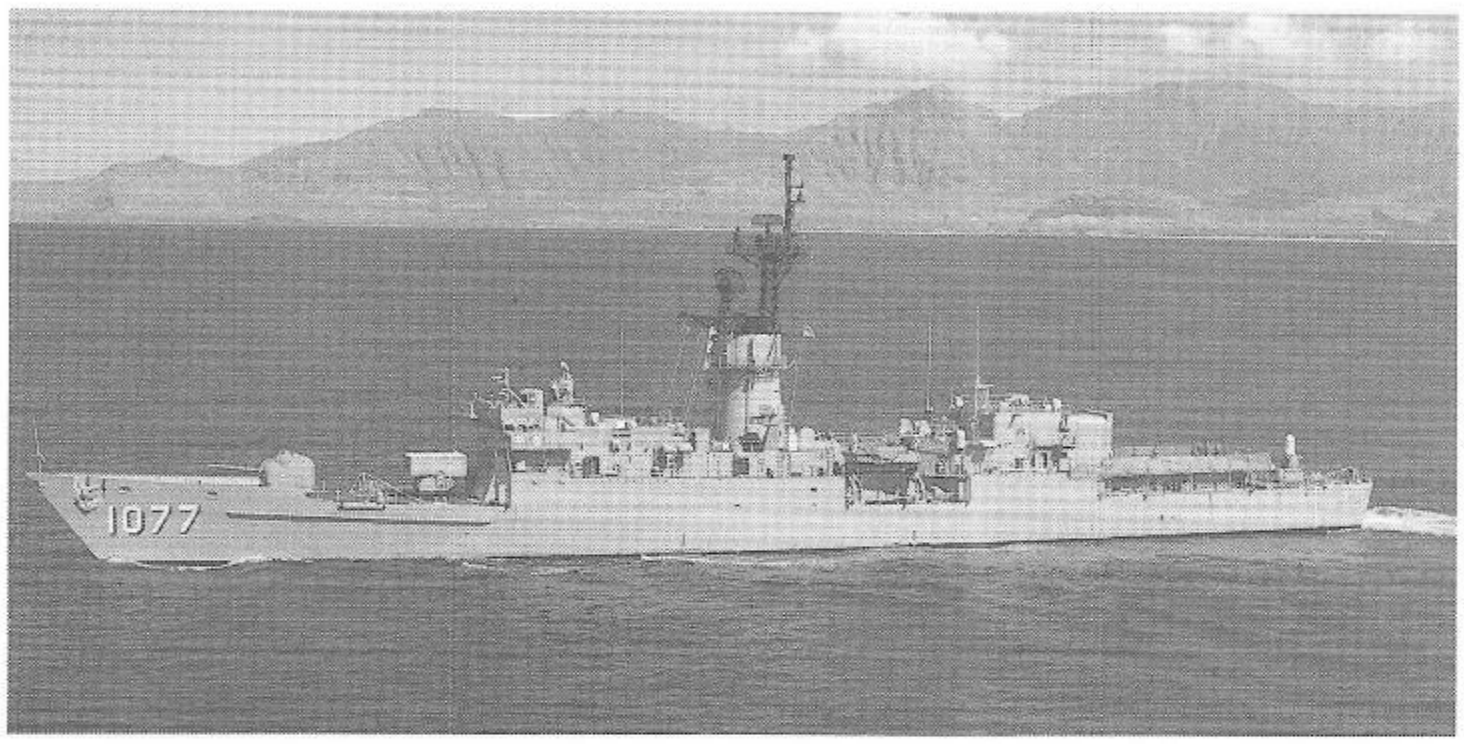
During their service the DASH was replaced by a Kaman SH-2 Seasprite helicopter and 31 of the ships were fitted with Sea Sparrow, although a mid-1970s plan to fit Sea Chapparal in the remainder came to naught.

Most of the 'Knox' class were fitted with EDO AN/SQS-35 VDS, but as submarines became quieter this had insufficient performance and 35 of the ships were further modified to take the EDO AN/SQR-18A TACTAS towed array, with modules attached to the 'fish'. The combination of LAMPS-I and the VDS resulted in such an increase in the data flow that the Commercial-Off-The-Shelf (COTS)-based Fast Frigate Integrated Shipboard Tactical System (FFISTS) was developed. FFISTS-1 was based on Hewlett-Packard workstations and was installed in six ships. This was followed by FFISTS-2 using SUN-4/110 SPARC workstations but the programme had not been completed by the time the ships started to be sold off. It appears that only the ships intended for Taiwan, Thailand and Turkey have the system.

In the early 1980s the Sea Sparrow short-range air defence system was replaced by a single Mk 15 20 mm Phalanx CIWS mounted on the quarterdeck. Also in the early 1980s the McDonnell Douglas Navy Mast-Mounted Sight (NMMS) was installed in ships undertaking Gulf deployments to assist in detecting floating mines, low-flying aircraft and small surface craft, especially in haze conditions. These were normally removed from ships as they returned from the Gulf, but it appears that the ships sold to Egypt, Thailand and Turkey have NMMS fitted.

An original plan to fit two 533 mm (21 in) torpedo tubes was never implemented. The ships were, however, given an anti-ship capability from 1972 onwards when the two port cells of the ASROC launcher were modified to accept RGM-84 Harpoon with two Harpoons displacing two ASROCs in the magazine, for a total of four missiles.

The 'Knox' class ships were criticised from the start for having only one propeller, while during their service they were considered too wet forward. The former could not be rectified, but all ships received bulwarks and spray strakes in the early 1980s, which increased their length slightly and added 9.1 tonnes to the displacement.



Onellet *(F 1077). This ship was transferred to the Royal Thai Navy in August 1996* (US Navy)

EXPORTS

The only early export order was for five, which were built in Spain as the 'Baleares' class, joining the Spanish fleet between 1973 and 1976 (see 'Baleares' class entry). With the end of the Cold War, however, the 'Knox' class ships were rapidly taken out of US service and were put into reserve before being offered for sale. They were offered to selected friendly navies on five-year leases, although not all the offers were taken up.

TABLE: EX-US NAVY 'KNOX' CLASS SHIPS ON FIVE-YEAR LEASES

Country	Quantity	Delivered	Comment
Egypt	2	1994	
Greece	3	1992-93	
Taiwan	3 3 3	1993 1995 1996	
Thailand	2	1994	May request two more later
Turkey	4 4	1993 1994	There is also one hulk used for spares

Recommissioned	1 Oct 1994

WEAPONS SYSTEMS

MISSILE LAUNCHER

Mk 16 launcher group

The 'Knox' class is fitted with a Mk 16 Launcher Group located on the foredeck, with a single Mk 112 launcher, which consists of four pairs of launch tubes, each pair elevating independently. The version installed in the 'Knox' class is the Mk 16 Mod 8, which has the port pair of tubes adapted to take RGM-84 Harpoon missiles. Maximum launch rate is three missiles per minute.

ANTI-SHIP MISSILES (ASM)

McDonnell Douglas UGM-84B Harpoon

The missile magazine can contain eight missiles, of which a maximum of two can be Harpoon. This missile can either fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses or it can approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. It can also use selectable seeker search expansion patterns and for the terminal phase can use either a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 kg)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg (11,905 lb) thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

ANTI-SUBMARINE MISSILES

Honeywell RUR-5A ASROC

The magazine also houses 12 ASROC missiles. ASROC consists of a Mk 46 torpedo with strap-on aerodynamic surfaces and a rocket motor to enable it to fly to within range of its submarine target. Attached to the rear end of the torpedo is a short airframe assembly of clam-like construction which is held together by a steel band, with a Naval Propulsion Plant solid propellant booster and four trapezoidal aerodynamic surfaces to provide stability in flight. The torpedo has a dome-shaped frangible plastic nose cap to protect the transducer as it enters the water. Payload is an Alliant Mk 46 Mod 5 torpedo, which has a seeker designed specifically to detect most types of target including submarines with anechoically coated hulls and has an estimated acquisition range of 460 m (1,508.8 ft).

When a submarine target is detected it is tracked and the attack console's fire-control computer predicts the target's position. The launcher is turned in the appropriate direction and elevated to an angle appropriate to the range. The fire-control computer then orders the launch and the booster burns for a programmed time of between 1 and 4 seconds, by which time the missile will have reached a height of between 60 and 305 m (197 and 1,001 ft), although the aerodynamically stable airframe enables it to coast up to 600 m (1,968 ft). On reaching the programmed position, an explosive bolt cuts the steel band holding the airframe assembly sections together and as they separate the parachute deploys to retard the torpedo's fall, water entry taking place some 14 to 50 seconds after launch. As the torpedo enters the water the frangible nose cap breaks off and the torpedo begins its search for the target using a predetermined pattern.

Specifications
ASROC missile
Length: 4.6 m (15.1 ft)
Diameter: 32.5 cm (12.8 in)
Span: 84.5 cm (33.3 in)

Weight: 435 kg (959 lb)
Range: 0.86-5.39 n miles (1.6-10 km)
Speed: Mach 0.9

Mk 46 Mod 5 torpedo
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight: 230 kg (507 lb)
Speed: 40 kts (max)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg (97 lb); PBXN-103

Manufacturer/Contractor
Loral Defense Systems, Akron, Ohio, USA.

TUBES

324 mm Mk 32 Mod 9 torpedo launchers
Two twin Mk 32 Mod 9 324 mm torpedo launchers are mounted at the forward end of the after deckhouse, angled outwards at 45°.

The torpedo magazine contains 22 torpedoes.

TORPEDOES

Mk 46 Mod 5 torpedo
Normal armament is the Honeywell Mk 46 Mod 5 anti-submarine torpedo, although some obsolete Mk 44 torpedoes are known to be still in service.

Specifications
Mk 46 Mod 5
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight:
torpedo: 230 kg (507 lb)
warhead: 44 kg (97 lb)
Speed: 40 kts (max)
Range: 5.9 n miles (11 km)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg; PBXN-103

GUNS

United Defense Mk 42 Mod 9 Single 127 mm (5 in)/54 gun mounting
There is one Mk 42 Mod 9 mounting, housing a single Mk 18 127 mm/54 gun. The Mk 18 gun has replaceable liner and a service life of some 2,000 rounds. A bayonet-type joint attaches the gun to the housing which includes a vertical sliding breech block and the entire gun assembly is supported on rollers in the slide. A separate rammer is mounted on the slide. The Mk 42 mounting was introduced in 1953 and the upper part of the mounting is fully power-driven and is enclosed in an armoured shield. The Mk 42 mounting requires a crew of 12: four men within the shield, and eight in the magazine and ammunition handling system.

Ammunition is loaded by a dual system with projectiles supplied automatically to the slide alternately from the right and left. The loading system consists of two manually loaded drums, one with 20 projectiles and the other with 20 charges which rotate to bring the projectile and cartridge together. Complete rounds are lifted from the lower hoist to the upper hoist and from there to the cradles which move them to the tray from where they are rammed into the breech.

Magazine capacity is 550 rounds and ammunition includes the Mk 41 AAC/HC, Mk 42 common, and Mk 48 illumination rounds, all of which weigh 31.75 kg (70 lb). All rounds have point detonating, proximity or mechanical time fuzes.

Specifications
Gun, 127 mm/54 Mk 18
Calibre: 127 mm
Length of barrel: 54 calibres
Muzzle velocity:
new barrel: 807 m/s (2,647 ft/s)
mid-life: 792 m/s (2,598 ft/s)
Max range: 13 n miles (24 km)
Max altitude: 14,400 m (47,000 ft)
Ammunition: 31.75 kg (70 lb)

Mounting, Mk 42 Mod 9
Traverse: 360° at 40°/s
Elevation: −15 to +85° at 25°/s
Rate of fire: 20-40 rds/min

Manufacturer/Contractor
United Defense Armament Systems Division, Minneapolis, Minnesota, USA.

Hughes Mk 15 CIWS Phalanx
There is one Hughes Mk 15 Phalanx close in weapons system (CIWS) situated on the quarterdeck. The mount consists of a 20 mm M61A1 Vulcan, six-barrel, Gatling-principle gun with a cylindrical magazine and feeding mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,378 ft/s)
Rate of fire: 3,000 rds/min
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor
Hughes Missile Systems, Tucson, Arizona, USA (system).

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

AN/SLQ-32(V)2 ESM Suite
These Egyptian ships have the AN/SLQ-32(V)2 EW suite, which gives radar warning on B to J-bands. (Note that AN/SLQ-32(V)2 does not have an active jamming element, which only comes with the AN/SLQ-32(V)3 or AN/SLQ-32(V)5 suites.

Manufacturer/Contractor
Raytheon Company, Electromagnetic Systems Division, Goleta, California, USA.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launchers
There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)

Rounds
Diameter: 130 mm (5.1 in)
Length, weight:
Mk 182: 1,209 mm; 22.7 kg
Super Chaffstar: 1,209 mm; 20.9 kg
Super Gemini: 451 mm; 5.5 kg
Super Hiram III: 1,220 mm; 13.6 kg
Super Hiram IV: 467 mm; 3.8 kg
Super Loroc: 734 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

AN/SLQ-25 Nixie noisemaker
One AN/SLQ-25 Nixie solid-state, electroacoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter to generate and amplify the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed over the transom. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. The winch streams and recovers the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed body, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, is 95 cm long (3.10 ft), 15.24 cm (6 in) in diameter and weighs 18 kg (40 lb). It receives amplifier outputs, converts them into acoustic signals and projects them.

Manufacturer/Contractor
Aerojet ElectroSystems, Sacramento, California, USA.

Masker/Prairie Masker noise suppression systems
The ships are fitted with both Masker and Prairie-Masker radiated noise suppression systems. In Masker, high-pressure air is bled off from either the ship's gas turbine or dedicated compressors and ejected from a pipe placed laterally across the ship's hull just forward of the machinery spaces. The forward motion of the ship causes the air to form a layer separating the hull from the water and thus masking the machinery noises which would otherwise be radiated directly into the water. Such a system is less effective at slow speeds where the air bubbles tend to rise to the surface rather than remain attached to the hull.

In Prairie Masker, air is passed down the propeller shaft and ejected from a groove in the leading edge of the blade, thus delaying the onset of cavitation.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Fast Frigate Integrated Shipboard Tactical System - 1 (FFISTS-1)

The Egyptian ships were among the nine 'Knox' class ships to receive the FFISTS-1 system while in US Service. FFISTS-1 was an 'off-the-shelf' system, with a 'star' network architecture and using four Desktop Tactical-support Computers (DTC-1), essentially commercial Hewlett-Packard HP9020A/C (Model 500) with 32-bit microprocessors and some additional software. These are linked to a large hard drive Shared Resource Monitor (SRM) (and, through this common access, to each other) and to the peripherals. All interconnections are provided by Hewlett-Packard HP-1B links. With the hard disks, the system has a memory of up to 130 Mbytes and a speed of 1.5 Mips.

One DTC-1 conducts ASW data fusion and also receives data from Link 14 and a satellite communications link. The second DTC-1 acts as the Link 11 input/output terminal and also as track supervisor, receiving processed data from the navigation radar console. The third DTC-1 interfaces with the sonar systems while the fourth conducts target motion analysis from the sonars, but especially the towed array sonar. Nine FFISTS-1s were manufactured and all were installed in 'Knox' class frigates.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 11
Tacan: SRN 15
IFF: UPX-12

WEAPONS CONTROL

AN/SWG-1A Harpoon Launch Control System (LCS)

SWG-1A is the Harpoon weapons control system, which activates the missile, selects the flight pattern and sets seeker search modes (with small, medium or large acquisition windows), as well as providing target range and bearing data. Alternatively, the missile can simply be launched along the bearing of the target, with the seeker activated early to scan a 90° sector; if, after a set time, no target has been acquired the missile commences a preset search pattern. SWG-1A takes account of other ships in the general target area and generates indirect flight plans for the missile, including waypoints to optimise angles of approach which will achieve the highest possibility of success while minimising the chances of the missile being destroyed by hostile fire. It can also be used to compute flight plans in a multiple attack so that several missiles, from either the same or different ships, arrive on target simultaneously, thus swamping the defences.

Mk 68 Gun Fire Control System (GFCS)

The Mk 68 GFCS provides target data, position orders and firing orders for the 127 mm (5 in) gun Mk 42 mountings for use against both surface and air targets. The system consists of a Mk 68 gun director, an AN/SPG-53 I/J-band radar, a Mk 47 computer, a Mk 16 stable element and the gun mount. The system requires a crew of eight. The Mk 68 gun director has an optical rangefinder, two handwheels for optical tracking, the radar receiver, transmitter and antenna as well as a slip ring assembly. It transmits bearing, elevation and range data both to the computer and the radar operator's console. It can be operated in automatic radar and optical tracking modes.

The SPG-53 radar incorporates both spiral and conical scan for acquisition and tracking respectively. Later versions have monopulse and low-level tracking capabilities together with splash spotting and a missile launch alarm. The radar has both automatic and manual tracking modes. The former involves transmitting radar error signals in both bearing and elevation to the director power-drive amplifiers, where they are converted into control signals which drive the director. Manual tracking is achieved by operating the range, bearing and elevation handwheels at the radar operator's console. The Mk 47 analogue computer receives inputs from the director, the radar, the stable element, gyrocompass and underwater log system and processes this data to produce data on future target location, gun position and fuze orders. When engaging air targets its operation is automatic but for engaging surface and land targets manual rate control may be adopted. The Mk 68 can be given a limited electro-optical capability by the Texas Instruments EOSS (Electro-Optical Surveillance System), which may be installed in the Australian ships.

Manufacturer/Contractor

Norden Systems.

Mk 114 ASW fire-control system

The Mk 114 is the fire-control system for ASW operations. The main element is the Mk 53 Attack Console, an electromechanical analogue system which consists of two major units, the attack plotter and the ballistic computer. The latter conducts weapon presets for both ASROC and ASW torpedoes. The Mk 114 system also includes the Mk 33 underwater fire-control switchboard which accepts data from two Mk 19 gyrocompasses and other sensors, as well as from the Mk 134 sonar stabilisation computer. The consoles have an AN/UYK-44 reconfigurable processor with some 70,000 lines of CMS-2 language code. The system interfaces with the sonar; in this case the bow-mounted EDO SQS-26 CX VDS and the EDO SQS-35 VDS.

NMMS electro-optic surveillance system

NMMS (Naval Mast-Mounted Sight) is designed to detect mines, low-flying aircraft and small boats by day or night in all weather conditions. It can also be used to support gunfire missions and to assist in helicopter landing control. NMMS consists of a systems electro-optronic package housed in a composite casing and mounted on a pedestal. The sensor package comprises multiplexer electronics, the boresight assembly and the sensors (a Si-Vidicon television camera and a thermal imager), which float on high-energy, rare-earth magnets which create an energy field designed to produce unblurred images. The thermal imager is based upon the US MCTNS (Manportable Common Thermal Night Sights) modules and has 120 elements with split Stirling cooling system. The sensor package also includes a Litton MMS Laser RangeFinder/ Designator (LRF/D) operating in the 1.06 micron range. Supporting the sensor package is a video tracker which can be used for manual or automatic tracking of targets. There is also a digital scan converter which enhances the thermal imager picture and also provides freeze frame and x2 zoom capabilities. The system is used for both manual and automatic tracking but can also conduct continuous horizon scanning of designated sectors.

It should be noted that the designation 'Mast Mounted Sight' derives from the device's US Army title and it does not necessarily follow that in naval use the device is mounted on the ship's mast. The control console can be collocated with the sight, installed in the bridge or the combat information centre according to the operational requirement.

Specifications

Weight (sensor head): 72.57 kg (160 lb)
Diameter: 64.77 cm (25.5 in)
Stabilisation: less than 20 mrad
Fields of view
thermal imager: 2 × 10°
television: 2 × 8°

Manufacturers/Contractors

McDonnell Douglas Electronic Systems Company (system).
Northrop Electronics Division, Electronics Systems Group (sensor package).

SONARS

EDO AN/SQS-26CX

The hull-mounted AN/SQS-26CX works in surface duct, bottom bounce and convergence zone modes. Surface duct is for shorter range, bottom bounce for medium ranges and convergence zone for longer ranges. The last two modes require electronic beam steering in elevation. SQS-26 is an active system transmitting at about 3.5 kHz with an output power of about 192 kW and receiving in seven channels between 1.5 and 4 kHz. The transduced is reported to be about 4.87 m (16.0 ft) in diameter and 1.68 m (5.5 ft) high, with 72 staves, each with eight elements. Ranges are reported to be approximately 10 n miles (18.5 km) in surface duct mode and 34.5 n miles (64 km) in convergence zone mode. SQS-26CX was developed specially for the 'Knox' class frigates and was the final version of the SQS-26, the next set in the series being the SQS-53A.

Manufacturer/Contractor

EDO, USA.

AN/SQR-18A(V)1 (TACTAS)

AN/SQR-18A(V)1 (also known as TACTAS (Tactical Towed Array Sonar). The low-noise array is 230 m (755 ft) long and is towed behind an SQS-35 VDS 'fish' on a cable some 0.73 km (2,400 ft) long. The system features an adaptive processor which acts to reduce interference from the towing ship's noise (and to a lesser extent from adjacent ships) and a tracked system to provide bearing resolution and target motion analysis. SQR-18 is integrated with the hull-mounted SQS-26 and AN/SQR-17 sonobuoy processor.

Manufacturer/Contractor

EDO, Government Systems Division, College Point, New York, USA.

max take-off: 6,124 kg (13,500 lb)

Max level speed at sea level: 138 kts (256 km/h)

Typical cruising speed: 120 kts (222 km/h)

Service ceiling: 7,285 m (23,894 ft)

Range with max standard fuel: 478 n miles (885 km)

Rasheed *(966). The five-year lease will expire in 1999 when the Egyptian Navy will take permanent ownership of the two frigates* (Diego Quevedo)

Power plant: 2—1,285 kW (1,723 shp) General Electric T700-GE-401 turboshafts

Accommodation: Crew of 3 in ASW role (pilot, co-pilot/tactical co-ordinator, sensor operator)

Sensors: Canadian Marconi LN-66HP surveillance radar; AN/ALR-66(V)1 radar warning/ESM; Teledyne Systems AN/ASN-150 tactical management system; dual Collins AN/ARC-159(V) UHF radios; Texas Instruments AN/ASQ-81(V)2 MAD; Computing Devices AN/USY-503 acoustic processor; Flightline Electronics AN/ARR-84 sonobuoy receiver and AN/ARN-146 on-top position indicator. Tele-Dynamics AN/AKT-22(V)6 sonobuoy datalink; 15 DIFAR and DICASS sonobuoys. AN/ALE-39 chaff/flare dispensers; AN/ASQ-18B torpedo presetter

Weapons: 1 or 2 Mk 46 or Mk 50 torpedoes; 8 Mk 25 marine smoke markers. Provision for pintle-mounted 7.62 mm machine guns in both doorways

PROPULSION

Specifications

System: Steam-turbines

Main machinery: 2 Combustion Engineering/Babcock & Wilcox boilers; 84.4 kg/cm² (1,200 psi); 510°C (950°F); 1 turbine; 26 MW (35,000 hp)

Shafts: 1

FURTHER INFORMATION

PROGRAMME

The five-year lease from the US Navy was agreed in mid-1993 and signed on 27 July 1994, when both ships sailed for Egypt. On completion of the lease the arrangement will be made permanent.

MODERNISATION

It is doubtful whether much modernisation work will be undertaken until the five-year lease is formally converted into an outright sale. Among the measures under consideration by the Egyptian Navy are:

- Replacing AN/SQR-18A(V)1 by AN/SQS 35 VDS sonar
- The removal of the Mk 16 ASROC launcher group
- Installing eight launcher/canisters for RGM-84 Harpoon

Damyat *(961) is one of two ex-US Navy 'Knox' class frigates operated on lease by the Egyptian Navy. Note the prominent platform abreast of the 'mack' for the SLQ-32 (V)2 ESM* (Diego Quevedo)

Recommissioned	25 Jul 1992

WEAPONS SYSTEMS

MISSILE LAUNCHER

Mk 16 launcher group

The 'Knox' class is fitted with a Mk 16 Launcher Group located on the foredeck, with a single Mk 112 launcher, which consists of four pairs of launch tubes, each pair elevating independently. The version installed in the 'Knox' class is the Mk 16 Mod 8, in which one pair of tubes has been adapted to take RGM-84 Harpoon missiles. Maximum launch rate is three missiles per minute.

SURFACE-TO-AIR MISSILES (SAM)

FIM-43 Redeye close in system

The FIM-43 Redeye system is a man-portable close-range SAM, which although originally developed for army use, is also used by a number of navies. Four launchers are deployed in the 'Epirus' class frigates. The system consists of an M46A2 launcher assembly with grip-stock, sighting system, an M41 missile in its launcher-container, and a battery coolant device which is fitted to the M46A2. On acquiring a target the operator activates the battery coolant unit and uses the optical sighting system (x7.5 magnification; 25° field of view) to track the target until the missile seeker 'locks-on', which generates both audio and visual signals, and the missile is launched. The first stage rocket carries the missile out of the tube and the aerodynamic surfaces deploy, and then, after 1.6 seconds, by which time the missile is 6 to 7 m (19 to 23 ft) ahead of the operator, the sustainer motor ignites, the warhead is armed, and the seeker constantly measures the difference between the gyro line of sight and the IR source. Throughout the engagement the seeker is continuously repositioned to remain aimed at the target.

Specifications
FIM-43
Length: 1.28 m (4.2 ft)
Diameter: 70 cm (27.5 in)
Weight: 8.2 kg (18 lb)
Speed: Mach 1.6
Range: 3,300 m (10,824 ft)
Altitude: 3,000 m (9,840 ft)
Guidance: IR passive homing

Manufacturers/Contractors
Hughes Missile Systems (prime).
Raytheon Company, Missile Systems Division (second source).
Dornier GmbH (prime European).

ANTI-SHIP MISSILES (ASM)

McDonnell Douglas UGM-84B Harpoon

The ship carries four Harpoon missiles: two in the launcher and two in the magazine. Harpoon can either fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses or it can approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. It can also use selectable seeker search expansion patterns, and for the terminal phase can use either a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 kg)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

ANTI-SUBMARINE MISSILES

Honeywell RUR-5A ASROC

The magazine also houses six ASROC missiles. ASROC consists of a Mk 46 torpedo with strap-on aerodynamic surfaces and a rocket motor to enable it to fly to within range of its submarine target. Attached to the rear end of the torpedo is a short airframe assembly of clam-like construction, held together by a steel band, with a Naval Propulsion Plant solid propellant booster and four trapezoidal aerodynamic surfaces to provide stability in flight. The torpedo has a dome-shaped frangible plastic nose cap to protect the transducer as it enters the water. Payload is an Alliant Mk 46 Mod 5 torpedo, which has a seeker designed specifically to detect most types of target including submarines with anechoically coated hulls and has an estimated acquisition range of 460 m (1,508 ft).

When a submarine target is detected it is tracked and the attack console's fire-control computer predicts the target's position. The launcher is turned in the appropriate direction and elevated to an angle appropriate to the range. The fire-control computer then orders the launch and the booster burns for a programmed time of between 1 and 4 seconds, by which time the missile will have reached a height of between 60 and 305 m (197 and 1,001 ft), although the aerodynamically stable airframe enables it to coast up to 600 m (1,969 ft). On reaching the programmed position, an explosive bolt cuts the steel band holding the airframe assembly sections together and as they separate the parachute deploys to retard the torpedo's fall, water entry taking place some 14 to 50 seconds after launch. As the torpedo enters the water the frangible nose cap breaks off and the torpedo begins its search for the target using a predetermined pattern.

Specifications

ASROC missile
Length: 4.6 m (15.1 ft)
Diameter: 32.5 cm (12.8 in)
Span: 84.5 cm (33.3 in)
Weight: 435 kg (959 lb)
Range: 0.86-5.39 n miles (1.6-10 km)
Speed: Mach 0.9

Mk 46 Mod 5 torpedo
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight: 230 kg (507 lb)
Speed: 40 kts (max)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg (97 lb); PBXN-103

Manufacturer/Contractor

Honeywell, USA.

TUBES

324 mm Mk 32 Mod 9 torpedo launchers

Two twin Mk 32 Mod 9 324 mm torpedo launchers are mounted at the forward end of the after deckhouse, angled outwards at 45°.
The torpedo magazine contains 22 torpedoes.

TORPEDOES

Mk 46 Mod 5 torpedo

Normal armament is the Honeywell Mk 46 Mod 5 anti-submarine torpedo.

Specifications

Mk 46 Mod 5
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight:
torpedo: 230 kg (507 lb)
warhead: 44 kg (97 lb)
Speed: 40 kts (max)
Range: 5.9 n miles (11 km)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg; PBXN-103

GUNS

United Defense Mk 42 Mod 9 Single 127 mm (5 in)/54 gun mounting

There is one Mk 42 Mod 9 mounting, housing a single Mk 18 127 mm/54 gun. The Mk 18 gun has replaceable liner and a service life of some 2,000 rounds. A bayonet-type joint attaches the gun to the housing which includes a vertical sliding breech block and the entire gun assembly is supported on rollers in the slide. A separate rammer is mounted on the slide. The Mk 42 mounting was introduced in 1953 and the upper part of the mounting is fully power-driven and is enclosed in an armoured shield. The Mk 42 mounting requires a crew of 12: four men within the shield, and eight in the magazine and ammunition handling system.

Ammunition is loaded by a dual system with projectiles supplied automatically to the slide alternately from the right and left. The loading system consists of two manually loaded drums, one with 20 projectiles and the other with 20 charges, which rotate to bring the projectile and cartridge together. Complete rounds are lifted from the lower hoist to the upper hoist and from there to the cradles which move them to the tray where they are rammed into the breech.

Magazine capacity is 550 rounds and ammunition includes the Mk 41 AAC/HC, Mk 42 common, and Mk 48 illumination rounds, all of which weigh 31.75 kg (70 lb). All rounds have point detonating, proximity or mechanical time fuzes.

Specifications

Gun, 127 mm/54 Mk 18
Calibre: 127 mm
Length of barrel: 54 calibres
Muzzle velocity:
new barrel: 807 m/s (2,647 ft/s)
mid-life: 792 m/s (2,597 ft/s)
Max range: 13 n miles (24 km)
Max altitude: 14,400 m (47,000 ft)
Ammunition: 31.75 kg (70 lb)

Mounting, Mk 42 Mod 9
Traverse: 360° at 40°/s
Elevation: −15 to +85° at 25°/s
Rate of fire: 20-40 rds/min

Manufacturer/Contractor

United Defense Armament Systems Division, Minneapolis, Minnesota, USA

Hughes Mk 15 CIWS Phalanx

There is one Hughes Mk 15 Phalanx close in weapons system (CIWS) situated on the quarterdeck. The mount consists of a 20 mm M61A1 Vulcan, six-barrel, Gatling-principle gun with a cylindrical magazine and feeding mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,378 ft/s)
Rate of fire: 3,000 rds/min
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor

Hughes Missile Systems, Tucson, Arizona, USA (system).

ELECTRONIC WARFARE SYSTEMS

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launchers

There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications

Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)

Rounds
Diameter: 130 mm (5.1 in)
Length, weight:
Mk 182: 1,209 mm; 22.7 kg
Super Chaffstar: 1,209 mm; 20.9 kg
Super Gemini: 451 mm; 5.5 kg
Super Hiram III: 1,220 mm; 13.6 kg
Super Hiram IV: 467 mm; 3.8 kg
Super Loroc: 734 mm; 13.2 kg

Manufacturers/Contractors

Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

AN/SLQ-25 Nixie noisemaker

One AN/SLQ-25 Nixie solid-state, electroacoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter to generate and amplify the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed over the transom. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. The winch streams and recovers the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed body, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, is 95 cm long (3.10 ft), 15.24 cm (6 in) in diameter and weighs 18 kg (40 lb). It receives amplifier outputs, converts them into acoustic signals and projects them.

Manufacturer/Contractor

Aerojet ElectroSystems, Sacramento, California, USA.

Masker/Prairie Masker noise suppression systems

The ships are fitted with both Masker and Prairie-Masker radiated noise suppression systems. In Masker, high-pressure air is bled off from either the ship's gas turbine or dedicated compressors and ejected from a pipe placed laterally across the ship's hull just forward of the machinery spaces. The forward motion of the ship causes the air to form a layer

separating the hull from the water and thus masking the machinery noises which would otherwise be radiated directly into the water. Such a system is less effective at slow speeds where the air bubbles tend to rise to the surface rather than remain attached to the hull.

In Prairie Masker, air is passed down the propeller shaft and ejected from a groove in the leading edge of the blade, thus delaying the onset of cavitation.

AN/SLQ-32(V)5 Sidekick ESM/ECM Suite

All ships have the AN/SLQ-32(V)2 EW suite, which was upgraded to (V)5 standard by the addition of the Sidekick modification kit while in US service. AN/SLQ-32(V)2 is the ESM system, which gives radar warning across the B to H-bands, while Raytheon's Sidekick adds jamming and deception capabilities.

Manufacturer/Contractor

Raytheon Company, Electromagnetic Systems Division, Goleta, California.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Fast Frigate Integrated Shipboard Tactical System - 2 (FFISTS-2) FFISTS-2 was developed from FFISTS-I and replaces the star-network by a distributed architecture, which uses DTC-2 workstations interconnected by a dual fibre optic or a Thicknet local area network. The DTC-2 work station is a SUN-4/110 SPARC station with either one or two 48 cm (19 in) raster scan screens, 32 Mbytes of RAM, a 200 Mbyte hard drive (eliminating the need for the shared hard drives used in FFISTS-1) and is rated at 7.5 mips. A twin-screen DTC-2 monitors the sonars while a single-screen DTC-2 acts as the Link 11 interface. A third, single-screen, DTC-2 provides data fusion from onboard and offboard sensors including Link 11, Link 14 and satellite communications. FFISTS-2 is reported to be capable of conducting not only ASW operations but also anti-ship operations.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 11; Link 14 (receive only)
Tacan: SRN 15
IFF: UPX-12.

WEAPONS CONTROL

AN/SWG-1A Harpoon Launch Control System (LCS)

SWG-1A is the Harpoon weapons control system, which activates the missile, selects the flight pattern and sets seeker search modes (with small, medium or large acquisition windows), as well as providing target range and bearing data. Alternatively, the missile can simply be launched along the bearing of the target, with the seeker activated early to scan a 90° sector; if, after a set time, no target has been acquired the missile commences a preset search pattern. SWG-1A takes account of other ships in the general target area and generates indirect flight plans for the missile, including waypoints to optimise angles of approach which will achieve the highest possibility of success while minimising the chances of the missile being destroyed by hostile fire. It can also be used to compute flight plans in a multiple attack so that several missiles, from either the same or different ships, arrive on target simultaneously, thus swamping the defences.

Mk 68 Gun Fire Control System (GFCS)

The Mk 68 GFCS provides target data, position orders and firing orders for the 127 mm (5 in) gun Mk 42 mountings for use against both surface and air targets. The system consists of a Mk 68 gun director and AN/SPG-53 I/J-band radar, a Mk 47 computer, a Mk 16 stable element and the gun mount. The system requires a crew of eight. The Mk 68 gun director has an optical rangefinder, two handwheels for optical tracking, the radar receiver, transmitter and antenna as well as a slip ring assembly. It transmits bearing, elevation and range data both to the computer and the radar operator's console. It can be operated in automatic radar and optical tracking modes.

The SPG-53 radar incorporates both spiral and conical scan for acquisition and tracking respectively. Later versions have monopulse and low-level tracking capabilities together with splash spotting and a missile launch alarm. The radar has both automatic and manual tracking modes. The former involves transmitting radar error signals in both bearing and elevation to the director power-drive amplifiers, where they are converted into control signals which drive the director. Manual tracking is achieved by operating the range, bearing and elevation handwheels at the radar operator's console. The Mk 47 analogue computer receives inputs from the director, the radar, the stable element, gyrocompass and underwater log system and processes this data to produce data on future target location, gun position and fuze orders. When engaging air targets its operation is automatic but for engaging surface and land targets manual rate control may be adopted.

Manufacturer/Contractor

Norden Systems.

Mk 114 ASW fire-control system

The Mk 114 is the fire-control system for ASW operations. The main element is the Mk 53 Attack Console, an electromechanical analogue system which consists of two major units, the attack plotter and the ballistic computer. The latter conducts weapon presets for both ASROC and ASW torpedoes. The Mk 114 system also includes the Mk 33 underwater fire-control switchboard which accepts data from two Mk 19 gyrocompasses and other sensors, as well as from the Mk 134 sonar stabilisation computer. The consoles have an AN/UYK-44 reconfigurable processor with some 70,000 lines of CMS-2 language code. The system interfaces with the sonar.

Manufacturer/Contractor

Loral Librascope.

NMMS electro-optic surveillance system

The McDonnell Douglas Navy Mast-Mounted Sight (NMMS) was an adaptation of the Mast-Mounted Sight (MMS), which was developed for use in US Army helicopters for target location and designation. NMMS is designed to detect mines, low-flying aircraft and small boats by day or night in all weather conditions. It can also be used to support gunfire missions and to assist in helicopter landing control. NMMS consists of a systems electro-optronic package housed in a composite casing and mounted on a pedestal. The sensor package comprises multiplexer electronics, the boresight assembly and the sensors (a Si-Vidicon television camera and a thermal imager), which float on high energy, rare-earth magnets which create an energy field designed to produce unblurred images. The thermal imager is based upon the US MCTNS (Manportable Common Thermal Night Sights) modules and has 120 elements with split Stirling cooling system. The sensor package also includes a Litton MMS Laser Range-Finder/ Designator (LRF/D) operating in the 1.06 micron range. Supporting the sensor package is a video tracker which can be used for manual or automatic tracking of targets. There is also a digital scan converter which enhances the thermal imager picture and also provides freeze frame and x2 zoom capabilities. The system is used for both manual and automatic tracking but can also conduct continuous horizon scanning of designated sectors.

It should be noted that the designation 'Mast Mounted Sight' derives from the device's US Army title and it does not necessarily follow that in naval use the device is mounted on the ship's mast. The control console can be collocated with the sight, installed in the bridge or the combat information centre according to the operational requirement.

Specifications

Weight (sensor head): 72.57 kg (160 lb)
Diameter: 64.77 cm (25.5 in)
Stabilisation: less than 20 mrad
Fields of view
thermal imager: 2 × 10°
television: 2 × 8°

Manufacturers/Contractors

McDonnell Douglas Electronic Systems Company (system).
Northrop Electronics Division, Electronics Systems Group (sensor package).

* Ships are fitted with either AN/SPS-10 or AN/SPS-67.

SONARS

EDO AN/SQS-26CX

The hull-mounted AN/SQS-26CX works in surface duct, bottom bounce and convergence zone modes. Surface duct is for shorter range, bottom bounce for medium ranges and convergence zone for longer ranges. The last two modes require electronic beam steering in elevation. SQS-26 is an active system transmitting at about 3.5 kHz with an output power of about 192 kW and

receiving in seven channels between 1.5 and 4 kHz. The transduced is reported to be about 4.87 m (16.0 ft) in diameter and 1.68 m (5.5 ft) high, with 72 staves, each with eight elements. Ranges are reported to be approximately 10 n miles (18.5 km) in surface duct mode and 34.5 n miles (64 km) in convergence zone mode. SQS-26CX was developed specially for the 'Knox' class frigates and was the final version of the SQS-26, the next set in the series being the SQS-53A.

EDO SQS-35

The EDO AN/SQS-35 is a variable depth sonar (VDS) designed to detect submarines at medium ranges. It uses an array with 24 staves, operates at 13 kHz and has a peak power of 30 kW. There is a large 'fish' which is lowered over the stern on a large gantry and then streamed on a long cable. SQS-35 is a single console system with miniaturised vacuum-tube electronics.

Manufacturer/Contractor

EDO, Government Systems Division, College Point, New York, USA.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck:

dimensions: 22.8 × 14 m (75 ft × 46 ft)

max helicopter take-off weight: 5,000 kg (11,000 lb)

Hangar: The hangar was originally designed to accommodate DASH helicopter drones, but was later enlarged to accommodate the SH-2 LAMPS-I Kaman SH-2 Seasprite. The after end of the hangar is telescopic

HELICOPTERS

The Hellenic Navy operates one Agusta-Bell AB-212ASW helicopter from these frigates.

Specifications

Main rotor diameter: 14.63 m (48.0 ft)
Length overall (both rotors turning): 22.15 m (72.6 ft)
Fuselage length: 12.92 m (42.39 ft)
Height to rotor head: 3.91 m (12.82 ft)
Rotor disc area: 168.1 m² (1,809 sq ft)
Max take-off weight: 5,070 kg (11,177 lb)
Max speed (never exceed): 130 kts (240 km/h)
Typical cruising speed: 100 kts (185 km/h)
Hovering ceiling (out of ground effect): 396 m (1,300 ft)
Range with max standard fuel: 332 n miles (615 km)
Engine: 1 Pratt & Whitney Canada PT6T-6 Turbo Twin Pac rated at 1,398 kW (1,875 shp)
Role equipment: Torpedoes

PROPULSION

Specifications

System: Steam-turbines
Main machinery: 2 Combustion Engineering/Babcock & Wilcox boilers; 84.4 kg/cm² (1,200 psi); 510°C (950°F); 1 turbine; 26 MW (35,000 hp)
Shafts: 1

FURTHER INFORMATION

PROGRAMME

It was officially announced on 11 February 1992 that three 'Knox' class would be leased from the US to the Hellenic Navy. *Makedonia* arrived at Salamis 25 August 1992, *Thrace* 15 September 1992 and *Epirus* 12 February 1993.

MODERNISATION

The Hellenic Navy plans to improve the air defence capabilities of these ships.

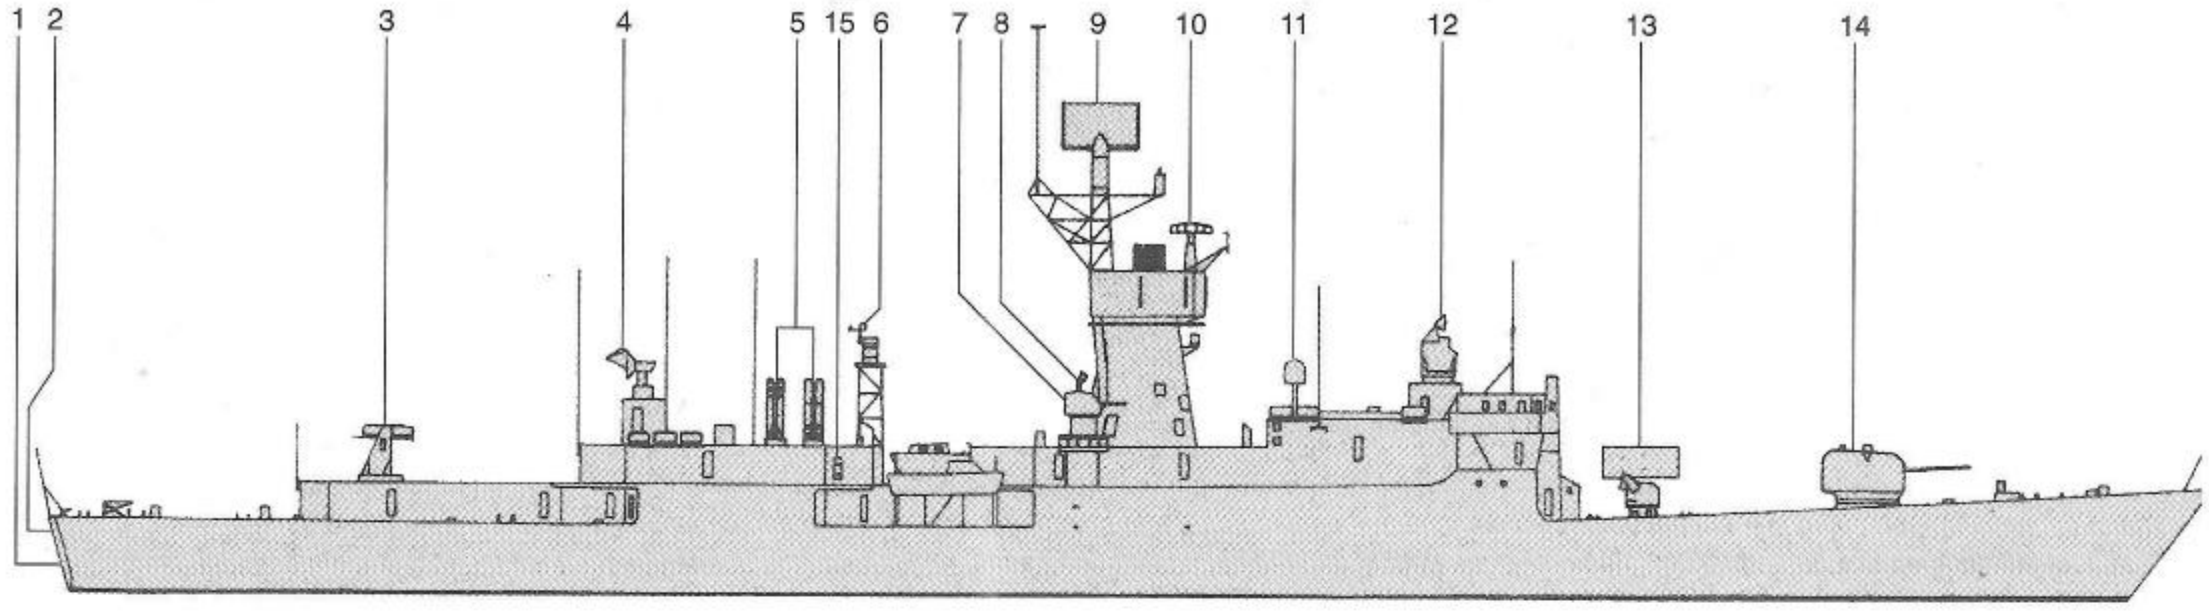
EQUIPMENT

The Greek ships have certain differences from the other ships operating with other navies:

- The AN/SLQ-32 ESM suite has the add-on Sidekick ECM capability.
- Four SAM launchers for Stinger.
- They are equipped with AN/SQS-35 VDS rather than AN/SQR-18(V)1.

Thrace *(F 457). Greece has leased three 'Knox' class frigates from the US Navy and, like the Turkish Navy, they operate an Agusta-Bell AB 212ASW* (Giorgio Ghiglione)

BALEARES (KNOX)



Baleares (Ian Sturton)

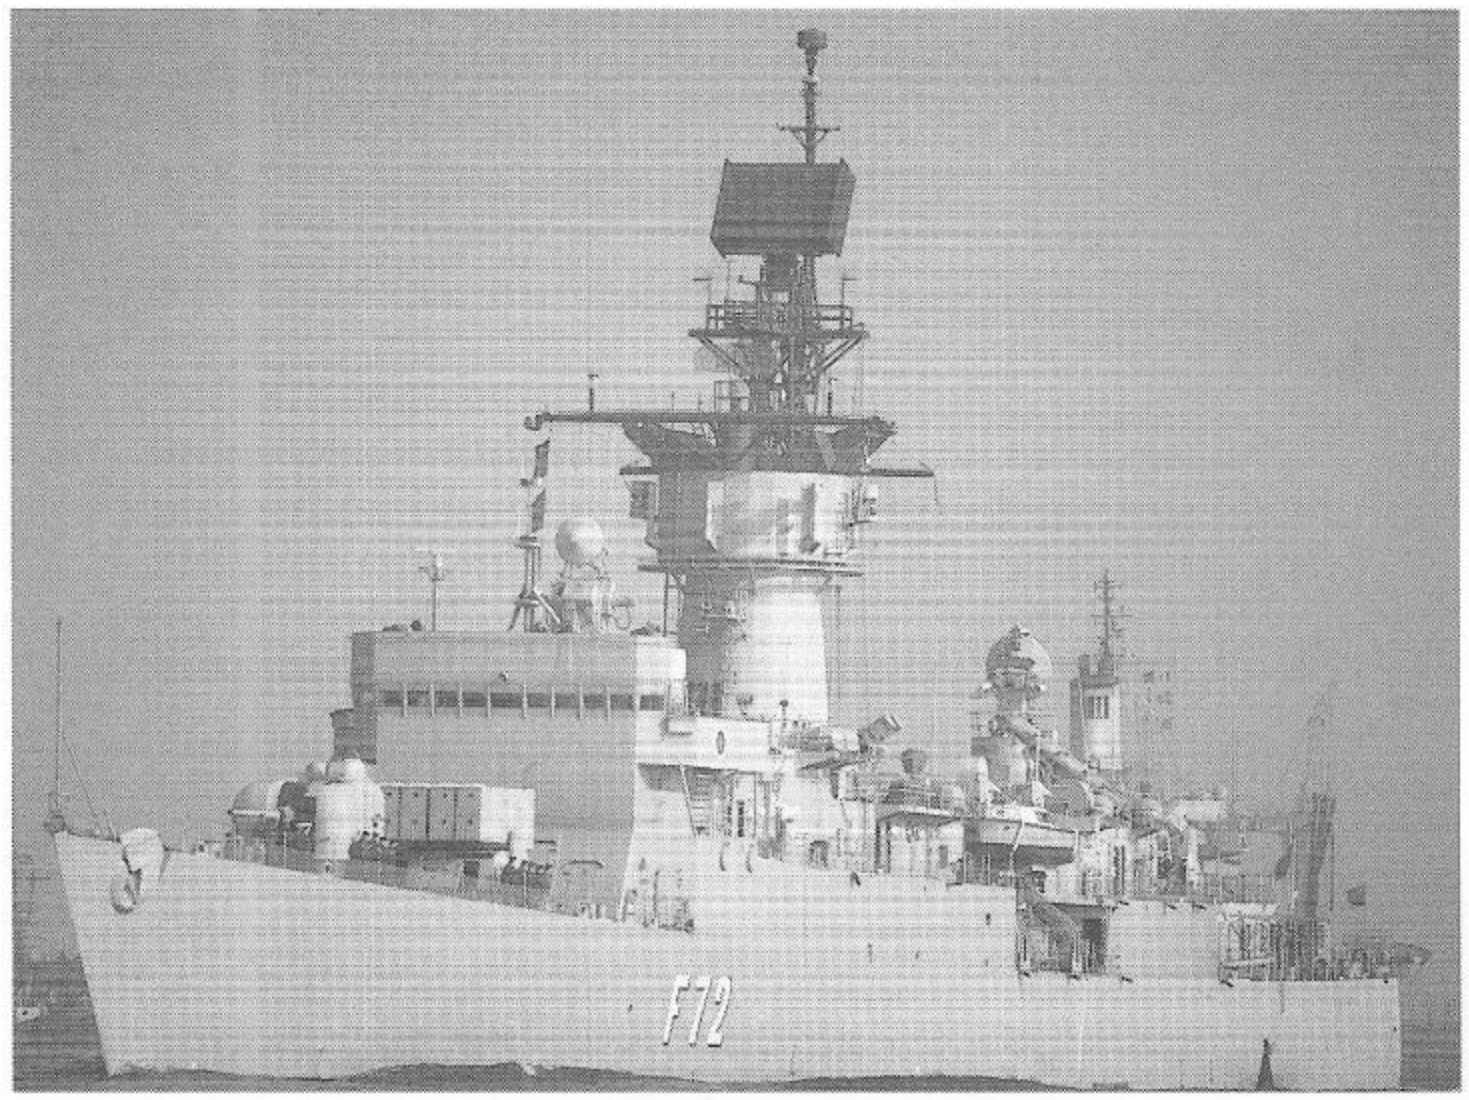
WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84A/C Block 1C Harpoon

Unlike US-built versions of the 'Knox' class, the Spanish 'Baleares' class does not launch Harpoons from the Mk 16 ASROC launcher, but mounts Harpoon launcher-containers atop the after superstructure immediately ahead of the SPG-51 radar, instead. There are mounting brackets for eight missile canisters, although only four are usually carried in peacetime. There are two groups of four launchers, with each group pointing across the ship to the opposite beam. The missiles are the Block 1C version, which has additional options, compared to previous blocks, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C



Andalucia *(F72) one of five modified 'Knox' class frigates built in Spain. The ship is dominated by the huge 'mack' which was intended to be the mounting for a series of billboard type antennas which never materialised* (Jane's/H M Steele)

missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg (11,905lb) thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

Mk 22 Mod 0 launcher
The Mk 22 Mod 0 single-arm launcher is mounted on the after superstructure. There are 16 missiles, which are stored vertically in a circular magazine. Maximum launch rate is seven missiles in 1 minute.

Standard Missile-1 Medium Range (SM-1MR)
Main air defence armament is the Standard SM-1MR. When the target is detected the data is evaluated by the ship's command system and the target is designated for the missile fire-control system, which then tracks and illuminates it. There is one SPG-51C tracker/illuminator radar, which can control one missile. Once the missile is launched, the tracker's main illumination beam holds the target while the rear reference illuminator beam provides guidance data through the missile's rear reference antenna. This guides the missile until the onboard seeker detects the CW reflected energy from the main illuminator beam. The onboard guidance system then brings the missile to an interception course.

Specifications
Length: 4.48 m (14.7 ft)
Diameter: 34.3 cm (13.5 in)
Wing span: 1.06 m (3.4 ft)
Weight: 642.3 kg (1,416 lb)
Speed: Mach 2
Range: 20.5 n miles (38 km)
Altitude: 19,800 m (64,944 ft)

Manufacturers/Contractors
Hughes Missile Systems, Tucson, Arizona, USA.
Raytheon, Missile Systems Division, Bedford, Maryland, USA.

ANTI-SUBMARINE MISSILES

Mk 112 launcher
The 'Baleares' class ships are equipped with the Mk 112 box launcher, which holds eight ASROC rounds, with a further eight rounds in the magazine.

Honeywell RUR-5A ASROC
ASROC consists of a Mk 46 torpedo with strap-on aerodynamic surfaces and a rocket motor to enable it to fly to within range of its submarine target. Attached to the rear end of the torpedo is a short airframe assembly of clam-like construction, held together by a steel band, with a Naval Propulsion Plant solid propellant booster and four trapezoidal aerodynamic surfaces to provide stability in flight. The torpedo has a dome-shaped frangible plastic nose cap to protect the transducer as it enters the water. Payload is an Alliant Mk 46 Mod 5 torpedo, which has a seeker designed specifically to detect most types of target including submarines with anechoically coated hulls and has an estimated acquisition range of 460 m (1,509 ft).

When a submarine target is detected it is tracked and the attack console's fire-control computer predicts the target's position. The launcher is turned in the appropriate direction and elevated to an angle appropriate to the range. The fire-control computer then orders the launch and the booster burns for a programmed time of between 1 and 4 seconds, by which time the missile will have reached a height of between 60 and 305 m (197 and 1,001 ft), although the aerodynamically stable airframe enables it to coast up to 600 m (1,968 ft). On reaching the programmed position, an explosive bolt cuts the steel band holding the airframe assembly sections together and as they separate the parachute deploys to retard the torpedo's fall, water entry taking place some 14 to 50 seconds after launch. As the torpedo enters the water the frangible nose cap breaks off and the torpedo begins its search for the target using a predetermined pattern.

Specifications
ASROC missile
Length: 4.6 m (15.1 ft)
Diameter: 32.5 cm (12.8 in)
Span: 84.5 cm (33.3 in)
Weight: 435 kg (959 lb)
Range: 0.86-5.39 n miles (1.6-10 km)
Speed: Mach 0.9

Mk 46 Mod 5 torpedo
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight: 230 kg (507 lb)
Speed: 40 kts (max)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg (97 lb); PBXN-103

Manufacturer/Contractor
Honeywell, USA.

TUBES

324 mm Mk 32 Mod 9 torpedo launchers
Two twin Mk 32 Mod 9 324 mm torpedo launchers are mounted at the forward end of the after deckhouse, angled outwards at 45°. The torpedo magazine contains 22 torpedoes.
(Note that the two stern-mounted 484 mm Mk 25 stern tubes for Westinghouse Mk 37 torpedoes are no longer used.)

TORPEDOES

Mk 46 Mod 5 torpedo

Specifications
Mk 46 Mod 5
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight:
torpedo: 230 kg (507 lb)
warhead: 44 kg (97 lb)
Speed: 40 kts (max)
Range: 5.9 n miles (11 km)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg; PBXN-103

GUNS

United Defense Mk 42 Mod 9 Single 127 mm (5 in)/54 gun mounting
There is one Mk 42 Mod 9 mounting, housing a single Mk 18 127 mm/54 gun. The Mk 18 gun has replaceable liner and a service life of some 2,000 rounds. A bayonet-type joint attaches the gun to the housing which includes a vertical sliding breech block and the entire gun assembly is supported on rollers in the slide. A separate rammer is mounted on the slide. The Mk 42 mounting was introduced in 1953 and the upper part of the mounting is fully power-driven and is enclosed in an armoured shield. The Mk 42 mounting requires a crew of 12: four men within the shield, and eight in the magazine and ammunition handling system.

Ammunition is loaded by a dual system with projectiles supplied automatically to the slide alternately from the right and left. The loading system consists of two manually loaded drums, one with 20 projectiles and the other with 20 charges, which rotate to bring the projectile and cartridge together. Complete rounds are lifted from the lower hoist to the upper hoist and from there to the cradles which move them to the tray where they are rammed into the breech.

Magazine capacity is 550 rounds and ammunition includes the Mk 41 AAC/HC, Mk 42 common, and Mk 48 illumination rounds, all of which weigh 31.75 kg (70 lb). All rounds have point detonating, proximity or mechanical time fuzes.

Specifications
Gun, 127 mm/54 Mk 18
Calibre: 127 mm
Length of barrel: 54 calibres
Muzzle velocity:
new barrel: 807 m/s (2,647 ft/s)
mid-life: 792 m/s (2,598 ft/s)
Max range: 13 n miles (24 km)
Max altitude: 14,400 m (47,000 ft)
Ammunition: 31.75 kg (70 lb)

Mounting, Mk 42 Mod 9
Traverse: 360° at 40°/s
Elevation: −15 to +85° at 25°/s
Rate of fire: 20-40 rds/min

Manufacturer/Contractor
United Defense Armament Systems Division, Minneapolis, Minnesota, USA.

Bazan Meroka
Two Bazan Meroka 12-barrelled 20 mm/120 close in weapons systems (CIWS) are mounted either side of the mack. Meroka is unique in its configuration and operation, consisting of 12 Oerlikon 20 mm KAA barrels arranged in a single unit of two superimposed rows of six with a common breech block. All operations, such as loading, feeding and unlocking, are carried out using compressed air from reservoirs on the mounting, which are recharged from an onboard compressor. Ammunition is brought to the barrels by two belt feeds, supplied by a hydraulically powered, rotating, 72 round magazine.

Specifications
Calibre: 20 mm
Length of barrel: 120 calibres
Muzzle velocity: 1,215 m/s (3,985 ft/s)
Traverse: 360° at 90°/s
Elevation: −20 to +85°
Crew: 0
Range: 0.75 n miles (1.5 km)
Rate of fire: 2,700-3,600 rds/min
Ammunition: 337 g (TP-T, HEI, SAPHEI-T, AP-T); 310 g (APDS-T)

Manufacturer/Contractor
Fabrica de Artilleria de Bazan, Spain.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Ceselsa Deneb

Deneb is a Spanish-developed and manufactured radar intercept system.

Manufacturer/Contractor
Ceselsa, Madrid, Spain.

ELECTRONIC COUNTERMEASURES (ECM)

Ceselsa Canopus

Canopus is a Spanish-developed and manufactured noise and deception jammer.

Manufacturer/Contractor
Ceselsa, Madrid, Spain.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launchers

There are two Mk 36 SRBOC (Super Rapid Bloom Off-board Countermeasures) units.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)

Rounds
Diameter: 130 mm (5.1 in)
Length, weight:
Mk 182: 1,209 mm; 22.7 kg
Super Chaffstar: 1,209 mm; 20.9 kg
Super Gemini: 451 mm; 5.5 kg
Super Hiram III: 1,220 mm; 13.6 kg
Super Hiram IV: 467 mm; 3.8 kg
Super Loroc: 734 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

TRITAN 1 tactical data handling system

TRITAN *(Tratamiento Informatico de Tactica Naval)* is a mainframe system based upon the Unisys CP-642A (USN designation AN/UYK-20A) computer which has a 256 k memory and an operating speed of 125 Kops (thousands of operations per second). The software is written in the CMS-2M language with programs produced at the tactical programming and instruction centre at Rota. Other hardware includes a Selenia (now Alenia) radar central unit, a Quantex Model 2600 (AN/USH-26) signal recorder, a Genicom Model 2120, a CV-2953A signal data converter, a CV-2834 video radar processor and the Sainco-produced horizontal and vertical display systems known as Consolas 'Tritan'. There is a data distribution system, Link 11 datalink hardware (the TE-237P terminal set and the 373E terminal set control) and the Ceselsa Deneb ESM subsystem. The system can track a total of 64 air and surface targets simultaneously, together with four subsurface targets.

The prime air search radar is the Hughes AN/SPS-52B, an E/F-band radar with a flat planar array tilted at an angle of 25° to the vertical. The array is composed of rows of slotted waveguide radiators fed by a sinuous feed system on one side of the array. Beam forming and steering is accomplished by computer-controlled switching of the feed to each row. The radar has its own AN/UYK-20 computer. The surface search radar is the Raytheon AN/SPS-10 G-band system with a 2.4 m (7.8 ft) open lattice construction antenna with horn feed.

In the 'Baleares' class TRITAN operates with the Raytheon DE 1160C (US Navy AN/SQS-56) sonar which is licence-built by Inisel, and the EDO AN/SQS-35V hull-mounted variable depth sonar is a medium frequency, medium range, hull-mounted sonar. The system is a preformed beam, digital sonar which provides panoramic echo ranging and passive surveillance. The Spanish systems are an upgraded version of DE 1160B with greater transmitter ability and, like all versions of this sonar, they transmit at 7.5 kHz.

There are three three-place (including supervisor) horizontal display consoles and two single-operator vertical consoles. The horizontal consoles are used for overall tactical picture compilation, air and anti-submarine operations.

Manufacturer/Contractor
Direccion de Construcciones, Madrid, Spain.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 11
Satcom: Saturn
Tacan: SRN 15A

WEAPONS CONTROL

Mk 68 Gun Fire Control System (GFCS)

The Mk 68 provides target data, position orders and firing orders for the 127 mm (5 in) gun Mk 42 mountings for use against both surface and air targets. The system consists of a Mk 68 gun director and AN/SPG-53B I/J-band radar, a Mk 47 computer, a Mk 16 stable element and the gun mount. The system requires a crew of eight. The Mk 68 gun director has an optical rangefinder, two handwheels for optical tracking, the radar receiver, transmitter and antenna as well as a slip ring assembly. It transmits bearing, elevation and range data both to the computer and the radar operator's console. It can be operated in automatic radar and optical tracking modes.

The SPG-53B radar incorporates both spiral and conical scan for acquisition and tracking respectively. Later versions have monopulse and low-level tracking capabilities together with splash spotting and a missile launch alarm. The radar has both automatic and manual tracking modes. The former involves transmitting radar error signals in both bearing and elevation to the director power-drive amplifiers, where they are converted into control signals which drive the director. Manual tracking is achieved by operating the range, bearing and elevation handwheels at the radar operator's console. The Mk 47 analogue computer receives inputs from the director, the radar, the stable element, gyrocompass and underwater log system and processes this data to produce data on future target location, gun position and fuze orders. When engaging air targets its operation is automatic but for engaging surface and land targets manual rate control may be adopted.

Manufacturer/Contractor
Norden Systems, USA.

Mk 74 missile system

The Mk 74 acquires, tracks and illuminates targets which have been assigned by the weapon direction system. It operates with a missile handling/launching system but is not involved in the launch sequence, which is controlled by the WDS. After missile launching the Mk 74 monitors the weapon and controls it until interception of the target then carries out a post-launch evaluation. The system consists of a computer system, an AN/SPG-51C radar, a Mk 73 director and associated consoles.

The AN/SPG-51C, has two independent channels each with a G/H-band tracking radar and an I/J-band illumination transmitter. This radar has longer detection and acquisition ranges than its predecessor, and automatic target scheduling, which require fewer operator decisions. The console with this system was the dedicated OJ-101. The Mod 14 radar incorporates a universal CW injection modulator in the CW injection transmitter to provide an uplink for the SM-2 missile and a monopulse receiver for more accurate angle tracking.

The Mk 73 director is a rotating electronic structure which includes the transmitter group, the control power supply for CW injection, the power supply for the pulse Doppler system, and a radar data converter. It can traverse up to 360° while elevation limits are −30 to +83°.

Manufacturer/Contractor
Raytheon Company, Equipment Division, USA.

Mk 114 ASW fire-control system

The Mk 114 ASW fire-control system's main element is the Mk 53 Attack Console, an electromechanical, analogue system consisting of two major units: the attack plotter and the ballistic computer. The latter conducts

The TRITAN 1 system was developed specifically for the 'Baleares' class frigates by the Spanish Direccion de Construcciones. The main console is produced by Sainco.

weapon presets for both ASROC and ASW torpedoes. The Mk 114 system also includes the Mk 33 underwater fire-control switchboard which accepts data from two Mk 19 gyrocompasses and other sensors, as well as from the Mk 134 sonar stabilisation computer. The consoles have an AN/UYK-44 reconfigurable processor with some 70,000 lines of CMS-2 language code. The system interfaces with the sonar.

Manufacturer/Contractor
Loral Librascope, USA.

SONARS

Raytheon DE 1160
The 'Baleares' class is fitted with a bow-mounted Raytheon DE 1160LF, medium/low-frequency sonar, the export version of the US Navy's AN/SQS-56. It differs from the SQS-56, however, in having a larger, low-frequency transducer array to give it convergence zone capability.

Specifications
Modes: Active and passive (both fully digital)
Frequencies: 5.6, 7.5, 8.4 kHz
Power output: 36 kW

Manufacturer/Contractor
Raytheon Company, Portsmouth, Rhode island, USA.

EDO SQS-35(V)
The EDO AN/SQS-35(V) is a variable depth sonar (VDS) designed to detect submarines at medium ranges. It uses an array with 24 staves, operates at 13 kHz and has a peak power of 30 kW. There is a large 'fish' which is lowered over the stern on a large gantry and then streamed on a long cable. SQS-35 is a single console system with miniaturised vacuum-tube electronics.

Manufacturer/Contractor
EDO, Government Systems Division, College Point, New York, USA.

Baleares *(F 71). The US versions of the 'Knox' class have a helicopter flight deck aft, but the Spanish Navy replaced this with a Mk 22 Mod 0 launcher and a magazine holding 16 Standard SM-1MR SAMs* (Bazan)

PROPULSION

Specifications
System: Steam-turbines
Main machinery: 2 Combustion Engineering V2M boilers; 84.4 kg/cm² (1,200 psi); 510°C (950°F); 1 Westinghouse turbine; 25.7 MW (35,000 hp(m))
Shafts: 1

FURTHER INFORMATION

PROGRAMME

This class resulted from a very close co-operation between Spain and the USA. The programme was approved on 17 November 1964, with the technical support agreement with the United States being signed on 31 March 1966. The ships and their major equipments were all made in Spain: major hull sections, turbines and gearboxes at El Ferrol; superstructures at Alicante; and boilers, distilling plants and propellers at Cadiz. The US Navy, however, supplied weapons and sensors.

DESIGN

As built, the overall design was essentially the same as that of the US Navy's 'Knox' class. There were, however, a number of exceptions of which the most important was that all helicopter facilities were omitted in order to install a medium-range Standard SM-1MR system, with the associated launcher, magazine and fire-control systems.

MODERNISATION

All five ships have undergone a major mid-life update, which was completed in two stages. The first stage was completed by the end of 1987 and all then passed through the second stage, the complete modernisation being accomplished by: *Asturias* — 1988; *Extremadura* — May 1989, *Cataluna* — early 1990; *Baleares* — July 1990; and *Andalucia* — February 1991.

Apart from general refurbishment, this modernisation programme included:

- mounting eight Harpoon launchers on the superstructure
- fitting two Meroka 20 mm CIWS and associated radars
- adding a Link 11 data terminal
- installing the *Tritan* automated command system
- installing the Deneb passive EW system
- fitting four Mk 36 SRBOC chaff launchers
- replacing SQS 23 with DE 1160 (SQS-56) sonar
- disabling the stern-mounted 533 mm (21 in) torpedo tubes

OPERATIONAL

All are based at El Ferrol, where they form the 31st Squadron.

Additional 'Knox' class
When surplus 'Knox' class ships were being offered to allied navies in the early 1990s, the Spanish Navy showed some initial interest in taking two ships. This was, however, cancelled by Spain in 1994.

WEAPONS SYSTEMS

MISSILE LAUNCHER

Mk 16 launcher group

The Taiwanese ships are fitted with a Mk 16 Launcher Group located on the foredeck, with a single Mk 112 launcher, which consists of four pairs of launch tubes, each pair elevating independently. The version installed is the Mk 16 Mod 8, in which the port pair of tubes have been adapted to take RGM-84 Harpoon missiles. Maximum launch rate is three missiles per minute.

ANTI-SHIP MISSILES (ASM)

McDonnell Douglas UGM-84B Harpoon

The ship can carry 16 missiles, of which a maximum of four (two loaded, plus two reloads in the magazine) can be Harpoon. This missile can either fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses or it can approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. It can also use selectable seeker search expansion patterns, and for the terminal phase can use either a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications

Block 1C
Length:
  with booster: 4.63 m (15.19 ft)
  without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
  with booster: 681.9 kg (1,503 kg)
  without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg (11,905 lb) thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

ANTI-SUBMARINE MISSILES

Honeywell RUR-5A ASROC

The ship carries 12 ASROC missiles. ASROC consists of a Mk 46 torpedo with strap-on aerodynamic surfaces and a rocket motor to enable it to fly to within range of its submarine target. Attached to the rear end of the torpedo is a short airframe assembly of clam-like construction, which is held together by a steel band, with a Naval Propulsion Plant solid propellant booster and four trapezoidal aerodynamic surfaces to provide stability in flight. The torpedo has a dome-shaped frangible plastic nose cap to protect the transducer as it enters the water. Payload is an Alliant Mk 46 Mod 5 torpedo, which has a seeker designed specifically to detect most types of target including submarines with anechoically coated hulls and has an estimated acquisition range of 460 m (1,509 ft).

When a submarine target is detected it is tracked and the attack console's fire-control computer predicts the target's position. The launcher is turned in the appropriate direction and elevated to an angle appropriate to the range. The fire-control computer then orders the launch and the booster burns for a programmed time of between 1 and 4 seconds, by which time the missile will have reached a height of between 60 and 305 m (197 and 1,001 ft), although the aerodynamically stable airframe enables it to coast up to 600 m (1,968 ft). On reaching the programmed position, an explosive bolt cuts the steel band holding the airframe assembly sections together and, as they separate, the parachute deploys to retard the torpedo's fall, water entry taking place some 14 to 50 seconds after launch. As the torpedo enters the water the frangible nose cap breaks off and the torpedo begins its search for the target using a predetermined pattern.

Specifications

ASROC missile
Length: 4.6 m (15.1 ft)
Diameter: 32.5 cm (12.8 in)
Span: 84.5 cm (33.3 in)
Weight: 435 kg (959 lb)
Range: 0.86-5.39 n miles (1.6-10 km)
Speed: Mach 0.9

Mk 46 Mod 5 torpedo
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight: 230 kg (507 lb)
Speed: 40 kts (max)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg (97 lb); PBXN-103

Manufacturer/Contractor

Honeywell, USA.

TUBES

324 mm Mk 32 Mod 9 torpedo launchers

Two twin Mk 32 Mod 9 324 mm torpedo launchers are mounted at the forward end of the after deckhouse, angled outwards at 45°. The torpedo magazine contains 22 torpedoes.

TORPEDOES

Mk 46 Mod 5 torpedo

Specifications

Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight:
  torpedo: 230 kg (507 lb)
  warhead: 44 kg (97 lb)
Speed: 40 kts (max)
Range: 5.9 n miles (11 km)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg; PBXN-103

GUNS

United Defense Mk 42 Mod 9 Single 127 mm (5 in)/54 gun mounting

There is one Mk 42 Mod 9 mounting, housing a single Mk 18 127 mm/54 gun. The Mk 18 gun has replaceable liner and a service life of some 2,000 rounds. A bayonet-type joint attaches the gun to the housing which includes a vertical sliding breech block and the entire gun assembly is supported on rollers in the slide. A separate rammer is mounted on the slide. The Mk 42 mounting was introduced in 1953 and the upper part of the mounting is fully power driven and is enclosed in an armoured shield. The Mk 42 mounting requires a crew of 12: four men within the shield, and eight in the magazine and ammunition handling system.

Ammunition is loaded by a dual system with projectiles supplied automatically to the slide alternately from the right and left. The loading system consists of two manually loaded drums, one with 20 projectiles and the other with 20 charges which rotate to bring the projectile and cartridge together. Complete rounds are lifted from the lower hoist to the upper hoist and from there to the cradles which move them to the tray from where they are rammed into the breech.

Magazine capacity is 550 rounds and ammunition includes the Mk 41 AAC/HC, Mk 42 common, and Mk 48 illumination rounds, all of which weigh 31.75 kg (70.0 lb). All rounds have point detonating, proximity or mechanical time fuzes.

Specifications

Gun, 127 mm/54 Mk 18
Calibre: 127 mm
Length of barrel: 54 calibres
Muzzle velocity:
  new barrel: 807 m/s (2,647 ft/s)
  mid-life: 792 m/s (2,598 ft/s)
Max range: 13 n miles (24 km)
Max altitude: 14,400 m (47,000 ft)
Ammunition: 31.75 kg (70.0 lb)

Mounting, Mk 42 Mod 9
Traverse: 360° at 40°/s
Elevation: −15 to +85° at 25°/s
Rate of fire: 20-40 rds/min

Manufacturer/Contractor

United Defense Armament Systems Division, Minneapolis, Minnesota, USA.

Hughes Mk 15 Phalanx CIWS

There is one Hughes Mk 15 Phalanx close in weapons system (CIWS) situated on the quarterdeck. The mount consists of a 20 mm, six-barrel, Gatling-principle gun with a cylindrical magazine and feeding mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,378 ft/s)
Rate of fire: 3,000 rds/min
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor

Hughes Missile Systems, Tucson, Arizona, USA (system).

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

AN/SLQ-32(V)5 Sidekick ESM/ECM Suite

All ships have the AN/SLQ-32(V)2 EW suite, which was upgraded to (V)5 standard by the addition of the Sidekick modification kit while in US service. AN/SLQ-32(V)2 is the ESM system, which gives radar warning across the B to H-bands, while Raytheon's Sidekick adds jamming and deception capabilities.

Manufacturer/Contractor

Raytheon Company, Electromagnetic Systems Division, Goleta, California.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launchers

There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications

Launcher

Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)

Rounds

Diameter: 130 mm (5.1 in)
Length, weight:
Mk 182: 1,209 mm; 22.7 kg
Super Chaffstar: 1,209 mm; 20.9 kg
Super Gemini: 451 mm; 5.5 kg
Super Hiram III: 1,220 mm; 13.6 kg
Super Hiram IV: 467 mm; 3.8 kg
Super Loroc: 734 mm; 13.2 kg

Manufacturers/Contractors

Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

T-Mk 6 Fanfare

The T-Mk 6 torpedo decoy consists of two winches each with a cable and a 'fish' containing a mechanical acoustic device. It was introduced into the US Navy in the 1950s and was replaced in most ships by AN/SLQ-25 Nixie.

Masker/Prairie Masker noise suppression systems

The ships are fitted with both Masker and Prairie-Masker radiated noise suppression systems. In Masker, high-pressure air is bled off from either the ship's gas turbine or dedicated compressors and ejected from a pipe placed laterally across the ship's hull just forward of the machinery spaces. The forward motion of the ship causes the air to form a layer separating the hull from the water and thus masking the machinery noises which would otherwise be radiated directly into the water. Such a system is less effective at slow speeds where the air bubbles tend to rise to the surface rather than remain attached to the hull.

In Prairie Masker, air is passed down the propeller shaft and ejected from a groove in the leading edge of the blade, thus delaying the onset of cavitation.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Fast Frigate Integrated Shipboard Tactical System - 2 (FFISTS-2)

FFISTS-2 was developed from FFISTS-1 and replaces the star-network by a distributed architecture, which uses DTC-2 workstations interconnected by a dual fibre optic or a Thicknet local area network. The DTC-2 workstation is a SUN-4/110 SPARC station with either one or two 48 cm (19 in) raster scan screens, 32 Mbytes of RAM, a 200 Mbyte hard drive (eliminating the need for the shared hard drives used in FFISTS-1) and is rated at 7.5 Mips. A twin-screen DTC-2 monitors the sonars while a single-screen DTC-2 acts as the Link 11 interface. A third, single-screen, DTC-2 provides data fusion from onboard and offboard sensors including Link 11, Link 14 and satellite communications. FFISTS-2 is reported to be capable of conducting not only ASW operations but also anti-ship operations.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 14 (receive only)
AN/SRQ-4 (LAMPS 1 helicopter-ship datalink)
Tacan: AN/SRN 15
IFF: AN/UPX-12

WEAPONS CONTROL

AN/SWG-1A Harpoon Launch Control System (LCS)

SWG-1A is the Harpoon weapons control system, which activates the missile, selects the flight pattern and sets seeker search modes (with small, medium or large acquisition windows), as well as providing target range and bearing data. Alternatively, the missile can simply be launched along the bearing of the target, with the seeker activated early to scan a 90° sector; if, after a set time, no target has been acquired the missile commences a preset search pattern. SWG-1A takes account of other ships in the general target area and generates indirect flight plans for the missile, including waypoints to optimise angles of approach which will achieve the highest possibility of success while minimising the chances of the missile being destroyed by hostile fire. It can also be used to compute flight plans in a multiple attack so that several missiles, from either the same or different ships, arrive on target simultaneously, thus swamping the defences.

Mk 68 Gun Fire Control System (GFCS)

The Mk 68 GFCS provides target data, position orders and firing orders for the 127 mm (5 in) gun Mk 42 mountings for use against both surface and air targets. The system consists of a Mk 68 gun director and AN/SPG-53 I/J-band radar, a Mk 47 computer, a Mk 16 stable element and the gun mount. The system requires a crew of eight. The Mk 68 gun director has an optical rangefinder, two handwheels for optical tracking, the radar receiver, transmitter and antenna as well as a slip ring assembly. It transmits bearing, elevation and range data both to the computer and the radar operator's console. It can be operated in automatic radar and optical tracking modes.

The SPG-53 radar incorporates both spiral and conical scan for acquisition and tracking respectively. Later versions have monopulse and low-level tracking capabilities together with splash spotting and a missile launch alarm. The radar has both automatic and manual tracking modes. The former involves transmitting radar error signals in both bearing and elevation to the director power-drive amplifiers, where they are converted into control signals which drive the director. Manual tracking is achieved by operating the range, bearing and elevation handwheels at the radar operator's console. The Mk 47 analogue computer receives inputs from the director, the radar, the stable element, gyrocompass and underwater log system and processes this data to produce data on future target location, gun position and fuze orders. When engaging air targets its operation is automatic but, for engaging surface and land targets, manual rate control may be adopted.

Manufacturer/Contractor

Norden Systems, USA.

Mk 114 ASW fire-control system

The Mk 114 is the fire-control system for ASW operations. The main element is the Mk 53 Attack Console, an electromechanical analogue system which consists of two major units, the attack plotter and the ballistic computer. The latter conducts weapon presets for both ASROC and ASW torpedoes. The Mk 114 system also includes the Mk 33 underwater fire-control switchboard which accepts data from two Mk 19 gyrocompasses and other sensors, as well as from the Mk 134 sonar stabilisation computer. The consoles have an AN/UYK-44 reconfigurable processor with some 70,000 lines of CMS-2 language code. The system interfaces with the sonar.

Manufacturer/Contractor

Loral Librascope, USA.

SONARS

EDO AN/SQS-26CX

The hull-mounted AN/SQS-26CX works in surface duct, bottom bounce and convergence zone modes. Surface duct is for shorter range, bottom bounce for medium ranges and convergence zone for longer ranges. The last two modes require electronic beam-steering in elevation. SQS-26 is an active system transmitting at about 3.5 kHz with an output power of about 192 kW and receiving in seven channels between 1.5 and 4 kHz. The transducer is reported to be about 4.87 m (16.0 ft) in diameter and 1.68 m (5.5 ft) high, with 72 staves, each with eight elements. Ranges are reported to be approximately 10 n miles (18.5 km) in surface duct mode and 34.5 n miles (64 km) in convergence zone mode. SQS-26CX was developed specially for the 'Knox' class frigates and was the final version of the SQS-26, the next set in the series being the SQS-53A.

Manufacturer/Contractor

EDO, Government Systems Division, College Point, New York, USA.

AN/SQR-18A(V)1 (TACTAS)

AN/SQR-18A(V)1 (also known as TACTAS (Tactical Towed Array Sonar)). The low-noise array is 230 m (754 ft) long and is towed behind an SQS-35 VDS 'fish' on a cable some 0.73 km (2,400 ft) long. The system features an adaptive processor which acts to reduce interference from the towing ship's noise (and to a lesser extent from adjacent ships) and a tracked system to provide bearing resolution and target motion analysis. SQR-18 is integrated with the hull-mounted SQS-26CX and AN/SQR-17 sonobuoy processor.

Manufacturer/Contractor

EDO, Government Systems Division, College Point, New York, USA.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck:

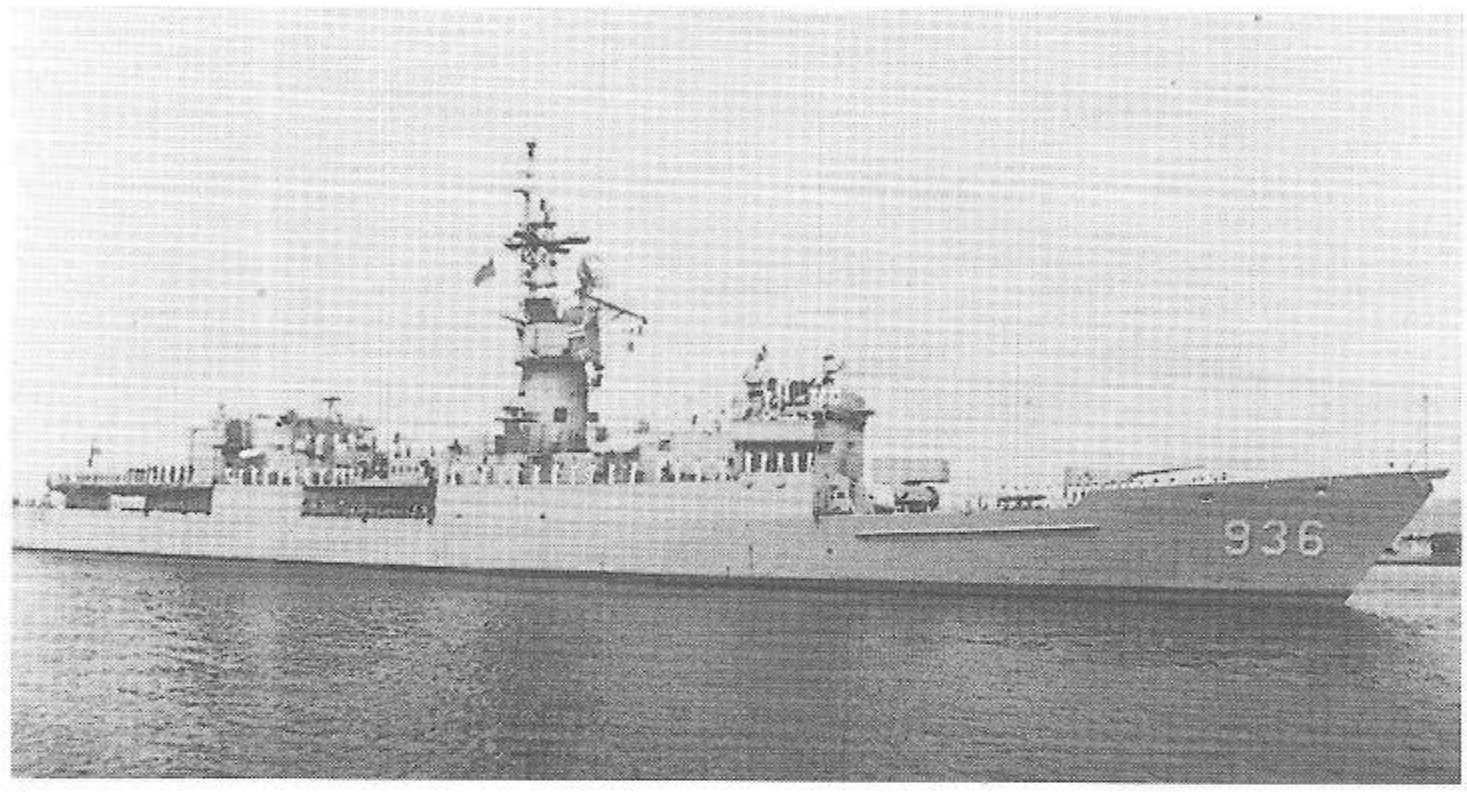
dimensions: 22.8 × 14 m (75 ft × 46 ft)

max helicopter take-off weight: 5,000 kg (11,000 lb)

Hangar: The hangar was originally designed to accommodate DASH helicopter drones, but was later enlarged to accommodate the SH-2 LAMPS I Kaman SH-2 Seasprite. The after end of the hangar is telescopic

HELICOPTERS

It is reported that the RoCN does not yet have suitable helicopters to operate from these ships. The S70C(M)1 Seahawks already in the inventory are too large and heavy, while the Kaman SH-2F/G LAMPS I helicopters are available but the funds have not yet been made available for their transfer.



Hae Yang *(936) is one of six ex-US Navy 'Knox' class frigates currently operated by the RoC Navy* (C Chung)

PROPULSION

Specifications

System: Steam turbines

Main machinery: 2 Combustion Engineering/Babcock & Wilcox boilers; 84.4 kg/cm² (1,200 psi); 510°C (950°F); one turbine; 26 MW (35,000 hp)

Shafts: 1

FURTHER INFORMATION

PROGRAMME

The first batch of three entered service with the RoCN in 1993, followed by the second three in 1995 and another three in 1996. It is also reported that the RoCN is interested in leasing another batch of three, to bring the total up to 12. All current ships are on a five-year lease and it is understood that both parties have agreed that they will be purchased outright as the leases expire. The second batch was overhauled and upgraded by Long Beach Shipyard, California before recommissioning in 1995.

OPERATIONAL

The first three ships achieved poor operational availability in 1994, but this may have been due to early problems with a class new to the RoCN.

These ships form the 168th Patrol Squadron, based at Suao, with the commander flying his flag in *Lan Yang* (935).

Specification

Mk 46 Mod 5
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight:
torpedo: 230 kg (507 lb)
warhead: 44 kg (97 lb)
Speed: 40 kts (max)
Range: 5.9 n miles (11 km)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg; PBXN-103

GUNS

United Defense Mk 42 Mod 9 Single 127 mm (5 in)/54 gun mounting

There is one Mk 42 Mod 9 mounting, housing a single Mk 18 127 mm/54 gun. The Mk 18 gun has replaceable liner and a service life of some 2,000 rounds. A bayonet-type joint attaches the gun to the housing which includes a vertical sliding breech block and the entire gun assembly is supported on rollers in the slide. A separate rammer is mounted on the slide. The Mk 42 mounting was introduced in 1953 and the upper part of the mounting is fully power-driven and is enclosed in an armoured shield. The Mk 42 mounting requires a crew of 12: four men within the shield, and eight in the magazine and ammunition handling system.

Ammunition is loaded by a dual system with projectiles supplied automatically to the slide alternately from the right and left. The loading system consists of two manually loaded drums, one with 20 projectiles and the other with 20 charges which rotate to bring the projectile and cartridge together. Complete rounds are lifted from the lower hoist to the upper hoist and from there to the cradles which move them to the tray from where they are rammed into the breech.

Magazine capacity is 550 rounds and ammunition includes the Mk 41 AAC/HC, Mk 42 common, and Mk 48 illumination rounds, all of which weigh 31.75 kg (70.0 lb). All rounds have point detonating, proximity or mechanical time fuzes.

Specifications

Gun, 127 mm/54 Mk 18
Calibre: 127 mm
Length of barrel: 54 calibres
Muzzle velocity:
new barrel: 807 m/s (2,647 ft/s)
mid-life: 792 m/s (2,598 ft/s)
Max range: 13 n miles (24 km)
Max altitude: 14,400 m (47,000 ft)
Ammunition: 31.75 kg (70.0 lb)

Mounting, Mk 42 Mod 9
Traverse: 360° at 40°/s
Elevation: −15 to +85° at 25°/s
Rate of fire: 20-40 rds/min

Manufacturer/Contractor

United Defense Armament Systems Division, Minneapolis, Minnesota, USA.

Hughes Mk 15 CIWS Phalanx

There is one Hughes Mk 15 Phalanx close in weapons system (CIWS) situated on the quarterdeck. The mount consists of a 20 mm M61A1 Vulcan, six-barrel, Gatling-principle gun with a cylindrical magazine and feeding mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,378 ft/s)
Rate of fire: 3,000 rds/min
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor

Hughes Missile Systems, Tucson, Arizona, USA (system).

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

AN/SLQ-32(V)5 Sidekick ESM/ECM suite

Both ships have the AN/SLQ-32(V)2 EW suite, which was upgraded to (V)5 standard by the addition of the Sidekick modification kit while in US service. AN/SLQ-32(V)2 is the ESM system, which gives radar warning across the B to H-bands, while Raytheon's Sidekick adds jamming and deception capabilities.

Manufacturer/Contractor

Raytheon Company, Electromagnetic Systems Division, Goleta, California.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launchers

There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications

Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)

Rounds
Diameter: 130 mm (5.1 in)
Length, weight:
Mk 182: 1,209 mm; 22.7 kg
Super Chaffstar: 1,209 mm; 20.9 kg
Super Gemini: 451 mm; 5.5 kg
Super Hiram III: 1,220 mm; 13.6 kg
Super Hiram IV: 467 mm; 3.8 kg
Super Loroc: 734 mm; 13.2 kg

Manufacturers/Contractors

Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

T-Mk 6 Fanfare

The T-Mk 6 torpedo decoy consists of two winches each with a cable and a 'fish' containing a mechanical acoustic device. It was introduced into the US Navy in the 1950s and was replaced in most ships by AN/SLQ-25 Nixie.

Masker/Prairie Masker noise suppression systems

The ships are fitted with both Masker and Prairie Masker radiated noise suppression systems. In Masker, high-pressure air is bled off from either the ship's gas turbine or dedicated compressors and ejected from a pipe placed laterally across the ship's hull just forward of the machinery spaces. The forward motion of the ship causes the air to form a layer separating the hull from the water and thus masking the machinery noises which would otherwise be radiated directly into the water. Such a system is less effective at slow speeds where the air bubbles tend to rise to the surface rather than remain attached to the hull.

In Prairie Masker, air is passed down the propeller shaft and ejected from a groove in the leading edge of the blade, thus delaying the onset of cavitation.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Fast Frigate Integrated Shipboard Tactical System - 2 (FFISTS-2)

FFISTS-2 was developed from FFISTS-1 and replaces the star-network by a distributed architecture, which uses DTC-2 workstations interconnected by a dual fibre optic or a Thicknet local area network. The DTC-2 workstation is a SUN-4/110 SPARC station with either one or two 48 cm (19 in) raster scan screens, 32 Mbytes of RAM, a 200 Mbyte hard drive (eliminating the need for the shared hard drives used in FFISTS-1) and is rated at 7.5 Mips. A twin-screen DTC-2 monitors the sonars while a single-screen DTC-2 acts as the Link 11 interface. A third, single-screen, DTC-2 provides data fusion from onboard and offboard sensors including Link 11, Link 14 and satellite communications. FFISTS-2 is reported to be capable of conducting not only ASW operations but also anti-ship operations.

COMMUNICATIONS AND DATALINKS

Datalinks: Link 14 (receive only)
AN/SRQ-4 (LAMPS I helicopter-ship datalink)
Tacan: AN/SRN 15
IFF: AN/UPX-12

WEAPONS CONTROL

AN/SWG-1A Harpoon Launch Control System (LCS)

SWG-1A is the Harpoon weapons control system, which activates the missile, selects the flight pattern and sets seeker search modes (with small, medium or large acquisition windows), as well as providing target range and bearing data. Alternatively, the missile can simply be launched along the bearing of the target, with the seeker activated early to scan a 90° sector; if, after a set time, no target has been acquired the missile commences a preset search pattern. SWG-1A takes account of other ships in the general target area and generates indirect flight plans for the missile, including waypoints to optimise angles of approach which will achieve the highest possibility of success while minimising the chances of the missile being destroyed by hostile fire. It can also be used to compute flight plans in a multiple attack so that several missiles, from either the same or different ships, arrive on target simultaneously, thus swamping the defences.

Mk 68 Gun Fire Control System (GFCS)

The Mk 68 GFCS provides target data, position orders and firing orders for the 127 mm (5 in) gun Mk 42 mountings for use against both surface and air targets. The system consists of a Mk 68 gun director and AN/SPG-53 I/J-band radar, a Mk 47 computer, a Mk 16 stable element and the gun mount. The system requires a crew of eight. The Mk 68 gun director has an optical rangefinder, two handwheels for optical tracking, the radar receiver, transmitter and antenna as well as a slip ring assembly. It transmits bearing, elevation and range data both to the computer and the radar operator's console. It can be operated in automatic radar and optical tracking modes.

The SPG-53 radar incorporates both spiral and conical scan for acquisition and tracking respectively. Later versions have monopulse and low-level tracking capabilities together with splash spotting and a missile launch alarm. The radar has both automatic and manual tracking modes. The former involves transmitting radar error signals in both bearing and elevation to the director power-drive amplifiers, where they are converted into control signals which drive the director. Manual tracking is achieved by operating the range, bearing and elevation handwheels at the radar operator's console. The Mk 47 analogue computer receives inputs from the director, the radar, the stable element, gyrocompass and underwater log system and processes this data to produce data on future target location, gun position and fuze orders. When engaging air targets, its operation is automatic but, for engaging surface and land targets, manual rate control may be adopted.

Manufacturer/Contractor

Norden Systems, USA.

Mk 114 ASW fire-control system

The Mk 114 is the fire-control system for ASW operations. The main element is the Mk 53 Attack Console, an electromechanical analogue system which consists of two major units, the attack plotter and the ballistic computer. The latter conducts weapon presets for both ASROC and ASW torpedoes. The Mk 114 system also includes the Mk 33 underwater fire-control switchboard which accepts data from two Mk 19 gyrocompasses and other sensors, as well as from the Mk 134 sonar stabilisation computer. The consoles have an AN/UYK-44 reconfigurable processor with some 70,000 lines of CMS-2 language code. The system interfaces with the sonar.

Manufacturer/Contractor

Loral Librascope, USA.

NMMS electro-optic surveillance system

The NMMS was included in the transfer package to the RTN. NMMS is designed to detect mines, low-flying aircraft and small boats by day or night in all weather conditions. It can also be used to support gunfire missions and to assist in helicopter landing control. NMMS consists of a systems electro-optronic package housed in a composite casing and mounted on a pedestal. The sensor package comprises multiplexer electronics, the boresight assembly and the sensors (a Si-Vidicon television camera and a thermal imager), which float on high-energy, rare-earth magnets which create an energy field designed to produce unblurred images. The thermal imager is based upon the US MCTNS (Man-portable Common Thermal Night Sights) modules and has 120 elements with split Stirling cooling system. The sensor package also includes a Litton MMS Laser RangeFinder/ Designator (LRF/D) operating in the 1.06 micron range. Supporting the sensor package is a video tracker which can be used for manual or automatic tracking of targets. There is also a digital scan converter which enhances the thermal imager picture and also provides freeze frame and ×2 zoom capabilities. The system is used for both manual and automatic tracking but can also conduct continuous horizon scanning of designated sectors.

It should be noted that the designation 'Mast Mounted Sight' derives from the device's US Army title and it does not necessarily follow that in naval use the device is mounted on the ship's mast. The control console can be collocated with the sight, installed in the bridge or the combat information centre according to the operational requirement.

Specifications

Weight (sensor head): 72.57 kg (160 lb)
Diameter: 64.77 cm (25.5 in)
Stabilisation: less than 20 mrad
Fields of view
thermal imager: 2 × 10°
television: 2 × 8°

Manufacturers/Contractors

McDonnell Douglas Electronic Systems, USA (system).
Northrop Electronics Division, USA (sensor package).

SONARS

EDO AN/SQS-26CX

The hull-mounted AN/SQS-26CX works in surface duct, bottom bounce and convergence zone modes. Surface duct is for shorter range, bottom bounce for medium ranges and convergence zone for longer ranges. The last two modes require electronic beam-steering in elevation. SQS-26 is an active system transmitting at about 3.5 kHz with an output power of about 192 kW and receiving in seven channels between 1.5 and 4 kHz. The transducer is reported to be about 4.87 m (16.0 ft) in diameter and 1.68 m (5.5 ft) high, with 72 staves, each with eight elements. Ranges are reported to be approximately 10 n miles (18.5 km) in surface duct mode and 34.5 n miles (64 km) in convergence zone mode. SQS-26CX was developed specially for the 'Knox' class frigates and was the final version of the SQS-26, the next set in the series being the SQS-53A.

AN/SQR-18A(V)1 (TACTAS)

AN/SQR-18A(V)1 (also known as TACTAS (Tactical Towed Array Sonar)). The low noise array is 230 m (754 ft) long and is towed behind an SQS-35 VDS 'fish' on a cable some 0.73 km (2,400 ft) long. The system features an adaptive processor which acts to reduce interference from the towing ship's noise (and to a lesser extent from adjacent ships) and a tracked system to provide bearing resolution and target motion analysis. SQR-18 is integrated with the hull-mounted SQS-26 and AN/SQR-17 sonobuoy processor.

Manufacturer/Contractor

EDO, Government Systems Division, College Point, New York, USA.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck:
dimensions: 22.8 × 14 m (75 ft × 46 ft)
max helicopter take-off weight: 5,000 kg (11,000 lb)

Hangar: The hangar was originally designed to accommodate DASH helicopter drones, but was later enlarged to accommodate the SH-2 LAMPS-I Kaman SH-2 Seasprite. The after end of the hangar is telescopic

HELICOPTERS

The Royal Thai Navy does not currently operate a helicopter of a size or type suitable for use from these two ships.

PROPULSION

Specifications
System: Steam turbines
Main machinery: 2 Combustion Engineering/Babcock & Wilcox boilers; 84.4 kg/cm² (1,200 psi); 510°C (950°F); 1 turbine; 26 MW (35,000 hp)
Shafts: 1

Laid down	11 July 1969
Launched	2 May 1970
Commissioned (US Navy)	22 May 1971 (*Bowen* (FF 1079))
Transferred to RTN	3 June 1994

WEAPONS SYSTEMS

MISSILE LAUNCHER

Mk 16 launcher group

The Thai ships are fitted with a Mk 16 Launcher Group located on the foredeck, with a single Mk 112 launcher, which consists of four pairs of launch tubes, each pair elevating independently. The version installed is the Mk 16 Mod 8, in which the port pair of tubes has been adapted to take RGM-84 Harpoon missiles. Maximum launch rate is three missiles per minute.

ANTI-SHIP MISSILES (ASM)

McDonnell Douglas UGM-84B Harpoon

A maximum of four missiles (two loaded, plus two reloads in the magazine) can be Harpoon. This missile can either fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low land-masses or it can approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. It can also use selectable seeker search expansion patterns, and for the terminal phase can use either a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)

Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

ANTI-SUBMARINE MISSILES

Honeywell RUR-5A ASROC

The ship also carries 12 ASROC missiles. ASROC consists of a Mk 46 torpedo with strap-on aerodynamic surfaces and a rocket motor to enable it to fly to within range of its submarine target. Attached to the rear end of the torpedo is a short airframe assembly of clam-like construction, held together by a steel band, with a Naval Propulsion Plant solid propellant booster and four trapezoidal aerodynamic surfaces to provide stability in flight. The torpedo has a dome-shaped frangible plastic nose cap to protect the transducer as it enters the water. Payload is an Alliant Mk 46 Mod 5 torpedo, which has a seeker designed specifically to detect most types of target including submarines with anechoically coated hulls and has an estimated acquisition range of 460 m (1,508 ft).

When a submarine target is detected it is tracked and the attack console's fire-control computer predicts the target's position. The launcher is turned in the appropriate direction and elevated to an angle appropriate to the range. The fire-control computer then orders the launch and the booster burns for a programmed time of between 1 and 4 seconds, by which time the missile will have reached a height of between 60 and 305 m (197 and 1,001 ft), although the aerodynamically stable airframe enables it to coast up to 600 m (1,968 ft). On reaching the programmed position, an explosive bolt cuts the steel band holding the airframe assembly sections together and as they separate the parachute deploys to retard the torpedo's fall, water entry taking place some 14 to 50 seconds after launch. As the torpedo enters the water the frangible nose cap breaks off and the torpedo begins its search for the target using a predetermined pattern.

Specifications

ASROC missile
Length: 4.6 m (15.1 ft)
Diameter: 32.5 cm (12.8 in)
Span: 84.5 cm (33.3 in)
Weight: 435 kg (959 lb)
Range: 0.86-5.39 n miles (1.6-10 km)
Speed: Mach 0.9

Mk 46 Mod 5 torpedo
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight: 230 kg (507 lb)
Speed: 40 kts (max)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg (97 lb); PBXN-103

Manufacturer/Contractor

Honeywell, USA.

TUBES

324 mm Mk 32 Mod 9 torpedo launchers

Two twin Mk 32 Mod 9 324 mm torpedo launchers are mounted at the forward end of the after deckhouse, angled outwards at 45°.

The torpedo magazine contains 22 torpedoes.

TORPEDOES

Mk 46 Mod 5 torpedo

Normal armament is the Honeywell Mk 46 Mod 5 anti-submarine torpedo.

Specifications

Mk 46 Mod 5
Diameter: 324 mm (12.75 in)
Length: 2.95 m (9.68 ft)
Weight:
torpedo: 230 kg (507 lb)
warhead: 44 kg (97 lb)
Speed: 40 kts (max)
Range: 5.9 n miles (11 km)
Homing: Active/passive acoustic homing head
Motor: 5-cylinder liquid mono-propellant (Otto) motor
Warhead: Mk 103 Mod 1; 44 kg; PBXN-103

GUNS

United Defense Mk 42 Mod 9 Single 127 mm (5 in)/54 gun mounting

There is one Mk 42 Mod 9 mounting, housing a single Mk 18 127 mm/54 gun. The Mk 18 gun has replaceable liner and a service life of some 2,000 rounds. A bayonet-type joint attaches the gun to the housing which includes a vertical sliding breech block and the entire gun assembly is supported on rollers in the slide. A separate rammer is mounted on the slide. The Mk 42 mounting was introduced in 1953 and the upper part of the mounting is fully power driven and is enclosed in an armoured shield. The Mk 42 mounting requires a crew of 12: four men within the shield, and eight in the magazine and ammunition handling system.

Ammunition is loaded by a dual system with projectiles supplied automatically to the slide alternately from the right and left. The loading system consists of two manually loaded drums, one with 20 projectiles and the other with 20 charges, which rotate to bring the projectile and cartridge together. Complete rounds are lifted from the lower hoist to the upper hoist and from there to the cradles which move them to the tray where they are rammed into the breech.

Magazine capacity is 550 rounds and ammunition includes the Mk 41 AAC/HC, Mk 42 common, and Mk 48 illumination rounds, all of which weigh 31.75 kg (70 lb). All rounds have point detonating, proximity or mechanical time fuzes.

Specifications

Gun, 127 mm/54 Mk 18
Calibre: 127 mm
Length of barrel: 54 calibres
Muzzle velocity:
new barrel: 807 m/s (2,647 ft/s)
mid-life: 792 m/s (2,597 ft/s)
Max range: 13 n miles (24 km)
Max altitude: 14,400 m (47,000 ft)
Ammunition: 31.75 kg (70 lb)

Mounting, Mk 42 Mod 9
Traverse: 360° at 40°/s
Elevation: −15 to +85° at 25°/s
Rate of fire: 20-40 rds/min

Manufacturer/Contractor

United Defense Armament Systems Division, Minneapolis, Minnesota, USA.

Hughes Mk 15 CIWS Phalanx

There is one Hughes Mk 15 Phalanx close in weapons system (CIWS) situated on the quarterdeck. The mount consists of a 20 mm, six-barrel, Gatling-principle gun with a cylindrical magazine and feeding mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,378 ft/s)
Rate of fire: 3,000 rds/min
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

AN/SLQ-32(V)2 ESM Suite

These ships have the AN/SLQ-32(V)2 EW suite, but there is some uncertainty as to whether they were fitted with the Sidekick 'add-on' prior to transfer. AN/SLQ-32(V)2 is the ESM system, which gives radar warning across the B to H-bands.

Manufacturer/Contractor

Raytheon Company, Electromagnetic Systems Division, Goleta, California.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launchers

There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications

Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)

Rounds
Diameter: 130 mm (5.1 in)
Length, weight:
Mk 182: 1,209 mm; 22.7 kg
Super Chaffstar: 1,209 mm; 20.9 kg
Super Gemini: 451 mm; 5.5 kg
Super Hiram III: 1,220 mm; 13.6 kg
Super Hiram IV: 467 mm; 3.8 kg
Super Loroc: 734 mm; 13.2 kg

Manufacturers/Contractors

Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

T-Mk 6 Fanfare

The T-Mk 6 torpedo decoy consists of two winches each with a cable and a 'fish' containing a mechanical acoustic device. It was introduced into the US Navy in the 1950s and was replaced in most ships by AN/SLQ-25 Nixie.

Masker/Prairie Masker noise suppression systems

The ships are fitted with both Masker and Prairie Masker radiated noise suppression systems. In Masker, high-pressure air is bled off from either the ship's gas turbine or dedicated compressors and ejected from a pipe placed laterally across the ship's hull just forward of the machinery spaces. The forward motion of the ship causes the air to form a layer separating the hull from the water and thus masking the machinery noises which would otherwise be radiated directly into the water. Such a system is less effective at slow speeds where the air bubbles tend to rise to the surface rather than remain attached to the hull.

In Prairie Masker, air is passed down the propeller shaft and ejected from a groove in the leading edge of the blade, thus delaying the onset of cavitation.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Fast Frigate Integrated Shipboard Tactical System - 2 (FFISTS-2)

The eight Turkish ships are all fitted with FFISTS and while some may have the FFISTS-1 version, the majority will have FFISTS-2. FFISTS-2 was developed from FFISTS-1 and replaces the star-network by a distributed architecture, which uses DTC-2 workstations interconnected by a dual fibre optic or a Thicknet local area network. The DTC-2 workstation is a SUN-4/110 SPARC station with either one or two 48 cm (19 in) raster scan screens, 32 Mbytes of RAM, a 200 Mbyte hard drive (eliminating the need for the shared hard drives used in FFISTS-1) and is rated at 7.5 Mips. A twin-screen DTC-2 monitors the sonars while a single-screen DTC-2 acts as the Link 11 interface. A third, single-screen, DTC-2 provides data fusion from onboard and offboard sensors including Link 11, Link 14 and satellite communications. FFISTS-2 is reported to be capable of conducting not only ASW operations but also anti-ship operations.

COMMUNICATIONS AND DATALINKS

Datalinks: Signaal Link 11; Link 14 receive only.
Tacan: SRN 15
IFF: UPX-12

WEAPONS CONTROL

AN/SWG-1A Harpoon Launch Control System (LCS)

SWG-1A is the Harpoon weapons control system, which activates the missile, selects the flight pattern and sets seeker search modes (with small, medium or large acquisition windows), as well as providing target range and bearing data. Alternatively, the missile can simply be launched along the bearing of the target, with the seeker activated early to scan a 90° sector; if, after a set time, no target has been acquired the missile commences a preset search pattern. SWG-1A takes account of other ships in the general target area and generates indirect flight plans for the missile, including waypoints to optimise angles of approach which will achieve the highest possibility of success while minimising the chances of the missile being destroyed by hostile fire. It can also be used to compute flight plans in a multiple attack so that several missiles, from either the same or different ships, arrive on target simultaneously, thus swamping the defences.

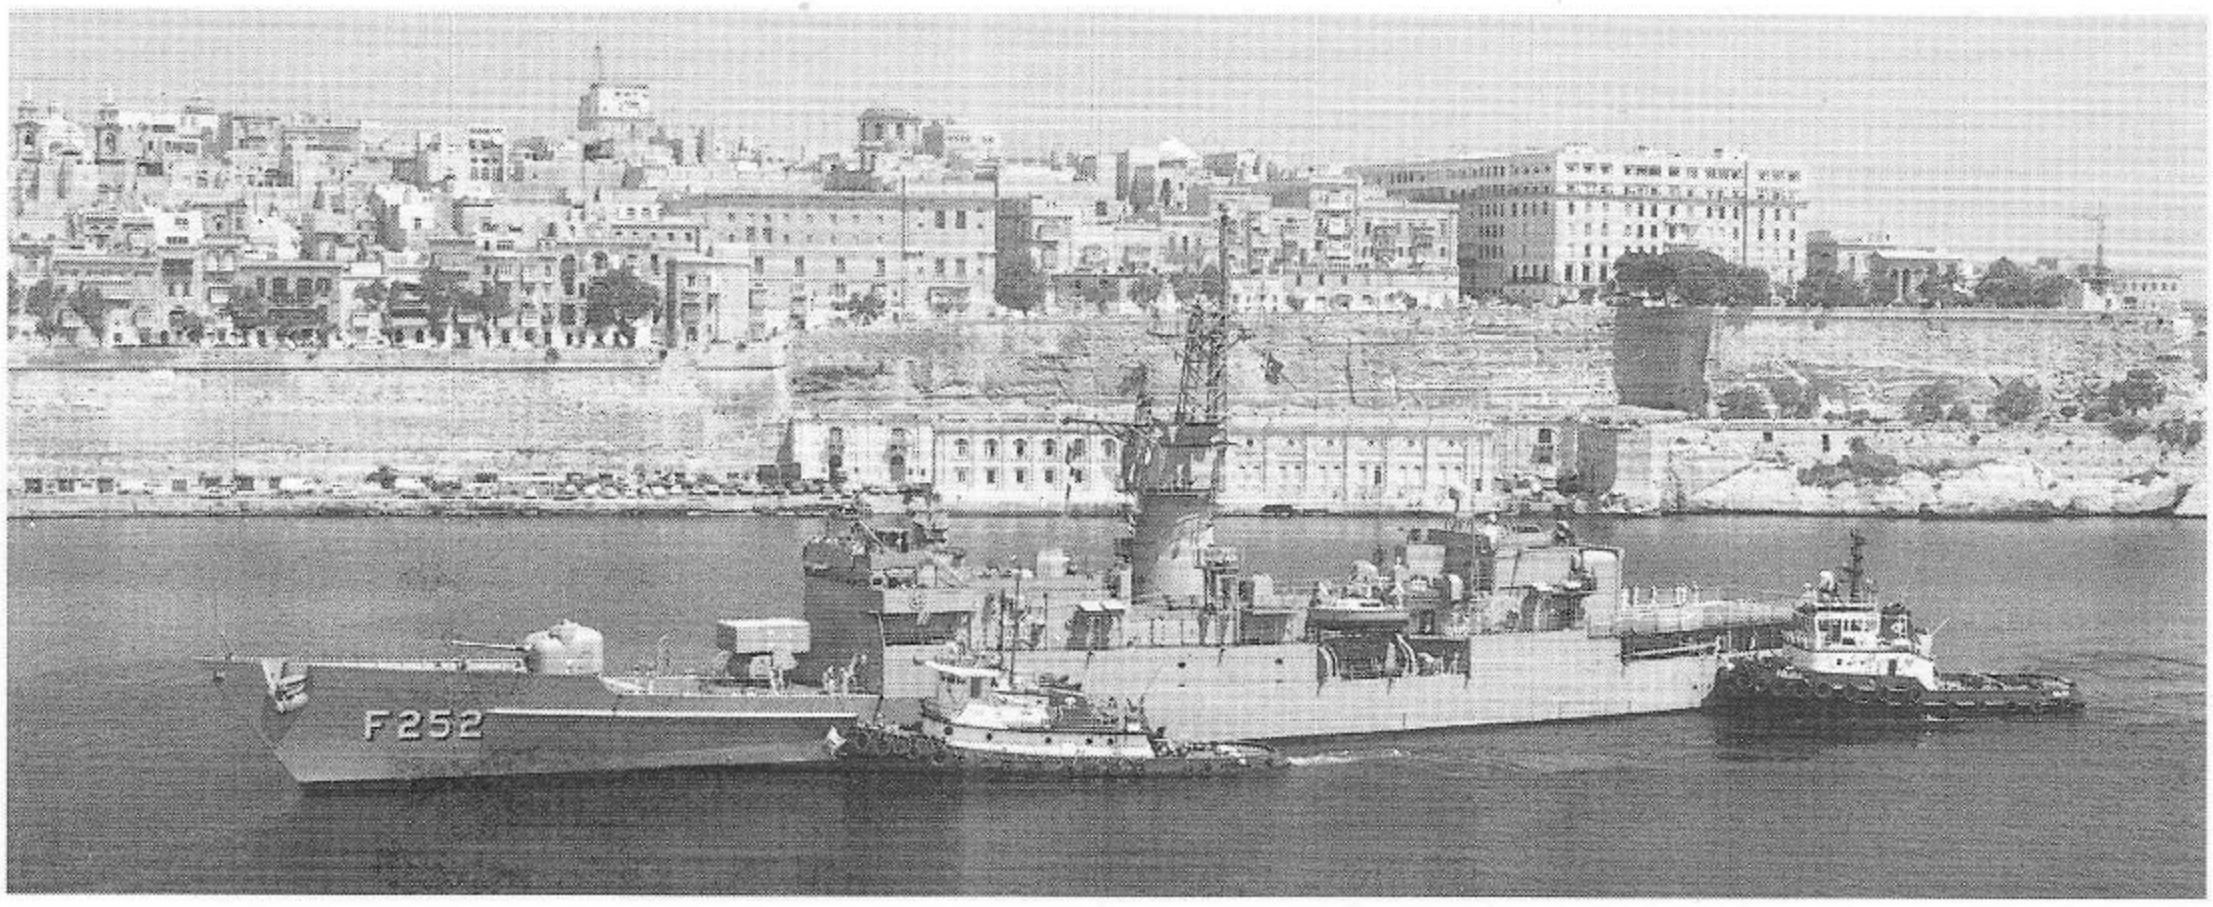
Mk 68 Gun Fire Control System (GFCS)

The Mk 68 GFCS provides target data, position orders and firing orders for the 127 mm (5 in) gun Mk 42 mountings for use against both surface and air targets. The system consists of a Mk 68 gun director and AN/SPG-53 I/J-band radar, a Mk 47 computer, a Mk 16 stable element and the gun mount. The system requires a crew of eight. The Mk 68 gun director has an optical rangefinder, two handwheels for optical tracking, the radar receiver, transmitter and antenna as well as a slip ring assembly. It transmits bearing, elevation and range data both to the computer and the radar operator's console. It can be operated in automatic radar and optical tracking modes.

The SPG-53 radar incorporates both spiral and conical scan for acquisition and tracking respectively. Later versions have monopulse and low-level tracking capabilities together with splash spotting and a missile launch alarm. The radar has both automatic and manual tracking modes. The former involves transmitting radar error signals in both bearing and elevation to the director power-driven amplifiers, where they are converted into control signals which drive the director. Manual tracking is achieved by operating the range, bearing and elevation handwheels at the radar operator's console. The Mk 47 analogue computer receives inputs from the director, the radar, the stable element, gyrocompass and underwater log system and processes this data to produce data on future target location, gun position and fuze orders. When engaging air targets its operation is automatic but, for engaging surface and land targets, manual rate control may be adopted.

Manufacturer/Contractor

Norden Systems, USA.



Kocatepe *(F 252), the former US Navy* Reasoner *(F 1063), entering Grand Harbour, Malta in 1986* (Jane's)

Mk 114 ASW fire-control system

The Mk 114 is the fire-control system for ASW operations. The main element is the Mk 53 Attack Console, an electromechanical analogue system which consists of two major units, the attack plotter and the ballistic computer. The latter conducts weapon presets for both ASROC and ASW torpedoes. The Mk 114 system also includes the Mk 33 underwater fire-control switchboard which accepts data from two Mk 19 gyrocompasses and other sensors, as well as from the Mk 134 sonar stabilisation computer. The consoles have an AN/UYK-44 reconfigurable processor with some 70,000 lines of CMS-2 language code. The system interfaces with the sonar.

Manufacturer/Contractor

Loral Librascope, USA.

NMMS electro-optic surveillance system

The NMMS was included in the transfer package. NMMS is designed to detect mines, low-flying aircraft and small boats by day or night in all weather conditions. It can also be used to support gunfire missions and to assist in helicopter landing control. NMMS consists of a systems electro-optic package housed in a composite casing and mounted on a pedestal. The sensor package comprises multiplexer electronics, the boresight assembly and the sensors (a Si-Vidicon television camera and a thermal imager), which float on high-energy, rare-earth magnets which create an energy field designed to produce unblurred images. The thermal imager is based upon the US MCTNS (Man-portable Common Thermal Night Sights) modules and has 120 elements with split Stirling cooling system. The sensor package also includes a Litton MMS Laser RangeFinder/ Designator (LRF/D) operating in the 1.06 micron range. Supporting the sensor package is a video tracker which can be used for manual or automatic tracking of targets. There is also a digital scan converter which enhances the thermal imager picture and also provides freeze frame and ×2 zoom capabilities. The system is used for both manual and automatic tracking but can also conduct continuous horizon scanning of designated sectors.

It should be noted that the designation 'Mast Mounted Sight' derives from the device's US Army title and it does not necessarily follow that in naval use the device is mounted on the ship's mast. The control console can be collocated with the sight, installed in the bridge or the combat information centre according to the operational requirement.

Specifications

Weight (sensor head): 72.57 kg (160 lb)
Diameter: 64.77 cm (25.5 in)
Stabilisation: less than 20 mrad
Fields of view
Thermal imager: 2 × 10°
Television: 2 × 8°

Manufacturers/Contractors

McDonnell Douglas Electronic Systems Company (system).
Northrop Electronics Division, Electronics Systems Group (sensor package).

RADARS

Set	AN/SPS-40B	AN/SPS 67*	AN/SPS-10*	LN-66	AN/SPG-53A/D/F
Company	Lockheed	Norden	Raytheon	Canadian Marconi	Western Electric
Role	2D surface search	Surface search	Surface search	Navigation	Fire control
Band	E/F	H (5.45-5.83 GHz)	G	I/J (9.3-9.4 GHz)	I/J
Beam	11 × 19°	1.5 × 16°	1.5 × 16°	2.5 × 22°	1.6°
Peak power	200 kW	500 kW	285 kW	75 kW	250 kW
Gain	21 dB	30 dB	30 dB	30 dB	39 dB
Pulsewidth	60 µs	0.1, 0.25, 1 µs	0.25-1.3 µs	1.0/0.1 µs	0.25 µs
PRF	300 pps	2,400, 1,200, 750 pps	312-325 pps	500/2,000 pps	1,000 pps
Scan rate	7.5/15 rpm	15/30 rpm	15 rpm	22 rpm	—
Range	175 n miles (320 km) 50,000 ft		Can detect a destroyer at 15 n miles		

* Ships are fitted with either AN/SPS-10 or AN/SPS-67.

SONARS

EDO AN/SQS-26CX

The hull-mounted AN/SQS-26CX works in surface duct, bottom bounce and convergence zone modes. Surface duct is for shorter range, bottom bounce for medium ranges and convergence zone for longer ranges. The last two modes require electronic beam-steering in elevation. SQS-26 is an active system transmitting at about 3.5 kHz with an output power of about 192 kW and receiving in seven channels between 1.5 and 4 kHz. The transducer is reported to be about 4.87 m (16.0 ft) in diameter and 1.68 m (5.5 ft) high, with 72 staves, each with eight elements. Ranges are reported to be approximately 10 n miles (18.5 km) in surface duct mode, and 34.5 n miles (64 km) in convergence zone mode. SQS-26CX was developed specially for the 'Knox' class frigates and was the final version of the SQS-26, the next set in the series being the SQS-53A.

Manufacturer/Contractor

EDO, Government Systems Division, College Point, New York, USA.

AN/SQR-18A(V)1 (TACTAS)

AN/SQR-18A(V)1 (also known as TACTAS (Tactical Towed Array Sonar). The low noise array is 230 m long and is towed behind an SQS-35 VDS 'fish' on a cable some 0.73 km (2,400 ft) long. The system features an adaptive processor which acts to reduce interference from the towing ship's noise (and to a lesser extent from adjacent ships) and a tracked system to provide bearing resolution and TMA. SQR-18 is integrated with the hull-mounted SQS-26 and AN/SQR-17 sonobuoy processor.

Manufacturer/Contractor

EDO, Government Systems Division, College Point, New York, USA.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck:
dimensions: 22.8 × 14 m (75 ft × 46 ft)
max helicopter take-off weight: 5,000 kg (11,000 lb)

Hangar: The hangar was originally designed to accommodate DASH helicopter drones, but was later enlarged to accommodate the SH-2 LAMPS-I Kaman SH-2 Seasprite. The after end of the hangar is telescopic.

HELICOPTERS

The Turkish Navy's shipborne ASW helicopter is the AB 212ASW, which type is seen embarked in these frigates. However, it is likely that the navy will acquire a smaller ASW helicopter.

PROPULSION

Specifications

System: Steam turbines
Main machinery: 2 Combustion Engineering/Babcock & Wilcox boilers; 84.4 kg/cm² (1,200 psi); 510°C (950°F); 1 turbine; 26 MW (35,000 hp)
Shafts: 1
